

ESP32-P4

ESP-IDF Programming Guide

Release v5.3.1
乐鑫信息科技
2024年09月03日

Table of contents

Table of contents	i
1 快速入门	3
1.1 概述	3
1.2 准备工作	3
1.2.1 硬件:	3
1.2.2 软件:	4
1.3 安装	4
1.3.1 IDE	4
1.3.2 手动安装	4
1.4 编译第一个工程	29
1.5 卸载 ESP-IDF	30
2 API 参考	31
2.1 API 约定	31
2.1.1 错误处理	31
2.1.2 配置结构体	31
2.1.3 私有 API	33
2.1.4 示例项目组件	33
2.1.5 API 稳定性	33
2.2 应用层协议	34
2.2.1 ASIO 端口	34
2.2.2 ESP-Modbus	34
2.2.3 ESP-MQTT	35
2.2.4 ESP-TLS	53
2.2.5 ESP HTTP 客户端	72
2.2.6 ESP 本地控制	89
2.2.7 ESP 串行从机链路	98
2.2.8 ESP x509 证书包	112
2.2.9 HTTP 服务器	115
2.2.10 HTTPS 服务器	143
2.2.11 ICMP 回显	148
2.2.12 mDNS 服务	153
2.2.13 Mbed TLS	153
2.2.14 IP 网络层协议	155
2.3 错误代码参考	155
2.4 连网 API	162
2.4.1 以太网	162
2.4.2 Thread	207
2.4.3 ESP-NETIF	217
2.4.4 IP 网络层协议	251
2.4.5 应用层协议	254
2.5 外设 API	254
2.5.1 模数转换器 (ADC) 单次转换模式驱动	254
2.5.2 模数转换器 (ADC) 连续转换模式驱动	264
2.5.3 模数转换器 (ADC) 校准驱动程序	273
2.5.4 Analog Comparator	275

2.5.5	时钟树	285
2.5.6	事件任务矩阵 (ETM)	304
2.5.7	GPIO & RTC GPIO	314
2.5.8	通用定时器	338
2.5.9	专用 GPIO	353
2.5.10	哈希消息认证码 (HMAC)	357
2.5.11	数字签名 (DS)	362
2.5.12	Inter-Integrated Circuit (I2C)	367
2.5.13	I2S	392
2.5.14	Image Signal Processor	439
2.5.15	LCD	452
2.5.16	低压差线性稳压器 (LDO)	474
2.5.17	LED PWM 控制器	476
2.5.18	Camera Controller Driver	500
2.5.19	电机控制脉宽调制器 (MCPWM)	507
2.5.20	并行 IO	561
2.5.21	脉冲计数器 (PCNT)	576
2.5.22	Pixel-Processing Accelerator (PPA)	591
2.5.23	红外遥控 (RMT)	605
2.5.24	SD Pull-up Requirements	633
2.5.25	SDMMC 主机驱动	634
2.5.26	SD SPI 主机驱动程序	641
2.5.27	Sigma-Delta 调制器 (SDM)	647
2.5.28	SPI flash API	652
2.5.29	SPI 主机驱动程序	683
2.5.30	SPI 从机驱动程序	705
2.5.31	SPI 从机半双工模式	712
2.5.32	JPEG Encoder and Decoder	720
2.5.33	温度传感器	737
2.5.34	电容式触摸传感器	746
2.5.35	Two-Wire Automotive Interface (TWAI)	769
2.5.36	通用异步接收器/发送器 (UART)	792
2.5.37	USB 设备栈	818
2.5.38	USB 主机	822
2.6	项目配置	873
2.6.1	简介	874
2.6.2	项目配置菜单	874
2.6.3	使用 sdkconfig.defaults	874
2.6.4	Kconfig 格式规定	874
2.6.5	Kconfig 选项的向后兼容性	875
2.6.6	配置选项参考	875
2.7	配网 API	1212
2.7.1	协议通信	1212
2.8	存储 API	1225
2.8.1	FAT 文件系统	1225
2.8.2	量产程序	1236
2.8.3	非易失性存储库	1240
2.8.4	NVS 加密	1263
2.8.5	NVS 分区生成程序	1269
2.8.6	NVS 分区解析程序	1274
2.8.7	SD/SDIO/MMC 驱动程序	1275
2.8.8	分区 API	1283
2.8.9	SPIFFS 文件系统	1292
2.8.10	虚拟文件系统组件	1297
2.8.11	磨损均衡 API	1313
2.9	系统 API	1316
2.9.1	应用程序镜像格式	1316
2.9.2	引导加载程序镜像的格式	1322

2.9.3	应用级追踪	1325
2.9.4	使用外部堆栈调用函数	1330
2.9.5	芯片版本	1332
2.9.6	控制台终端	1335
2.9.7	eFuse Manager	1345
2.9.8	错误代码和辅助函数	1376
2.9.9	ESP HTTPS OTA 升级	1379
2.9.10	事件循环库	1386
2.9.11	FreeRTOS 概述	1399
2.9.12	FreeRTOS (IDF)	1401
2.9.13	FreeRTOS (附加功能)	1516
2.9.14	堆内存分配	1543
2.9.15	基于 MMU 的存储管理	1558
2.9.16	Memory Synchronization	1564
2.9.17	堆内存调试	1568
2.9.18	ESP 定时器	1580
2.9.19	内部 API 和不稳定的 API	1585
2.9.20	处理器间调用 (IPC)	1587
2.9.21	中断分配	1592
2.9.22	日志库	1599
2.9.23	杂项系统 API	1607
2.9.24	空中升级 (OTA)	1624
2.9.25	电源管理	1636
2.9.26	POSIX Thread	1643
2.9.27	随机数发生器	1648
2.9.28	睡眠模式	1651
2.9.29	SoC 功能	1666
2.9.30	系统时间	1688
2.9.31	异步内存复制	1694
2.9.32	ULP LP-Core 协处理器编程	1699
2.9.33	看门狗	1721
3	H/W 硬件参考	1729
4	API 指南	1731
4.1	应用层跟踪库	1731
4.1.1	概述	1731
4.1.2	运行模式	1731
4.1.3	配置选项与依赖项	1732
4.1.4	如何使用此库	1733
4.2	应用程序的启动流程	1741
4.2.1	一级引导程序	1741
4.2.2	二级引导程序	1741
4.2.3	应用程序启动阶段	1742
4.3	引导加载程序 (Bootloader)	1743
4.3.1	引导加载程序兼容性	1743
4.3.2	日志级别	1744
4.3.3	恢复出厂设置	1744
4.3.4	从测试固件启动	1745
4.3.5	回滚	1745
4.3.6	看门狗	1745
4.3.7	引导加载程序大小	1745
4.3.8	从深度睡眠中快速启动	1746
4.3.9	自定义引导加载程序	1746
4.4	构建系统	1746
4.4.1	概述	1746
4.4.2	使用构建系统	1747
4.4.3	示例项目	1748

4.4.4	项目 CMakeLists 文件	1749
4.4.5	组件 CMakeLists 文件	1751
4.4.6	组件配置	1753
4.4.7	预处理器定义	1753
4.4.8	组件依赖	1753
4.4.9	覆盖项目的部分设置	1757
4.4.10	仅配置组件	1759
4.4.11	CMake 调试	1759
4.4.12	组件 CMakeLists 示例	1759
4.4.13	自定义 sdkconfig 的默认值	1763
4.4.14	flash 参数	1763
4.4.15	构建 Bootloader	1764
4.4.16	编写纯 CMake 组件	1764
4.4.17	组件中使用第三方 CMake 项目	1764
4.4.18	组件中使用预建库	1765
4.4.19	在自定义 CMake 项目中使用 ESP-IDF	1765
4.4.20	ESP-IDF CMake 构建系统 API	1766
4.4.21	文件通配 & 增量构建	1770
4.4.22	构建系统的元数据	1770
4.4.23	构建系统内部	1771
4.4.24	从 ESP-IDF GNU Make 构建系统迁移到 CMake 构建系统	1772
4.5	C Support	1773
4.5.1	C Version	1774
4.5.2	Unsupported C Features	1774
4.6	C++ 支持	1774
4.6.1	esp-idf-cxx 组件	1774
4.6.2	C++ 语言标准	1774
4.6.3	多线程	1775
4.6.4	异常处理	1775
4.6.5	运行时类型信息 (RTTI)	1775
4.6.6	在 C++ 中进行开发	1775
4.6.7	限制	1777
4.6.8	注意事项	1777
4.7	核心转储	1777
4.7.1	概述	1777
4.7.2	配置	1777
4.7.3	将核心转储保存到 flash	1778
4.7.4	将核心转储保存到 UART	1779
4.7.5	核心转储命令	1780
4.7.6	回溯中的 ROM 函数	1781
4.7.7	按需转储变量	1781
4.7.8	运行 idf.py coredump-info 和 idf.py coredump-debug	1782
4.8	Current Consumption Measurement of Modules	1784
4.8.1	Notes to Measurement	1784
4.8.2	Hardware Connection	1784
4.8.3	Measurement Steps	1786
4.9	Deep Sleep Wake Stubs	1787
4.9.1	Introduction	1787
4.9.2	Implement wake stub	1788
4.9.3	Example	1789
4.10	错误处理	1789
4.10.1	概述	1790
4.10.2	错误码	1790
4.10.3	错误码到错误消息	1790
4.10.4	ESP_ERROR_CHECK 宏	1790
4.10.5	ESP_ERROR_CHECK_WITHOUT_ABORT 宏	1791
4.10.6	ESP_RETURN_ON_ERROR 宏	1791
4.10.7	ESP_GOTO_ON_ERROR 宏	1791

4.10.8	ESP_RETURN_ON_FALSE 宏	1791
4.10.9	ESP_GOTO_ON_FALSE 宏	1791
4.10.10	CHECK 宏使用示例	1791
4.10.11	错误处理模式	1792
4.10.12	C++ 异常	1793
4.11	片外 RAM	1793
4.11.1	简介	1793
4.11.2	硬件	1793
4.11.3	配置片外 RAM	1793
4.11.4	片外 RAM 使用限制	1795
4.11.5	初始化失败	1795
4.11.6	加密	1795
4.12	严重错误	1795
4.12.1	概述	1796
4.12.2	紧急处理程序	1796
4.12.3	寄存器转储与回溯	1797
4.12.4	GDB Stub	1799
4.12.5	RTC 看门狗超时	1800
4.12.6	Guru Meditation 错误	1800
4.12.7	其他严重错误	1801
4.13	硬件抽象	1804
4.13.1	架构	1804
4.13.2	LL 层 (低级层)	1805
4.13.3	HAL (硬件抽象层)	1806
4.14	JTAG 调试	1807
4.14.1	引言	1807
4.14.2	工作原理	1807
4.14.3	选择 JTAG 适配器	1808
4.14.4	安装 OpenOCD	1809
4.14.5	配置 ESP32-P4 目标板	1809
4.14.6	启动调试器	1812
4.14.7	调试范例	1812
4.14.8	从源码构建 OpenOCD	1812
4.14.9	注意事项和补充内容	1817
4.14.10	相关文档	1821
4.15	链接器脚本生成机制	1846
4.15.1	概述	1846
4.15.2	快速上手	1846
4.15.3	链接器脚本生成机制内核	1849
4.16	lwIP	1855
4.16.1	支持的 API	1855
4.16.2	BSD 套接字 API	1855
4.16.3	Netconn API	1859
4.16.4	lwIP FreeRTOS 任务	1859
4.16.5	IPv6 支持	1860
4.16.6	ESP-lwIP 自定义修改	1860
4.16.7	性能优化	1862
4.17	存储器类型	1863
4.17.1	DRAM (数据 RAM)	1863
4.17.2	IRAM (指令 RAM)	1864
4.17.3	IROM (代码从 flash 中运行)	1865
4.17.4	DROM (数据存储在 flash 中)	1865
4.17.5	RTC FAST memory (RTC 快速存储器)	1865
4.17.6	紧密耦合内存 (TCM)	1865
4.17.7	具备 DMA 功能	1865
4.17.8	在堆栈中放置 DMA 缓冲区	1866
4.18	OpenThread	1866
4.18.1	OpenThread 协议栈运行模式	1866

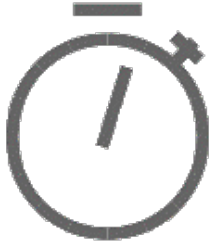

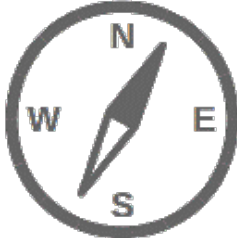

4.18.2	编写 OpenThread 应用程序	1867
4.18.3	OpenThread 边界路由器	1868
4.19	分区表	1868
4.19.1	概述	1868
4.19.2	内置分区表	1869
4.19.3	创建自定义分区表	1869
4.19.4	生成二进制分区表	1872
4.19.5	分区大小检查	1872
4.19.6	烧写分区表	1873
4.19.7	分区工具 (parttool.py)	1873
4.20	性能	1874
4.20.1	如何优化性能	1874
4.20.2	指南	1874
4.21	Reproducible Builds	1891
4.21.1	Introduction	1891
4.21.2	Reasons for Non-Reproducible Builds	1891
4.21.3	Enabling Reproducible Builds in ESP-IDF	1891
4.21.4	How Reproducible Builds Are Achieved	1891
4.21.5	Reproducible Builds and Debugging	1892
4.21.6	Factors Which Still Affect Reproducible Builds	1892
4.22	线程局部存储	1892
4.22.1	概述	1892
4.22.2	FreeRTOS 原生 API	1892
4.22.3	Pthread API	1893
4.22.4	C11 标准	1893
4.23	工具	1893
4.23.1	IDF 前端工具 - idf.py	1893
4.23.2	IDF 监视器	1897
4.23.3	IDF Docker 镜像	1905
4.23.4	IDF Windows 安装程序	1908
4.23.5	IDF 组件管理器	1909
4.23.6	IDF clang-tidy	1910
4.23.7	可下载 ESP-IDF 工具	1911
4.24	ESP32-P4 中的单元测试	1924
4.24.1	添加常规测试用例	1924
4.24.2	添加多设备测试用例	1925
4.24.3	添加多阶段测试用例	1926
4.24.4	应用于不同芯片的单元测试	1926
4.24.5	编译单元测试程序	1927
4.24.6	运行单元测试	1927
4.24.7	带缓存补偿定时器的定时代码	1928
4.24.8	Mocks	1929
4.25	在主机上运行 ESP-IDF 应用程序	1931
4.25.1	介绍	1931
4.25.2	使用模拟器的前提	1932
4.25.3	构建和运行	1932
4.25.4	组件 Linux/Mock 支持情况概述	1932
4.26	USB 串行/JTAG 控制器控制台	1933
4.26.1	硬件要求	1933
4.26.2	软件配置	1934
4.26.3	上传应用程序	1934
4.26.4	限制	1934
4.27	低功耗模式使用指南	1935
4.27.1	系统低功耗模式介绍	1935
5	迁移指南	1943
5.1	迁移到 ESP-IDF 5.x	1943
5.1.1	从 4.4 迁移到 5.0	1943

5.1.2	从 5.0 迁移到 5.1	1971
5.1.3	从 5.1 迁移到 5.2	1974
5.1.4	从 5.2 迁移到 5.3	1976
6	安全指南	1981
6.1	概述	1981
6.1.1	安全	1981
6.2	功能	1984
6.2.1	flash 加密	1984

这里是乐鑫 IoT 开发框架 ([esp-idf](#)) 的文档中心。ESP-IDF 是 [ESP32](#)、[ESP32-S](#)、[ESP32-C](#)、[ESP32-H](#) 和 [ESP32-P](#) 系列芯片的官方开发框架。

本文档仅包含针对 ESP32-P4 芯片的 ESP-IDF 使用。

		
快速入门	API 参考	API 指南

Chapter 1

快速入门

本文档旨在指导用户搭建 ESP32-P4 硬件开发的软件环境，通过一个简单的示例展示如何使用 ESP-IDF (Espressif IoT Development Framework) 配置菜单，并编译、下载固件至 ESP32-P4 开发板等步骤。

备注：这是 ESP-IDF 稳定版本 v5.3.1 的文档，还有其他版本的文档[ESP-IDF 版本简介](#) 供参考。

1.1 概述

ESP32-P4 SoC 芯片支持以下功能：

- 搭载 RISC-V 32 位双核处理器的高性能 MCU
- 强大的图像与语音处理能力
- 支持单精度 FPU 和 AI 扩展
- 外设丰富包括 MIPI、USB、SDIO、以太网等
- 内置安全硬件

ESP32-P4 采用 40 nm 工艺制成，具有最佳的功耗性能、射频性能、稳定性、通用性和可靠性，适用于各种应用场景和不同功耗需求。

乐鑫为用户提供完整的软、硬件资源，进行 ESP32-P4 硬件设备的开发。其中，乐鑫的软件开发环境 ESP-IDF 旨在协助用户快速开发物联网 (IoT) 应用，可满足用户对 Wi-Fi、蓝牙、低功耗等方面的要求。

1.2 准备工作

1.2.1 硬件：

- 一款 **ESP32-P4** 开发板
- **USB 数据线** (A 转 Micro-B)
- 电脑 (Windows、Linux 或 macOS)

备注：目前一些开发板使用的是 USB Type C 接口。请确保使用合适的数据线来连接开发板！

以下是 ESP32-P4 官方开发板，点击链接可了解更多硬件信息。

即将发布

1.2.2 软件：

如需在 **ESP32-P4** 上使用 ESP-IDF，请安装以下软件：

- 设置 **工具链**，用于编译 ESP32-P4 代码；
- **编译构建工具**——CMake 和 Ninja 编译构建工具，用于编译 ESP32-P4 **应用程序**；
- 获取 **ESP-IDF** 软件开发框架。该框架已经基本包含 ESP32-P4 使用的 API（软件库和源代码）和运行 **工具链** 的脚本；

1.3 安装

为安装所需软件，乐鑫提供了以下方法，可根据需要选择其中之一。

1.3.1 IDE

备注： 建议通过自己喜欢的集成开发环境 (IDE) 安装 ESP-IDF。

- [Eclipse Plugin](#)
- [VSCode Extension](#)

1.3.2 手动安装

请根据操作系统，选择对应的手动安装流程。

Windows 平台工具链的标准设置

概述 ESP-IDF 需要安装一些必备工具，才能围绕 ESP32-P4 构建固件，包括 Python、Git、交叉编译器、CMake 和 Ninja 编译工具等。

本入门指南介绍了如何通过 **命令提示符** 进行有关操作。不过，安装 ESP-IDF 后，还可以使用 [Eclipse Plugin](#) 或其他支持 CMake 的图形化工具 IDE。

备注： 限定条件：

- 请注意 ESP-IDF 和 ESP-IDF 工具的安装路径不能超过 90 个字符，安装路径过长可能会导致构建失败。
- Python 或 ESP-IDF 的安装路径中一定不能包含空格或括号。
- 除非操作系统配置为支持 Unicode UTF-8，否则 Python 或 ESP-IDF 的安装路径中也不能包括特殊字符（非 ASCII 码字符）

系统管理员可以通过如下方式将操作系统配置为支持 Unicode UTF-8: Control Panel > 更改 date、time、或 number 格式 > Administrative tab > 更改 system locale > 勾选选项 Beta: Use Unicode UTF-8 for worldwide language support > Ok > 重启电脑。

ESP-IDF 工具安装器 安装 ESP-IDF 必备工具最简易的方式是下载一个 ESP-IDF 工具安装器。

在线安装与离线安装的区别 在线安装程序非常小，可以安装 ESP-IDF 的所有版本。在安装过程中，安装程序只下载必要的依赖文件，包括 [Git For Windows](#) 安装器。在线安装程序会将下载的文件存储在缓存目录 %userprofile%/espressif 中。

离线安装程序不需要任何网络连接。安装程序中包含了所有需要的依赖文件，包括 [Git For Windows](#) 安装器。

安装内容 安装程序会安装以下组件：

- 内置的 Python
- 交叉编译器
- OpenOCD
- CMake 和 Ninja 编译工具
- ESP-IDF

安装程序允许将程序下载到现有的 ESP-IDF 目录。推荐将 ESP-IDF 下载到 %userprofile%\Desktop\esp-idf 目录下，其中 %userprofile% 代表家目录。

启动 ESP-IDF 环境 安装结束时，如果勾选了 Run ESP-IDF PowerShell Environment 或 Run ESP-IDF Command Prompt (cmd.exe)，安装程序会在选定的提示符窗口启动 ESP-IDF。

Run ESP-IDF PowerShell Environment:

图 1: 完成 ESP-IDF 工具安装向导时运行 Run ESP-IDF PowerShell Environment

Run ESP-IDF Command Prompt (cmd.exe):

使用命令提示符 在后续步骤中，将介绍如何使用 Windows 的命令提示符进行操作。

ESP-IDF 工具安装器可在“开始”菜单中，创建一个打开 ESP-IDF 命令提示符窗口的快捷方式。本快捷方式可以打开 Windows 命令提示符 (即 cmd.exe)，并运行 export.bat 脚本以设置各环境变量 (比如 PATH, IDF_PATH 等)。此外，还可以通过 Windows 命令提示符使用各种已经安装的工具。

注意，本快捷方式仅适用 ESP-IDF 工具安装器中指定的 ESP-IDF 路径。如果电脑上存在多个 ESP-IDF 路径 (比如需要不同版本的 ESP-IDF)，有以下两种解决方法：

1. 为 ESP-IDF 工具安装器创建的快捷方式创建一个副本，并将新快捷方式的 ESP-IDF 工作路径指定为希望使用的 ESP-IDF 路径。
2. 或者，可以运行 cmd.exe，并切换至希望使用的 ESP-IDF 目录，然后运行 export.bat。注意，这种方法要求 PATH 中存在 Python 和 Git。如果在使用时遇到有关“找不到 Python 或 Git”的错误信息，请使用第一种方法。

开始使用 ESP-IDF 现在你已经具备了使用 ESP-IDF 的所有条件，接下来将介绍如何开始第一个工程。

本指南将介绍如何初步上手 ESP-IDF，包括如何使用 ESP32-P4 创建第一个工程，并构建、烧录和监控设备输出。

```

Checking if Python packages are up to date...
Python requirements from C:\Users\test\esp\esp-idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

idf.py build

C:\Users\test\esp\esp-idf>
```

图 4: ESP-IDF 命令提示符窗口

备注: 如果还未安装 ESP-IDF，请参照[安装](#)中的步骤，获取使用本指南所需的所有软件。

开始创建工程 现在，可以准备开发 ESP32-P4 应用程序了。可以从 ESP-IDF 中 `examples` 目录下的 `get-started/hello_world` 工程开始。

重要: ESP-IDF 编译系统不支持 ESP-IDF 路径或其工程路径中带有空格。

将 `get-started/hello_world` 工程复制至本地的 `~/esp` 目录下：

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

备注: ESP-IDF 的 `examples` 目录下有一系列示例工程，可以按照上述方法复制并运行其中的任何示例，也可以直接编译示例，无需进行复制。

连接设备 现在，请将 ESP32-P4 开发板连接到 PC，并查看开发板使用的串口。

在 Windows 操作系统中，串口名称通常以 COM 开头。

有关如何查看串口名称的详细信息，请见与 [ESP32-P4 创建串口连接](#)。

备注: 请记住串口名，以便后续使用。

配置工程 请进入 `hello_world` 目录，设置 ESP32-P4 为目标芯片，然后运行工程配置工具 `menuconfig`。

Windows

```
cd %userprofile%\esp\hello_world
idf.py set-target esp32p4
idf.py menuconfig
```

打开一个新工程后，应首先使用 `idf.py set-target esp32p4` 设置“目标”芯片。注意，此操作将清除并初始化项目之前的编译和配置（如有）。也可以直接将“目标”配置为环境变量（此时可跳过该步骤）。更多信息，请见[选择目标芯片：set-target](#)。

正确操作上述步骤后，系统将显示以下菜单：

可以通过此菜单设置项目的具体变量，包括 Wi-Fi 网络名称、密码和处理器速度等。`hello_world` 示例项目会以默认配置运行，因此在这一项目中，可以跳过使用 `menuconfig` 进行项目配置这一步骤。

备注: 终端窗口中显示出的菜单颜色可能会与上图不同。可以通过选项 `--style` 来改变外观。请运行 `idf.py menuconfig --help` 命令，获取更多信息。

编译工程 请使用以下命令，编译烧录工程：

```
idf.py build
```

运行以上命令可以编译应用程序和所有 ESP-IDF 组件，接着生成引导加载程序、分区表和应用程序二进制文件。

```

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↪-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
↪bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↪partition-table.bin
or run 'idf.py -p PORT flash'
```

如果一切正常，编译完成后将生成 `.bin` 文件。

烧录到设备 请运行以下命令，将刚刚生成的二进制文件烧录至 ESP32-P4 开发板：

```
idf.py -p PORT flash
```

请将 `PORT` 替换为 ESP32-P4 开发板的串口名称。如果 `PORT` 未经定义，`idf.py` 将尝试使用可用的串口自动连接。

更多有关 `idf.py` 参数的详情，请见 [idf.py](#)。

备注：勾选 `flash` 选项将自动编译并烧录工程，因此无需再运行 `idf.py build`。

若在烧录过程中遇到问题，请参考下文中的“其他提示”。也可以前往 [烧录故障排除](#) 或与 [ESP32-P4 创建串口连接](#) 获取更多详细信息。

常规操作 在烧录过程中，会看到类似如下的输出日志：

```
...
esptool.py v4.8.dev3
Serial port /dev/cu.SLAB_USBtoUART
Connecting....
Chip is ESP32-P4 (revision v0.0)
Features: High-Performance MCU
Crystal is 40MHz
MAC: 00:00:00:00:00:00
Uploading stub...
Running stub...
Stub running...
Changing baud rate to 460800
Changed.
Configuring flash size...
Flash will be erased from 0x00002000 to 0x00007fff...
Flash will be erased from 0x00010000 to 0x0003bfff...
Flash will be erased from 0x00008000 to 0x00008fff...

↪kbit/s)...
Hash of data verified.

Leaving...
Hard resetting via RTS pin...
Done
```

如果一切顺利，烧录完成后，开发板将会复位，应用程序“hello_world”开始运行。

如果希望使用 Eclipse 或是 VS Code IDE，而非 idf.py，请参考 [Eclipse Plugin](#)，以及 [VSCode Extension](#)。

监视输出 可以使用 `idf.py -p PORT monitor` 命令，监视“hello_world”工程的运行情况。注意，不要忘记将 `PORT` 替换为自己的串口名称。

运行该命令后，[IDF 监视器](#) 应用程序将启动。

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...] /esp/hello_world/build
Executing "python [...] /esp-idf/tools/idf_monitor.py -b 115200 [...] /esp/hello_
↪world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...
```

此时，就可以在启动日志和诊断日志之后，看到打印的“Hello world!”了。

```

...
Hello world!
Restarting in 10 seconds...
This is esp32p4 chip with 2 CPU core(s), silicon revision v0.0, 2 MB external
↵flash
Minimum free heap size: 618848 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...

```

使用快捷键 `Ctrl+]` ，可退出 ESP-IDF 监视器。

备注：也可以运行以下命令，一次性执行构建、烧录和监视过程：

```
idf.py -p PORT flash monitor
```

此外，

- 请前往 [IDF 监视器](#)，了解更多使用 ESP-IDF 监视器的快捷键和其他详情。
- 请前往 [idf.py](#)，查看更多 `idf.py` 命令和选项。

恭喜完成 ESP32-P4 的入门学习！

现在，可以尝试一些其他 [examples](#)，或者直接开发自己的应用程序。

重要：一些示例程序不支持 ESP32-P4，因为 ESP32-P4 中不包含所需的硬件。

在编译示例程序前请查看 README 文件中 Supported Targets 表格。如果表格中包含 ESP32-P4，或者不存在这个表格，那么即表示 ESP32-P4 支持这个示例程序。

其他提示

权限问题 使用某些 Linux 版本向 ESP32-P4 烧录固件时，可能会出现类似 `Could not open port <PORT>: Permission denied: '<PORT>'` 错误消息。此时可以在 Linux 将用户添加至 [dialout 组](#) 或 [uucp 组](#) 来解决此类问题。

兼容的 Python 版本 ESP-IDF 支持 Python 3.8 及以上版本，建议升级操作系统到最新版本从而更新 Python。也可选择从 [sources](#) 安装最新版 Python，或使用 Python 管理系统如 [pyenv](#) 对版本进行升级管理。

擦除 flash ESP-IDF 支持擦除 flash。请运行以下命令，擦除整个 flash：

```
idf.py -p PORT erase-flash
```

若存在需要擦除的 OTA 数据，请运行以下命令：

```
idf.py -p PORT erase-otadata
```

擦除 flash 需要一段时间，在擦除过程中，请勿断开设备连接。

相关文档 想要自定义安装流程的高阶用户可参照：

- 在 [Windows 环境下更新 ESP-IDF 工具](#)
- 与 [ESP32-P4 创建串口连接](#)
- [Eclipse Plugin](#)
- [VSCode Extension](#)
- [IDF 监视器](#)

在 Windows 环境下更新 ESP-IDF 工具

使用脚本安装 ESP-IDF 工具 请从 Windows “命令提示符” 窗口，切换至 ESP-IDF 的安装目录。然后运行：

```
install.bat
```

对于 Powershell，请切换至 ESP-IDF 的安装目录。然后运行：

```
install.ps1
```

该命令可下载并安装 ESP-IDF 所需的工具。如已经安装了某个版本的工具，则该命令将无效。该工具的下
载安装位置由 ESP-IDF 工具安装器的设置决定，默认情况下为：C:\Users\username\.espressif。

使用“导出脚本”将 ESP-IDF 工具添加至 PATH 环境变量 ESP-IDF 工具安装器将在“开始菜单”为
“ESP-IDF 命令提示符”创建快捷方式。点击该快捷方式可打开 Windows 命令提示符窗口，可在该窗口使
用所有已安装的工具。

有些情况下，正在使用的命令提示符窗口并不是通过快捷方式打开的，此时如果想要在该窗口使用
ESP-IDF，可以根据下方步骤将 ESP-IDF 工具添加至 PATH 环境变量。

首先，请打开需要使用 ESP-IDF 的命令提示符窗口，切换至安装 ESP-IDF 的目录，然后执行 `export.bat`，
具体命令如下：

```
cd %userprofile%\esp\esp-idf  
export.bat
```

对于 Powershell 用户，请同样切换至安装 ESP-IDF 的目录，然后执行 `export.ps1`，具体命令如下：

```
cd ~/esp/esp-idf  
export.ps1
```

运行完成后，就可以通过命令提示符使用 ESP-IDF 工具了。

与 ESP32-P4 创建串口连接

可以使用 USB 至 UART 桥或 ESP32-P4 支持的 USB 外设，与 ESP32-P4 创建串口连接。

部分开发板中已经安装有 USB 至 UART 桥。如未安装，可使用外部桥。

支持的 USB 外设 ESP32-P4 支持 USB 外设。无需 USB 至 UART 桥，便可直接烧录设备。

部分支持 USB 外设的开发板同时也包含 USB 至 UART 桥。

安装有 USB 至 UART 桥的开发板 在安装有 USB 至 UART 桥的开发板中，PC 和桥之间通过 USB 连接，
桥和 ESP32-P4 之间通过 UART 连接。

外部 USB 至 UART 桥 部分开发板使用外部 USB 至 UART 桥。这种情况通常出现在需要控制空间和成
本的产品中，例如一些小型开发板或成品。

使用 USB 进行烧录 ESP32-P4 支持 USB 外设，无需外部 USB 至 UART 桥，即可烧录二进制文件。

ESP32-P4 上的 USB 使用 **GPIO24/26** 作为 **D+**，**GPIO24/26** 作为 **D-**。

使用 UART 进行烧录 本节描述如何使用 USB 至 UART 桥在 ESP32-P4 和 PC 之间建立串行连接。板上
桥与外部桥均适用。

图 6: 支持 USB 的 SoC

图 7: 安装有 USB 至 UART 桥的开发板

图 8: 外部 USB 至 UART 桥

连接 ESP32-P4 和 PC 用 USB 线将 ESP32-P4 开发板连接到 PC。如果设备驱动程序没有自动安装，请先确认 ESP32-P4 开发板上的 USB 至 UART 桥（或外部转 UART 适配器）型号，然后在网上搜索驱动程序，并进行手动安装。

以下是乐鑫 ESP32-P4 开发板驱动程序的链接：

- CP210x: [CP210x USB 至 UART 桥 VCP 驱动程序](#)
- FTDI: [FTDI 虚拟 COM 端口驱动程序](#)

以上驱动仅供参考，请查看开发板用户指南，了解开发板具体使用的 USB 至 UART 桥芯片。一般情况下，当 ESP32-P4 开发板与 PC 连接时，对应驱动程序应该已经被打包在操作系统中，并已经自动安装。

对于使用 USB 至 UART 桥下载的设备，可以运行以下命令，包括定义波特率的可选参数。

```
idf.py -p PORT [-b BAUD] flash
```

将 PORT 替换为 ESP32-P4 开发板的串口名称。-b 为可选参数，默认的波特率为 460800。如需改变烧录器的波特率，请用需要的波特率代替 BAUD。

要查看串口名称，Windows 用户请参考[check-port-on-windows](#)，Linux 与 macOS 用户请参考[check-port-on-linux-and-macos](#)。

例如，Windows 平台上串口名称为 COM3，所需波特率为 115200，可使用如下命令烧录开发板：

```
idf.py -p COM3 -b 115200 flash
```

Linux 平台上串口名称为 /dev/ttyUSB0，所需波特率为 115200，可使用如下命令烧录开发板：

```
idf.py -p /dev/ttyUSB0 -b 115200 flash
```

macOS 平台上串口名称为 /dev/cu.usbserial-1401，所需波特率为 115200，可使用如下命令烧录开发板：

```
idf.py -p /dev/cu.usbserial-1401 -b 115200 flash
```

备注：如果设备不支持自动下载模式，则需要手动进入下载模式。请按住 BOOT 按钮，同时按一下 RESET 按钮。之后，松开 BOOT 按钮。

在 Windows 上查看端口 检查 Windows 设备管理器中的 COM 端口列表。断开 ESP32-P4 与 PC 的连接，然后重新连接，查看哪个端口从列表中消失后又再次出现。

以下为 ESP32 DevKitC 和 ESP32 WROVER KIT 串口：

在 Linux 和 macOS 上查看端口 查看 ESP32-P4 开发板（或外部转串口适配器）的串口设备名称，请将以下命令运行两次。首先，断开开发板或适配器，首次运行以下命令；然后，连接开发板或适配器，再次运行以下命令。其中，第二次运行命令后出现的端口即是 ESP32-P4 对应的串口：

Linux:

```
ls /dev/tty*
```

macOS:

```
ls /dev/cu.*
```

备注：对于 macOS 用户：若没有看到串口，请检查是否安装 USB/串口驱动程序。具体应使用的驱动程序，见章节[连接 ESP32-P4 和 PC](#)。对于 macOS High Sierra (10.13) 的用户，你可能还需要手动允许驱动程序的加载，具体可打开系统偏好设置 -> 安全和隐私 -> 通用，检查是否有信息显示：“来自开发人员的系统软件...”，其中开发人员的名称为 Silicon Labs 或 FTDI。

图 9: 设备管理器中 ESP32-DevKitC 的 USB 至 UART 桥

图 10: Windows 设备管理器中 ESP-WROVER-KIT 的两个 USB 串行端口

在 Linux 中添加用户到 dialout 或 uucp 组 当前登录用户应当可以通过 USB 对串口进行读写操作。在多数 Linux 版本中，都可以通过以下命令，将用户添加到 dialout 组，从而获许读写权限：

```
sudo usermod -a -G dialout $USER
```

在 Arch Linux 中，需要通过以下命令将用户添加到 uucp 组中：

```
sudo usermod -a -G uucp $USER
```

请重新登录，确保串口读写权限生效。

确认串口连接 现在，请使用串口终端程序，查看重置 ESP32-P4 后终端上是否有输出，从而验证串口连接是否可用。

ESP32-P4 的控制台波特率默认为 115200。

Windows 和 Linux 操作系统 在本示例中，我们将使用 PuTTY SSH Client，PuTTY SSH Client 既可用于 Windows 也可用于 Linux。也可以使用其他串口程序并设置如下的通信参数。

运行终端，配置在上述步骤中确认的串口：波特率 = 115200（如有需要，请更改为使用芯片的默认波特率），数据位 = 8，停止位 = 1，奇偶校验 = N。以下截屏分别展示了如何在 Windows 和 Linux 中配置串口和上述通信参数（如 115200-8-1-N）。注意，这里一定要选择在上述步骤中确认的串口进行配置。

图 11: 在 Windows 操作系统中使用 PuTTY 设置串口通信参数

然后，请检查 ESP32-P4 是否有打印日志。如有，请在终端打开串口进行查看。这里的日志内容取决于加载到 ESP32-P4 的应用程序，请参考[输出示例](#)。如果没有看到输出日志，请尝试重启开发板。

图 12: 在 Linux 操作系统中使用 PuTTY 设置串口通信参数

备注：请在验证完串口通信正常后，关闭串口终端。如果终端一直保持打开的状态，之后上传固件时将无法访问串口。

备注：如果没有日志输出，请检查以下原因：

- ESP32-P4 的供电是否正常
- 启动终端程序后，是否重置开发板
- 使用在 [Windows 上查看端口](#) 与在 [Linux 和 macOS 上查看端口](#) 中描述的方法，检查所选串口是否正确
- 其他程序是否正在使用该串口
- 对于 [Windows 和 Linux 操作系统](#) 中描述的串口终端程序，其选择的端口是否正确
- 串口终端程序中的串口设置是否适用于该应用程序
- 开发板上选择的 USB 连接器 (UART) 是否正确
- 应用程序是否会输出日志
- 是否禁用了日志输出 (使用 [hello world 示例](#) 进行测试)

macOS 操作系统 macOS 提供了 **屏幕命令**，因此无需安装串口终端程序。

- 参考在 [Linux 和 macOS 上查看端口](#)，运行以下命令：

```
ls /dev/cu.*
```

- 会看到类似如下输出：

```
/dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_
↪USBtoUART7
```

- 根据连接到电脑上的开发板类型和数量，输出结果会有所不同。请选择开发板的设备名称，并运行以下命令（如有需要，请将“115200”更改为使用芯片的默认波特率）：

```
screen /dev/cu.device_name 115200
```

将 device_name 替换为运行 `ls /dev/cu.*` 后出现的设备串口号。

- **屏幕**显示的日志即为所需内容。日志内容取决于加载到 ESP32-P4 的应用程序，请参考[输出示例](#)。请使用 `Ctrl-A + K` 键退出当前 **屏幕**会话。

备注：请在验证完串口通信正常后，关闭 **当前屏幕会话**。如果直接关闭终端窗口而没有关闭 **屏幕**，之后上传固件时将无法访问串口。

输出示例 以下是一个日志示例。如果没看到任何输出，请尝试重置开发板。

```
ets Jun  8 2016 00:22:57

(下页继续)

(续上页)

```
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```

如果打印出的日志是可读的（而不是乱码），则表示串口连接正常。此时，可以继续安装，并最终将应用程序上载到 ESP32-P4。

备注：在某些串口接线方式下，在 ESP32-P4 启动并开始打印串口日志前，需要在终端程序中禁用串口 RTS & DTR 管脚。该问题仅存在于将 RTS & DTR 管脚直接连接到 EN & GPIO35 管脚上的情况，绝大多数开发板（包括乐鑫所有的开发板）都没有这个问题。更多详细信息，请参考 [esptool 文档](#)。

如在安装 ESP32-P4 硬件开发的软件环境时，从 [第五步：开始使用 ESP-IDF 吧](#) 跳转到了这里，请从 [第五步：开始使用 ESP-IDF 吧](#) 继续阅读。

烧录故障排除

连接失败 如果在运行给定命令时出现如“连接失败”这样的错误，造成该错误的原因之一可能是运行 `esptool.py` 时出现错误。`esptool.py` 是构建系统调用的程序，用于重置芯片、与 ROM 引导加载器交互以及烧录固件的工具。可以按照以下步骤进行手动复位，轻松解决该问题。如果问题仍未解决，请参考 [esptool 故障排除](#) 获取更多信息。

`esptool.py` 通过使 USB 至 UART 桥（如 FTDI 或 CP210x）的 DTR 和 RTS 控制线生效来自动复位 ESP32-P4（请参考 [与 ESP32-P4 创建串口连接](#) 获取更多详细信息）。DTR 和 RTS 控制线又连接到 ESP32-P4 的 GPIO35 和 CHIP_PU (EN) 管脚上，因此 DTR 和 RTS 的电压电平变化会使 ESP32-P4 进入固件下载模式。相关示例可查看 ESP32 DevKitC 开发板的 [原理图](#)。

一般来说，使用官方的 ESP-IDF 开发板不会出现问题。但是，`esptool.py` 在以下情况下不能自动重置硬件：

- 硬件未连接到 GPIO35 和 CHIP_PU 的 DTR 和 RTS 控制线。
- DTR 和 RTS 控制线的配置方式不同。
- 不存在这样的串行控制线路。

根据硬件的种类，也可以将 ESP32-P4 开发板手动设置为固件下载模式（复位）。

- 对于乐鑫开发板，可以参考对应开发板的入门指南或用户指南。例如，可以通过按住 Boot 按钮 (GPIO35) 再按住 EN 按钮 (CHIP_PU) 来手动复位 ESP-IDF 开发板。
- 对于其他类型的硬件，可以尝试将 GPIO35 拉低。

Linux 和 macOS 平台工具链的标准设置

详细安装步骤 请根据下方详细步骤，完成安装过程。

设置开发环境 以下是为 ESP32-P4 设置 ESP-IDF 的具体步骤。

- [第一步：安装准备](#)
- [第二步：获取 ESP-IDF](#)
- [第三步：设置工具](#)
- [第四步：设置环境变量](#)
- [第五步：开始使用 ESP-IDF 吧](#)

第一步：安装准备 为了在 ESP32-P4 中使用 ESP-IDF，需要根据操作系统安装一些软件包。可以参考以下安装指南，安装 Linux 和 macOS 的系统上所有需要的软件包。

Linux 用户 编译 ESP-IDF 需要以下软件包。请根据使用的 Linux 发行版本，选择合适的安装命令。

- Ubuntu 和 Debian:

```
sudo apt-get install git wget flex bison gperf python3 python3-pip python3-venv cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.0-0
```

- CentOS 7 & 8:

```
sudo yum -y update && sudo yum install git wget flex bison gperf python3 python3-setuptools cmake ninja-build ccache dfu-util libusb
```

目前仍然支持 CentOS 7，但为了更好的用户体验，建议使用 CentOS 8。

- Arch:

```
sudo pacman -S --needed gcc git make flex bison gperf python cmake ninja ccache dfu-util libusb
```

备注:

- 使用 ESP-IDF 需要 CMake 3.16 或以上版本。较早的 Linux 发行版可能需要升级自身的软件源仓库，或开启 backports 套件库，或安装“cmake3”软件包（不是安装“cmake”）。
- 如果上述列表中没有当前所用系统，请参考所用系统的相关文档，查看安装软件包所用的命令。

macOS 用户 ESP-IDF 将使用 macOS 上默认安装的 Python 版本。

- 安装 CMake 和 Ninja 编译工具：
 - 若有 HomeBrew，可以运行:

```
brew install cmake ninja dfu-util
```

- 若有 MacPorts，可以运行:

```
sudo port install cmake ninja dfu-util
```

- 若以上均不适用，请访问 [CMake](#) 和 [Ninja](#) 主页，查询有关 macOS 平台的下载安装问题。
- 强烈建议同时安装 [ccache](#) 以获得更快的编译速度。如有 [HomeBrew](#)，可通过 [MacPorts](#) 上的 brew install ccache 或 sudo port install ccache 完成安装。

备注: 如在上述任何步骤中遇到以下错误:

```
xcrun: error: invalid active developer path (/Library/Developer/CommandLineTools), missing xcrun at: /Library/Developer/CommandLineTools/usr/bin/xcrun
```

则必须安装 XCode 命令行工具，可运行 xcode-select --install 命令进行安装。

Apple M1 用户 如果使用的是 Apple M1 系列且看到如下错误提示:

```
WARNING: directory for tool xtensa-esp32-elf version esp-2021r2-patch3-8.4.0 is present, but tool was not found
ERROR: tool xtensa-esp32-elf has no installed versions. Please run 'install.sh' to install it.
```

或者:

```
zsh: bad CPU type in executable: ~/.espressif/tools/xtensa-esp32-elf/esp-2021r2-patch3-8.4.0/xtensa-esp32-elf/bin/xtensa-esp32-elf-gcc
```

运行如下命令，安装 Apple Rosetta 2:

```
/usr/sbin/softwareupdate --install-rosetta --agree-to-license
```

安装 Python 3 Catalina 10.15 发布说明 中表示不推荐使用 Python 2.7 版本，在未来的 macOS 版本中也不会默认包含 Python 2.7。执行以下命令来检查当前使用的 Python 版本：

```
python --version
```

如果输出结果是 Python 2.7.17，则代表默认解析器是 Python 2.7。这时需要运行以下命令检查电脑上是否已经安装过 Python 3：

```
python3 --version
```

如果运行上述命令出现错误，则代表电脑上没有安装 Python 3。

请根据以下步骤安装 Python 3：

- 使用 [HomeBrew](#) 进行安装的方法如下：

```
brew install python3
```

- 使用 [MacPorts](#) 进行安装的方法如下：

```
sudo port install python38
```

第二步：获取 ESP-IDF 在围绕 ESP32-P4 构建应用程序之前，请先获取乐鑫提供的软件库文件 [ESP-IDF 仓库](#)。

获取 ESP-IDF 的本地副本：打开终端，切换到要保存 ESP-IDF 的工作目录，使用 `git clone` 命令克隆远程仓库。针对不同操作系统的详细步骤，请见下文。

打开终端，运行以下命令：

```
mkdir -p ~/esp
cd ~/esp
git clone -b v5.3.1 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF 将下载至 `~/esp/esp-idf`。

请前往 [ESP-IDF 版本简介](#)，查看 ESP-IDF 不同版本的具体适用场景。

第三步：设置工具 除了 ESP-IDF 本身，还需要为支持 ESP32-P4 的项目安装 ESP-IDF 使用的各种工具，比如编译器、调试器、Python 包等。

```
cd ~/esp/esp-idf
./install.sh esp32p4
```

或使用 Fish shell：

```
cd ~/esp/esp-idf
./install.fish esp32p4
```

上述命令仅仅为 ESP32-P4 安装所需工具。如果需要为多个目标芯片开发项目，则可以一次性指定多个目标，如下所示：

```
cd ~/esp/esp-idf
./install.sh esp32,esp32s2
```

或使用 Fish shell：

```
cd ~/esp/esp-idf
./install.fish esp32,esp32s2
```

如果需要一次性为所有支持的目标芯片安装工具，可以运行如下命令：

```
cd ~/esp/esp-idf
./install.sh all
```

或使用 Fish shell：

```
cd ~/esp/esp-idf
./install.fish all
```

备注：对于 macOS 用户，如在上述任何步骤中遇到以下错误：

```
<urlopen error [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed: unable_
↳to get local issuer certificate (_ssl.c:xxx)
```

可运行电脑 Python 文件夹中的 `Install Certificates.command` 安装证书。了解更多信息，请参考[安装 ESP-IDF 工具时出现的下载错误](#)。

下载工具备选方案 ESP-IDF 工具安装器会下载 Github 发布版本中附带的一些工具，如果访问 Github 较为缓慢，可以设置一个环境变量，从而优先选择 Espressif 的下载服务器进行 Github 资源下载。

备注：该设置只影响从 Github 发布版本中下载的单一个工具，它并不会改变访问任何 Git 仓库的 URL。

要在安装工具时优先选择 Espressif 下载服务器，请在运行 `install.sh` 时使用以下命令：

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

备注：推荐国内用户使用国内的下载服务器，以加快下载速度。

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.cn/github_assets"
./install.sh
```

自定义工具安装路径 本步骤中介绍的脚本将 ESP-IDF 所需的编译工具默认安装在用户的根目录中，即 Linux 系统中的 `$HOME/.espressif` 目录。可以选择将工具安装到其他目录中，**但在运行安装脚本前，导出环境变量 `IDF_TOOLS_PATH`**。注意，请确保用户账号已经具备了读写该路径的权限。

```
export IDF_TOOLS_PATH="$HOME/required_idf_tools_path"
./install.sh

. ./export.sh
```

如果修改了 `IDF_TOOLS_PATH` 变量，请在运行任意 ESP-IDF 工具或脚本前，将该变量导出到环境变量中。

备注：如未导出环境变量，大多数 shell 将不支持在变量赋值中使用 `IDF_TOOLS_PATH`，例如 `IDF_TOOLS_PATH="$HOME/required_idf_tools_path" ./install.sh`。因为即便在源脚本中

导出或修改了该变量，当前的执行环境也不受变量赋值影响。

第四步：设置环境变量 此时，刚刚安装的工具尚未添加至 PATH 环境变量，无法通过“命令窗口”使用这些工具。因此，必须设置一些环境变量。这可以通过 ESP-IDF 提供的另一个脚本进行设置。

请在需要运行 ESP-IDF 的终端窗口运行以下命令：

```
. $HOME/esp/esp-idf/export.sh
```

对于 fish shell（仅支持 fish 3.0.0 及以上版本），请运行以下命令：

```
. $HOME/esp/esp-idf/export.fish
```

注意，命令开始的“.”与路径之间应有一个空格！

如果需要经常运行 ESP-IDF，可以为执行 export.sh 创建一个别名，具体步骤如下：

1. 复制并粘贴以下命令到 shell 配置文件中（.profile、.bashrc、.zprofile 等）

```
alias get_idf='. $HOME/esp/esp-idf/export.sh'
```

2. 通过重启终端窗口或运行 source [path to profile]，如 source ~/.bashrc 来刷新配置文件。

现在可以在任何终端窗口中运行 get_idf 来设置或刷新 ESP-IDF 环境。

不建议直接将 export.sh 添加到 shell 的配置文件。这样做会导致在每个终端会话中都激活 IDF 虚拟环境（包括无需使用 ESP-IDF 的会话）。这违背了使用虚拟环境的目的，还可能影响其他软件的使用。

第五步：开始使用 ESP-IDF 吧 现在你已经具备了使用 ESP-IDF 的所有条件，接下来将介绍如何开始第一个工程。

本指南将介绍如何初步上手 ESP-IDF，包括如何使用 ESP32-P4 创建第一个工程，并构建、烧录和监控设备输出。

备注：如果还未安装 ESP-IDF，请参照[安装](#)中的步骤，获取使用本指南所需的所有软件。

开始创建工程 现在，可以准备开发 ESP32-P4 应用程序了。可以从 ESP-IDF 中 [examples](#) 目录下的 [get-started/hello_world](#) 工程开始。

重要：ESP-IDF 编译系统不支持 ESP-IDF 路径或其工程路径中带有空格。

将 [get-started/hello_world](#) 工程复制至本地的 ~/esp 目录下：

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

备注：ESP-IDF 的 [examples](#) 目录下有一系列示例工程，可以按照上述方法复制并运行其中的任何示例，也可以直接编译示例，无需进行复制。

连接设备 现在，请将 ESP32-P4 开发板连接到 PC，并查看开发板使用的串口。

通常，串口在不同操作系统下显示的名称有所不同：

- **Linux 操作系统：**以 /dev/tty 开头

- **macOS 操作系统:** 以 `/dev/cu.` 开头

有关如何查看串口名称的详细信息，请见与 [ESP32-P4 创建串口连接](#)。

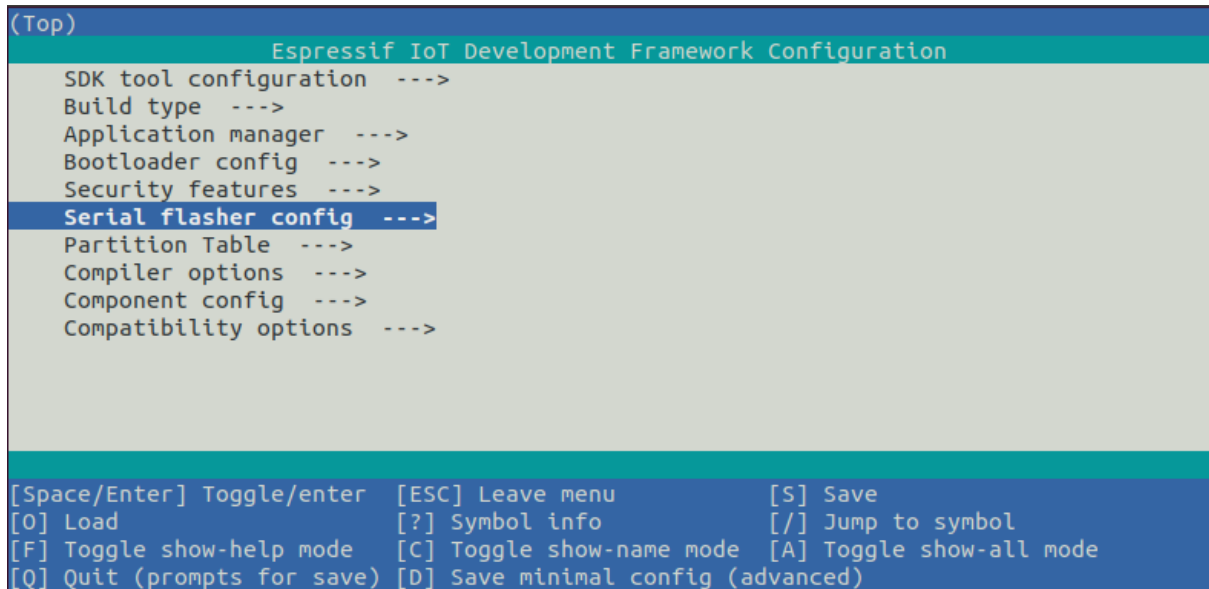

备注: 请记住串口名，以便后续使用。

配置工程 请进入 `hello_world` 目录，设置 ESP32-P4 为目标芯片，然后运行工程配置工具 `menuconfig`。

```
cd ~/esp/hello_world
idf.py set-target esp32p4
idf.py menuconfig
```

打开一个新工程后，应首先使用 `idf.py set-target esp32p4` 设置“目标”芯片。注意，此操作将清除并初始化项目之前的编译和配置（如有）。也可以直接将“目标”配置为环境变量（此时可跳过该步骤）。更多信息，请见[选择目标芯片：set-target](#)。

正确操作上述步骤后，系统将显示以下菜单：

```
(Top)
Espressif IoT Development Framework Configuration
SDK tool configuration --->
Build type --->
Application manager --->
Bootloader config --->
Security features --->
Serial flasher config --->
Partition Table --->
Compiler options --->
Component config --->
Compatibility options --->

[Space/Enter] Toggle/enter  [ESC] Leave menu          [S] Save
[O] Load                    [?] Symbol info          [/] Jump to symbol
[F] Toggle show-help mode  [C] Toggle show-name mode [A] Toggle show-all mode
[Q] Quit (prompts for save) [D] Save minimal config (advanced)
```

图 13: 工程配置—主窗口

可以通过此菜单设置项目的具体变量，包括 Wi-Fi 网络名称、密码和处理器速度等。`hello_world` 示例项目会以默认配置运行，因此在这一项目中，可以跳过使用 `menuconfig` 进行项目配置这一步骤。

备注: 终端窗口中显示出的菜单颜色可能会与上图不同。可以通过选项 `--style` 来改变外观。请运行 `idf.py menuconfig --help` 命令，获取更多信息。

编译工程 请使用以下命令，编译烧录工程：

```
idf.py build
```

运行以上命令可以编译应用程序和所有 ESP-IDF 组件，接着生成引导加载程序、分区表和应用程序二进制文件。

```

$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../../../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↪-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
↪bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↪partition-table.bin
or run 'idf.py -p PORT flash'

```

如果一切正常，编译完成后将生成.bin 文件。

烧录到设备 请运行以下命令，将刚刚生成的二进制文件烧录至 ESP32-P4 开发板：

```
idf.py -p PORT flash
```

请将 `PORT` 替换为 ESP32-P4 开发板的串口名称。如果 `PORT` 未经定义，`idf.py` 将尝试使用可用的串口自动连接。

更多有关 `idf.py` 参数的详情，请见 [idf.py](#)。

备注：勾选 `flash` 选项将自动编译并烧录工程，因此无需再运行 `idf.py build`。

若在烧录过程中遇到问题，请参考下文中的“其他提示”。也可以前往 [烧录故障排除](#) 或与 [ESP32-P4 创建串口连接](#) 获取更多详细信息。

常规操作 在烧录过程中，会看到类似如下的输出日志：

```

...
esptool.py v4.8.dev3
Serial port /dev/cu.SLAB_USBtoUART
Connecting....
Chip is ESP32-P4 (revision v0.0)
Features: High-Performance MCU
Crystal is 40MHz
MAC: 00:00:00:00:00:00
Uploading stub...
Running stub...
Stub running...
Changing baud rate to 460800
Changed.
Configuring flash size...
Flash will be erased from 0x00002000 to 0x00007fff...
Flash will be erased from 0x00010000 to 0x0003bfff...
Flash will be erased from 0x00008000 to 0x00008fff...
SHA digest in image updated
Compressed 20960 bytes to 12653...
Writing at 0x00002000... (100 %)

```

(下页继续)

(续上页)

```

Wrote 20960 bytes (12653 compressed) at 0x00002000 in 0.6 seconds (effective 277.1
↪kbit/s)...
Hash of data verified.
Compressed 179584 bytes to 94528...
Writing at 0x00035efb... (100 %)
Wrote 179584 bytes (94528 compressed) at 0x00010000 in 2.6 seconds (effective 549.
↪9 kbit/s)...
Hash of data verified.
Compressed 3072 bytes to 103...
Writing at 0x00008000... (100 %)
Wrote 3072 bytes (103 compressed) at 0x00008000 in 0.1 seconds (effective 420.7
↪kbit/s)...
Hash of data verified.

Leaving...
Hard resetting via RTS pin...
Done

```

如果一切顺利，烧录完成后，开发板将会复位，应用程序“hello_world”开始运行。

如果希望使用 Eclipse 或是 VS Code IDE，而非 idf.py，请参考 [Eclipse Plugin](#)，以及 [VSCode Extension](#)。

监视输出 可以使用 `idf.py -p PORT monitor` 命令，监视“hello_world”工程的运行情况。注意，不要忘记将 `PORT` 替换为自己的串口名称。

运行该命令后，[IDF 监视器](#) 应用程序将启动。

```

$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
↪world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...

```

此时，就可以在启动日志和诊断日志之后，看到打印的“Hello world!”了。

```

...
Hello world!
Restarting in 10 seconds...
This is esp32p4 chip with 2 CPU core(s), silicon revision v0.0, 2 MB external
↪flash
Minimum free heap size: 618848 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...

```

使用快捷键 `Ctrl+]`，可退出 ESP-IDF 监视器。

备注：也可以运行以下命令，一次性执行构建、烧录和监视过程：

```
idf.py -p PORT flash monitor
```

此外，

- 请前往 [IDF 监视器](#)，了解更多使用 ESP-IDF 监视器的快捷键和其他详情。
- 请前往 [idf.py](#)，查看更多 `idf.py` 命令和选项。

恭喜完成 ESP32-P4 的入门学习!

现在，可以尝试一些其他 [examples](#)，或者直接开发自己的应用程序。

重要：一些示例程序不支持 ESP32-P4，因为 ESP32-P4 中不包含所需的硬件。

在编译示例程序前请查看 README 文件中 Supported Targets 表格。如果表格中包含 ESP32-P4，或者不存在这个表格，那么即表示 ESP32-P4 支持这个示例程序。

其他提示

权限问题 使用某些 Linux 版本向 ESP32-P4 烧录固件时，可能会出现类似 Could not open port <PORT>: Permission denied: '<PORT>' 错误消息。此时可以在 Linux 将用户添加至 [dialout 组](#) 或 [uucp 组](#) 来解决此类问题。

兼容的 Python 版本 ESP-IDF 支持 Python 3.8 及以上版本，建议升级操作系统到最新版本从而更新 Python。也可选择从 [sources](#) 安装最新版 Python，或使用 Python 管理系统如 [pyenv](#) 对版本进行升级管理。

擦除 flash ESP-IDF 支持擦除 flash。请运行以下命令，擦除整个 flash：

```
idf.py -p PORT erase-flash
```

若存在需要擦除的 OTA 数据，请运行以下命令：

```
idf.py -p PORT erase-otadata
```

擦除 flash 需要一段时间，在擦除过程中，请勿断开设备连接。

建议：更新 ESP-IDF 乐鑫会不时推出新版本的 ESP-IDF，修复 bug 或提供新的功能。请注意，ESP-IDF 的每个主要版本和次要版本都有相应的支持期限。支持期限满后，版本停止更新维护，用户可将项目升级到最新的 ESP-IDF 版本。更多关于支持期限的信息，请参考 [ESP-IDF 版本](#)。

因此，在使用时，也应注意更新本地版本。最简单的方法是：直接删除本地的 esp-idf 文件夹，然后按照 [第二步：获取 ESP-IDF](#) 中的指示，重新完成克隆。

另一种方法是仅更新变更的部分，具体方式请前往 [更新 ESP-IDF](#) 章节查看。具体更新步骤会根据使用的 ESP-IDF 版本有所不同。

注意，更新完成后，请再次运行安装脚本，以防新版 ESP-IDF 所需的工具也有所更新。具体请参考 [第三步：设置工具](#)。

一旦重新安装好工具，请使用导出脚本更新环境，具体请参考 [第四步：设置环境变量](#)。

相关文档

- [与 ESP32-P4 创建串口连接](#)
- [Eclipse Plugin](#)
- [VSCode Extension](#)
- [IDF 监视器](#)

1.4 编译第一个工程

如果已经安装好 ESP-IDF，且没有使用集成开发环境 (IDE)，请在命令提示行中，按照在 [Windows 中开始创建工程](#) 或在 [Linux 和 macOS 中开始创建工程](#) 编译第一个工程。

1.5 卸载 ESP-IDF

如需卸载 ESP-IDF，请参考[卸载 ESP-IDF](#)。

Chapter 2

API 参考

2.1 API 约定

本文介绍了 ESP-IDF 应用程序编程接口 (API) 中常见的约定和假设。

ESP-IDF 提供了几种编程接口：

- 在 ESP-IDF 组件的公共头文件中声明的 C 函数、结构体、枚举、类型定义和预处理器宏。编程指南的 API 参考部分描述了这些函数、结构体和类型。
- 编译系统函数、预定义变量和选项，详情请参阅[ESP-IDF CMake 构建系统 API](#)。
- [Kconfig](#) 选项，可用于代码及编译系统文件 (CMakeLists.txt)。
- [主机工具](#) 及其命令行参数。

ESP-IDF 由多个组件组成，组件中包含专门为 ESP 芯片编写的代码或第三方库（即第三方组件）。对于某些第三方库，ESP-IDF 提供专用的包装器和接口，以简化对第三方库的使用，或提高其与 ESP-IDF 其他功能的兼容性。某些情况下，第三方组件将直接呈现底层库的原始 API。

以下各节介绍了部分 ESP-IDF API 及其使用的相关内容。

2.1.1 错误处理

多数 ESP-IDF API 会返回由 `esp_err_t` 类型定义的错误代码。有关出错处理的更多信息，请参阅[错误处理](#) 部分。有关 ESP-IDF 组件返回的错误代码列表，请参阅[错误代码参考](#)。

2.1.2 配置结构体

重要： 为确保应用程序与未来 ESP-IDF 版本的兼容性，请正确初始化配置结构体。

多数 ESP-IDF 中的初始化、配置和安装函数（通常以 `..._init()`、`..._config()` 和 `..._install()` 命名）都需要一个指向配置结构体的指针作为参数。例如：

```
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = callback_arg,
    .name = "my_timer"
};
```

(下页继续)

```
esp_timer_handle_t my_timer;
esp_err_t err = esp_timer_create(&my_timer_args, &my_timer);
```

初始化函数不会存储指向配置结构体的指针，因此在栈上分配结构体是安全的。

应用程序必须初始化结构体的所有字段，以下为错误示例：

```
esp_timer_create_args_t my_timer_args;
my_timer_args.callback = &my_timer_callback;
/* 错误！字段 .arg 和 .name 未初始化 */
esp_timer_create(&my_timer_args, &my_timer);
```

大多数 ESP-IDF 示例使用 C99 的 [指定初始化器](#) 来完成结构体初始化，从而以简洁的方式设置子集字段，并将剩余字段初始化为零：

```
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    /* 正确，字段 .arg 和 .name 已初始化为零 */
};
```

C++ 语言同样支持指定初始化器语法，但初始化器必须遵循声明顺序。在 C++ 代码中使用 ESP-IDF API 时，可以考虑使用以下模式：

```
/* 正确：.dispatch_method、.name 以及 .skip_unhandled_events 初始化为零 */
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = &my_arg,
};

///  
/* 错误：esp_timer_create_args_t 中，.arg 在 .callback 之后声明 */
//const esp_timer_create_args_t my_timer_args = {
//    .arg = &my_arg,
//    .callback = &my_timer_callback,
//};
```

了解指定初始化器的更多信息，请参见[指定初始化器](#)。注意，C++20 之前的 C++ 语言不是当前 ESP-IDF 的默认版本，不支持指定初始化器。如需使用 C++20 之前的 C++ 标准编译代码，可以借助 GCC 扩展生成以下模式：

```
esp_timer_create_args_t my_timer_args = {};
/* 所有字段初始化为零 */
my_timer_args.callback = &my_timer_callback;
```

默认初始化器

ESP-IDF 为某些配置结构体提供了用于设置字段默认值的宏：

```
httpd_config_t config = HTTPD_DEFAULT_CONFIG();
/* HTTPD_DEFAULT_CONFIG_
↳ 扩展到一个指定的初始化器。此时，所有字段均已设置为默认值，且支持编辑：*/
config.server_port = 8081;
httpd_handle_t server;
esp_err_t err = httpd_start(&server, &config);
```

当特定配置结构体提供了默认初始化器宏时，推荐使用该默认初始化器宏。

2.1.3 私有 API

在 ESP-IDF 中，某些头文件包含的 API 仅限于在 ESP-IDF 源代码中使用，不支持在应用程序中使用。此类头文件的名称或路径通常带有 `private` 或 `esp_private`。某些组件（如 `hal`）则仅包含私有 API。

私有 API 可能在次要或补丁版本之间以不兼容的方式被删除或更改。

2.1.4 示例项目组件

ESP-IDF 示例中提供了一系列演示 ESP-IDF API 使用方式的工程。为避免在各个示例中重复引用相同的代码片段，示例的常用组件中定义了一些通用辅助工具。这些常用组件包括 `common_components` 目录下的组件和示例本身的部分组件，它们不属于 ESP-IDF API 的范畴。

不建议在自定义项目中通过 `EXTRA_COMPONENT_DIRS` 编译系统变量直接引用这些组件，因为在不同的 ESP-IDF 版本中，组件可能存在显著变化。基于 ESP-IDF 示例开始新项目时，需将项目及其所依赖的公共组件从 ESP-IDF 中复制出来，并将公共组件视为项目的一部分。请注意，公共组件是针对示例编写的，可能不包括生产应用程序所需的所有出错处理。在使用前，需阅读代码并判断它是否适用于所需用例。

2.1.5 API 稳定性

ESP-IDF 使用 [语义版本管理办法](#)，详情请参阅 [版本管理](#)。

ESP-IDF 的次要版本和错误修复版本会保证与过往版本的兼容性。以下各节解释了兼容性的不同方面和限制。

源代码级别兼容性

ESP-IDF 确保在 ESP-IDF 组件的公共头文件中声明的 C 函数、结构体、枚举、类型定义和预处理宏的源代码级别兼容性。源代码级别兼容性意味着应用程序无需修改即可在新版本的 ESP-IDF 上重新编译。

以下在次要版本之间的更改不会破坏源代码级别兼容性：

- 使用 `deprecated` 属性废弃函数、使用预处理器 `#warning` 废弃头文件。废弃功能已在 ESP-IDF 发布说明中列出。建议更新源代码以使用替换被废弃的函数或文件的新函数或文件。ESP-IDF 的主要版本将移除废弃的函数和文件。
- 重命名组件，在组件间移动源代码和头文件，但需确保编译系统仍可以找到正确的文件。
- 重命名 Kconfig 选项。Kconfig 系统的 [向后兼容性](#) 确保应用程序在 `sdkconfig` 文件、CMake 文件和源代码中仍然可以使用原始的 Kconfig 选项名称。

缺少二进制兼容性

ESP-IDF 无法确保版本间的二进制兼容性。这意味着，如果使用某个 ESP-IDF 版本构建了一个预编译库，在下一个次要或错误修复版本中，无法确保该库将以相同方式运行。以下更改可以保持源代码级别兼容性，但不保证二进制兼容性：

- 更改 C 枚举成员的数值。
- 添加新的结构体成员或更改成员顺序。关于有助于确保兼容性的提示，请参阅 [配置结构体](#)。
- 用具有相同签名的 `static inline` 函数替换 `extern` 函数，反之亦然。
- 用兼容的 C 函数替换类似于函数的宏。

其他不兼容情况

尽管我们致力于优化 ESP-IDF 版本升级，但是在次要版本之间，ESP-IDF 的某些部分可能会不兼容。如有不属于下列情况的意外重大更新，欢迎向我们发送报告：

- [私有 API](#)。
- [示例项目组件](#)。

- 明确标记为“beta”、“preview”或“experimental”的功能。
- 为缓解安全问题做出的更改，或以更安全的行为取代不安全的默认行为的更改。
- 从未运行成功的功能。例如，如果某个函数或枚举值从未成功使用，则可能会以修复的形式将其重命名或删除。这包括依赖于非功能芯片硬件功能的软件功能。
- 未明确记录的意外或未定义行为可能会被修复或更改，如缺少参数范围验证。
- 在菜单配置中 *Kconfig* 选项的位置。
- 示例项目的位置和名称。

2.2 应用层协议

2.2.1 ASIO 端口

ASIO 是一个跨平台的 C++ 库，参见 <https://think-async.com/Asio/>。它采用现代 C++ 方法提供了一个一致的异步模型。

ASIO 组件自 ESP-IDF 版本 v5.0 起移到了单独的仓库：

- [GitHub ASIO 组件](#)

运行 `idf.py add-dependency espressif/asio` 将 ASIO 组件添加到你的项目中。

文档

访问以下链接查看相关文档：

- [ASIO 文档 \(English\)](#)

2.2.2 ESP-Modbus

乐鑫的 ESP-Modbus 库 (`esp-modbus`) 支持基于 RS485、Wi-Fi 和以太网接口的 Modbus 通信。自 ESP-IDF v5.0 版本以来，组件 `freemodbus` 已被移动到单独的代码仓库中：

- [GitHub 上的 ESP-Modbus 组件](#)

托管文档

相应文档请参阅：

- [ESP-Modbus 文档](#)

应用示例

以下示例分别介绍了 ESP-Modbus 库的串行端口、TCP 端口的从机和主机实现。

- [protocols/modbus/serial/mb_slave](#)
- [protocols/modbus/serial/mb_master](#)
- [protocols/modbus/tcp/mb_tcp_slave](#)
- [protocols/modbus/tcp/mb_tcp_master](#)

详情请参阅具体示例的 `README.md`。

协议参考

- Modbus 组织与规范协议请参阅 [The Modbus Organization](#)。

2.2.3 ESP-MQTT

概述

ESP-MQTT 是 MQTT 协议客户端的实现，MQTT 是一种基于发布/订阅模式的轻量级消息传输协议。ESP-MQTT 当前支持 MQTT v5.0。

特性

- 支持基于 TCP 的 MQTT、基于 Mbed TLS 的 SSL、基于 WebSocket 的 MQTT 以及基于 WebSocket Secure 的 MQTT
- 通过 URI 简化配置流程
- 多个实例（一个应用程序中有多个客户端）
- 支持订阅、发布、认证、遗嘱消息、保持连接心跳机制以及 3 个服务质量 (QoS) 级别（组成全功能客户端）

应用示例

- `protocols/mqtt/tcp`: 基于 TCP 的 MQTT，默认端口 1883
- `protocols/mqtt/ssl`: 基于 TLS 的 MQTT，默认端口 8883
- `protocols/mqtt/ssl_ds`: 基于 TLS 的 MQTT，使用数字签名外设进行身份验证，默认端口 8883
- `protocols/mqtt/ssl_mutual_auth`: 基于 TLS 的 MQTT，使用证书进行身份验证，默认端口 8883
- `protocols/mqtt/ssl_psk`: 基于 TLS 的 MQTT，使用预共享密钥进行身份验证，默认端口 8883
- `protocols/mqtt/ws`: 基于 WebSocket 的 MQTT，默认端口 80
- `protocols/mqtt/wss`: 基于 WebSocket Secure 的 MQTT，默认端口 443
- `protocols/mqtt5`: 使用 ESP-MQTT 库连接 MQTT v5.0 的服务器

MQTT 消息重传

调用 `esp_mqtt_client_publish` 或其非阻塞形式 `esp_mqtt_client_enqueue`，可以创建新的 MQTT 消息。

QoS 0 的消息将只发送一次，QoS 1 和 2 具有不同行为，因为协议需要执行额外步骤来完成该过程。

ESP-MQTT 库将始终重新传输未确认的 QoS 1 和 2 发布消息，以避免连接错误导致信息丢失，虽然 MQTT 规范要求仅在重新连接且 Clean Session 标志设置为 0 时重新传输（针对此行为，将 `disable_clean_session` 设置为 true）。

可能需要重传的 QoS 1 和 2 消息总是处于排队状态，但若使用 `esp_mqtt_client_publish` 则会立即进行第一次传输尝试。未确认消息的重传将在 `message_retransmit_timeout` 之后进行。在 `CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS` 之后，消息会过期并被删除。如已设置 `CONFIG_MQTT_REPORT_DELETED_MESSAGES`，则会发送事件来通知用户。

配置

通过设置 `esp_mqtt_client_config_t` 结构体中的字段来进行配置。配置结构体包含以下子结构体，用于配置客户端的多种操作。

- `esp_mqtt_client_config_t::broker_t` - 允许设置地址和安全验证。

- `esp_mqtt_client_config_t::credentials_t` - 用于身份验证的客户端凭据。
- `esp_mqtt_client_config_t::session_t` - MQTT 会话相关配置。
- `esp_mqtt_client_config_t::network_t` - 网络相关配置。
- `esp_mqtt_client_config_t::task_t` - 允许配置 FreeRTOS 任务。
- `esp_mqtt_client_config_t::buffer_t` - 输入输出的缓冲区大小。

下文将详细介绍不同配置。

服务器

地址 通过 `address` 结构体的 `uri` 字段或者 `hostname`、`transport` 以及 `port` 的组合，可以设置服务器地址。也可以选择设置 `path`，该字段对 WebSocket 连接而言非常有用。

使用 `uri` 字段的格式为 `scheme://hostname:port/path`。

- 当前支持 mqtt、mqtts、ws 和 wss 协议
- 基于 TCP 的 MQTT 示例：
 - `mqtt://mqtt.eclipseprojects.io`: 基于 TCP 的 MQTT，默认端口 1883
 - `mqtt://mqtt.eclipseprojects.io:1884`: 基于 TCP 的 MQTT，端口 1884
 - `mqtt://username:password@mqtt.eclipseprojects.io:1884`: 基于 TCP 的 MQTT，端口 1884，带有用户名和密码
- 基于 SSL 的 MQTT 示例：
 - `mqtts://mqtt.eclipseprojects.io`: 基于 SSL 的 MQTT，端口 8883
 - `mqtts://mqtt.eclipseprojects.io:8884`: 基于 SSL 的 MQTT，端口 8884
- 基于 WebSocket 的 MQTT 示例：
 - `ws://mqtt.eclipseprojects.io:80/mqtt`
- 基于 WebSocket Secure 的 MQTT 示例：
 - `wss://mqtt.eclipseprojects.io:443/mqtt`
- 最简配置：

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .broker.address.uri = "mqtt://mqtt.eclipseprojects.io",
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler,
↪client);
esp_mqtt_client_start(client);
```

备注：默认情况下，MQTT 客户端使用事件循环库来发布相关 MQTT 事件（已连接、已订阅、已发布等）。

验证 为验证服务器身份，对于使用 TLS 的安全链接，必须设置 `verification` 结构体。服务器证书可设置为 PEM 或 DER 格式。如要选择 DER 格式，必须设置等效 `certificate_len` 字段，否则应在 `certificate` 字段传入以空字符结尾的 PEM 格式字符串。

- 从服务器获取证书，例如：`mqtt.eclipseprojects.io`

```
openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 < /dev/
↪null \
2> /dev/null | openssl x509 -outform PEM > mqtt_eclipse_org.pem
```

- 检查示例应用程序：[protocols/mqtt/ssl](#)
- 配置：

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .broker = {
        .address.uri = "mqtts://mqtt.eclipseprojects.io:8883",
```

(下页继续)

```

        .verification.certificate = (const char *)mqtt_eclipse_org_pem_start,
    },
};

```

了解其他字段的详细信息，请查看[API 参考](#) 以及[TLS 服务器验证](#)。

客户端凭据 `credentials` 字段下包含所有客户端相关凭据。

- `username`: 指向用于连接服务器用户名的指针，也可通过 URI 设置
- `client_id`: 指向客户端 ID 的指针，默认为 ESP32_%CHIPID%，其中 %CHIPID% 是十六进制 MAC 地址的最后 3 个字节

认证 可以通过 `authentication` 字段设置认证参数。客户端支持以下认证方式：

- `password`: 使用密码
- `certificate` 和 `key`: 进行双向 TLS 身份验证，PEM 或 DER 格式均可
- `use_secure_element`: 使用 ESP32 中的安全元素 (ATECC608A)
- `ds_data`: 使用某些乐鑫设备的数字签名外设

会话 使用 `session` 字段进行 MQTT 会话相关配置。

遗嘱消息 (LWT) 通过设置 `last_will` 结构体的以下字段，MQTT 会在一个客户端意外断开连接时通过遗嘱消息通知其他客户端。

- `topic`: 指向 LWT 消息主题的指针
- `msg`: 指向 LWT 消息的指针
- `msg_len`: LWT 消息的长度，`msg` 不以空字符结尾时需要该字段
- `qos`: LWT 消息的服务质量
- `retain`: 指定 LWT 消息的保留标志

在项目配置菜单中设置 MQTT 通过 `idf.py menuconfig`，可以在 Component config > ESP-MQTT Configuration 中找到 MQTT 设置。

相关设置如下：

- `CONFIG_MQTT_PROTOCOL_311`: 启用 MQTT 协议 3.1.1 版本
- `CONFIG_MQTT_TRANSPORT_SSL` 和 `CONFIG_MQTT_TRANSPORT_WEBSOCKET`: 启用特定 MQTT 传输层，例如 SSL、WEBSOCKET 和 WEBSOCKET_SECURE
- `CONFIG_MQTT_CUSTOM_OUTBOX`: 禁用 `mqtt_outbox` 默认实现，因此可以提供特定实现

事件

MQTT 客户端可能会发布以下事件：

- `MQTT_EVENT_BEFORE_CONNECT`: 客户端已初始化并即将开始连接至服务器。
- `MQTT_EVENT_CONNECTED`: 客户端已成功连接至服务器。客户端已准备好收发数据。
- `MQTT_EVENT_DISCONNECTED`: 由于无法读取或写入数据，例如因为服务器无法使用，客户端已终止连接。
- `MQTT_EVENT_SUBSCRIBED`: 服务器已确认客户端的订阅请求。事件数据将包含订阅消息的消息 ID。
- `MQTT_EVENT_UNSUBSCRIBED`: 服务器已确认客户端的退订请求。事件数据将包含退订消息的消息 ID。
- `MQTT_EVENT_PUBLISHED`: 服务器已确认客户端的发布消息。消息将仅针对 QoS 级别 1 和 2 发布，因为级别 0 不会进行确认。事件数据将包含发布消息的消息 ID。

- `MQTT_EVENT_DATA`: 客户端已收到发布消息。事件数据包含: 消息 ID、发布消息所属主题名称、收到的数据及其长度。对于超出内部缓冲区的数据, 将发布多个 `MQTT_EVENT_DATA`, 并更新事件数据的 `current_data_offset` 和 `total_data_len` 以跟踪碎片化消息。
- `MQTT_EVENT_ERROR`: 客户端遇到错误。使用事件数据 `error_handle` 字段中的 `error_type`, 可以发现错误。错误类型决定 `error_handle` 结构体的哪些部分会被填充。

API 参考

Header File

- `components/mqtt/esp-mqtt/include/mqtt_client.h`
- This header file can be included with:

```
#include "mqtt_client.h"
```

- This header file is a part of the API provided by the `mqtt` component. To declare that your component depends on `mqtt`, add the following to your `CMakeLists.txt`:

```
REQUIRES mqtt
```

or

```
PRIV_REQUIRES mqtt
```

Functions

`esp_mqtt_client_handle_t esp_mqtt_client_init (const esp_mqtt_client_config_t *config)`

Creates *MQTT* client handle based on the configuration.

参数 `config` -- *MQTT* configuration structure

返回 `mqtt_client_handle` if successfully created, `NULL` on error

`esp_err_t esp_mqtt_client_set_uri (esp_mqtt_client_handle_t client, const char *uri)`

Sets *MQTT* connection URI. This API is usually used to overrides the URI configured in `esp_mqtt_client_init`.

参数

- `client` -- *MQTT* client handle
- `uri` --

返回 `ESP_FAIL` if URI parse error, `ESP_OK` on success

`esp_err_t esp_mqtt_client_start (esp_mqtt_client_handle_t client)`

Starts *MQTT* client with already created client handle.

参数 `client` -- *MQTT* client handle

返回 `ESP_OK` on success `ESP_ERR_INVALID_ARG` on wrong initialization `ESP_FAIL` on other error

`esp_err_t esp_mqtt_client_reconnect (esp_mqtt_client_handle_t client)`

This api is typically used to force reconnection upon a specific event.

参数 `client` -- *MQTT* client handle

返回 `ESP_OK` on success `ESP_ERR_INVALID_ARG` on wrong initialization `ESP_FAIL` if client is in invalid state

`esp_err_t esp_mqtt_client_disconnect (esp_mqtt_client_handle_t client)`

This api is typically used to force disconnection from the broker.

参数 `client` -- *MQTT* client handle

返回 `ESP_OK` on success `ESP_ERR_INVALID_ARG` on wrong initialization

`esp_err_t esp_mqtt_client_stop (esp_mqtt_client_handle_t client)`

Stops *MQTT* client tasks.

- Notes:
- Cannot be called from the *MQTT* event handler

参数 `client` -- *MQTT* client handle

返回 ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

int **esp_mqtt_client_subscribe_single** (*esp_mqtt_client_handle_t* client, const char *topic, int qos)
Subscribe the client to defined topic with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a *MQTT* event callback i.e. internal *MQTT* task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.
- `esp_mqtt_client_subscribe` could be used to call this function.

参数

- `client` -- *MQTT* client handle
- `topic` -- topic filter to subscribe
- `qos` -- Max qos level of the subscription

返回 message_id of the subscribe message on success -1 on failure -2 in case of full outbox.

int **esp_mqtt_client_subscribe_multiple** (*esp_mqtt_client_handle_t* client, const *esp_mqtt_topic_t* *topic_list, int size)

Subscribe the client to a list of defined topics with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a *MQTT* event callback i.e. internal *MQTT* task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.
- `esp_mqtt_client_subscribe` could be used to call this function.

参数

- `client` -- *MQTT* client handle
- `topic_list` -- List of topics to subscribe
- `size` -- size of topic_list

返回 message_id of the subscribe message on success -1 on failure -2 in case of full outbox.

int **esp_mqtt_client_unsubscribe** (*esp_mqtt_client_handle_t* client, const char *topic)

Unsubscribe the client from defined topic.

Notes:

- Client must be connected to send unsubscribe message
- It is thread safe, please refer to `esp_mqtt_client_subscribe_single` for details

参数

- `client` -- *MQTT* client handle
- `topic` --

返回 message_id of the subscribe message on success -1 on failure

int **esp_mqtt_client_publish** (*esp_mqtt_client_handle_t* client, const char *topic, const char *data, int len, int qos, int retain)

Client to send a publish message to the broker.

Notes:

- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)

- Client doesn't have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If MQTT_SKIP_PUBLISH_IF_DISCONNECTED is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

参数

- **client** -- *MQTT* client handle
- **topic** -- topic string
- **data** -- payload string (set to NULL, sending empty payload message)
- **len** -- data length, if set to 0, length is calculated from payload string
- **qos** -- QoS of publish message
- **retain** -- retain flag

返回 message_id of the publish message (for QoS 0 message_id will always be zero) on success.
-1 on failure, -2 in case of full outbox.

int **esp_mqtt_client_enqueue** (*esp_mqtt_client_handle_t* client, const char *topic, const char *data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the `esp_mqtt_client_publish()` which sends the publish message immediately in the user task's context). Thus, it could be used as a non blocking version of `esp_mqtt_client_publish()`.

参数

- **client** -- *MQTT* client handle
- **topic** -- topic string
- **data** -- payload string (set to NULL, sending empty payload message)
- **len** -- data length, if set to 0, length is calculated from payload string
- **qos** -- QoS of publish message
- **retain** -- retain flag
- **store** -- if true, all messages are enqueued; otherwise only QoS 1 and QoS 2 are enqueued

返回 message_id if queued successfully, -1 on failure, -2 in case of full outbox.

esp_err_t **esp_mqtt_client_destroy** (*esp_mqtt_client_handle_t* client)

Destroys the client handle.

Notes:

- Cannot be called from the *MQTT* event handler

参数 **client** -- *MQTT* client handle

返回 ESP_OK ESP_ERR_INVALID_ARG on wrong initialization

esp_err_t **esp_mqtt_set_config** (*esp_mqtt_client_handle_t* client, const *esp_mqtt_client_config_t* *config)

Set configuration structure, typically used when updating the config (i.e. on "before_connect" event).

Notes:

- When calling this function make sure to have all the intended configurations set, otherwise default values are set.

参数

- **client** -- *MQTT* client handle
- **config** -- *MQTT* configuration structure

返回 ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG if conflicts on transport configuration. ESP_OK on success

`esp_err_t esp_mqtt_client_register_event` (`esp_mqtt_client_handle_t` client, `esp_mqtt_event_id_t` event, `esp_event_handler_t` event_handler, void *event_handler_arg)

Registers *MQTT* event.

参数

- **client** -- *MQTT* client handle
- **event** -- event type
- **event_handler** -- handler callback
- **event_handler_arg** -- handlers context

返回 ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on wrong initialization ESP_OK on success

`esp_err_t esp_mqtt_client_unregister_event` (`esp_mqtt_client_handle_t` client, `esp_mqtt_event_id_t` event, `esp_event_handler_t` event_handler)

Unregisters mqtt event.

参数

- **client** -- mqtt client handle
- **event** -- event ID
- **event_handler** -- handler to unregister

返回 ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on invalid event ID ESP_OK on success

int `esp_mqtt_client_get_outbox_size` (`esp_mqtt_client_handle_t` client)

Get outbox size.

参数 **client** -- *MQTT* client handle

返回 outbox size 0 on wrong initialization

`esp_err_t esp_mqtt_dispatch_custom_event` (`esp_mqtt_client_handle_t` client, `esp_mqtt_event_t` *event)

Dispatch user event to the mqtt internal event loop.

参数

- **client** -- *MQTT* client handle
- **event** -- *MQTT* event handle structure

返回 ESP_OK on success ESP_ERR_TIMEOUT if the event couldn't be queued (ref also CONFIG_MQTT_EVENT_QUEUE_SIZE)

Structures

struct `esp_mqtt_error_codes`

MQTT error code structure to be passed as a contextual information into ERROR event

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

error_type	related member variables	note
MQTT_ERROR_TYPE_TCP_TRANSPORT	esp_tls_last_esp_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno	Error reported from tcp_transport/esp-tls
MQTT_ERROR_TYPE_CONNECTION_REFUSED	connect_return_code	Internal error reported from <i>MQTT</i> broker on connection

Public Members

`esp_err_t esp_tls_last_esp_err`

last esp_err code reported from esp-tls component

int **esp_tls_stack_err**

tls specific error code reported from underlying tls stack

int **esp_tls_cert_verify_flags**

tls flags reported from underlying tls stack during certificate verification

esp_mqtt_error_type_t **error_type**

error type referring to the source of the error

esp_mqtt_connect_return_code_t **connect_return_code**

connection refused error code reported from MQTT* broker on connection

int **esp_transport_sock_errno**

errno from the underlying socket

struct **esp_mqtt_event_t**

MQTT event configuration structure

Public Members

esp_mqtt_event_id_t **event_id**

MQTT event type

esp_mqtt_client_handle_t **client**

MQTT client handle for this event

char ***data**

Data associated with this event

int **data_len**

Length of the data for this event

int **total_data_len**

Total length of the data (longer data are supplied with multiple events)

int **current_data_offset**

Actual offset for the data associated with this event

char ***topic**

Topic associated with this event

int **topic_len**

Length of the topic for this event associated with this event

int **msg_id**

MQTT messaged id of message

int **session_present**

MQTT session_present flag for connection event

esp_mqtt_error_codes_t ***error_handle**

esp-mqtt error handle including esp-tls errors as well as internal *MQTT* errors

bool **retain**

Retained flag of the message associated with this event

int **qos**

QoS of the messages associated with this event

bool **dup**

dup flag of the message associated with this event

esp_mqtt_protocol_ver_t **protocol_ver**

MQTT protocol version used for connection, defaults to value from menuconfig

struct **esp_mqtt_client_config_t**

MQTT client configuration structure

- Default values can be set via menuconfig
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

Public Members

struct *esp_mqtt_client_config_t::broker_t* **broker**

Broker address and security verification

struct *esp_mqtt_client_config_t::credentials_t* **credentials**

User credentials for broker

struct *esp_mqtt_client_config_t::session_t* **session**

MQTT session configuration.

struct *esp_mqtt_client_config_t::network_t* **network**

Network configuration

struct *esp_mqtt_client_config_t::task_t* **task**

FreeRTOS task configuration.

struct *esp_mqtt_client_config_t::buffer_t* **buffer**

Buffer size configuration.

struct *esp_mqtt_client_config_t::outbox_config_t* **outbox**

Outbox configuration.

struct **broker_t**
Broker related configuration

Public Members

struct *esp_mqtt_client_config_t::broker_t::address_t* **address**
Broker address configuration

struct *esp_mqtt_client_config_t::broker_t::verification_t* **verification**
Security verification of the broker

struct **address_t**
Broker address

- uri have precedence over other fields
- If uri isn't set at least hostname, transport and port should.

Public Members

const char ***uri**
Complete *MQTT* broker URI

const char ***hostname**
Hostname, to set ipv4 pass it as string)

esp_mqtt_transport_t **transport**
Selects transport

const char ***path**
Path in the URI

uint32_t **port**
MQTT server port

struct **verification_t**
Broker identity verification
If fields are not set broker's identity isn't verified. it's recommended to set the options in this struct for security reasons.

Public Members

bool **use_global_ca_store**
Use a global ca_store, look esp-tls documentation for details.

`esp_err_t (*crt_bundle_attach)(void *conf)`

Pointer to ESP x509 Certificate Bundle attach function for the usage of certificate bundles. Client only attach the bundle, the clean up must be done by the user.

const char ***certificate**

Certificate data, default is NULL. It's not copied nor freed by the client, user needs to clean up.

size_t **certificate_len**

Length of the buffer pointed to by certificate.

const struct *psk_key_hint* ***psk_hint_key**

Pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). PSK is enabled only if there are no other ways to verify broker. It's not copied nor freed by the client, user needs to clean up.

bool **skip_cert_common_name_check**

Skip any validation of server certificate CN field, this reduces the security of TLS and makes the *MQTT* client susceptible to MITM attacks

const char ****alpn_protos**

NULL-terminated list of supported application protocols to be used for ALPN.

const char ***common_name**

Pointer to the string containing server certificate common name. If non-NULL, server certificate CN must match this name, If NULL, server certificate CN must match hostname. This is ignored if skip_cert_common_name_check=true. It's not copied nor freed by the client, user needs to clean up.

struct **buffer_t**

Client buffer size configuration

Client have two buffers for input and output respectively.

Public Members

int **size**

size of *MQTT* send/receive buffer

int **out_size**

size of *MQTT* output buffer. If not defined, defaults to the size defined by `buffer_size`

struct **credentials_t**

Client related credentials for authentication.

Public Members

const char ***username**

MQTT username

const char ***client_id**

Set *MQTT* client identifier. Ignored if `set_null_client_id == true` If NULL set the default client id. Default client id is `ESP32_CHIPID%` where `CHIPID%` are last 3 bytes of MAC address in hex format

bool **set_null_client_id**

Selects a NULL client id

struct *esp_mqtt_client_config_t::credentials_t::authentication_t* **authentication**

Client authentication

struct **authentication_t**

Client authentication

Fields related to client authentication by broker

For mutual authentication using TLS, user could select certificate and key, secure element or digital signature peripheral if available.

Public Members

const char ***password**

MQTT password

const char ***certificate**

Certificate for ssl mutual authentication, not required if mutual authentication is not needed. Must be provided with `key`. It's not copied nor freed by the client, user needs to clean up.

size_t **certificate_len**

Length of the buffer pointed to by certificate.

const char ***key**

Private key for SSL mutual authentication, not required if mutual authentication is not needed. If it is not NULL, also `certificate` has to be provided. It's not copied nor freed by the client, user needs to clean up.

size_t **key_len**

Length of the buffer pointed to by key.

const char ***key_password**

Client key decryption password, not PEM nor DER, if provided `key_password_len` must be correctly set.

int **key_password_len**

Length of the password pointed to by `key_password`

bool **use_secure_element**

Enable secure element, available in ESP32-ROOM-32SE, for SSL connection

void ***ds_data**

Carrier of handle for digital signature parameters, digital signature peripheral is available in some Espressif devices. It's not copied nor freed by the client, user needs to clean up.

struct **network_t**

Network related configuration

Public Members

int **reconnect_timeout_ms**

Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled (defaults to 10s)

int **timeout_ms**

Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s).

int **refresh_connection_after_ms**

Refresh connection after this value (in milliseconds)

bool **disable_auto_reconnect**

Client will reconnect to server (when errors/disconnect). Set `disable_auto_reconnect=true` to disable

esp_transport_handle_t **transport**

Custom transport handle to use. Warning: The transport should be valid during the client lifetime and is destroyed when `esp_mqtt_client_destroy` is called.

struct ifreq ***if_name**

The name of interface for data to go through. Use the default interface without setting

struct **outbox_config_t**

Client outbox configuration options.

Public Members

uint64_t **limit**

Size limit for the outbox in bytes.

struct **session_t**

MQTT Session related configuration

Public Members

struct *esp_mqtt_client_config_t::session_t::last_will_t* **last_will**

Last will configuration

bool **disable_clean_session**

MQTT clean session, default clean_session is true

int **keepalive**

MQTT keepalive, default is 120 seconds When configuring this value, keep in mind that the client attempts to communicate with the broker at half the interval that is actually set. This conservative approach allows for more attempts before the broker's timeout occurs

bool **disable_keepalive**

Set `disable_keepalive=true` to turn off keep-alive mechanism, keepalive is active by default. Note: setting the config value `keepalive` to 0 doesn't disable keepalive feature, but uses a default keepalive period

esp_mqtt_protocol_ver_t **protocol_ver**

MQTT protocol version used for connection.

int **message_retransmit_timeout**

timeout for retransmitting of failed packet

struct **last_will_t**

Last Will and Testament message configuration.

Public Members

const char ***topic**

LWT (Last Will and Testament) message topic

const char ***msg**

LWT message, may be NULL terminated

int **msg_len**

LWT message length, if msg isn't NULL terminated must have the correct length

int **qos**

LWT message QoS

int **retain**

LWT retained message flag

struct **task_t**

Client task configuration

Public Members

int **priority**

MQTT task priority

int **stack_size**
MQTT task stack size

struct **topic_t**
Topic definition struct

Public Members

const char ***filter**
Topic filter to subscribe

int **qos**
Max QoS level of the subscription

Macros

MQTT_ERROR_TYPE_ESP_TLS

MQTT_ERROR_TYPE_TCP_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from **MQTT_ERROR_TYPE_ESP_TLS** layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

esp_mqtt_client_subscribe (client_handle, topic_type, qos_or_size)

Convenience macro to select subscribe function to use.

Notes:

- Usage of `esp_mqtt_client_subscribe_single` is the same as previous `esp_mqtt_client_subscribe`, refer to it for details.

参数

- **client_handle** -- *MQTT* client handle
- **topic_type** -- Needs to be char* for single subscription or `esp_mqtt_topic_t` for multiple topics
- **qos_or_size** -- It's either a qos when subscribing to a single topic or the size of the subscription array when subscribing to multiple topics.

返回 message_id of the subscribe message on success -1 on failure -2 in case of full outbox.

Type Definitions

typedef struct esp_mqtt_client ***esp_mqtt_client_handle_t**

typedef enum *esp_mqtt_event_id_t* **esp_mqtt_event_id_t**

MQTT event types.

User event handler receives context data in *esp_mqtt_event_t* structure with

- client - *MQTT* client handle
- various other data depending on event type

typedef enum *esp_mqtt_connect_return_code_t* **esp_mqtt_connect_return_code_t**

MQTT connection error codes propagated via ERROR event

typedef enum *esp_mqtt_error_type_t* **esp_mqtt_error_type_t**

MQTT connection error codes propagated via ERROR event

```
typedef enum esp_mqtt_transport_t esp_mqtt_transport_t
```

```
typedef enum esp_mqtt_protocol_ver_t esp_mqtt_protocol_ver_t
```

MQTT protocol version used for connection

```
typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t
```

MQTT error code structure to be passed as a contextual information into ERROR event

Important: This structure extends *esp_tls_last_error* error structure and is backward compatible with it (so might be down-casted and treated as *esp_tls_last_error* error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

<code>error_type</code>	related member variables	note	<code>MQTT_ERROR_TYPE_TCP_TRANSPORT</code>
<code>esp_tls_last_esp_err</code> ,	<code>esp_tls_stack_err</code> ,	<code>esp_tls_cert_verify_flags</code> ,	<code>sock_errno</code>
Error reported from	<code>tcp_transport/esp-tls</code>	<code>MQTT_ERROR_TYPE_CONNECTION_REFUSED</code>	<code>connect_return_code</code>
Internal error reported from	<i>MQTT</i> broker on connection		

```
typedef struct esp_mqtt_event_t esp_mqtt_event_t
```

MQTT event configuration structure

```
typedef esp_mqtt_event_t *esp_mqtt_event_handle_t
```

```
typedef struct esp_mqtt_client_config_t esp_mqtt_client_config_t
```

MQTT client configuration structure

- Default values can be set via `menuconfig`
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related `len` field set to 0. DER format requires a related `len` field set to the correct length.

```
typedef struct topic_t esp_mqtt_topic_t
```

Topic definition struct

Enumerations

```
enum esp_mqtt_event_id_t
```

MQTT event types.

User event handler receives context data in *esp_mqtt_event_t* structure with

- client - *MQTT* client handle
- various other data depending on event type

Values:

enumerator **MQTT_EVENT_ANY**

enumerator **MQTT_EVENT_ERROR**

on error event, additional context: connection return code, error handle from `esp_tls` (if supported)

enumerator **MQTT_EVENT_CONNECTED**

connected event, additional context: session_present flag

enumerator **MQTT_EVENT_DISCONNECTED**

disconnected event

enumerator **MQTT_EVENT_SUBSCRIBED**

subscribed event, additional context:

- msg_id message id
- error_handle `error_type` in case subscribing failed
- data pointer to broker response, check for errors.
- data_len length of the data for this event

enumerator **MQTT_EVENT_UNSUBSCRIBED**

unsubscribed event, additional context: msg_id

enumerator **MQTT_EVENT_PUBLISHED**

published event, additional context: msg_id

enumerator **MQTT_EVENT_DATA**

data event, additional context:

- msg_id message id
- topic pointer to the received topic
- topic_len length of the topic
- data pointer to the received data
- data_len length of the data for this event
- current_data_offset offset of the current data for this event
- total_data_len total length of the data received
- retain retain flag of the message
- qos QoS level of the message
- dup dup flag of the message Note: Multiple MQTT_EVENT_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

enumerator **MQTT_EVENT_BEFORE_CONNECT**

The event occurs before connecting

enumerator **MQTT_EVENT_DELETED**

Notification on delete of one message from the internal outbox, if the message couldn't have been sent and acknowledged before expiring defined in `OUTBOX_EXPIRED_TIMEOUT_MS`. (events are not posted upon deletion of successfully acknowledged messages)

- This event id is posted only if `MQTT_REPORT_DELETED_MESSAGES==1`
- Additional context: msg_id (id of the deleted message).

enumerator **MQTT_USER_EVENT**

Custom event used to queue tasks into mqtt event handler All fields from the `esp_mqtt_event_t` type could be used to pass an additional context data to the handler.

enum **esp_mqtt_connect_return_code_t**

MQTT connection error codes propagated via ERROR event

Values:

enumerator **MQTT_CONNECTION_ACCEPTED**

Connection accepted

enumerator **MQTT_CONNECTION_REFUSE_PROTOCOL**

MQTT connection refused reason: Wrong protocol

enumerator **MQTT_CONNECTION_REFUSE_ID_REJECTED**

MQTT connection refused reason: ID rejected

enumerator **MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE**

MQTT connection refused reason: Server unavailable

enumerator **MQTT_CONNECTION_REFUSE_BAD_USERNAME**

MQTT connection refused reason: Wrong user

enumerator **MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED**

MQTT connection refused reason: Wrong username or password

enum **esp_mqtt_error_type_t**

MQTT connection error codes propagated via ERROR event

Values:

enumerator **MQTT_ERROR_TYPE_NONE**

enumerator **MQTT_ERROR_TYPE_TCP_TRANSPORT**

enumerator **MQTT_ERROR_TYPE_CONNECTION_REFUSED**

enumerator **MQTT_ERROR_TYPE_SUBSCRIBE_FAILED**

enum **esp_mqtt_transport_t**

Values:

enumerator **MQTT_TRANSPORT_UNKNOWN**

enumerator **MQTT_TRANSPORT_OVER_TCP**

MQTT over TCP, using scheme: *MQTT*

enumerator **MQTT_TRANSPORT_OVER_SSL**

MQTT over SSL, using scheme: *MQTTS*

enumerator **MQTT_TRANSPORT_OVER_WS**

MQTT over WebSocket, using scheme:: *ws*

enumerator **MQTT_TRANSPORT_OVER_WSS**

MQTT over WebSocket Secure, using scheme: *wss*

enum **esp_mqtt_protocol_ver_t**

MQTT protocol version used for connection

Values:

enumerator **MQTT_PROTOCOL_UNDEFINED**

enumerator **MQTT_PROTOCOL_V_3_1**

enumerator **MQTT_PROTOCOL_V_3_1_1**

enumerator **MQTT_PROTOCOL_V_5**

2.2.4 ESP-TLS

概述

ESP-TLS 组件提供简化 API 接口，用于访问常用 TLS 功能，支持如 CA 认证验证、SNI、ALPN 协商和非阻塞连接等常见场景，相关配置可在数据结构体 `esp_tls_cfg_t` 中指定。配置完成后，使用以下 API 进行 TLS 通信：

- `esp_tls_init()`：初始化 TLS 连接句柄。
- `esp_tls_conn_new_sync()`：开启新的阻塞式 TLS 连接。
- `esp_tls_conn_new_async()`：开启新的非阻塞式 TLS 连接。
- `esp_tls_conn_read()`：读取 TLS 层之上的应用数据。
- `esp_tls_conn_write()`：将应用数据写入 TLS 连接。
- `esp_tls_conn_destroy()`：释放连接。

任何应用层协议，如 HTTP1、HTTP2 等，均可调用 ESP-TLS 组件接口实现。

应用示例

使用 ESP-TLS 建立安全套接字连接的 HTTPS 简单示例，请参阅 [protocols/https_request](#)。

ESP-TLS 组件的树形结构

ESP-TLS 组件文件 `esp-tls/esp_tls.h` 包含该组件的公共 API 头文件。在 ESP-TLS 组件内部，为了实现安全会话功能，会使用 MbedTLS 和 WolfSSL 两个 SSL/TLS 库中的其中一个进行安全会话的建立，与 MbedTLS 相关的 API 存放在 `esp-tls/private_include/esp_tls_mbedtls.h`，而与 WolfSSL 相关的 API 存放在 `esp-tls/private_include/esp_tls_wolfssl.h`。

TLS 服务器验证

ESP-TLS 在客户端提供了多种验证 TLS 服务器的选项，如验证对端服务器的服务器证书、或使用预共享密钥验证服务器。用户应在 `esp_tls_cfg_t` 结构体中选择以下任一选项完成 TLS 服务器验证，若未做选择，则客户端默认在 TLS 连接创建时，会返回错误。

- **cacert_buf** 和 **cacert_bytes**: 以缓冲区的形式向 `esp_tls_cfg_t` 结构体提供 CA 证书，ESP-TLS 将使用缓冲区中的 CA 证书验证服务器。注意，须在 `esp_tls_cfg_t` 结构体中设置以下变量：
 - `cacert_buf` - 指针，指向包含 CA 证书的缓冲区。
 - `cacert_bytes` - CA 证书大小（以字节为单位）。
- **use_global_ca_store**: `global_ca_store` 可一次性完成初始化及设置，并用于验证 ESP-TLS 连接的服务器，注意需要在这些服务器各自的 `esp_tls_cfg_t` 结构体中设置 `use_global_ca_store = true`。有关初始化和设置 `global_ca_store` 的不同 API，请参阅文末的 API 参考。
- **crt_bundle_attach**: ESP x509 证书包 API 提供了便捷的服务器验证方法，即打包一组自定义的 x509 根证书，用于 TLS 服务器验证，详情请参阅 [ESP x509 证书包](#)。
- **psk_hint_key**: 要使用预共享密钥验证服务器，必须在 ESP-TLS menuconfig 中启用 `CONFIG_ESP_TLS_PSK_VERIFICATION`，然后向结构体 `esp_tls_cfg_t` 提供指向 PSK 提示和密钥的指针。若未选择有关服务器验证的其他选项，ESP-TLS 将仅用 PSK 验证服务器。
- **跳过服务器验证**: 该选项并不安全，仅供测试使用。在 ESP-TLS menuconfig 中启用 `CONFIG_ESP_TLS_INSECURE` 和 `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` 可启用该选项，此时，若未在 `esp_tls_cfg_t` 结构体选择其他服务器验证选项，ESP-TLS 将默认跳过服务器验证。

警告: 启用 **跳过服务器验证** 选项存在潜在风险，若未通过 API 或 `ca_store` 等其他机制提供服务器证书，可能导致设备与伪造身份的服务器建立 TLS 连接。

ESP-TLS 服务器证书选择回调

使用 MbedTLS 协议栈时，ESP-TLS 组件支持设置服务器证书选择回调函数。此时，在服务器握手期间可选择使用哪个服务器证书，该回调可获取客户端发送的“Client Hello”消息中提供的 TLS 扩展（ALPN、SPI 等），并基于此选择传输哪个服务器证书给客户端。要启用此功能，请在 ESP-TLS menuconfig 中启用 `CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK`。

证书选择回调可在结构体 `esp_tls_cfg_t` 中配置，具体如下：

```
int cert_selection_callback(mbedtls_ssl_context *ssl)
{
    /* 回调应执行的代码 */
    return 0;
}

esp_tls_cfg_t cfg = {
    cert_select_cb = cert_section_callback,
};
```

底层 SSL/TLS 库选择

ESP-TLS 组件支持以 MbedTLS 或 WolfSSL 作为其底层 SSL/TLS 库，默认仅使用 MbedTLS，WolfSSL 的 SSL/TLS 库可在 <https://github.com/espressif/esp-wolfssl> 上公开获取，该仓库提供二进制格式的 WolfSSL 组件，并提供了一些示例帮助用户了解相关 API。有关许可证和其他选项，请参阅仓库的 `README.md` 文件。下文介绍了在工程中使用 WolfSSL 的具体流程。

备注： 库选项位于 ESP-TLS 内部，因此切换库不会更改工程的 ESP-TLS 特定代码。

在 ESP-IDF 使用 WolfSSL

要在工程中使用 WolfSSL，可采取以下两种方式：

- 1) 使用以下三行命令，将 WolfSSL 作为组件直接添加到工程中：

```
(首先用 cd 命令进入工程目录)
mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git
```

- 2) 将 WolfSSL 作为额外组件添加到工程中。

- 使用以下命令下载 WolfSSL：

```
git clone https://github.com/espressif/esp-wolfssl.git
```

- 参照 [wolfssl/examples](#) 示例，在工程的 CMakeLists.txt 文件中设置 EXTRA_COMPONENT_DIRS，从而在 ESP-IDF 中包含 ESP-WolfSSL，详情请参阅 [构建系统](#) 中的 [可选的项目变量](#) 小节。

完成上述步骤后，可以在工程配置菜单中将 WolfSSL 作为底层 SSL/TLS 库，具体步骤如下：

```
idf.py menuconfig > ESP-TLS > SSL/TLS Library > Mbedtls/Wolfssl
```

MbedTLS 与 WolfSSL 对比

下表是在使用 WolfSSL 和 MbedTLS 两种 SSL/TLS 库，并将所有相关配置设置为默认值时，运行具有服务器身份验证的 [protocols/https_request](#) 示例的比较结果。对于 MbedTLS，IN_CONTENT 长度和 OUT_CONTENT 长度分别设置为 16384 字节和 4096 字节。

属性	WolfSSL	MbedTLS
总消耗堆空间	~ 19 KB	~ 37 KB
任务栈使用	~ 2.2 KB	~ 3.6 KB
二进制文件大小	~ 858 KB	~ 736 KB

备注： 若配置选项不同或相应库的版本不同，得到的值可能与上表不同。

ESP-TLS 的数字签名

ESP-TLS 支持在 ESP32-P4 中使用数字签名 (DS)，但只有当 ESP-TLS 以 MbedTLS（默认协议栈）为底层 SSL/TLS 协议栈时，才支持使用 TLS 的数字签名。有关数字签名的详细信息，请参阅 [数字签名 \(DS\)](#)。有关数字签名的技术细节（例如私钥参数计算），请参阅 [ESP32-P4 技术参考手册 > 数字签名 \(DS\) \[PDF\]](#)。在使用数字签名前，应预先配置数字签名外设，请参阅 [TLS 连接所需的 DS 外设配置](#)。

数字签名外设必须用所需的加密私钥参数初始化，相应参数在配置数字签名外设时获取。具备所需的数字签名上下文，即数字签名参数时，ESP-TLS 会在内部初始化数字签名外设。要将数字签名上下文传递给 ESP-TLS 上下文，请参阅以下代码段。注意，在删除 TLS 连接之前，不应释放传递给 ESP-TLS 上下文的数字签名上下文。

```
#include "esp_tls.h"
esp_ds_data_ctx_t *ds_ctx;
/* 使用加密的私钥参数初始化 ds_ctx，这类参数可以从 nvs_
↳ 中读取，或由应用程序代码提供 */
```

(下页继续)

```
esp_tls_cfg_t cfg = {
    .clientcert_buf = /* 客户端证书 */,
    .clientcert_bytes = /* 客户端证书长度 */,
    /* 其他配置选项 */
    .ds_data = (void *)ds_ctx,
};
```

备注: 当使用数字签名进行 TLS 连接时, 除其他必要参数外, 仅需提供客户端证书 (clientcert_buf) 和数字签名参数 (ds_data), 此时可将客户端密钥 (clientkey_buf) 设置为 NULL。

- 使用数字签名外设进行双向认证的示例请参阅 [SSL 双向认证](#), 该示例使用 ESP-TLS 实现 TLS 连接。

TLS 加密套件

ESP-TLS 支持在客户端模式下设置加密套件列表, TLS 密码套件列表用于向服务器传递所支持的密码套件信息, 用户可以根据自己需求增减加密套件, 且适用于任何 TLS 协议栈配置。如果服务器支持列表中的任一密码套件, 则 TLS 连接成功, 反之连接失败。

连接客户端时, 在 `esp_tls_cfg_t` 结构体中设置 `ciphersuites_list` 的步骤如下:

```
/* 加密套件列表必须以 0 结尾, 并且在整个 TLS 连接期间, 加密套件的内存地址空间有效。
↪ */
static const int ciphersuites_list[] = {MBEDTLS_TLS_ECDHE_ECDSA_WITH_AES_256_GCM_
↪SHA384, MBEDTLS_TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384, 0};
esp_tls_cfg_t cfg = {
    .ciphersuites_list = ciphersuites_list,
};
```

ESP-TLS 不会检查 `ciphersuites_list` 的有效性, 因此需调用 `esp_tls_get_ciphersuites_list()` 获取 TLS 协议栈中支持的加密套件列表, 并检查设置的加密套件是否在支持的加密套件列表中。

备注: 此功能仅在 MbedTLS 协议栈中有效。

TLS 协议版本

ESP-TLS 能够为 TLS 连接设置相应的 TLS 协议版本, 指定版本将用于建立专用 TLS 连接。也就是说, 在运行时不同的 TLS 连接可以配置到 TLS 1.2、TLS 1.3 等不同协议版本。

备注: 目前, 仅在 MbedTLS 作为 ESP-TLS 的底层 SSL/TLS 协议栈时支持此功能。

要在 ESP-TLS 中设置 TLS 协议版本, 请设置 `esp_tls_cfg_t::tls_version`, 从 `esp_tls_proto_ver_t` 中选择所需版本。如未指定协议版本字段, 将默认根据服务器要求建立 TLS 连接。

ESP-TLS 连接的协议版本可按如下方式配置:

```
#include "esp_tls.h"
esp_tls_cfg_t cfg = {
    .tls_version = ESP_TLS_VER_TLS_1_2,
};
```

API 参考

Header File

- [components/esp-tls/esp_tls.h](#)
- This header file can be included with:

```
#include "esp_tls.h"
```

- This header file is a part of the API provided by the `esp-tls` component. To declare that your component depends on `esp-tls`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp-tls
```

or

```
PRIV_REQUIRES esp-tls
```

Functions

`esp_err_t esp_tls_cfg_server_session_tickets_init (esp_tls_cfg_server_t *cfg)`

Initialize the server side TLS session ticket context.

This function initializes the server side tls session ticket context which holds all necessary data structures to enable tls session tickets according to RFC5077. Use `esp_tls_cfg_server_session_tickets_free` to free the data.

参数 `cfg` -- **[in]** server configuration as `esp_tls_cfg_server_t`

返回 `ESP_OK` if setup succeeded `ESP_ERR_INVALID_ARG` if context is already initialized
`ESP_ERR_NO_MEM` if memory allocation failed `ESP_ERR_NOT_SUPPORTED` if session tickets are not available due to build configuration `ESP_FAIL` if setup failed

void `esp_tls_cfg_server_session_tickets_free (esp_tls_cfg_server_t *cfg)`

Free the server side TLS session ticket context.

参数 `cfg` -- server configuration as `esp_tls_cfg_server_t`

`esp_tls_t *esp_tls_init (void)`

Create TLS connection.

This function allocates and initializes `esp-tls` structure handle.

返回 `tls` Pointer to `esp-tls` as `esp-tls` handle if successfully initialized, `NULL` if allocation error

`esp_tls_t *esp_tls_conn_http_new (const char *url, const esp_tls_cfg_t *cfg)`

Create a new blocking TLS/SSL connection with a given "HTTP" url.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_tls_conn_http_new_sync` (and its asynchronous version `esp_tls_conn_http_new_async`)

参数

- `url` -- **[in]** url of host.
- `cfg` -- **[in]** TLS configuration as `esp_tls_cfg_t`. If you wish to open non-TLS connection, keep this `NULL`. For TLS connection, a pass pointer to `'esp_tls_cfg_t'`. At a minimum, this structure should be zero-initialized.

返回 pointer to `esp_tls_t`, or `NULL` if connection couldn't be opened.

int `esp_tls_conn_new_sync (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)`

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

参数

- `hostname` -- **[in]** Hostname of the host.
- `hostlen` -- **[in]** Length of hostname.

- **port** -- **[in]** Port number of the host.
- **cfg** -- **[in]** TLS configuration as `esp_tls_cfg_t`. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to `esp_tls_cfg_t`. At a minimum, this structure should be zero-initialized.
- **tls** -- **[in]** Pointer to esp-tls as esp-tls handle.

返回

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

int **esp_tls_conn_http_new_sync** (const char *url, const *esp_tls_cfg_t* *cfg, *esp_tls_t* *tls)

Create a new blocking TLS/SSL connection with a given "HTTP" url.

The behaviour is same as `esp_tls_conn_new_sync()` API. However this API accepts host's url.

参数

- **url** -- **[in]** url of host.
- **cfg** -- **[in]** TLS configuration as `esp_tls_cfg_t`. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to 'esp_tls_cfg_t'. At a minimum, this structure should be zero-initialized.
- **tls** -- **[in]** Pointer to esp-tls as esp-tls handle.

返回

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

int **esp_tls_conn_new_async** (const char *hostname, int hostlen, int port, const *esp_tls_cfg_t* *cfg, *esp_tls_t* *tls)

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn't wait for the connection to get established.

参数

- **hostname** -- **[in]** Hostname of the host.
- **hostlen** -- **[in]** Length of hostname.
- **port** -- **[in]** Port number of the host.
- **cfg** -- **[in]** TLS configuration as `esp_tls_cfg_t`. `non_block` member of this structure should be set to be true.
- **tls** -- **[in]** pointer to esp-tls as esp-tls handle.

返回

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

int **esp_tls_conn_http_new_async** (const char *url, const *esp_tls_cfg_t* *cfg, *esp_tls_t* *tls)

Create a new non-blocking TLS/SSL connection with a given "HTTP" url.

The behaviour is same as `esp_tls_conn_new_async()` API. However this API accepts host's url.

参数

- **url** -- **[in]** url of host.
- **cfg** -- **[in]** TLS configuration as `esp_tls_cfg_t`.
- **tls** -- **[in]** pointer to esp-tls as esp-tls handle.

返回

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

ssize_t **esp_tls_conn_write** (*esp_tls_t* *tls, const void *data, size_t datalen)

Write from buffer 'data' into specified tls connection.

参数

- **tls** -- **[in]** pointer to esp-tls as esp-tls handle.
- **data** -- **[in]** Buffer from which data will be written.
- **datalen** -- **[in]** Length of data buffer.

返回

- ≥ 0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- < 0 if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- `ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE`. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

`ssize_t esp_tls_conn_read (esp_tls_t *tls, void *data, size_t datalen)`

Read from specified tls connection into the buffer 'data'.

参数

- **tls** -- **[in]** pointer to esp-tls as esp-tls handle.
- **data** -- **[in]** Buffer to hold read data.
- **datalen** -- **[in]** Length of data buffer.

返回

- > 0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- < 0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

`int esp_tls_conn_destroy (esp_tls_t *tls)`

Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with `esp_tls_conn_new_sync()` (or `esp_tls_conn_http_new_sync()`) and `esp_tls_conn_new_async()` (or `esp_tls_conn_http_new_async()`) APIs.

参数 **tls** -- **[in]** pointer to esp-tls as esp-tls handle.

返回 - 0 on success

- -1 if socket error or an invalid argument

`ssize_t esp_tls_get_bytes_avail (esp_tls_t *tls)`

Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls's `mbedtls_ssl_get_bytes_avail()` API.

参数 **tls** -- **[in]** pointer to esp-tls as esp-tls handle.

返回

- -1 in case of invalid arg
- bytes available in the application data record read buffer

`esp_err_t esp_tls_get_conn_sockfd (esp_tls_t *tls, int *sockfd)`

Returns the connection socket file descriptor from esp_tls session.

参数

- **tls** -- **[in]** handle to esp_tls context
- **sockfd** -- **[out]** int pointer to sockfd value.

返回 - `ESP_OK` on success and value of sockfd will be updated with socket file descriptor for connection

- `ESP_ERR_INVALID_ARG` if $(tls == NULL \parallel sockfd == NULL)$

`esp_err_t esp_tls_set_conn_sockfd (esp_tls_t *tls, int sockfd)`

Sets the connection socket file descriptor for the esp_tls session.

参数

- **tls** -- **[in]** handle to esp_tls context
- **sockfd** -- **[in]** sockfd value to set.

返回 - ESP_OK on success and value of sockfd for the tls connection shall updated with the provided value

- ESP_ERR_INVALID_ARG if (tls == NULL || sockfd < 0)

esp_err_t **esp_tls_get_conn_state** (*esp_tls_t* *tls, *esp_tls_conn_state_t* *conn_state)

Gets the connection state for the esp_tls session.

参数

- **tls** -- **[in]** handle to esp_tls context
- **conn_state** -- **[out]** pointer to the connection state value.

返回 - ESP_OK on success and value of sockfd for the tls connection shall updated with the provided value

- ESP_ERR_INVALID_ARG (Invalid arguments)

esp_err_t **esp_tls_set_conn_state** (*esp_tls_t* *tls, *esp_tls_conn_state_t* conn_state)

Sets the connection state for the esp_tls session.

参数

- **tls** -- **[in]** handle to esp_tls context
- **conn_state** -- **[in]** connection state value to set.

返回 - ESP_OK on success and value of sockfd for the tls connection shall updated with the provided value

- ESP_ERR_INVALID_ARG (Invalid arguments)

void ***esp_tls_get_ssl_context** (*esp_tls_t* *tls)

Returns the ssl context.

参数 **tls** -- **[in]** handle to esp_tls context

返回 - ssl_ctx pointer to ssl context of underlying TLS layer on success

- NULL in case of error

esp_err_t **esp_tls_init_global_ca_store** (void)

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling `esp_tls_set_global_ca_store()`. To be effective, this function must be called before any call to `esp_tls_set_global_ca_store()`.

返回

- ESP_OK if creating global CA store was successful.
- ESP_ERR_NO_MEM if an error occurred when allocating the mbedTLS resources.

esp_err_t **esp_tls_set_global_ca_store** (const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls `esp_tls_init_global_ca_store()` if it has not already been called. The application must call this function before calling `esp_tls_conn_new()`.

参数

- **cacert_pem_buf** -- **[in]** Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
- **cacert_pem_bytes** -- **[in]** Length of the buffer.

返回

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void **esp_tls_free_global_ca_store** (void)

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

`esp_err_t esp_tls_get_and_clear_last_error` (`esp_tls_error_handle_t` h, int *esp_tls_code, int *esp_tls_flags)

Returns last error in esp_tls with detailed mbedtls related error codes. The error information is cleared internally upon return.

参数

- **h** -- [in] esp-tls error handle.
- **esp_tls_code** -- [out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code
- **esp_tls_flags** -- [out] last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

返回

- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK (0) if no error occurred
- specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

`esp_err_t esp_tls_get_and_clear_error_type` (`esp_tls_error_handle_t` h, `esp_tls_error_type_t` err_type, int *error_code)

Returns the last error captured in esp_tls of a specific type The error information is cleared internally upon return.

参数

- **h** -- [in] esp-tls error handle.
- **err_type** -- [in] specific error type
- **error_code** -- [out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

返回

- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK if a valid error returned and was cleared

`esp_err_t esp_tls_get_error_handle` (`esp_tls_t` *tls, `esp_tls_error_handle_t` *error_handle)

Returns the ESP-TLS error_handle.

参数

- **tls** -- [in] handle to esp_tls context
- **error_handle** -- [out] pointer to the error handle.

返回

- ESP_OK on success and error_handle will be updated with the ESP-TLS error handle.
- ESP_ERR_INVALID_ARG if (tls == NULL || error_handle == NULL)

`mbedtls_x509_crt` *`esp_tls_get_global_ca_store` (void)

Get the pointer to the global CA store currently being used.

The application must first call `esp_tls_set_global_ca_store()`. Then the same CA store could be used by the application for APIs other than `esp_tls`.

备注: Modifying the pointer might cause a failure in verifying the certificates.

返回

- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

`const int` *`esp_tls_get_ciphersuites_list` (void)

Get supported TLS ciphersuites list.

See <https://www.iana.org/assignments/tls-parameters/tls-parameters.xhtml#tls-parameters-4> for the list of ciphersuites

返回 Pointer to a zero-terminated array of IANA identifiers of TLS ciphersuites.

int **esp_tls_server_session_create** (*esp_tls_cfg_server_t* *cfg, int sockfd, *esp_tls_t* *tls)

Create TLS/SSL server session.

This function creates a TLS/SSL server context for already accepted client connection and performs TLS/SSL handshake with the client

参数

- **cfg** -- [in] Pointer to *esp_tls_cfg_server_t*
- **sockfd** -- [in] FD of accepted connection
- **tls** -- [out] Pointer to allocated *esp_tls_t*

返回

- 0 if successful
- <0 in case of error

void **esp_tls_server_session_delete** (*esp_tls_t* *tls)

Close the server side TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with `esp_tls_server_session_create()`

参数 **tls** -- [in] pointer to *esp_tls_t*

esp_err_t **esp_tls_plain_tcp_connect** (const char *host, int hostlen, int port, const *esp_tls_cfg_t* *cfg, *esp_tls_error_handle_t* error_handle, int *sockfd)

Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

参数

- **host** -- [in] Hostname of the host.
- **hostlen** -- [in] Length of hostname.
- **port** -- [in] Port number of the host.
- **cfg** -- [in] ESP-TLS configuration as *esp_tls_cfg_t*.
- **error_handle** -- [out] ESP-TLS error handle holding potential errors occurred during connection
- **sockfd** -- [out] Socket descriptor if successfully connected on TCP layer

返回 ESP_OK on success ESP_ERR_INVALID_ARG if invalid output parameters ESP-TLS based error codes on failure

Structures

struct **psk_key_hint**

ESP-TLS preshared key and hint structure.

Public Members

const uint8_t ***key**

key in PSK authentication mode in binary format

const size_t **key_size**

length of the key

const char ***hint**

hint in PSK authentication mode in string format

struct **tls_keep_alive_cfg**

esp-tls client session ticket ctx

Keep alive parameters structure

Public Members

bool **keep_alive_enable**

Enable keep-alive timeout

int **keep_alive_idle**

Keep-alive idle time (second)

int **keep_alive_interval**

Keep-alive interval time (second)

int **keep_alive_count**

Keep-alive packet retry send count

struct **esp_tls_cfg**

ESP-TLS configuration parameters.

备注: Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
 - Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
 - Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.
-

Public Members

const char ****alpn_protos**

Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char **alpn_protos = { "h2", NULL };

- where 'h2' is the protocol name

const unsigned char ***cacert_buf**

Certificate Authority's certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support
This buffer should be NULL terminated in case of PEM

const unsigned char ***cacert_pem_buf**

CA certificate buffer legacy name

unsigned int **cacert_bytes**

Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of PEM format)

unsigned int **cacert_pem_bytes**

Size of Certificate Authority certificate legacy name

const unsigned char ***clientcert_buf**

Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char ***clientcert_pem_buf**

Client certificate legacy name

unsigned int **clientcert_bytes**

Size of client certificate pointed to by clientcert_pem_buf (including NULL-terminator in case of PEM format)

unsigned int **clientcert_pem_bytes**

Size of client certificate legacy name

const unsigned char ***clientkey_buf**

Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char ***clientkey_pem_buf**

Client key legacy name

unsigned int **clientkey_bytes**

Size of client key pointed to by clientkey_pem_buf (including NULL-terminator in case of PEM format)

unsigned int **clientkey_pem_bytes**

Size of client key legacy name

const unsigned char ***clientkey_password**

Client key decryption password string

unsigned int **clientkey_password_len**

String length of the password pointed to by clientkey_password

bool **use_ecdsa_peripheral**

Use the ECDSA peripheral for the private key operations

uint8_t **ecdsa_key_efuse_blk**

The efuse block where the ECDSA key is stored

bool **non_block**

Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool **use_secure_element**

Enable this option to use secure element or atec608a chip

int **timeout_ms**

Network timeout in milliseconds. Note: If this value is not set, by default the timeout is set to 10 seconds. If you wish that the session should wait indefinitely then please use a larger value e.g., INT32_MAX

bool **use_global_ca_store**

Use a global ca_store for all the connections in which this bool is set.

const char ***common_name**

If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool **skip_common_name**

Skip any validation of server certificate CN field

tls_keep_alive_cfg_t ***keep_alive_cfg**

Enable TCP keep-alive timeout for SSL connection

const *psk_hint_key_t* ***psk_hint_key**

Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

esp_err_t (***crt_bundle_attach**)(void *conf)

Function pointer to esp_cert_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

void ***ds_data**

Pointer for digital signature peripheral context

bool **is_plain_tcp**

Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather than TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp_tls_plain_tcp_connect() API

struct ifreq ***if_name**

The name of interface for data to go through. Use the default interface without setting

esp_tls_addr_family_t **addr_family**

The address family to use when connecting to a host.

const int ***ciphersuites_list**

Pointer to a zero-terminated array of IANA identifiers of TLS ciphersuites. Please check the list validity by esp_tls_get_ciphersuites_list() API

esp_tls_proto_ver_t **tls_version**

TLS protocol version of the connection, e.g., TLS 1.2, TLS 1.3 (default - no preference)

struct **esp_tls_cfg_server**

ESP-TLS Server configuration parameters.

Public Members

const char ****alpn_protos**

Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char ****alpn_protos** = { "h2", NULL };

- where 'h2' is the protocol name

const unsigned char ***cacert_buf**

Client CA certificate in a buffer. This buffer should be NULL terminated

const unsigned char ***cacert_pem_buf**

Client CA certificate legacy name

unsigned int **cacert_bytes**

Size of client CA certificate pointed to by cacert_pem_buf

unsigned int **cacert_pem_bytes**

Size of client CA certificate legacy name

const unsigned char ***servercert_buf**

Server certificate in a buffer This buffer should be NULL terminated

const unsigned char ***servercert_pem_buf**

Server certificate legacy name

unsigned int **servercert_bytes**

Size of server certificate pointed to by servercert_pem_buf

unsigned int **servercert_pem_bytes**

Size of server certificate legacy name

const unsigned char ***serverkey_buf**

Server key in a buffer This buffer should be NULL terminated

const unsigned char ***serverkey_pem_buf**

Server key legacy name

unsigned int **serverkey_bytes**

Size of server key pointed to by serverkey_pem_buf

unsigned int **serverkey_pem_bytes**

Size of server key legacy name

const unsigned char ***serverkey_password**

Server key decryption password string

unsigned int **serverkey_password_len**

String length of the password pointed to by serverkey_password

bool **use_ecdsa_peripheral**

Use ECDSA peripheral to use private key

uint8_t **ecdsa_key_efuse_blk**

The efuse block where ECDSA key is stored

bool **use_secure_element**

Enable this option to use secure element or atec608a chip

void ***userdata**

User data to be added to the ssl context. Can be retrieved by callbacks

Type Definitions

- This header file is a part of the API provided by the `esp-tls` component. To declare that your component depends on `esp-tls`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp-tls
```

or

```
PRIV_REQUIRES esp-tls
```

Structures

struct **esp_tls_last_error**

Error structure containing relevant errors in case tls error occurred.

Public Members

esp_err_t **last_error**

error code (based on `ESP_ERR_ESP_TLS_BASE`) of the last occurred error

int **esp_tls_error_code**

esp_tls error code from last esp_tls failed api

int **esp_tls_flags**

last certification verification flags

Macros

ESP_ERR_ESP_TLS_BASE

Starting number of ESP-TLS error codes

ESP_ERR_ESP_TLS_CANNOT_RESOLVE_HOSTNAME

Error if hostname couldn't be resolved upon tls connection

ESP_ERR_ESP_TLS_CANNOT_CREATE_SOCKET

Failed to create socket

ESP_ERR_ESP_TLS_UNSUPPORTED_PROTOCOL_FAMILY

Unsupported protocol family

ESP_ERR_ESP_TLS_FAILED_CONNECT_TO_HOST

Failed to connect to host

ESP_ERR_ESP_TLS_SOCKET_SETOPT_FAILED

failed to set/get socket option

ESP_ERR_ESP_TLS_CONNECTION_TIMEOUT

new connection in esp_tls_low_level_conn connection timeouted

ESP_ERR_ESP_TLS_SE_FAILED

ESP_ERR_ESP_TLS_TCP_CLOSED_FIN

ESP_ERR_MBEDTLS_CERT_PARTLY_OK

ESP_TLS_ERR_SSL_WANT_READ

Definition of errors reported from IO API (potentially non-blocking) in case of error:

- `esp_tls_conn_read()`
- `esp_tls_conn_write()`

ESP_TLS_ERR_SSL_WANT_WRITE**ESP_TLS_ERR_SSL_TIMEOUT****Type Definitions**

```
typedef struct esp_tls_last_error *esp_tls_error_handle_t
```

```
typedef struct esp_tls_last_error esp_tls_last_error_t
```

Error structure containing relevant errors in case tls error occurred.

Enumerations

```
enum esp_tls_error_type_t
```

Definition of different types/sources of error codes reported from different components

Values:

enumerator **ESP_TLS_ERR_TYPE_UNKNOWN**

enumerator **ESP_TLS_ERR_TYPE_SYSTEM**

System error –`errno`

enumerator **ESP_TLS_ERR_TYPE_MBEDTLS**

Error code from mbedTLS library

enumerator **ESP_TLS_ERR_TYPE_MBEDTLS_CERT_FLAGS**

Certificate flags defined in mbedTLS

enumerator **ESP_TLS_ERR_TYPE_ESP**

ESP-IDF error type `-esp_err_t`

enumerator **ESP_TLS_ERR_TYPE_WOLFSSL**

Error code from wolfSSL library

enumerator **ESP_TLS_ERR_TYPE_WOLFSSL_CERT_FLAGS**

Certificate flags defined in wolfSSL

enumerator **ESP_TLS_ERR_TYPE_MAX**

Last err type `-invalid entry`

2.2.5 ESP HTTP 客户端

概述

`esp_http_client` 提供了一组 API，用于从 ESP-IDF 应用程序中发起 HTTP/S 请求，具体的使用步骤如下：

- 首先调用 `esp_http_client_init()`，创建一个 `esp_http_client_handle_t` 实例，即基于给定的 `esp_http_client_config_t` 配置创建 HTTP 客户端句柄。此函数必须第一个被调用。若用户未明确定义参数的配置值，则使用默认值。
- 其次调用 `esp_http_client_perform()`，执行 `esp_http_client` 的所有操作，包括打开连接、交换数据、关闭连接（如需要），同时在当前任务完成前阻塞该任务。所有相关的事件（在 `esp_http_client_config_t` 中指定）将通过事件处理程序被调用。
- 最后调用 `esp_http_client_cleanup()` 来关闭连接（如有），并释放所有分配给 HTTP 客户端实例的内存。此函数必须在操作完成后最后一个被调用。

应用示例

使用 ESP HTTP 客户端发起 HTTP/S 请求的简单示例，可参考 [protocols/esp_http_client](#)。

HTTP 基本请求

如需了解实现细节，请参考应用示例中的 `http_rest_with_url` 和 `http_rest_with_hostname_path` 函数。

持久连接

持久连接是 HTTP 客户端在多次交换中重复使用同一连接的方法。如果服务器没有使用 `Connection: close` 头来请求关闭连接，连接就会一直保持开放，用于其他新请求。

为了使 ESP HTTP 客户端充分利用持久连接的优势，建议尽可能多地使用同一个句柄实例来发起请求，可参考应用示例中的函数 `http_rest_with_url` 和 `http_rest_with_hostname_path`。示例中，一旦创建连接，即会在连接关闭前发出多个请求（如 GET、POST、PUT 等）。

HTTPS 请求

ESP HTTP 客户端支持使用 **mbedTLS** 的 SSL 连接，需将 `url` 配置为以 `https` 开头，或将 `transport_type` 设置为 `HTTP_TRANSPORT_OVER_SSL`。可以通过 `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS` 来配置 HTTPS 支持（默认启用）。

备注：在发起 HTTPS 请求时，如需服务器验证，首先需要向 `esp_http_client_config_t` 配置中的 `cert_pem` 成员提供额外的根证书（PEM 格式）。用户还可以通过 `esp_http_client_config_t` 配置中的 `crt_bundle_attach` 成员，使用 ESP x509 Certificate Bundle 进行服务器验证。

如需了解上文备注中的实现细节，请参考应用示例中的函数 `https_with_url` 和 `https_with_hostname_path`。

HTTP 流

有些应用程序需要主动打开连接并控制数据交换（数据流）。在这种情况下，应用流程与常规请求不同。请参考以下示例：

- `esp_http_client_init()`：创建一个 HTTP 客户端句柄。
- `esp_http_client_set_*` 或 `esp_http_client_delete_*`：修改 HTTP 连接参数（可选）。
- `esp_http_client_open()`：用 `write_len`（该参数为需要写入服务器的内容长度）打开 HTTP 连接，设置 `write_len=0` 为只读连接。
- `esp_http_client_write()`：向服务器写入数据，最大长度为 `esp_http_client_open()` 函数中的 `write_len` 值；配置 `write_len=0` 无需调用此函数。
- `esp_http_client_fetch_headers()`：在发送完请求头和服务器数据（如有）后，读取 HTTP 服务器的响应头。从服务器返回 `content-length`，并可以由 `esp_http_client_get_status_code()` 继承，以获取连接的 HTTP 状态。
- `esp_http_client_read()`：读取 HTTP 流。
- `esp_http_client_close()`：关闭连接。
- `esp_http_client_cleanup()`：释放分配的资源。

如需了解实现细节，请参考应用示例中的函数 `http_perform_as_stream_reader`。

HTTP 认证

ESP HTTP 客户端同时支持基本和摘要认证。

- 用户可以在 `url` 或 `esp_http_client_config_t` 配置中的 `username` 和 `password` 处输入用户名和密码。对于 `auth_type = HTTP_AUTH_TYPE_BASIC`，HTTP 客户端只需执行一项操作就可通过认证过程。
- 如果 `auth_type = HTTP_AUTH_TYPE_NONE`，但配置中有 `username` 和 `password` 字段，HTTP 客户端需要执行两项操作。客户端在第一次尝试连接服务器时，会收到 401 Unauthorized 头，而后再根据这些信息来选择认证方法，并在第二项操作中执行。
- 如需了解实现细节，请参考应用示例中的函数 `http_auth_basic`、`http_auth_basic_redirect`（用于基本认证）和 `http_auth_digest`（用于摘要认证）。
- 目前，摘要认证仅支持 MD5 和 SHA-256 算法。

认证配置示例

- 基于 URI 的认证

```
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

- 基于用户名和密码的认证

```
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

事件处理

ESP HTTP 客户端支持事件处理，发生相关事件时会触发相应的事件处理程序。`esp_http_client_event_id_t` 中包含了所有使用 ESP HTTP 客户端执行 HTTP 请求时可能发生的事件。

通过 `esp_http_client_config_t::event_handler` 设置回调函数即可启用事件处理功能。

ESP HTTP 客户端诊断信息

诊断信息可以帮助用户深入了解出现的问题。在 ESP HTTP 客户端中，可以通过在事件循环库中注册事件处理程序来获取诊断信息。此功能的增加基于 [ESP Insights](#) 框架，该框架可帮助收集诊断信息。然而，即使不依赖 ESP Insights 框架，也可以获取诊断信息。事件处理程序可通过 `esp_event_handler_register()` 函数注册到事件循环中。

事件循环中不同 HTTP 客户端事件的预期数据类型如下所示：

- `HTTP_EVENT_ERROR`: `esp_http_client_handle_t`
- `HTTP_EVENT_ON_CONNECTED`: `esp_http_client_handle_t`
- `HTTP_EVENT_HEADERS_SENT`: `esp_http_client_handle_t`
- `HTTP_EVENT_ON_HEADER`: `esp_http_client_handle_t`
- `HTTP_EVENT_ON_DATA`: `esp_http_client_on_data_t`
- `HTTP_EVENT_ON_FINISH`: `esp_http_client_handle_t`
- `HTTP_EVENT_DISCONNECTED`: `esp_http_client_handle_t`
- `HTTP_EVENT_REDIRECT`: `esp_http_client_redirect_event_data_t`

在无法接收到 `HTTP_EVENT_DISCONNECTED` 之前，与事件数据一起接收到的 `esp_http_client_handle_t` 将始终有效。这个句柄主要是为了区分不同的客户端连接，无法用于其他目的，因为它可能会随着客户端连接状态的变化而改变。

TLS 协议版本

可在 `esp_http_client_config_t` 中设置用于底层 TLS 连接的 TLS 协议版本。了解更多信息，请参考 [ESP-TLS](#) 中的 [TLS 协议版本](#) 章节。

HTTP 客户端的 TLS 协议版本可按如下方式配置：

```
#include "esp_http_client.h"
esp_http_client_config_t config = {
    .tls_version = ESP_HTTP_CLIENT_TLS_VER_TLS_1_2,
};
```

Functions

`esp_http_client_handle_t esp_http_client_init` (const `esp_http_client_config_t` *config)

Start a HTTP session This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.

参数 config -- [in] The configurations, see `http_client_config_t`

返回

- `esp_http_client_handle_t`
- NULL if any errors

`esp_err_t esp_http_client_perform` (`esp_http_client_handle_t` client)

Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same `esp_http_client_handle_t` as input as the `esp_http_client_init` call returned. `esp_http_client_perform` performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking `esp_http_client_perform()`, `is_async` member of `esp_http_client_config_t` must be set while making a call to `esp_http_client_init()` API. You can do any amount of calls to `esp_http_client_perform` while using the same `esp_http_client_handle_t`. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. `esp_http_client` will then attempt to reuse the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use `esp_http_client_set_*` between the invokes to set options for the following `esp_http_client_perform`.

备注: You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several `esp_http_client_handle_t`. This function include `esp_http_client_open` -> `esp_http_client_write` -> `esp_http_client_fetch_headers` -> `esp_http_client_read` (and option) `esp_http_client_close`.

参数 client -- The `esp_http_client` handle

返回

- ESP_OK on successful
- ESP_FAIL on error

`esp_err_t esp_http_client_cancel_request` (`esp_http_client_handle_t` client)

Cancel an ongoing HTTP request. This API closes the current socket and opens a new socket with the same `esp_http_client` context.

参数 **client** -- The esp_http_client handle

返回

- ESP_OK on successful
- ESP_FAIL on error
- ESP_ERR_INVALID_ARG
- ESP_ERR_INVALID_STATE

esp_err_t **esp_http_client_set_url** (*esp_http_client_handle_t* client, const char *url)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

参数

- **client** -- **[in]** The esp_http_client handle
- **url** -- **[in]** The url

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_http_client_set_post_field** (*esp_http_client_handle_t* client, const char *data, int len)

Set post data, this function must be called before esp_http_client_perform. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

参数

- **client** -- **[in]** The esp_http_client handle
- **data** -- **[in]** post data pointer
- **len** -- **[in]** post length

返回

- ESP_OK
- ESP_FAIL

int **esp_http_client_get_post_field** (*esp_http_client_handle_t* client, char **data)

Get current post field information.

参数

- **client** -- **[in]** The client
- **data** -- **[out]** Point to post data pointer

返回 Size of post data

esp_err_t **esp_http_client_set_header** (*esp_http_client_handle_t* client, const char *key, const char *value)

Set http request header, this function must be called after esp_http_client_init and before any perform function.

参数

- **client** -- **[in]** The esp_http_client handle
- **key** -- **[in]** The header key
- **value** -- **[in]** The header value

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_http_client_get_header** (*esp_http_client_handle_t* client, const char *key, char **value)

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after esp_http_client_init.

参数

- **client** -- **[in]** The esp_http_client handle
- **key** -- **[in]** The header key
- **value** -- **[out]** The header value

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_http_client_get_username** (*esp_http_client_handle_t* client, char **value)

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after *esp_http_client_init*.

参数

- **client** -- [in] The *esp_http_client* handle
- **value** -- [out] The username value

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_set_username** (*esp_http_client_handle_t* client, const char *username)

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

参数

- **client** -- [in] The *esp_http_client* handle
- **username** -- [in] The username value

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_get_password** (*esp_http_client_handle_t* client, char **value)

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after *esp_http_client_init*.

参数

- **client** -- [in] The *esp_http_client* handle
- **value** -- [out] The password value

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_set_password** (*esp_http_client_handle_t* client, const char *password)

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

参数

- **client** -- [in] The *esp_http_client* handle
- **password** -- [in] The password value

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_set_auth_type** (*esp_http_client_handle_t* client, *esp_http_client_auth_type_t* auth_type)

Set http request auth_type.

参数

- **client** -- [in] The *esp_http_client* handle
- **auth_type** -- [in] The *esp_http_client* auth type

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_get_user_data** (*esp_http_client_handle_t* client, void **data)

Get http request user_data. The value stored from the *esp_http_client_config_t* will be written to the address passed into data.

参数

- **client** -- [in] The *esp_http_client* handle
- **data** -- [out] A pointer to the pointer that will be set to user_data.

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_set_user_data** (*esp_http_client_handle_t* client, void *data)

Set http request user_data. The value passed in +data+ will be available during event callbacks. No memory management will be performed on the user's behalf.

参数

- **client** -- [in] The esp_http_client handle
- **data** -- [in] The pointer to the user data

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

int **esp_http_client_get_errno** (*esp_http_client_handle_t* client)

Get HTTP client session errno.

参数 **client** -- [in] The esp_http_client handle

返回

- (-1) if invalid argument
- errno

esp_err_t **esp_http_client_set_method** (*esp_http_client_handle_t* client, *esp_http_client_method_t* method)

Set http request method.

参数

- **client** -- [in] The esp_http_client handle
- **method** -- [in] The method

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_set_timeout_ms** (*esp_http_client_handle_t* client, int timeout_ms)

Set http request timeout.

参数

- **client** -- [in] The esp_http_client handle
- **timeout_ms** -- [in] The timeout value

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_delete_header** (*esp_http_client_handle_t* client, const char *key)

Delete http request header.

参数

- **client** -- [in] The esp_http_client handle
- **key** -- [in] The key

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_http_client_open** (*esp_http_client_handle_t* client, int write_len)

This function will be open the connection, write all header strings and return.

参数

- **client** -- [in] The esp_http_client handle
- **write_len** -- [in] HTTP Content length need to write to the server

返回

- ESP_OK
- ESP_FAIL

int **esp_http_client_write** (*esp_http_client_handle_t* client, const char *buffer, int len)

This function will write data to the HTTP connection previously opened by esp_http_client_open()

参数

- **client** -- [in] The esp_http_client handle
- **buffer** -- The buffer
- **len** -- [in] This value must not be larger than the write_len parameter provided to esp_http_client_open()

返回

- (-1) if any errors
- Length of data written

int64_t **esp_http_client_fetch_headers** (*esp_http_client_handle_t* client)

This function need to call after esp_http_client_open, it will read from http stream, process all receive headers.

参数 client -- [in] The esp_http_client handle

返回

- (0) if stream doesn't contain content-length header, or chunked encoding (checked by esp_http_client_is_chunked response)
- (-1: ESP_FAIL) if any errors
- (-ESP_ERR_HTTP_EAGAIN = -0x7007) if call is timed-out before any data was ready
- Download data length defined by content-length header

bool **esp_http_client_is_chunked_response** (*esp_http_client_handle_t* client)

Check response data is chunked.

参数 client -- [in] The esp_http_client handle

返回 true or false

int **esp_http_client_read** (*esp_http_client_handle_t* client, char *buffer, int len)

Read data from http stream.

备注: (-ESP_ERR_HTTP_EAGAIN = -0x7007) is returned when call is timed-out before any data was ready

参数

- **client** -- [in] The esp_http_client handle
- **buffer** -- The buffer
- **len** -- [in] The length

返回

- (-1) if any errors
- Length of data was read

int **esp_http_client_get_status_code** (*esp_http_client_handle_t* client)

Get http response status code, the valid value if this function invoke after esp_http_client_perform

参数 client -- [in] The esp_http_client handle

返回 Status code

int64_t **esp_http_client_get_content_length** (*esp_http_client_handle_t* client)

Get http response content length (from header Content-Length) the valid value if this function invoke after esp_http_client_perform

参数 client -- [in] The esp_http_client handle

返回

- (-1) Chunked transfer
- Content-Length value as bytes

esp_err_t **esp_http_client_close** (*esp_http_client_handle_t* client)

Close http connection, still kept all http request resources.

参数 client -- [in] The esp_http_client handle

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_http_client_cleanup** (*esp_http_client_handle_t* client)

This function must be the last function to call for an session. It is the opposite of the `esp_http_client_init` function and must be called with the same handle as input that a `esp_http_client_init` call returned. This might close all connections this handle has used and possibly has kept open until now. Don't call this function if you intend to transfer more files, re-using handles is a key to good performance with `esp_http_client`.

参数 **client** -- [in] The `esp_http_client` handle

返回

- ESP_OK
- ESP_FAIL

esp_http_client_transport_t **esp_http_client_get_transport_type** (*esp_http_client_handle_t* client)

Get transport type.

参数 **client** -- [in] The `esp_http_client` handle

返回

- HTTP_TRANSPORT_UNKNOWN
- HTTP_TRANSPORT_OVER_TCP
- HTTP_TRANSPORT_OVER_SSL

esp_err_t **esp_http_client_set_redirection** (*esp_http_client_handle_t* client)

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request. When `disable_auto_redirect` is set, the client will not call this function but the event `HTTP_EVENT_REDIRECT` will be dispatched giving the user control over the redirection event.

参数 **client** -- [in] The `esp_http_client` handle

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_http_client_reset_redirect_counter** (*esp_http_client_handle_t* client)

Reset the redirection counter. This is useful to reset redirect counter in cases where the same handle is used for multiple requests.

参数 **client** -- [in] The `esp_http_client` handle

返回

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_set_auth_data** (*esp_http_client_handle_t* client, const char *auth_data, int len)

On receiving a custom authentication header, this API can be invoked to set the authentication information from the header. This API can be called from the event handler.

参数

- **client** -- [in] The `esp_http_client` handle
- **auth_data** -- [in] The authentication data received in the header
- **len** -- [in] length of `auth_data`.

返回

- ESP_ERR_INVALID_ARG
- ESP_OK

void **esp_http_client_add_auth** (*esp_http_client_handle_t* client)

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

备注: There is a possibility of receiving body message with redirection status codes, thus make sure to flush

off body data after calling this API.

参数 **client** -- [in] The `esp_http_client` handle

bool **esp_http_client_is_complete_data_received** (*esp_http_client_handle_t* client)

Checks if entire data in the response has been read without any error.

参数 **client** -- [in] The `esp_http_client` handle

返回

- true
- false

int **esp_http_client_read_response** (*esp_http_client_handle_t* client, char *buffer, int len)

Helper API to read larger data chunks This is a helper API which internally calls `esp_http_client_read` multiple times till the end of data is reached or till the buffer gets full.

参数

- **client** -- [in] The `esp_http_client` handle
- **buffer** -- The buffer
- **len** -- [in] The buffer length

返回

- Length of data was read

esp_err_t **esp_http_client_flush_response** (*esp_http_client_handle_t* client, int *len)

Process all remaining response data This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to `esp_http_client_read_response` in situations where the content of the response may be ignored.

参数

- **client** -- [in] The `esp_http_client` handle
- **len** -- Length of data discarded

返回

- ESP_OK If successful, len will have discarded length
- ESP_FAIL If failed to read response
- ESP_ERR_INVALID_ARG If the client is NULL

esp_err_t **esp_http_client_get_url** (*esp_http_client_handle_t* client, char *url, const int len)

Get URL from client.

参数

- **client** -- [in] The `esp_http_client` handle
- **url** -- [inout] The buffer to store URL
- **len** -- [in] The buffer length

返回

- ESP_OK
- ESP_FAIL

esp_err_t **esp_http_client_get_chunk_length** (*esp_http_client_handle_t* client, int *len)

Get Chunk-Length from client.

参数

- **client** -- [in] The `esp_http_client` handle
- **len** -- [out] Variable to store length

返回

- ESP_OK If successful, len will have length of current chunk
- ESP_FAIL If the server is not a chunked server
- ESP_ERR_INVALID_ARG If the client or len are NULL

Structures

struct **esp_http_client_event**

HTTP Client events data.

Public Members

esp_http_client_event_id_t **event_id**

event_id, to know the cause of the event

esp_http_client_handle_t **client**

esp_http_client_handle_t context

void ***data**

data of the event

int **data_len**

data length of data

void ***user_data**

user_data context, from *esp_http_client_config_t* user_data

char ***header_key**

For HTTP_EVENT_ON_HEADER event_id, it's store current http header key

char ***header_value**

For HTTP_EVENT_ON_HEADER event_id, it's store current http header value

struct **esp_http_client_on_data**

Argument structure for HTTP_EVENT_ON_DATA event.

Public Members

esp_http_client_handle_t **client**

Client handle

int64_t **data_process**

Total data processed

struct **esp_http_client_redirect_event_data**

Argument structure for HTTP_EVENT_REDIRECT event.

Public Members

esp_http_client_handle_t **client**

Client handle

int **status_code**

Status Code

struct **esp_http_client_config_t**

HTTP configuration.

Public Members

const char ***url**

HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char ***host**

Domain or IP as string

int **port**

Port to connect, default depend on esp_http_client_transport_t (80 or 443)

const char ***username**

Using for Http authentication

const char ***password**

Using for Http authentication

[*esp_http_client_auth_type_t*](#) **auth_type**

Http authentication type, see esp_http_client_auth_type_t

const char ***path**

HTTP Path, if not set, default is /

const char ***query**

HTTP query

const char ***cert_pem**

SSL server certification, PEM format as string, if the client requires to verify server

size_t **cert_len**

Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char ***client_cert_pem**

SSL client certification, PEM format as string, if the server requires to verify client

size_t **client_cert_len**

Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char ***client_key_pem**

SSL client key, PEM format as string, if the server requires to verify client

size_t **client_key_len**

Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

const char ***client_key_password**

Client key decryption password string

size_t **client_key_password_len**

String length of the password pointed to by client_key_password

esp_http_client_proto_ver_t **tls_version**

TLS protocol version of the connection, e.g., TLS 1.2, TLS 1.3 (default - no preference)

const char ***user_agent**

The User Agent string to send with HTTP requests

esp_http_client_method_t **method**

HTTP Method

int **timeout_ms**

Network timeout in milliseconds

bool **disable_auto_redirect**

Disable HTTP automatic redirects

int **max_redirection_count**

Max number of redirections on receiving HTTP redirect status code, using default value if zero

int **max_authorization_retries**

Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

http_event_handle_cb **event_handler**

HTTP Event Handle

esp_http_client_transport_t **transport_type**

HTTP transport type, see esp_http_client_transport_t

int **buffer_size**

HTTP receive buffer size

int **buffer_size_tx**

HTTP transmit buffer size

void ***user_data**

HTTP user_data context

bool **is_async**

Set asynchronous mode, only supported with HTTPS for now

bool **use_global_ca_store**

Use a global ca_store for all the connections in which this bool is set.

bool **skip_cert_common_name_check**

Skip any validation of server certificate CN field

const char ***common_name**

Pointer to the string containing server certificate common name. If non-NULL, server certificate CN must match this name, If NULL, server certificate CN must match hostname.

esp_err_t (***crt_bundle_attach**)(void *conf)

Function pointer to esp_cert_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

bool **keep_alive_enable**

Enable keep-alive timeout

int **keep_alive_idle**

Keep-alive idle time. Default is 5 (second)

int **keep_alive_interval**

Keep-alive interval time. Default is 5 (second)

int **keep_alive_count**

Keep-alive packet retry send count. Default is 3 counts

struct ifreq ***if_name**

The name of interface for data to go through. Use the default interface without setting

void ***ds_data**

Pointer for digital signature peripheral context, see ESP-TLS Documentation for more details

Macros

DEFAULT_HTTP_BUF_SIZE

ESP_ERR_HTTP_BASE

Starting number of HTTP error codes

ESP_ERR_HTTP_MAX_REDIRECT

The error exceeds the number of HTTP redirects

ESP_ERR_HTTP_CONNECT

Error open the HTTP connection

ESP_ERR_HTTP_WRITE_DATA

Error write HTTP data

ESP_ERR_HTTP_FETCH_HEADER

Error read HTTP header from server

ESP_ERR_HTTP_INVALID_TRANSPORT

There are no transport support for the input scheme

ESP_ERR_HTTP_CONNECTING

HTTP connection hasn't been established yet

ESP_ERR_HTTP_EAGAIN

Mapping of errno EAGAIN to esp_err_t

ESP_ERR_HTTP_CONNECTION_CLOSED

Read FIN from peer and the connection closed

Type Definitions

```
typedef struct esp_http_client *esp_http_client_handle_t
```

```
typedef struct esp_http_client_event *esp_http_client_event_handle_t
```

```
typedef struct esp_http_client_event esp_http_client_event_t
```

HTTP Client events data.

```
typedef struct esp_http_client_on_data esp_http_client_on_data_t
```

Argument structure for HTTP_EVENT_ON_DATA event.

```
typedef struct esp_http_client_redirect_event_data esp_http_client_redirect_event_data_t
```

Argument structure for HTTP_EVENT_REDIRECT event.

```
typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)
```

Enumerations

```
enum esp_http_client_event_id_t
```

HTTP Client events id.

Values:

enumerator **HTTP_EVENT_ERROR**

This event occurs when there are any errors during execution

enumerator **HTTP_EVENT_ON_CONNECTED**

Once the HTTP has been connected to the server, no data exchange has been performed

enumerator **HTTP_EVENT_HEADERS_SENT**

After sending all the headers to the server

enumerator **HTTP_EVENT_HEADER_SENT**

This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

enumerator **HTTP_EVENT_ON_HEADER**

Occurs when receiving each header sent from the server

enumerator **HTTP_EVENT_ON_DATA**

Occurs when receiving data from the server, possibly multiple portions of the packet

enumerator **HTTP_EVENT_ON_FINISH**

Occurs when finish a HTTP session

enumerator **HTTP_EVENT_DISCONNECTED**

The connection has been disconnected

enumerator **HTTP_EVENT_REDIRECT**

Intercepting HTTP redirects to handle them manually

enum **esp_http_client_transport_t**

HTTP Client transport.

Values:

enumerator **HTTP_TRANSPORT_UNKNOWN**

Unknown

enumerator **HTTP_TRANSPORT_OVER_TCP**

Transport over tcp

enumerator **HTTP_TRANSPORT_OVER_SSL**

Transport over ssl

enum **esp_http_client_proto_ver_t**

Values:

enumerator **ESP_HTTP_CLIENT_TLS_VER_ANY**

enumerator **ESP_HTTP_CLIENT_TLS_VER_TLS_1_2**

enumerator **ESP_HTTP_CLIENT_TLS_VER_TLS_1_3**

enumerator **ESP_HTTP_CLIENT_TLS_VER_MAX**

enum **esp_http_client_method_t**

HTTP method.

Values:

enumerator **HTTP_METHOD_GET**

HTTP GET Method

enumerator **HTTP_METHOD_POST**

HTTP POST Method

enumerator **HTTP_METHOD_PUT**

HTTP PUT Method

enumerator **HTTP_METHOD_PATCH**

HTTP PATCH Method

enumerator **HTTP_METHOD_DELETE**

HTTP DELETE Method

enumerator **HTTP_METHOD_HEAD**

HTTP HEAD Method

enumerator **HTTP_METHOD_NOTIFY**

HTTP NOTIFY Method

enumerator **HTTP_METHOD_SUBSCRIBE**

HTTP SUBSCRIBE Method

enumerator **HTTP_METHOD_UNSUBSCRIBE**

HTTP UNSUBSCRIBE Method

enumerator **HTTP_METHOD_OPTIONS**

HTTP OPTIONS Method

enumerator **HTTP_METHOD_COPY**

HTTP COPY Method

enumerator **HTTP_METHOD_MOVE**

HTTP MOVE Method

enumerator **HTTP_METHOD_LOCK**

HTTP LOCK Method

enumerator **HTTP_METHOD_UNLOCK**

HTTP UNLOCK Method

enumerator **HTTP_METHOD_PROPFIND**

HTTP PROPFIND Method

enumerator **HTTP_METHOD_PROPPATCH**

HTTP PROPPATCH Method

enumerator **HTTP_METHOD_MKCOL**

HTTP MKCOL Method

enumerator **HTTP_METHOD_MAX**

enum **esp_http_client_auth_type_t**

HTTP Authentication type.

Values:

enumerator **HTTP_AUTH_TYPE_NONE**

No authentication

enumerator **HTTP_AUTH_TYPE_BASIC**

HTTP Basic authentication

enumerator **HTTP_AUTH_TYPE_DIGEST**

HTTP Digest authentication

enum **HttpStatus_Code**

Enum for the HTTP status codes.

Values:

enumerator **HttpStatus_Ok**

enumerator **HttpStatus_MultipleChoices**

enumerator **HttpStatus_MovedPermanently**

enumerator **HttpStatus_Found**

enumerator **HttpStatus_SeeOther**

enumerator **HttpStatus_TemporaryRedirect**

enumerator **HttpStatus_PermanentRedirect**

enumerator **HttpStatus_BadRequest**

enumerator **HttpStatus_Unauthorized**

enumerator **HttpStatus_Forbidden**

enumerator **HttpStatus_NotFound**

enumerator **HttpStatus_InternalError**

2.2.6 ESP 本地控制

概述

通过 ESP-IDF 的 ESP 本地控制 (**esp_local_ctrl**) 组件，可使用 HTTPS 或 BLE 协议控制 ESP 设备。通过一系列可配置的处理程序，该组件允许你对应用程序定义的读/写 **属性** 进行访问。

同样，对于 HTTP 传输：

```

/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char servercert_start[] asm("_binary_servercert_pem_
↪start");
extern const unsigned char servercert_end[]   asm("_binary_servercert_pem_
↪end");
https_conf.servercert = servercert_start;
https_conf.servercert_len = servercert_end - servercert_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_
↪start");
extern const unsigned char prvtkey_pem_end[]   asm("_binary_prvtkey_pem_
↪end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .sec_params = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx         = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

你可以利用以下选项设置 ESP 本地控制的传输安全性：

1. PROTOCOM_SEC2: 指定使用基于 SRP6a 的密钥交换和基于 AES-GCM 的端到端加密。这一选项通过增强的 PAKE 协议（即 SRP6a）提供了强大的安全保障，是最受欢迎的选项。
2. PROTOCOM_SEC1: 指定使用基于 Curve25519 的密钥交换和基于 AES-CTR 的端到端加密。
3. PROTOCOM_SEC0: 指定以明文（无安全性）方式交换数据。
4. PROTOCOM_SEC_CUSTOM: 自定义安全需求。注意，使用这一选项时，必须提供 `protocomm_security_t *` 类型的 `custom_handle`。

备注：相应的安全方案需通过项目配置菜单启用。要了解详情，请参考 *Protocol Communication* 中关于启用 `protocomm` 安全版本的章节。

创建属性

启用 `esp_local_ctrl` 后，可以为其添加属性。每个属性必须具有唯一的名称 `name`（字符串），还需具有类型 `type`（如枚举）、标记 `flags`（位域）和大小 `size`。

如果希望属性值的长度可变（例如，字符串或字节流），则 `size` 值应保持为 0。对于有固定长度属性值的数据类型，如整型、浮点型等，将 `size` 字段设置为正确的值，有助于 `esp_local_ctrl` 对接收到的写入请求的参数进行内部检查。

`type` 和 `flags` 字段的含义取决于具体的应用程序，它们可以是枚举、位域、甚至整型。可以使用 `type` 表示属性，用 `flags` 指定属性的特征。

例如，以下属性被用作时间戳。此处假设应用程序定义了 `TYPE_TIMESTAMP` 和 `READONLY` 来设置此处的 `type` 和 `flags` 字段：

```
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name      = "timestamp",
    .type      = TYPE_TIMESTAMP,
    .size      = sizeof(int32_t),
    .flags     = READONLY,
    .ctx       = func_get_time,
    .ctx_free_fn = NULL
};

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
```

另外，此示例中还设置了一个 `ctx` 字段，指向自定义的 `func_get_time()`，用于在属性的 `get/set` 处理程序中检索时间戳。

以下为 `get_prop_values()` 处理程序的一个示例，用于检索时间戳：

```
static esp_err_t get_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     esp_local_ctrl_prop_val_t *prop_
                                     ↪values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;

            /* Use static variable for saving the value. This is_
            ↪essential because the value has to be valid even after this function_
            ↪returns. Alternative is to use dynamic allocation and set the free_fn_
            ↪field */
            static int32_t ts = func_get_time();
            prop_values[i].data = &ts;
        }
    }
    return ESP_OK;
}
```

以下为 `set_prop_values()` 应用程序的一个示例，注意此示例是如何为只读属性限制写入操作：

```
static esp_err_t set_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     const esp_local_ctrl_prop_val_t_
                                     ↪*prop_values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s",_
            ↪props[i].name);
        }
    }
}
```

(下页继续)

(续上页)

```

        return ESP_ERR_INVALID_ARG;
    } else {
        ESP_LOGI(TAG, "Setting %s", props[i].name);

        /* For keeping it simple, lets only log the incoming data */
        ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                                prop_values[i].size, ESP_LOG_INFO);
    }
}
return ESP_OK;
}

```

完整示例请参见 [protocols/esp_local_ctrl](#)。

客户端实现

在客户端的实现过程中，首先，通过支持的传输模式与设备建立 `protocomm` 会话，然后发送并接收 `esp_local_ctrl` 服务能够处理的 `protobuf` 信息。`esp_local_ctrl` 服务会将这些信息转换为请求，并发起相应的处理程序 (`set/get`)。接着，为每个处理程序生成的响应会被再次打包到一条 `protobuf` 信息中，传输回客户端。

以下是 `esp_local_ctrl` 服务能够处理的各种 `protobuf` 信息：

1. `get_prop_count`：返回服务支持的属性总数。
2. `get_prop_values`：接受一个索引数组，并返回这些索引相对应的属性信息（名称、类型、标志）和属性值。
3. `set_prop_values`：接受一个索引数组和一个新值数组，用于设置索引对应的属性值。

注意，在多个会话中，一个属性的索引可能相同，也可能不同。因此，客户端必须用唯一的属性名称来识别属性。每次建立新会话时，客户端都应首先调用 `get_prop_count`，然后调用 `get_prop_values`，为所有属性建立从索引到名称的映射。为一组属性调用 `set_prop_values` 时，必须先用创建的映射将名称转换为索引。如前所述，每次使用同一设备建立新会话时，客户端必须刷新该映射。

下面列出了 `esp_local_ctrl` 服务提供的各种 `protocomm` 端点：

表 1: ESP 本地控制服务提供的端点

端点名称 (BLE + GATT 服 务器)	URI (HTTPS 服务器 + mDNS)	描述
<code>esp_local_ctrl</code>	<code>https://[esp_host] [hostname]>.local/esp_local_ctrl/version</code>	检索版本字符串
<code>esp_local_ctrl</code>	<code>https://[esp_host] [hostname]>.local/esp_local_ctrl/control</code>	发送或接收控制信息

API 参考

Header File

- `components/esp_local_ctrl/include/esp_local_ctrl.h`
- This header file can be included with:

```
#include "esp_local_ctrl.h"
```

- This header file is a part of the API provided by the `esp_local_ctrl` component. To declare that your component depends on `esp_local_ctrl`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_local_ctrl
```

or

PRIV_REQUIRES esp_local_ctrl

Functions

const *esp_local_ctrl_transport_t* ***esp_local_ctrl_get_transport_ble** (void)

Function for obtaining BLE transport mode.

const *esp_local_ctrl_transport_t* ***esp_local_ctrl_get_transport_httpd** (void)

Function for obtaining HTTPD transport mode.

esp_err_t **esp_local_ctrl_start** (const *esp_local_ctrl_config_t* *config)

Start local control service.

参数 config -- [in] Pointer to configuration structure

返回

- ESP_OK : Success
- ESP_FAIL : Failure

esp_err_t **esp_local_ctrl_stop** (void)

Stop local control service.

esp_err_t **esp_local_ctrl_add_property** (const *esp_local_ctrl_prop_t* *prop)

Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`

参数 prop -- [in] Property description structure

返回

- ESP_OK : Success
- ESP_FAIL : Failure

esp_err_t **esp_local_ctrl_remove_property** (const char *name)

Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

参数 name -- [in] Name of the property to remove

返回

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Failure

const *esp_local_ctrl_prop_t* ***esp_local_ctrl_get_property** (const char *name)

Get property description structure by name.

This API may be used to get a property's context structure `esp_local_ctrl_prop_t` when its name is known

参数 name -- [in] Name of the property to find

返回

- Pointer to property
- NULL if not found

esp_err_t **esp_local_ctrl_set_handler** (const char *ep_name, *protocomm_req_handler_t* handler, void *user_ctx)

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

备注: In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the `protocomm_ble_config_t` structure set in `esp_local_ctrl_config_t`, and passed

to `esp_local_ctrl_start()`.

参数

- **ep_name** -- [in] Name of the endpoint
- **handler** -- [in] Endpoint handler function
- **user_ctx** -- [in] User data

返回

- ESP_OK : Success
- ESP_FAIL : Failure

Unions

union **esp_local_ctrl_transport_config_t**

#include <esp_local_ctrl.h> Transport mode (BLE / HTTPD) configuration.

Public Members

esp_local_ctrl_transport_config_ble_t *ble

This is same as `protocomm_ble_config_t`. See `protocomm_ble.h` for available configuration parameters.

esp_local_ctrl_transport_config_httpd_t *httpd

This is same as `httpd_ssl_config_t`. See `esp_https_server.h` for available configuration parameters.

Structures

struct **esp_local_ctrl_prop**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

Public Members

char ***name**

Unique name of property

uint32_t **type**

Type of property. This may be set to application defined enums

size_t **size**

Size of the property value, which:

- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by `esp_local_ctrl` when setting the value of such a property

uint32_t flags

Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

void *ctx

Pointer to some context data relevant for this property. This will be available for use inside the `get_prop_values` and `set_prop_values` handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the `esp_local_ctrl` service is stopped.

void (*ctx_free_fn)(void *ctx)

Function used by `esp_local_ctrl` to internally free the property context when `esp_local_ctrl_remove_property()` or `esp_local_ctrl_stop()` is called.

struct esp_local_ctrl_prop_val

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

Public Members**void *data**

Pointer to memory holding property value

size_t size

Size of property value

void (*free_fn)(void *data)

This may be set by the application in `get_prop_values()` handler to tell `esp_local_ctrl` to call this function on the data pointer above, for freeing its resources after sending the `get_prop_values` response.

struct esp_local_ctrl_handlers

Handlers for receiving and responding to local control commands for getting and setting properties.

Public Members

esp_err_t (***get_prop_values**)(size_t props_count, const *esp_local_ctrl_prop_t* props[], *esp_local_ctrl_prop_val_t* prop_values[], void *usr_ctx)

Handler function to be implemented for retrieving current values of properties.

备注: If any of the properties have fixed sizes, the size field of corresponding element in `prop_values` need to be set

Param props_count [in] Total elements in the props array

Param props [in] Array of properties, the current values for which have been requested by the client

Param prop_values [out] Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument

Param usr_ctx [in] This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

Return Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : InvalidArgument
- ESP_ERR_INVALID_STATE : InvalidProto
- All other error codes : InternalError

esp_err_t (***set_prop_values**)(size_t props_count, const *esp_local_ctrl_prop_t* props[], const *esp_local_ctrl_prop_val_t* prop_values[], void *usr_ctx)

Handler function to be implemented for changing values of properties.

备注: If any of the properties have variable sizes, the size field of the corresponding element in `prop_values` must be checked explicitly before making any assumptions on the size.

Param props_count [in] Total elements in the props array

Param props [in] Array of properties, the values for which the client requests to change

Param prop_values [in] Array of property values, the elements of which need to be used for updating those properties specified by props argument

Param usr_ctx [in] This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

Return Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : InvalidArgument
- ESP_ERR_INVALID_STATE : InvalidProto
- All other error codes : InternalError

void ***usr_ctx**

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the `esp_local_ctrl` service, and freed only when the service is stopped.

void (***usr_ctx_free_fn**)(void *usr_ctx)

Pointer to function which will be internally invoked on `usr_ctx` for freeing the context resources when `esp_local_ctrl_stop()` is called.

struct **esp_local_ctrl_proto_sec_cfg**

Protocom security configs

Public Members

esp_local_ctrl_proto_sec_t **version**

This sets protocom security version, `sec0/sec1` or custom. If custom, user must provide handle via `proto_sec_custom_handle` below

void ***custom_handle**

Custom security handle if security is set custom via `proto_sec` above. This handle must follow `protocomm_security_t` signature

const void ***pop**

Proof of possession to be used for local control. Could be NULL.

const void ***sec_params**

Pointer to security params (NULL if not needed). This is not needed for protocomm security 0 This pointer should hold the struct of type `esp_local_ctrl_security1_params_t` for protocomm security 1 and `esp_local_ctrl_security2_params_t` for protocomm security 2 respectively. Could be NULL.

struct **esp_local_ctrl_config**

Configuration structure to pass to `esp_local_ctrl_start()`

Public Members

const *esp_local_ctrl_transport_t* ***transport**

Transport layer over which service will be provided

esp_local_ctrl_transport_config_t **transport_config**

Transport layer over which service will be provided

esp_local_ctrl_proto_sec_cfg_t **proto_sec**

Security version and POP

esp_local_ctrl_handlers_t **handlers**

Register handlers for responding to get/set requests on properties

size_t **max_properties**

This limits the number of properties that are available at a time

Macros

ESP_LOCAL_CTRL_TRANSPORT_BLE

ESP_LOCAL_CTRL_TRANSPORT_HTTPD

Type Definitions

typedef struct *esp_local_ctrl_prop* **esp_local_ctrl_prop_t**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

typedef struct *esp_local_ctrl_prop_val* **esp_local_ctrl_prop_val_t**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

typedef struct *esp_local_ctrl_handlers* **esp_local_ctrl_handlers_t**

Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct *esp_local_ctrl_transport* **esp_local_ctrl_transport_t**

Transport mode (BLE / HTTPD) over which the service will be provided.

This is forward declaration of a private structure, implemented internally by `esp_local_ctrl`.

```
typedef struct protocomm_ble_config esp_local_ctrl_transport_config_ble_t
```

Configuration for transport mode BLE.

This is a forward declaration for `protocomm_ble_config_t`. To use this, application must set `CONFIG_BT_ENABLED` and include `protocomm_ble.h`.

```
typedef struct httpd_config esp_local_ctrl_transport_config_httpd_t
```

Configuration for transport mode HTTPD.

This is a forward declaration for `httpd_ssl_config_t` (for HTTPS) or `httpd_config_t` (for HTTP)

```
typedef enum esp_local_ctrl_proto_sec esp_local_ctrl_proto_sec_t
```

Security types for esp_local_control.

```
typedef protocomm_security1_params_t esp_local_ctrl_security1_params_t
```

```
typedef protocomm_security2_params_t esp_local_ctrl_security2_params_t
```

```
typedef struct esp_local_ctrl_proto_sec_cfg esp_local_ctrl_proto_sec_cfg_t
```

Protocom security configs

```
typedef struct esp_local_ctrl_config esp_local_ctrl_config_t
```

Configuration structure to pass to `esp_local_ctrl_start()`

Enumerations

```
enum esp_local_ctrl_proto_sec
```

Security types for esp_local_control.

Values:

enumerator `PROTOCOLCOM_SEC0`

enumerator `PROTOCOLCOM_SEC1`

enumerator `PROTOCOLCOM_SEC2`

enumerator `PROTOCOLCOM_SEC_CUSTOM`

2.2.7 ESP 串行从机链路

概述

乐鑫有多款芯片可用作从机的芯片。这些从机依赖于一些通用总线，并在总线上实现了各自的通信协议。`esp_serial_slave_link` 组件能让主机通过总线驱动和相应的协议与 ESP 从机进行通信。

`esp_serial_slave_link` 设备初始化完成后，应用程序就能通过它与 ESP 从机方便地通信。

备注: `esp_serial_slave_link` 组件自 ESP-IDF 版本 v5.0 起移到了单独的仓库：

- [ESSL component on GitHub](#)

运行 `idf.py add-dependency espressif/esp_serial_slave_link` 将 ESSL 组件添加到你的项目中。

乐鑫设备协议

如需了解关于乐鑫设备协议详情，请参考以下文档：

ESP SPI 从机 HD（半双工）模式协议

乐鑫芯片的 SPI 从机功能支持概况

	ESP32	ESP32-S2	ESP32-C3	ESP32-S3	ESP32-C2	ESP32-C6	ESP32-H2	ESP32-P4
SPI 从机 HD	N	Y (v2)	Y (v2)	Y (v2)	Y (v2)	Y (v2)	Y (v2)	Y (v2)
Tohost intr		N	N	N	N	N	N	N
Erhost intr		2 *	2 *	2 *	2 *	2 *	2 *	2 *
TX DMA		Y	Y	Y	Y	Y	Y	Y
RX DMA		Y	Y	Y	Y	Y	Y	Y
共享寄存器		72	64	64	64	64	64	64

概述 在半双工模式下，主机须使用从机定义的协议与从机通信。每个传输事务按顺序可能包括以下阶段：

- 命令阶段：8 位，主机到从机
此阶段决定事务的其它阶段。参见[支持的命令](#)。
- 地址阶段：8 位，主机到从机，可选
对于某些命令（如 WRBUF、RDBUF），此阶段指定要写入/读取的共享寄存器地址。对于其他包括此阶段的命令，这没有实际意义，但仍必须存在于事务中。
- Dummy 阶段：8 位，浮动，可选
此阶段是主机和从机在总线上的周转时间，并为从机向主机发送数据提供了充分的准备时间。
- 数据阶段：长度可变，方向由命令确定。
这一阶段可以输出数据（OUT，方向为由从机向主机），或者输入数据（IN，方向为由主机向从机）。

方向是指哪一方（主机或从机）控制 MOSI、MISO、WP 和 HD 管脚。

数据 IO 模式 在某些 IO 模式下，可以使用更多数据线来发送数据。因此，与 1 位模式相比，发送相同数据量所需的 SPI 时钟周期更少。例如，在 QIO 模式下，地址和数据（IN 和 OUT）应发送到全部 4 条数据线上（MOSI、MISO、WP 和 HD）。下表展示了 ESP32-S2 SPI 从机支持的模式，以及相应模式下使用的数据线数量。

Mode	命令线数	地址线数	dummy 线数	数据线数
1-bit	1	1	1	1
DOUT	1	1	4	2
DIO	1	2	4	2
QOUT	1	1	4	4
QIO	1	4	4	4
QPI	4	4	4	4

除 QPI 模式外，使用哪种模式通常取决于主机发送的命令（请参考[支持的命令](#)）。

QPI 模式 QPI 模式是 SPI 从机的一种特殊状态。主机可发送 ENQPI 命令，使从机进入 QPI 模式。在 QPI 模式下，命令以 4 位形式发送，因此与其他正常模式不兼容。只有在从机处于 QPI 模式时，主机才能发送 QPI 命令。主机可发送 EXQPI 命令退出 QPI 模式。

支持的命令

备注：命令名称是从主机视角确定的。例如，WRBUF 表示由主机向从机的缓冲区写入。

名称	描述	命令	地址	数据
WRBUF	写入缓冲区	0x01	Buf addr	主到从，不超过缓冲区大小
RDBUF	读取缓冲区	0x02	Buf addr	从到主，不超过缓冲区大小
WRDMA	写入 DMA	0x03	8 位	主到从，不超过从机提供的长度
RDDMA	读取 DMA	0x04	8 位	从到主，不超过从机提供的长度
SEG_DONE	段完成	0x05	•	•
ENQPI	进入 QPI 模式	0x06	•	•
WR_DONE	写入段完成	0x07	•	•
CMD8	中断	0x08	•	•
CMD9	中断	0x09	•	•
CMDA	中断	0x0A	•	•
EXQPI	退出 QPI 模式	0xDD	•	•

此外，WRBUF、RDBUF、WRDMA 和 RDDMA 命令都有 2 位和 4 位版本。要在 2 位或 4 位模式下操作，请用下表中的对应命令掩码与原始命令按位或 (bit OR) 后发送。例如，命令 0xA1 表示 QIO 模式下的 WRBUF。

模式	掩码
1-bit	0x00
DOUT	0x10
DIO	0x50
QOUT	0x20
QIO	0xA0
QPI	0xA0

段事务模式 目前，SPI 从机 HD 驱动程序仅支持段事务模式。在此模式下，对于从机加载到 DMA 的事务，主机可以分段读取或写入。这样，主机就无需准备与从机数据大小相同的大缓冲区。主机在一个缓冲区的读取/写入完成后，须向从机发送相应的终止命令作为同步信号。在从机收到终止命令后，从机驱动程序会将新数据（如有）更新到 DMA 上。

WRDMA 的终止命令是 WR_DONE (0x07)，RDDMA 的终止命令是 CMD8 (0x08)。

以下是主机自从机 DMA 读取数据的流程示例：

1. 从机将 4092 字节数据加载到 RDDMA。
2. 主机进行七次 RDDMA 事务，每个事务长 512 字节，并自从机读取前 3584 字节。
3. 主机进行最后一次 RDDMA 事务，长度为 512 字节（长度可以与从机相同、更长或更短）。前 508 字节是从机发送的有效数据，最后 4 字节无意义。
4. 主机向从机发送 CMD8。
5. 从机将其他的 4092 字节数据加载到 RDDMA。
6. 主机发送 CMD8 后，可以开始新的读取事务。

术语解释

- ESSL：ESP 串行从机链路 (ESP Serial Slave Link)，即本文档描述的组件。
- 主机：运行 `esp_serial_slave_link` 组件的设备。
- ESSL 设备：主机上的虚拟设备，关联到一个 ESP 从机，其设备上下文中具有如何通过总线驱动和从机的总线协议与其通信的信息。
- ESSL 设备句柄：ESSL 设备上下文的一个句柄，包含配置信息、状态信息和 ESSL 组件所需的数据。设备上下文中储存了驱动配置、通信状态和主从机共享的数据等。
 - 在使用前，应将上下文初始化；如不再使用，应该反初始化。主机应用程序通过这一句柄操作 ESSL 设备。
- ESP 从机：连接到总线的从机，ESSL 组件的通信对象。
- 总线：特指用于主机和从机相互通信的总线。
- 从机协议：Espressif 硬件和软件在总线上使用的特殊通信协议。
- TX buffer num：计数器，位于从机，可由主机读取。指示由从机加载到硬件上、用于接收主机数据的累计 buffer 总数。
- RX data size：计数器，位于从机，可由主机读取。指示由从机加载到硬件上、需发送给主机的累计数据大小。

ESP 从机提供的服务

Espressif 从机提供下列服务：

1. Tohost 中断：从机可通过中断线向主机通知某些事件。（可选）
2. Frhost 中断：主机可向从机通知某些事件。
3. TX FIFO（主机到从机）：从机能够以接收 buffer 为单位，接收主机发送的数据。从机通过更新 TX buffer num 的方式，将可以接收多少数据的信息通知主机。主机读取 TX buffer num，减去已使用的 buffer 数，得到剩余 buffer 数量。
4. RX FIFO（从机到主机）：从机可向主机发送数据流。SDIO 从机也可通过中断线通知主机，从机有待发送的新数据。从机通过更新 RX data size，将准备发送的数据大小通知主机。主机读取该数据大小，减去已接收的数据长度，得到剩余数据大小。
5. 共享寄存器：主机可以读取从机寄存器上的部分内容，也可写入从机寄存器供从机读取。

从机提供的服务取决于从机的模型。如需了解详情，请参考[乐鑫芯片的 SPI 从机功能支持概况](#)。

初始化 ESP 串行从机链路

ESP SDIO 从机 ESP SDIO 从机链路 (ESSL SDIO) 设备依赖于 SDMMC 组件。它可通过 SDMMC Host 或 SDSPI Host 功能均可与 ESP SDIO 从机通信。ESSL 设备初始化步骤如下：

1. 初始化 SDMMC 卡（参考[SDMMC 驱动相关文档](#)）结构体。
2. 调用 `sdmmc_card_init()` 初始化该卡。
3. 用 `essl_sdio_config_t` 初始化 ESSL 设备。其中，`card` 成员应为第二步中的 `sdmmc_card_t`，`recv_buffer_size` 成员应填写为预先协商的值。
4. 调用 `essl_init()` 对 SDIO 部分进行初始化。
5. 调用 `essl_wait_for_ready()` 等待从机就绪。

ESP SPI 从机

备注：如果你正在用 SPI 接口与 ESP SDIO 从机进行通信，则应该用 [SDIO 接口](#) 代替。

暂不支持。

API

初始化完成后，你可调用以下 API 使用从机提供的服务：

Tohost 中断（可选）

1. 调用 `essl_get_intr_ena()` 了解哪些事件触发了对主机的中断。
2. 调用 `essl_set_intr_ena()` 设置能够触发主机中断的事件。
3. 调用 `essl_wait_int()` 等待从机中断或超时。
4. 中断触发后，调用 `essl_get_intr()` 了解哪些事件处于活跃状态，并调用 `essl_clear_intr()` 将其清空。

Erhost 中断

1. 调用 `essl_send_slave_intr()` 触发从机的通用中断。

TX FIFO

1. 调用 `essl_get_tx_buffer_num()` 了解从机准备用于接收主机数据的 buffer 数。你可选择是否调用该函数。主机向从机发送数据包前，也会轮询 `tx_buffer_num`，直到从机的 buffer 数量足够或超时。
2. 调用 `essl_send_packet()` 向从机发送数据。

RX FIFO

1. 调用 `essl_get_rx_data_size()` 了解从机需发送给主机的数据大小。你可选择是否调用该函数。当主机尝试接收数据时，如果目前的 `rx_data_size` 小于主机准备接收数据的 buffer 大小，就会对 `rx_data_size` 进行一次更新。如果 `rx_data_size` 一直为 0，主机可能会轮询 `rx_data_size` 直到超时。
2. 调用 `essl_get_packet()` 接收来自从机的数据。

重置计数器（可选） 如果从机计数器已重置，调用 `essl_reset_cnt()` 重置内部计数器。

应用示例

以下示例展示了 ESP32-P4 SDIO 主机如何与从机互相通信，其中主机使用了 ESSL SDIO：

[peripherals/sdio](#)

如需了解详情，请参考 README.md 中的示例。

API 参考

Header File

- `components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl.h`

Functions

`esp_err_t essl_init` (*essl_handle_t* handle, uint32_t wait_ms)

Initialize the slave.

参数

- **handle** -- Handle of an ESSL device.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer `init`.

`esp_err_t essl_wait_for_ready` (*essl_handle_t* handle, uint32_t wait_ms)

Wait for interrupt of an ESSL slave device.

参数

- **handle** -- Handle of an ESSL device.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t essl_get_tx_buffer_num` (*essl_handle_t* handle, uint32_t *out_tx_num, uint32_t wait_ms)

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

参数

- **handle** -- Handle of a ESSL device.
- **out_tx_num** -- Output of buffer num that host can send data to ESSL slave.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

`esp_err_t essl_get_rx_data_size` (*essl_handle_t* handle, uint32_t *out_rx_size, uint32_t wait_ms)

Get the size, in bytes, of the data that the ESSL slave is ready to send

参数

- **handle** -- Handle of an ESSL device.
- **out_rx_size** -- Output of data size to read from slave, in bytes
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

`esp_err_t essl_reset_cnt` (*essl_handle_t* handle)

Reset the counters of this component. Usually you don't need to do this unless you know the slave is reset.

参数 **handle** -- Handle of an ESSL device.

返回

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init.

`esp_err_t essl_send_packet` (*essl_handle_t* handle, const void *start, size_t length, uint32_t wait_ms)

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is `buffer_size` (configured during initialization).

参数

- **handle** -- Handle of an ESSL device.
- **start** -- Start address of the packet to send

- **length** -- Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init or other argument is not valid.
- ESP_ERR_TIMEOUT: No buffer to use, or error ftrom SDMMC host controller.
- ESP_ERR_NOT_FOUND: Slave is not ready for receiving.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

`esp_err_t essl_get_packet(essl_handle_t handle, void *out_data, size_t size, size_t *out_length, uint32_t wait_ms)`

Get a packet from ESSL slave.

参数

- **handle** -- Handle of an ESSL device.
- **out_data** -- [out] Data output address
- **size** -- The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns ESP_ERR_NOT_FINISHED
- **out_length** -- [out] Output of length the data actually received from slave.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK Success: All the data has been read from the slave.
- ESP_ERR_INVALID_ARG: Invalid argument, The handle is not initialized or the other arguments are invalid.
- ESP_ERR_NOT_FINISHED: Read was successful, but there is still data remaining.
- ESP_ERR_NOT_FOUND: Slave is not ready to send data.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

`esp_err_t essl_write_reg(essl_handle_t handle, uint8_t addr, uint8_t value, uint8_t *value_o, uint32_t wait_ms)`

Write general purpose R/W registers (8-bit) of ESSL slave.

备注: sdio 28-31 are reserved, the lower API helps to skip.

参数

- **handle** -- Handle of an ESSL device.
- **addr** -- Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- **value** -- Value to write to the register.
- **value_o** -- Output of the returned written value.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

`esp_err_t essl_read_reg(essl_handle_t handle, uint8_t add, uint8_t *value_o, uint32_t wait_ms)`

Read general purpose R/W registers (8-bit) of ESSL slave.

参数

- **handle** -- Handle of a `essl` device.
- **add** -- Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see `essl_spi.h`
- **value_o** -- Output value read from the register.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

esp_err_t **essl_wait_int** (*essl_handle_t* handle, uint32_t wait_ms)

wait for an interrupt of the slave

参数

- **handle** -- Handle of an ESSL device.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: If interrupt is triggered.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- ESP_ERR_TIMEOUT: No interrupts before timeout.

esp_err_t **essl_clear_intr** (*essl_handle_t* handle, uint32_t intr_mask, uint32_t wait_ms)

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

参数

- **handle** -- Handle of an ESSL device.
- **intr_mask** -- Mask of interrupt bits to clear.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

esp_err_t **essl_get_intr** (*essl_handle_t* handle, uint32_t *intr_raw, uint32_t *intr_st, uint32_t wait_ms)

Get interrupt bits of ESSL slave.

参数

- **handle** -- Handle of an ESSL device.
- **intr_raw** -- Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- **intr_st** -- Output of the masked interrupt bits. set to NULL if only raw bits are read.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: Success
- ESP_INVALID_ARG: If both *intr_raw* and *intr_st* are NULL.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

esp_err_t **essl_set_intr_ena** (*essl_handle_t* handle, uint32_t ena_mask, uint32_t wait_ms)

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

参数

- **handle** -- Handle of an ESSL device.
- **ena_mask** -- Mask of the interrupt bits to enable.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

esp_err_t **essl_get_intr_ena** (*essl_handle_t* handle, uint32_t *ena_mask_o, uint32_t wait_ms)

Get interrupt enable bits of ESSL slave.

参数

- **handle** -- Handle of an ESSL device.
- **ena_mask_o** -- Output of interrupt bit enable mask.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK Success
- One of the error codes from SDMMC host controller

esp_err_t **essl_send_slave_intr** (*essl_handle_t* handle, uint32_t intr_mask, uint32_t wait_ms)

Send interrupts to slave. Each bit of the interrupt will be triggered.

参数

- **handle** -- Handle of an ESSL device.
- **intr_mask** -- Mask of interrupt bits to send to slave.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

返回

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

Type Definitions

```
typedef struct essl_dev_t *essl_handle_t
```

Handle of an ESSL device.

Header File

- [components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h](#)

Functions

esp_err_t **essl_sdio_init_dev** (*essl_handle_t* *out_handle, const *essl_sdio_config_t* *config)

Initialize the ESSL SDIO device and get its handle.

参数

- **out_handle** -- Output of the handle.
- **config** -- Configuration for the ESSL SDIO device.

返回

- ESP_OK: on success
- ESP_ERR_NO_MEM: memory exhausted.

esp_err_t **essl_sdio_deinit_dev** (*essl_handle_t* handle)

Deinitialize and free the space used by the ESSL SDIO device.

参数 **handle** -- Handle of the ESSL SDIO device to deinit.

返回

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: wrong handle passed

Structures

```
struct essl_sdio_config_t
```

Configuration for the ESSL SDIO device.

Public Members

```
sdmmc_card_t *card
```

The initialized sdmmc card pointer of the slave.

```
int recv_buffer_size
```

The pre-negotiated recv buffer size used by both the host and the slave.

Header File

- components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h

Functions

esp_err_t **essl_spi_init_dev** (*essl_handle_t* *out_handle, const *essl_spi_config_t* *init_config)

Initialize the ESSL SPI device function list and get its handle.

参数

- **out_handle** -- [out] Output of the handle
- **init_config** -- Configuration for the ESSL SPI device

返回

- ESP_OK: On success
- ESP_ERR_NO_MEM: Memory exhausted
- ESP_ERR_INVALID_STATE: SPI driver is not initialized
- ESP_ERR_INVALID_ARG: Wrong register ID

esp_err_t **essl_spi_deinit_dev** (*essl_handle_t* handle)

Deinitialize the ESSL SPI device and free the memory used by the device.

参数 **handle** -- Handle of the ESSL SPI device

返回

- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI is not in use

esp_err_t **essl_spi_read_reg** (void *arg, uint8_t addr, uint8_t *out_value, uint32_t wait_ms)

Read from the shared registers.

备注: The registers for Master/Slave synchronization are reserved. Do not use them. (see *rx_sync_reg* in *essl_spi_config_t*)

参数

- **arg** -- Context of the component. (Member *arg* from *essl_handle_t*)
- **addr** -- Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1).
- **out_value** -- [out] Read buffer for the shared registers.
- **wait_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

返回

- ESP_OK: success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
- or other return value from :cpp:func:spi_device_transmit.

esp_err_t **essl_spi_get_packet** (void *arg, void *out_data, size_t size, uint32_t wait_ms)

Get a packet from Slave.

参数

- **arg** -- Context of the component. (Member *arg* from *essl_handle_t*)
- **out_data** -- [out] Output data address
- **size** -- The size of the output data.
- **wait_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

返回

- ESP_OK: On Success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The output data address is neither DMA capable nor 4 byte-aligned

- **ESP_ERR_INVALID_SIZE**: Master requires `size` bytes of data but Slave did not load enough bytes.

`esp_err_t` **essl_spi_write_reg** (void *arg, uint8_t addr, uint8_t value, uint8_t *out_value, uint32_t wait_ms)

Write to the shared registers.

备注: The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in `essl_spi_config_t`)

备注: Feature of checking the actual written value (`out_value`) is not supported.

参数

- **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** -- Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1)
- **value** -- Buffer for data to send, should be align to 4.
- **out_value** -- [out] Not supported, should be set to NULL.
- **wait_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

返回

- **ESP_OK**: success
- **ESP_ERR_INVALID_STATE**: ESSL SPI has not been initialized.
- **ESP_ERR_INVALID_ARG**: The address argument is not valid. See note 1.
- **ESP_ERR_NOT_SUPPORTED**: Should set `out_value` to NULL. See note 2.
- or other return value from `:cpp:func:spi_device_transmit`.

`esp_err_t` **essl_spi_send_packet** (void *arg, const void *data, size_t size, uint32_t wait_ms)

Send a packet to Slave.

参数

- **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)
- **data** -- Address of the data to send
- **size** -- Size of the data to send.
- **wait_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

返回

- **ESP_OK**: On success
- **ESP_ERR_INVALID_STATE**: ESSL SPI has not been initialized.
- **ESP_ERR_INVALID_ARG**: The data address is not DMA capable
- **ESP_ERR_INVALID_SIZE**: Master will send `size` bytes of data but Slave did not load enough RX buffer

void **essl_spi_reset_cnt** (void *arg)

Reset the counter in Master context.

备注: Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized

参数 **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)

`esp_err_t` **essl_spi_rdbuf** (`spi_device_handle_t` spi, uint8_t *out_data, int addr, int len, uint32_t flags)

Read the shared buffer from the slave in ISR way.

备注: The slave's HW doesn't guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

备注: `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

参数

- **spi** -- SPI device handle representing the slave
- **out_data** -- [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** -- Address of the slave shared buffer
- **len** -- Length to read
- **flags** -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

返回

- ESP_OK: on success
- or other return value from `:cpp:func:spi_device_transmit`.

`esp_err_t` `essl_spi_rdbuf_polling` (`spi_device_handle_t` spi, `uint8_t` *out_data, int addr, int len, `uint32_t` flags)

Read the shared buffer from the slave in polling way.

备注: `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

参数

- **spi** -- SPI device handle representing the slave
- **out_data** -- [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** -- Address of the slave shared buffer
- **len** -- Length to read
- **flags** -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

返回

- ESP_OK: on success
- or other return value from `:cpp:func:spi_device_transmit`.

`esp_err_t` `essl_spi_wrbuf` (`spi_device_handle_t` spi, `const uint8_t` *data, int addr, int len, `uint32_t` flags)

Write the shared buffer of the slave in ISR way.

备注: `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

参数

- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **addr** -- Address of the slave shared buffer,
- **len** -- Length to write
- **flags** -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

返回

- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

esp_err_t **essl_spi_wrbuf_polling** (*spi_device_handle_t* spi, const uint8_t *data, int addr, int len, uint32_t flags)

Write the shared buffer of the slave in polling way.

备注: out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

参数

- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **addr** -- Address of the slave shared buffer,
- **len** -- Length to write
- **flags** -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

返回

- ESP_OK: success
- or other return value from :cpp:func:spi_device_polling_transmit.

esp_err_t **essl_spi_rddma** (*spi_device_handle_t* spi, uint8_t *out_data, int len, int seg_len, uint32_t flags)

Receive long buffer in segments from the slave through its DMA.

备注: This function combines several :cpp:func:essl_spi_rddma_seg and one :cpp:func:essl_spi_rddma_done at the end. Used when the slave is working in segment mode.

参数

- **spi** -- SPI device handle representing the slave
- **out_data** -- [out] Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- **len** -- Total length of data to receive.
- **seg_len** -- Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the rddma_done will still be sent.)
- **flags** -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

返回

- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

esp_err_t **essl_spi_rddma_seg** (*spi_device_handle_t* spi, uint8_t *out_data, int seg_len, uint32_t flags)

Read one data segment from the slave through its DMA.

备注: To read long buffer, call :cpp:func:essl_spi_rddma instead.

参数

- **spi** -- SPI device handle representing the slave
- **out_data** -- [out] Buffer to hold the received data. strongly suggested to be in the DRAM and aligned to 4
- **seg_len** -- Length of this segment
- **flags** -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

返回

- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

esp_err_t **essl_spi_rddma_done** (*spi_device_handle_t* spi, uint32_t flags)

Send the rddma_done command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

备注: This is required only when the slave is working in segment mode.

参数

- **spi** -- SPI device handle representing the slave
- **flags** -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

返回

- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

esp_err_t **essl_spi_wrdma** (*spi_device_handle_t* spi, const uint8_t *data, int len, int seg_len, uint32_t flags)

Send long buffer in segments to the slave through its DMA.

备注: This function combines several :cpp:func:essl_spi_wrdma_seg and one :cpp:func:essl_spi_wrdma_done at the end. Used when the slave is working in segment mode.

参数

- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **len** -- Total length of data to send.
- **seg_len** -- Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the wrdma_done will still be sent.)
- **flags** -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

返回

- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

esp_err_t **essl_spi_wrdma_seg** (*spi_device_handle_t* spi, const uint8_t *data, int seg_len, uint32_t flags)

Send one data segment to the slave through its DMA.

备注: To send long buffer, call :cpp:func:essl_spi_wrdma instead.

参数

- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **seg_len** -- Length of this segment
- **flags** -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

返回

- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

esp_err_t **essl_spi_wrdma_done** (*spi_device_handle_t* spi, uint32_t flags)

Send the wrdma_done command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

备注: This is required only when the slave is working in segment mode.

参数

- **spi** -- SPI device handle representing the slave
- **flags** -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

返回

- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

Structures

struct **essl_spi_config_t**

Configuration of ESSL SPI device.

Public Members

spi_device_handle_t ***spi**

Pointer to SPI device handle.

uint32_t **tx_buf_size**

The pre-negotiated Master TX buffer size used by both the host and the slave.

uint8_t **tx_sync_reg**

The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

uint8_t **rx_sync_reg**

The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

2.2.8 ESP x509 证书包

概述

ESP x509 证书包 API 提供了一种简便的方法，帮助你安装自定义 x509 根证书用于 TLS 服务器验证。

备注: 目前在使用 WolfSSL 时该证书包不可用。

该证书包中包括 Mozilla NSS 根证书存储区的完整根证书列表。使用 `gen_cert_bundle.py` python 程序，可将证书的主题名称和公钥存储在文件中，并嵌入 ESP32-P4 二进制文件。

生成证书包时，你需选择：

- 来自 Mozilla 的完整根证书包，包含超过 130 份证书。目前提供的证书包更新于 2024 年 3 月 11 日，星期一，15:25:27 (GMT)。
- 一组预先筛选的常用根证书。其中仅包含约 41 份证书，但根据 SSL 证书颁发机构统计数据，其绝对使用率约达到 90%，市场覆盖率约达 99%。

此外，还可指定证书文件的路径或包含证书的目录，将其他证书添加到生成的证书包中。

备注：信任所有根证书意味着如果任何证书被收回，就必须更新证书列表，包括从 `cacrt_all.pem` 中将其删除。

配置

多数配置可通过 `menuconfig` 完成。CMake 会根据配置信息生成及嵌入证书包。

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`：自动创建并附加证书包。
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`：决定添加证书列表中的哪些证书。
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`：指定要在证书包中嵌入的其他证书的路径。

要在使用 ESP-TLS 时启用证书包，将函数指针指向证书包的 `attach` 函数：

```
esp_tls_cfg_t cfg = {  
    .crt_bundle_attach = esp_cert_bundle_attach,  
};
```

此步骤是为了避免在用户未使能的情况下嵌入证书包。

如果直接使用 mbedTLS 包，在设置阶段直接调用 `attach` 函数可以激活证书包：

```
mbedtls_ssl_config conf;  
mbedtls_ssl_config_init(&conf);  
  
esp_cert_bundle_attach(&conf);
```

生成根证书列表

根证书列表来自 Mozilla 的 [NSS 根证书商店](#)。

运行 `mk-ca-bundle.pl` 脚本可下载和创建列表。脚本发布于 [curl](#)。

还可通过 [curl](#) 网站直接下载完整列表：[从 Mozilla 提取的 CA 证书](#)。

常用证书包是通过筛选出市场份额超过 1% 的授权机构来决定的，筛选数据来自 [w3tech 的 SSL Survey](#)。

根据这些授权机构，从 Mozilla 提供的 [列表](#) 的 `cmn_cert_authorities.csv` 中筛选证书名称。

更新证书包

证书包嵌入到应用程序中，通过 OTA 更新与应用程序一起更新。如果想使用比目前 ESP-IDF 中的证书包更新的包，则可按照[生成根证书列表](#)中的说明从 Mozilla 下载证书列表。

定期同步

证书包会与 Mozilla 的 NSS 根证书商店定期同步。在 ESP-IDF 的次要版本或补丁版本中，为了保证兼容性，会将上游证书包中已弃用的证书添加到弃用列表。如有需要，可以通过 `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_DEPRECATED_LIST` 将弃用证书加入默认证书包。这些弃用证书将在下一个 ESP-IDF 主要版本中移除。

应用示例

使用 ESP-TLS 创建安全套接字连接的简单 HTTPS 示例: [protocols/https_x509_bundle](#), 该示例使用了证书包并添加了两个自定义证书用于验证。

使用 ESP-TLS 和默认证书包的 HTTPS 示例: [protocols/https_request](#)。

使用 mbedTLS 和默认证书包的 HTTPS 示例: [protocols/https_mbedtls](#)。

API 参考

Header File

- [components/mbedtls/esp_cert_bundle/include/esp_cert_bundle.h](#)
- This header file can be included with:

```
#include "esp_cert_bundle.h"
```

- This header file is a part of the API provided by the `mbedtls` component. To declare that your component depends on `mbedtls`, add the following to your `CMakeLists.txt`:

```
REQUIRES mbedtls
```

or

```
PRIV_REQUIRES mbedtls
```

Functions

esp_err_t **esp_cert_bundle_attach** (void *conf)

Attach and enable use of a bundle for certificate verification.

Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through `esp_cert_bundle_set()` it will default to the bundle defined in `menuconfig` and embedded in the binary.

参数 `conf` -- **[in]** The config struct for the SSL connection.

返回

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void **esp_cert_bundle_detach** (mbedtls_ssl_config *conf)

Disable and deallocate the certification bundle.

Removes the certificate verification callback and deallocates used resources

参数 `conf` -- **[in]** The config struct for the SSL connection.

esp_err_t **esp_cert_bundle_set** (const uint8_t *x509_bundle, size_t bundle_size)

Set the default certificate bundle used for verification.

Overrides the default certificate bundle only in case of successful initialization. In most use cases the bundle should be set through `menuconfig`. The bundle needs to be sorted by subject name since binary search is used to find certificates.

参数

- **x509_bundle** -- **[in]** A pointer to the certificate bundle.
- **bundle_size** -- **[in]** Size of the certificate bundle in bytes.

返回

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

2.2.9 HTTP 服务器

概述

HTTP Server 组件提供了在 ESP32 上运行轻量级 Web 服务器的功能，下面介绍使用 HTTP Server 组件 API 的详细步骤：

- `httpd_start()`：创建 HTTP 服务器的实例，根据具体的配置为其分配内存和资源，并返回该服务器实例的句柄。服务器使用了两个套接字，一个用来监听 HTTP 流量（TCP 类型），另一个用来处理控制信号（UDP 类型），它们在服务器的任务循环中轮流使用。通过向 `httpd_start()` 传递 `httpd_config_t` 结构体，可以在创建服务器实例时配置任务的优先级和堆栈的大小。TCP 流量被解析为 HTTP 请求，根据请求的 URI 来调用用户注册的处理程序，在处理程序中需要发送回 HTTP 响应数据包。
- `httpd_stop()`：根据传入的句柄停止服务器，并释放相关联的内存和资源。这是一个阻塞函数，首先给服务器任务发送停止信号，然后等待其终止。期间服务器任务会关闭所有已打开的连接，删除已注册的 URI 处理程序，并将所有会话的上下文数据重置为空。
- `httpd_register_uri_handler()`：通过传入 `httpd_uri_t` 结构体类型的对象来注册 URI 处理程序。该结构体包含如下成员：`uri` 名字，`method` 类型（比如 `HTTPD_GET/HTTPD_POST/HTTPD_PUT` 等等），`esp_err_t *handler (httpd_req_t *req)` 类型的函数指针，指向用户上下文数据的 `user_ctx` 指针。

应用示例

```

/* URI 处理函数，在客户端发起 GET /uri 请求时被调用 */
esp_err_t get_handler(httpd_req_t *req)
{
    /* 发送回简单的响应数据包 */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* URI 处理函数，在客户端发起 POST/uri 请求时被调用 */
esp_err_t post_handler(httpd_req_t *req)
{
    /* 定义 HTTP POST 请求数据的目标缓存区
     * httpd_req_recv() 只接收 char* 数据，但也可以是
     * 任意二进制数据（需要类型转换）
     * 对于字符串数据，null 终止符会被省略，
     * content_len 会给出字符串的长度 */
    char content[100];

    /* 如果内容长度大于缓冲区则截断 */
    size_t recv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, recv_size);
    if (ret <= 0) { /* 返回 0 表示连接已关闭 */
        /* 检查是否超时 */
        if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
            /* 如果是超时，可以调用 httpd_req_recv() 重试
             * 简单起见，这里我们直接
             * 响应 HTTP 408（请求超时）错误给客户端 */
            httpd_resp_send_408(req);
        }
        /* 如果发生了错误，返回 ESP_FAIL 可以确保
         * 底层套接字被关闭 */
        return ESP_FAIL;
    }
}

```

(下页继续)

```
    }

    /* 发送简单的响应数据包 */
    const char resp[] = "URI POST Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* GET /uri 的 URI 处理结构 */
httpd_uri_t uri_get = {
    .uri      = "/uri",
    .method   = HTTP_GET,
    .handler  = get_handler,
    .user_ctx = NULL
};

/* POST/uri 的 URI 处理结构 */
httpd_uri_t uri_post = {
    .uri      = "/uri",
    .method   = HTTP_POST,
    .handler  = post_handler,
    .user_ctx = NULL
};

/* 启动 Web 服务器的函数 */
httpd_handle_t start_webserver(void)
{
    /* 生成默认的配置参数 */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* 置空 esp_http_server 的实例句柄 */
    httpd_handle_t server = NULL;

    /* 启动 httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* 注册 URI 处理程序 */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    /* 如果服务器启动失败，返回的句柄是 NULL */
    return server;
}

/* 停止 Web 服务器的函数 */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* 停止 httpd server */
        httpd_stop(server);
    }
}
```

简单 HTTP 服务器示例 请查看位于 [protocols/http_server/simple](#) 的 HTTP 服务器示例，该示例演示了如何处理任意内容长度的数据，读取请求头和 URL 查询参数，设置响应头。

HTTP 长连接

HTTP 服务器具有长连接的功能，允许重复使用同一个连接（会话）进行多次传输，同时保持会话的上下文数据。上下文数据可由处理程序动态分配，在这种情况下需要提前指定好自定义的回调函数，以便

在连接/会话被关闭时释放这部分内存资源。

长连接示例

```

/* 自定义函数，用来释放上下文数据 */
void free_ctx_func(void *ctx)
{
    /* 也可以是 free 以外的代码逻辑 */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* 若上下文中不存在会话，则新建一个 */
    if (! req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /*!< 指向上下文数据 */
        req->free_ctx = free_ctx_func; /*!< 释放上下文数据的函数_
→ */
    }

    /* 访问上下文数据 */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *) req->sess_ctx;

    /* 响应 */
    .....
    .....
    .....

    return ESP_OK;
}

```

详情请参考位于 [protocols/http_server/persistent_sockets](#) 的示例代码。

Websocket 服务器

HTTP 服务器组件提供 websocket 支持。可以在 menuconfig 中使用 `CONFIG_HTTPD_WS_SUPPORT` 选项启用 websocket 功能。有关如何使用 websocket 功能，请参阅 [protocols/http_server/ws_echo_server](#) 目录下的示例代码。

事件处理

ESP HTTP 服务器有各种事件，当特定事件发生时，[事件循环库](#) 可以触发处理程序。必须使用 `esp_event_handler_register()` 注册处理程序以便 ESP HTTP 服务器进行事件处理。

`esp_http_server_event_id_t` 包含 ESP HTTP 服务器可能发生的所有事件。

以下为事件循环中不同 ESP HTTP 服务器事件的预期数据类型：

- `HTTP_SERVER_EVENT_ERROR`: `httpd_err_code_t`
- `HTTP_SERVER_EVENT_START`: `NULL`
- `HTTP_SERVER_EVENT_ON_CONNECTED`: `int`
- `HTTP_SERVER_EVENT_ON_HEADER`: `int`
- `HTTP_SERVER_EVENT_HEADERS_SENT`: `int`
- `HTTP_SERVER_EVENT_ON_DATA`: `esp_http_server_event_data`
- `HTTP_SERVER_EVENT_SENT_DATA`: `esp_http_server_event_data`
- `HTTP_SERVER_EVENT_DISCONNECTED`: `int`
- `HTTP_SERVER_EVENT_STOP`: `NULL`

API 参考

Header File

- `components/esp_http_server/include/esp_http_server.h`
- This header file can be included with:

```
#include "esp_http_server.h"
```

- This header file is a part of the API provided by the `esp_http_server` component. To declare that your component depends on `esp_http_server`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_http_server
```

or

```
PRIV_REQUIRES esp_http_server
```

Functions

`esp_err_t httpd_start` (`httpd_handle_t *handle`, const `httpd_config_t *config`)

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```
//Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}
```

参数

- **config** -- **[in]** Configuration for new instance of the server
- **handle** -- **[out]** Handle to newly created instance of the server. NULL on error

返回

- `ESP_OK` : Instance created successfully
- `ESP_ERR_INVALID_ARG` : Null argument(s)
- `ESP_ERR_HTTPD_ALLOC_MEM` : Failed to allocate memory for instance
- `ESP_ERR_HTTPD_TASK` : Failed to launch server task

`esp_err_t httpd_stop` (`httpd_handle_t handle`)

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```

// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}

```

参数 `handle` -- [in] Handle to server returned by `httpd_start`

返回

- `ESP_OK` : Server stopped successfully
- `ESP_ERR_INVALID_ARG` : Handle argument is Null

`esp_err_t httpd_register_uri_handler` (`httpd_handle_t` handle, const `httpd_uri_t` *uri_handler)

Registers a URI handler.

Example usage:

```

esp_err_t my_uri_handler(httpd_req_t* req)
{
    // Recv , Process and Send
    ....
    ....
    ....

    // Fail condition
    if (....) {
        // Return fail to close session //
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri      = "/my_uri/path/xyz",
    .method   = HTTPD_GET,
    .handler  = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}

```

备注: URI handlers can be registered in real time as long as the server handle is valid.

参数

- `handle` -- [in] handle to HTTPD server instance
- `uri_handler` -- [in] pointer to handler that needs to be registered

返回

- ESP_OK : On successfully registering the handler
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_HANDLERS_FULL : If no slots left for new handler
- ESP_ERR_HTTPD_HANDLER_EXISTS : If handler with same URI and method is already registered

esp_err_t **httpd_unregister_uri_handler** (*httpd_handle_t* handle, const char *uri, *httpd_method_t* method)

Unregister a URI handler.

参数

- **handle** -- **[in]** handle to HTTPD server instance
- **uri** -- **[in]** URI string
- **method** -- **[in]** HTTP method

返回

- ESP_OK : On successfully deregistering the handler
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_NOT_FOUND : Handler with specified URI and method not found

esp_err_t **httpd_unregister_uri** (*httpd_handle_t* handle, const char *uri)

Unregister all URI handlers with the specified uri string.

参数

- **handle** -- **[in]** handle to HTTPD server instance
- **uri** -- **[in]** uri string specifying all handlers that need to be deregistered

返回

- ESP_OK : On successfully deregistering all such handlers
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_NOT_FOUND : No handler registered with specified uri string

esp_err_t **httpd_sess_set_recv_override** (*httpd_handle_t* hd, int sockfd, *httpd_recv_func_t* recv_func)

Override web server's receive function (by session FD)

This function overrides the web server's receive function. This same function is used to read HTTP request packets.

备注: This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
 - a URI handler where sockfd is obtained using httpd_req_to_sockfd()
-

参数

- **hd** -- **[in]** HTTPD instance handle
- **sockfd** -- **[in]** Session socket FD
- **recv_func** -- **[in]** The receive function to be set for this session

返回

- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

esp_err_t **httpd_sess_set_send_override** (*httpd_handle_t* hd, int sockfd, *httpd_send_func_t* send_func)

Override web server's send function (by session FD)

This function overrides the web server's send function. This same function is used to send out any response to any HTTP request.

备注: This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
 - a URI handler where sockfd is obtained using httpd_req_to_sockfd()
-

参数

- **hd** -- **[in]** HTTPD instance handle
- **sockfd** -- **[in]** Session socket FD
- **send_func** -- **[in]** The send function to be set for this session

返回

- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

esp_err_t **httpd_sess_set_pending_override** (*httpd_handle_t* hd, int sockfd, *httpd_pending_func_t* pending_func)

Override web server's pending function (by session FD)

This function overrides the web server's pending function. This function is used to test for pending bytes in a socket.

备注: This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
 - a URI handler where sockfd is obtained using httpd_req_to_sockfd()
-

参数

- **hd** -- **[in]** HTTPD instance handle
- **sockfd** -- **[in]** Session socket FD
- **pending_func** -- **[in]** The receive function to be set for this session

返回

- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

esp_err_t **httpd_req_async_handler_begin** (*httpd_req_t* *r, *httpd_req_t* **out)

Start an asynchronous request. This function can be called in a request handler to get a request copy that can be used on a async thread.

备注:

- This function is necessary in order to handle multiple requests simultaneously. See examples/async_requests for example usage.
 - You must call httpd_req_async_handler_complete() when you are done with the request.
-

参数

- **r** -- **[in]** The request to create an async copy of
- **out** -- **[out]** A newly allocated request which can be used on an async thread

返回

- ESP_OK : async request object created

esp_err_t **httpd_req_async_handler_complete** (*httpd_req_t* *r)

Mark an asynchronous request as completed. This will.

- free the request memory
- relinquish ownership of the underlying socket, so it can be reused.
- allow the http server to close our socket if needed (lru_purge_enable)

备注: If async requests are not marked completed, eventually the server will no longer accept incoming connections. The server will log a "httpd_accept_conn: error in accept (23)" message if this happens.

参数 **r** -- **[in]** The request to mark async work as completed
返回

- ESP_OK : async request was marked completed

int **httpd_req_to_sockfd** (*httpd_req_t* *r)

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : `httpd_sess_get_ctx()`, `httpd_sess_trigger_close()`, `httpd_sess_update_lru_counter()`.

备注: This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.

参数 **r** -- **[in]** The request whose socket descriptor should be found
返回

- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

int **httpd_req_recv** (*httpd_req_t* *r, char *buf, size_t buf_len)

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use `content_len` provided in `httpd_req_t` structure to know the length of data to be fetched. If `content_len` is too large for the buffer then user may have to make multiple calls to this function, each time fetching 'buf_len' number of bytes, while the pointer to content data is incremented internally by the same number.

备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
 - Presently Chunked Encoding is not supported
-

参数

- **r** -- **[in]** The request being responded to
- **buf** -- **[in]** Pointer to a buffer that the data will be read into
- **buf_len** -- **[in]** Length of the buffer

返回

- Bytes : Number of bytes read into the buffer successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCKET_ERR_INVALID : Invalid arguments
- HTTPD_SOCKET_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCKET_ERR_FAIL : Unrecoverable error while calling socket recv()

size_t **httpd_req_get_hdr_value_len** (*httpd_req_t* *r, const char *field)

Search for a field in request headers and return the string length of it's value.

备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - Once `httpd_resp_send()` API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
-

参数

- **r** -- **[in]** The request being responded to
- **field** -- **[in]** The header field to be searched in the request

返回

- **Length** : If field is found in the request URL
- **Zero** : Field not found / Invalid request / Null arguments

esp_err_t `httpd_req_get_hdr_value_str` (*httpd_req_t* *r, const char *field, char *val, size_t val_size)

Get the value string of a field from the request headers.

备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - Once `httpd_resp_send()` API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
 - If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
 - Use `httpd_req_get_hdr_value_len()` to know the right buffer length
-

参数

- **r** -- **[in]** The request being responded to
- **field** -- **[in]** The field to be searched in the header
- **val** -- **[out]** Pointer to the buffer into which the value will be copied if the field is found
- **val_size** -- **[in]** Size of the user buffer "val"

返回

- **ESP_OK** : Field found in the request header and value string copied
- **ESP_ERR_NOT_FOUND** : Key not found
- **ESP_ERR_INVALID_ARG** : Null arguments
- **ESP_ERR_HTTPD_INVALID_REQ** : Invalid HTTP request pointer
- **ESP_ERR_HTTPD_RESULT_TRUNC** : Value string truncated

size_t `httpd_req_get_url_query_len` (*httpd_req_t* *r)

Get Query string length from the request URL.

备注: This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid

参数 **r** -- **[in]** The request being responded to

返回

- **Length** : Query is found in the request URL
- **Zero** : Query not found / Null arguments / Invalid request

esp_err_t `httpd_req_get_url_query_str` (*httpd_req_t* *r, char *buf, size_t buf_len)

Get Query string from the request URL.

备注:

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using `httpd_req_get_hdr_value_str()` to know the 'Content-Type' (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
 - This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid
 - If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
 - Prior to calling this function, one can use `httpd_req_get_url_query_len()` to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string
-

参数

- **r** -- **[in]** The request being responded to
- **buf** -- **[out]** Pointer to the buffer into which the query string will be copied (if found)
- **buf_len** -- **[in]** Length of output buffer

返回

- `ESP_OK` : Query is found in the request URL and copied to buffer
- `ESP_ERR_NOT_FOUND` : Query not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid HTTP request pointer
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Query string truncated

esp_err_t **httpd_query_key_value** (const char *qry, const char *key, char *val, size_t val_size)

Helper function to get a URL query tag from a query string of the type param1=val1¶m2=val2.

备注:

- The components of URL query string (keys and values) are not URLdecoded. The user must check for 'Content-Type' field in the request headers and then depending upon the specified encoding (URLencoded or otherwise) apply the appropriate decoding algorithm.
 - If actual value size is greater than `val_size`, then the value is truncated, accompanied by truncation error as return value.
-

参数

- **qry** -- **[in]** Pointer to query string
- **key** -- **[in]** The key to be searched in the query string
- **val** -- **[out]** Pointer to the buffer into which the value will be copied if the key is found
- **val_size** -- **[in]** Size of the user buffer "val"

返回

- `ESP_OK` : Key is found in the URL query string and copied to buffer
- `ESP_ERR_NOT_FOUND` : Key not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Value string truncated

esp_err_t **httpd_req_get_cookie_val** (*httpd_req_t* *req, const char *cookie_name, char *val, size_t *val_size)

Get the value string of a cookie value from the "Cookie" request headers by cookie name.

参数

- **req** -- **[in]** Pointer to the HTTP request
- **cookie_name** -- **[in]** The cookie name to be searched in the request
- **val** -- **[out]** Pointer to the buffer into which the value of cookie will be copied if the cookie is found

- **val_size** -- **[inout]** Pointer to size of the user buffer "val". This variable will contain cookie length if ESP_OK is returned and required buffer length incase ESP_ERR_HTTPD_RESULT_TRUNC is returned.

返回

- ESP_OK : Key is found in the cookie string and copied to buffer
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated
- ESP_ERR_NO_MEM : Memory allocation failure

bool **httpd_uri_match_wildcard** (const char *uri_template, const char *uri_to_match, size_t match_upto)

Test if a URI matches the given wildcard template.

Template may end with "?" to make the previous character optional (typically a slash), "*" for a wildcard match, and "?*" to make the previous character optional, and if present, allow anything to follow.

Example:

- * matches everything
- /foo/? matches /foo and /foo/
- /foo/* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
- /foo/?* or /foo/*? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters "?" and "*" anywhere else in the template will be taken literally.

参数

- **uri_template** -- **[in]** URI template (pattern)
- **uri_to_match** -- **[in]** URI to be matched
- **match_upto** -- **[in]** how many characters of the URI buffer to test (there may be trailing query string etc.)

返回 true if a match was found

esp_err_t **httpd_resp_send** (*httpd_req_t* *r, const char *buf, ssize_t buf_len)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use `httpd_resp_send_chunk()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers : `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

参数

- **r** -- **[in]** The request being responded to
- **buf** -- **[in]** Buffer from where the content is to be fetched
- **buf_len** -- **[in]** Length of the buffer, HTTPD_RESP_USE_STRLEN to use `strlen()`

返回

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer

- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

`esp_err_t httpd_resp_send_chunk` (`httpd_req_t *r`, `const char *buf`, `ssize_t buf_len`)

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpd_resp_send()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - When you are finished sending all your chunks, you must call this function with `buf_len` as 0.
 - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
-

参数

- **r** -- **[in]** The request being responded to
- **buf** -- **[in]** Pointer to a buffer that stores the data
- **buf_len** -- **[in]** Length of the buffer, `HTTPD_RESP_USE_STRLEN` to use `strlen()`

返回

- `ESP_OK` : On successfully sending the response packet chunk
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

static inline `esp_err_t httpd_resp_sendstr` (`httpd_req_t *r`, `const char *str`)

API to send a complete string as HTTP response.

This API simply calls `httpd_resp_send` with buffer length set to string length assuming the buffer contains a null terminated string

参数

- **r** -- **[in]** The request being responded to
- **str** -- **[in]** String to be sent as response body

返回

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

static inline `esp_err_t httpd_resp_sendstr_chunk` (`httpd_req_t *r`, `const char *str`)

API to send a string as an HTTP response chunk.

This API simply calls `httpd_resp_send_chunk` with buffer length set to string length assuming the buffer contains a null terminated string

参数

- **r** -- **[in]** The request being responded to
- **str** -- **[in]** String to be sent as response body (NULL to finish response packet)

返回

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request

esp_err_t **httpd_resp_set_status** (*httpd_req_t* *r, const char *status)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the '200 OK' response is sent as the response.

备注:

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
 - This API only sets the status to this value. The status isn't sent out until any of the send APIs is executed.
 - Make sure that the lifetime of the status string is valid till send function is called.
-

参数

- **r** -- **[in]** The request being responded to
- **status** -- **[in]** The HTTP status code of this response

返回

- ESP_OK : On success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

esp_err_t **httpd_resp_set_type** (*httpd_req_t* *r, const char *type)

API to set the HTTP content type.

This API sets the 'Content Type' field of the response. The default content type is 'text/html'.

备注:

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
 - This API only sets the content type to this value. The type isn't sent out until any of the send APIs is executed.
 - Make sure that the lifetime of the type string is valid till send function is called.
-

参数

- **r** -- **[in]** The request being responded to
- **type** -- **[in]** The Content Type of the response

返回

- ESP_OK : On success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

esp_err_t **httpd_resp_set_hdr** (*httpd_req_t* *r, const char *field, const char *value)

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - The header isn't sent out until any of the send APIs is executed.
 - The maximum allowed number of additional headers is limited to value of `max_resp_headers` in config structure.
 - Make sure that the lifetime of the field value strings are valid till send function is called.
-

参数

- **r** -- **[in]** The request being responded to
- **field** -- **[in]** The field name of the HTTP header
- **value** -- **[in]** The value of this HTTP header

返回

- `ESP_OK` : On successfully appending new header
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_HDR` : Total additional headers exceed max allowed
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

esp_err_t `httpd_resp_send_err` (*httpd_req_t* *req, *httpd_err_code_t* error, const char *msg)

For sending out error code in response to HTTP request.

备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
 - If you wish to send additional data in the body of the response, please use the lower-level functions directly.
-

参数

- **req** -- **[in]** Pointer to the HTTP request for which the response needs to be sent
- **error** -- **[in]** Error type to send
- **msg** -- **[in]** Error message string (pass NULL for default message)

返回

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

esp_err_t `httpd_resp_send_custom_err` (*httpd_req_t* *req, const char *status, const char *msg)

For sending out custom error code in response to HTTP request.

备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
 - If you wish to send additional data in the body of the response, please use the lower-level functions directly.
-

参数

- **req** -- **[in]** Pointer to the HTTP request for which the response needs to be sent
- **status** -- **[in]** Error status to send
- **msg** -- **[in]** Error message string

返回

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline [esp_err_t](#) `httpd_resp_send_404` ([httpd_req_t](#) *r)

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

参数 `r` -- **[in]** The request being responded to

返回

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline [esp_err_t](#) `httpd_resp_send_408` ([httpd_req_t](#) *r)

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

参数 `r` -- **[in]** The request being responded to

返回

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline [esp_err_t](#) `httpd_resp_send_500` ([httpd_req_t](#) *r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

备注:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.

- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
-

参数 **r** -- **[in]** The request being responded to
返回

- **ESP_OK** : On successfully sending the response packet
- **ESP_ERR_INVALID_ARG** : Null arguments
- **ESP_ERR_HTTPD_RESP_SEND** : Error in raw send
- **ESP_ERR_HTTPD_INVALID_REQ** : Invalid request pointer

int **httpd_send** (*httpd_req_t* *r, const char *buf, size_t buf_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

备注:

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
 - Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn't have to call this API, but you would rather use either of : *httpd_resp_send()*, *httpd_resp_send_chunk()*
-

参数

- **r** -- **[in]** The request being responded to
- **buf** -- **[in]** Buffer from where the fully constructed packet is to be read
- **buf_len** -- **[in]** Length of the buffer

返回

- **Bytes** : Number of bytes that were sent successfully
- **HTTPD SOCK_ERR_INVALID** : Invalid arguments
- **HTTPD SOCK_ERR_TIMEOUT** : Timeout/interrupted while calling socket send()
- **HTTPD SOCK_ERR_FAIL** : Unrecoverable error while calling socket send()

int **httpd_socket_send** (*httpd_handle_t* hd, int sockfd, const char *buf, size_t buf_len, int flags)

A low level API to send data on a given socket

This internally calls the default send function, or the function registered by *httpd_sess_set_send_override()*.

备注: This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

参数

- **hd** -- **[in]** server instance
- **sockfd** -- **[in]** session socket file descriptor
- **buf** -- **[in]** buffer with bytes to send
- **buf_len** -- **[in]** data size
- **flags** -- **[in]** flags for the send() function

返回

- **Bytes** : The number of bytes sent successfully

- `HTTPD_SOCKET_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCKET_ERR_TIMEOUT` : Timeout/interrupted while calling socket send()
- `HTTPD_SOCKET_ERR_FAIL` : Unrecoverable error while calling socket send()

int `httpd_socket_recv` (*[httpd_handle_t](#)* hd, int sockfd, char *buf, size_t buf_len, int flags)

A low level API to receive data from a given socket

This internally calls the default recv function, or the function registered by `httpd_sess_set_recv_override()`.

备注: This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

参数

- **hd** -- **[in]** server instance
- **sockfd** -- **[in]** session socket file descriptor
- **buf** -- **[in]** buffer with bytes to send
- **buf_len** -- **[in]** data size
- **flags** -- **[in]** flags for the send() function

返回

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- `HTTPD_SOCKET_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCKET_ERR_TIMEOUT` : Timeout/interrupted while calling socket recv()
- `HTTPD_SOCKET_ERR_FAIL` : Unrecoverable error while calling socket recv()

[esp_err_t](#) `httpd_register_err_handler` (*[httpd_handle_t](#)* handle, *[httpd_err_code_t](#)* error, *[httpd_err_handler_func_t](#)* handler_fn)

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by `httpd_err_code_t`. See prototype `httpd_err_handler_func_t` above for details.

参数

- **handle** -- **[in]** HTTP server handle
- **error** -- **[in]** Error type
- **handler_fn** -- **[in]** User implemented handler function (Pass NULL to unset any previously set handler)

返回

- `ESP_OK` : handler registered successfully
- `ESP_ERR_INVALID_ARG` : invalid error code or server handle

[esp_err_t](#) `httpd_queue_work` (*[httpd_handle_t](#)* handle, *[httpd_work_fn_t](#)* work, void *arg)

Queue execution of a function in HTTPD's context.

This API queues a work function for asynchronous execution

备注: Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

参数

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **work** -- **[in]** Pointer to the function to be executed in the HTTPD's context
- **arg** -- **[in]** Pointer to the arguments that should be passed to this function

返回

- `ESP_OK` : On successfully queueing the work

- `ESP_FAIL` : Failure in ctrl socket
- `ESP_ERR_INVALID_ARG` : Null arguments

void `*httpd_sess_get_ctx` (*httpd_handle_t* handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the `httpd_req_t` structure. But, there are cases where the web server's send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

参数

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **sockfd** -- **[in]** The socket descriptor for which the context should be extracted.

返回

- `void*` : Pointer to the context associated with this session
- `NULL` : Empty context / Invalid handle / Invalid socket fd

void `httpd_sess_set_ctx` (*httpd_handle_t* handle, int sockfd, void *ctx, *httpd_free_ctx_fn_t* free_fn)

Set session context by socket descriptor.

参数

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **sockfd** -- **[in]** The socket descriptor for which the context should be extracted.
- **ctx** -- **[in]** Context object to assign to the session
- **free_fn** -- **[in]** Function that should be called to free the context

void `*httpd_sess_get_transport_ctx` (*httpd_handle_t* handle, int sockfd)

Get session 'transport' context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

参见:

`httpd_sess_get_ctx()`

参数

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **sockfd** -- **[in]** The socket descriptor for which the context should be extracted.

返回

- `void*` : Pointer to the transport context associated with this session
- `NULL` : Empty context / Invalid handle / Invalid socket fd

void `httpd_sess_set_transport_ctx` (*httpd_handle_t* handle, int sockfd, void *ctx, *httpd_free_ctx_fn_t* free_fn)

Set session 'transport' context by socket descriptor.

参见:

`httpd_sess_set_ctx()`

参数

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **sockfd** -- **[in]** The socket descriptor for which the context should be extracted.
- **ctx** -- **[in]** Transport context object to assign to the session
- **free_fn** -- **[in]** Function that should be called to free the transport context

void ***httpd_get_global_user_ctx** (*httpd_handle_t* handle)

Get HTTPD global user context (it was set in the server config struct)

参数 **handle** -- **[in]** Handle to server returned by httpd_start

返回 global user context

void ***httpd_get_global_transport_ctx** (*httpd_handle_t* handle)

Get HTTPD global transport context (it was set in the server config struct)

参数 **handle** -- **[in]** Handle to server returned by httpd_start

返回 global transport context

esp_err_t **httpd_sess_trigger_close** (*httpd_handle_t* handle, int sockfd)

Trigger an httpd session close externally.

备注: Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

参数

- **handle** -- **[in]** Handle to server returned by httpd_start
- **sockfd** -- **[in]** The socket descriptor of the session to be closed

返回

- ESP_OK : On successfully initiating closure
- ESP_FAIL : Failure to queue work
- ESP_ERR_NOT_FOUND : Socket fd not found
- ESP_ERR_INVALID_ARG : Null arguments

esp_err_t **httpd_sess_update_lru_counter** (*httpd_handle_t* handle, int sockfd)

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

备注: Calling this API is only necessary if the LRU Purge Enable option is enabled.

参数

- **handle** -- **[in]** Handle to server returned by httpd_start
- **sockfd** -- **[in]** The socket descriptor of the session for which LRU counter is to be updated

返回

- ESP_OK : Socket found and LRU counter updated
- ESP_ERR_NOT_FOUND : Socket not found
- ESP_ERR_INVALID_ARG : Null arguments

esp_err_t **httpd_get_client_list** (*httpd_handle_t* handle, size_t *fds, int *client_fds)

Returns list of current socket descriptors of active sessions.

备注: Size of provided array has to be equal or greater than maximum number of opened sockets, configured upon initialization with max_open_sockets field in httpd_config_t structure.

参数

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **fds** -- **[inout]** In: Size of provided `client_fds` array Out: Number of valid client fds returned in `client_fds`,
- **client_fds** -- **[out]** Array of client fds

返回

- `ESP_OK` : Successfully retrieved session list
- `ESP_ERR_INVALID_ARG` : Wrong arguments or list is longer than provided array

Structures

struct **esp_http_server_event_data**

Argument structure for `HTTP_SERVER_EVENT_ON_DATA` and `HTTP_SERVER_EVENT_SENT_DATA` event

Public Members

int **fd**

Session socket file descriptor

int **data_len**

Data length

struct **httpd_config**

HTTP Server Configuration Structure.

备注: Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

Public Members

unsigned **task_priority**

Priority of FreeRTOS task which runs the server

size_t **stack_size**

The maximum stack size allowed for the server task

BaseType_t **core_id**

The core the HTTP server task will run on

uint32_t **task_caps**

The memory capabilities to use when allocating the HTTP server task's stack

uint16_t **server_port**

TCP Port number for receiving and transmitting HTTP traffic

uint16_t **ctrl_port**

UDP Port number for asynchronously exchanging control signals between various components of the server

`uint16_t max_open_sockets`

Max number of sockets/clients connected at any time (3 sockets are reserved for internal working of the HTTP server)

`uint16_t max_uri_handlers`

Maximum allowed uri handlers

`uint16_t max_resp_headers`

Maximum allowed additional headers in HTTP response

`uint16_t backlog_conn`

Number of backlog connections

`bool lru_purge_enable`

Purge "Least Recently Used" connection

`uint16_t recv_wait_timeout`

Timeout for recv function (in seconds)

`uint16_t send_wait_timeout`

Timeout for send function (in seconds)

`void *global_user_ctx`

Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the `httpd_req_t` struct.

When shutting down, the server frees up the user context by calling `free()` on the `global_user_ctx` field. If you wish to use a custom function for freeing the global user context, please specify that here.

[*httpd_free_ctx_fn_t*](#) `global_user_ctx_free_fn`

Free function for global user context

`void *global_transport_ctx`

Global transport context.

Similar to `global_user_ctx`, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using `free()`, unless `global_transport_ctx_free_fn` is specified.

[*httpd_free_ctx_fn_t*](#) `global_transport_ctx_free_fn`

Free function for global transport context

`bool enable_so_linger`

bool to enable/disable linger

`int linger_timeout`

linger timeout (in seconds)

`bool keep_alive_enable`

Enable keep-alive timeout

int **keep_alive_idle**

Keep-alive idle time. Default is 5 (second)

int **keep_alive_interval**

Keep-alive interval time. Default is 5 (second)

int **keep_alive_count**

Keep-alive packet retry send count. Default is 3 counts

httpd_open_func_t **open_fn**

Custom session opening callback.

Called on a new session socket just after `accept()`, but before reading any data.

This is an opportunity to set up e.g. SSL encryption using `global_transport_ctx` and the `send/recv/pending` session overrides.

If a context needs to be maintained between these functions, store it in the session using `httpd_sess_set_transport_ctx()` and retrieve it later with `httpd_sess_get_transport_ctx()`

Returning a value other than `ESP_OK` will immediately close the new socket.

httpd_close_func_t **close_fn**

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

The server will only close the socket if no custom session closing callback is set. If a custom callback is used, `close(sockfd)` should be called in here for most cases.

Set the user or transport context to `NULL` if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

httpd_uri_match_func_t **uri_match_fn**

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) `NULL` : Internally do basic matching using `strcmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

struct **httpd_req**

HTTP Request Data Structure.

Public Members

httpd_handle_t **handle**

Handle to server instance

int **method**

The type of HTTP request, -1 if unsupported method, HTTP_ANY for wildcard method to support every method

const char **uri**[HTTPD_MAX_URI_LEN + 1]

The URI of this request (1 byte extra for null termination)

size_t **content_len**

Length of the request body

void ***aux**

Internally used members

void ***user_ctx**

User context pointer passed during URI registration.

void ***sess_ctx**

Session Context Pointer

A session context. Contexts are maintained across 'sessions' for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling free(), unless free_ctx function is set.

[*httpd_free_ctx_fn_t*](#) **free_ctx**

Pointer to free context hook

Function to free session context

If the web server's socket closes, it frees up the session context by calling free() on the sess_ctx member. If you wish to use a custom function for freeing the session context, please specify that here.

bool **ignore_sess_ctx_changes**

Flag indicating if Session Context changes should be ignored

By default, if you change the sess_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free_ctx or free()) only if the socket gets closed.

struct **httpd_uri**

Structure for URI handler.

Public Members

const char ***uri**

The URI to handle

***httpd_method_t* method**

Method supported by the URI, HTTP_ANY for wildcard method to support all methods

***esp_err_t* (*handler)(*httpd_req_t* *r)**

Handler to call for supported request method. This must return ESP_OK, or else the underlying socket will be closed.

void **user_ctx*

Pointer to user context data which will be available to handler

Macros**HTTP_ANY****HTTPD_MAX_REQ_HDR_LEN****HTTPD_MAX_URI_LEN****HTTPD SOCK_ERR_FAIL****HTTPD SOCK_ERR_INVALID****HTTPD SOCK_ERR_TIMEOUT****HTTPD_200**

HTTP Response 200

HTTPD_204

HTTP Response 204

HTTPD_207

HTTP Response 207

HTTPD_400

HTTP Response 400

HTTPD_404

HTTP Response 404

HTTPD_408

HTTP Response 408

HTTPD_500

HTTP Response 500

HTTPD_TYPE_JSON

HTTP Content type JSON

HTTPD_TYPE_TEXT

HTTP Content type text/HTML

HTTPD_TYPE_OCTET

HTTP Content type octext-stream

ESP_HTTPD_DEF_CTRL_PORT

HTTP Server control socket port

HTTPD_DEFAULT_CONFIG()**ESP_ERR_HTTPD_BASE**

Starting number of HTTPD error codes

ESP_ERR_HTTPD_HANDLERS_FULL

All slots for registering URI handlers have been consumed

ESP_ERR_HTTPD_HANDLER_EXISTS

URI handler with same method and target URI already registered

ESP_ERR_HTTPD_INVALID_REQ

Invalid request pointer

ESP_ERR_HTTPD_RESULT_TRUNC

Result string truncated

ESP_ERR_HTTPD_RESP_HDR

Response header field larger than supported

ESP_ERR_HTTPD_RESP_SEND

Error occurred while sending response packet

ESP_ERR_HTTPD_ALLOC_MEM

Failed to dynamically allocate memory for resource

ESP_ERR_HTTPD_TASK

Failed to launch server task/thread

HTTPD_RESP_USE_STRLEN**Type Definitions**

```
typedef void *httpd_handle_t
```

HTTP Server Instance Handle.

Every instance of the server will have a unique handle.

```
typedef enum http_method httpd_method_t
```

HTTP Method Type wrapper over "enum http_method" available in "http_parser" library.

```
typedef void (*httpd_free_ctx_fn_t)(void *ctx)
```

Prototype for freeing context data (if any)

Param ctx [in] object to free

```
typedef esp_err_t (*httpd_open_func_t)(httpd_handle_t hd, int sockfd)
```

Function prototype for opening a session.

Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

Param hd [in] server instance

Param sockfd [in] session socket file descriptor

Return

- ESP_OK : On success
- Any value other than ESP_OK will signal the server to close the socket immediately

```
typedef void (*httpd_close_func_t)(httpd_handle_t hd, int sockfd)
```

Function prototype for closing a session.

备注: It's possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

Param hd [in] server instance

Param sockfd [in] session socket file descriptor

```
typedef bool (*httpd_uri_match_func_t)(const char *reference_uri, const char *uri_to_match, size_t match_upto)
```

Function prototype for URI matching.

Param reference_uri [in] URI/template with respect to which the other URI is matched

Param uri_to_match [in] URI/template being matched to the reference URI/template

Param match_upto [in] For specifying the actual length of `uri_to_match` up to which the matching algorithm is to be applied (The maximum value is `strlen(uri_to_match)`, independent of the length of `reference_uri`)

Return true on match

```
typedef struct httpd_config httpd_config_t
```

HTTP Server Configuration Structure.

备注: Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

```
typedef struct httpd_req httpd_req_t
```

HTTP Request Data Structure.

```
typedef struct httpd_uri httpd_uri_t
```

Structure for URI handler.

```
typedef int (*httpd_send_func_t)(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
```

Prototype for HTTPDs low-level send function.

备注: User specified send function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will eventually be conveyed as return value of `httpd_send()` function

Param `hd` [in] server instance
Param `sockfd` [in] session socket file descriptor
Param `buf` [in] buffer with bytes to send
Param `buf_len` [in] data size
Param `flags` [in] flags for the `send()` function
Return

- Bytes : The number of bytes sent successfully
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket `send()`
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket `send()`

```
typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
```

Prototype for HTTPDs low-level `recv` function.

备注: User specified `recv` function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will eventually be conveyed as return value of `httpd_req_recv()` function

Param `hd` [in] server instance
Param `sockfd` [in] session socket file descriptor
Param `buf` [in] buffer with bytes to send
Param `buf_len` [in] data size
Param `flags` [in] flags for the `send()` function
Return

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket `recv()`
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket `recv()`

```
typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
```

Prototype for HTTPDs low-level "get pending bytes" function.

备注: User specified pending function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will be handled accordingly in the server task.

Param `hd` [in] server instance
Param `sockfd` [in] session socket file descriptor
Return

- Bytes : The number of bytes waiting to be received
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket `pending()`
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket `pending()`

```
typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
```

Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

备注:

- If implemented, the server will not automatically send out HTTP error response codes, therefore, `httpd_resp_send_err()` must be invoked inside this function if user wishes to generate HTTP error responses.
 - When invoked, the validity of `uri`, `method`, `content_len` and `user_ctx` fields of the `httpd_req_t` parameter is not guaranteed as the HTTP request may be partially received/parsed.
 - The function must return `ESP_OK` if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type `HTTPD_500_INTERNAL_SERVER_ERROR` and the socket closed anyway.
-

Param req [in] HTTP request for which the error needs to be handled

Param error [in] Error type

Return

- `ESP_OK` : error handled successful
- `ESP_FAIL` : failure indicates that the underlying socket needs to be closed

typedef void (**httpd_work_fn_t**)(void *arg)

Prototype of the HTTPD work function Please refer to `httpd_queue_work()` for more details.

Param arg [in] The arguments for this work function

Enumerations

enum **httpd_err_code_t**

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

Values:

enumerator **HTTPD_500_INTERNAL_SERVER_ERROR**

enumerator **HTTPD_501_METHOD_NOT_IMPLEMENTED**

enumerator **HTTPD_505_VERSION_NOT_SUPPORTED**

enumerator **HTTPD_400_BAD_REQUEST**

enumerator **HTTPD_401_UNAUTHORIZED**

enumerator **HTTPD_403_FORBIDDEN**

enumerator **HTTPD_404_NOT_FOUND**

enumerator **HTTPD_405_METHOD_NOT_ALLOWED**

enumerator **HTTPD_408_REQ_TIMEOUT**

enumerator **HTTPD_411_LENGTH_REQUIRED**

enumerator **HTTPD_414_URI_TOO_LONG**

enumerator **HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE**

enumerator **HTTPD_ERR_CODE_MAX**

enum **esp_http_server_event_id_t**

HTTP Server events id.

Values:

enumerator **HTTP_SERVER_EVENT_ERROR**

This event occurs when there are any errors during execution

enumerator **HTTP_SERVER_EVENT_START**

This event occurs when HTTP Server is started

enumerator **HTTP_SERVER_EVENT_ON_CONNECTED**

Once the HTTP Server has been connected to the client, no data exchange has been performed

enumerator **HTTP_SERVER_EVENT_ON_HEADER**

Occurs when receiving each header sent from the client

enumerator **HTTP_SERVER_EVENT_HEADERS_SENT**

After sending all the headers to the client

enumerator **HTTP_SERVER_EVENT_ON_DATA**

Occurs when receiving data from the client

enumerator **HTTP_SERVER_EVENT_SENT_DATA**

Occurs when an ESP HTTP server session is finished

enumerator **HTTP_SERVER_EVENT_DISCONNECTED**

The connection has been disconnected

enumerator **HTTP_SERVER_EVENT_STOP**

This event occurs when HTTP Server is stopped

2.2.10 HTTPS 服务器

概述

HTTPS 服务器组件建立在[HTTP 服务器](#)组件的基础上。该服务器借助常规 HTTP 服务器中的钩子注册函数，注册 SSL 会话回调处理函数。

[HTTP 服务器](#) 组件的所有文档同样适用于用户按照本文档搭建的服务器。

API 说明

下列 *HTTP* 服务器的 API 已不适用于 *HTTPS* 服务器。这些 API 仅限内部使用，用于处理安全会话和维护内部状态。

- “send”、“receive” 和 “pending” 回调注册函数——处理安全套接字
 - `httpd_sess_set_send_override()`
 - `httpd_sess_set_recv_override()`
 - `httpd_sess_set_pending_override()`
- “transport context”——传输层上下文
 - `httpd_sess_get_transport_ctx()`: 返回会话使用的 SSL
 - `httpd_sess_set_transport_ctx()`
 - `httpd_get_global_transport_ctx()`: 返回共享的 SSL 上下文
 - `httpd_config::global_transport_ctx`
 - `httpd_config::global_transport_ctx_free_fn`
 - `httpd_config::open_fn`: 用于设置安全套接字

其他 API 均可使用，没有其他限制。

如何使用

请参考示例 [protocols/https_server](#) 来学习如何搭建安全的服务器。

总体而言，只需生成证书，将其嵌入到固件中，并且在初始化结构体中配置好正确的证书地址和长度后，将其传入服务器启动函数。

通过改变初始化配置结构体中的标志 `httpd_ssl_config::transport_mode`，可以选择是否需要 SSL 连接来启动服务器。在测试时或在速度比安全性更重要的可信环境中，可以使用此功能。

性能

建立起始会话大约需要两秒，在时钟速度较慢或日志记录冗余信息较多的情况下，可能需要花费更多时间。后续通过已打开的安全套接字建立请求的速度会更快，最快只需不到 100 ms。

事件处理

ESP HTTPS 服务器在特定事件发生时，可以通过 [事件循环库](#) 触发事件处理程序。处理程序必须使用 `esp_event_handler_register()` 进行注册，以帮助 ESP HTTPS 服务器处理事件。

`esp_https_server_event_id_t` 包含了 ESP HTTPS 服务器可能发生的所有事件。

事件循环中不同 ESP HTTPS 服务器事件的预期数据类型如下所示：

- `HTTPS_SERVER_EVENT_ERROR`: `esp_https_server_last_error_t`
- `HTTPS_SERVER_EVENT_START`: `NULL`
- `HTTPS_SERVER_EVENT_ON_CONNECTED`: `NULL`
- `HTTPS_SERVER_EVENT_ON_DATA`: `int`
- `HTTPS_SERVER_EVENT_SENT_DATA`: `NULL`
- `HTTPS_SERVER_EVENT_DISCONNECTED`: `NULL`
- `HTTPS_SERVER_EVENT_STOP`: `NULL`

API 参考

Header File

- [components/esp_https_server/include/esp_https_server.h](#)
- This header file can be included with:

```
#include "esp_https_server.h"
```

- This header file is a part of the API provided by the `esp_https_server` component. To declare that your component depends on `esp_https_server`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_https_server
```

or

```
PRIV_REQUIRES esp_https_server
```

Functions

`esp_err_t httpd_ssl_start` (`httpd_handle_t *handle`, `httpd_ssl_config_t *config`)

Create a SSL capable HTTP server (secure mode may be disabled in config)

参数

- **config** -- [inout] - server config, must not be const. Does not have to stay valid after calling this function.
- **handle** -- [out] - storage for the server handle, must be a valid pointer

返回 success

`esp_err_t httpd_ssl_stop` (`httpd_handle_t handle`)

Stop the server. Blocks until the server is shut down.

参数 **handle** -- [in]

返回

- ESP_OK: Server stopped successfully
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_FAIL: Failure to shut down server

Structures

struct `esp_https_server_user_cb_arg`

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

Public Members

`httpd_ssl_user_cb_state_t user_cb_state`

State of user callback

`esp_tls_t *tls`

ESP-TLS connection handle

struct `httpd_ssl_config`

HTTPS server config struct

Please use `HTTPD_SSL_CONFIG_DEFAULT()` to initialize it.

Public Members

`httpd_config_t httpd`

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

const uint8_t ***servercert**

Server certificate

size_t **servercert_len**

Server certificate byte length

const uint8_t ***cacert_pem**

CA certificate ((CA used to sign clients, or client cert itself)

size_t **cacert_len**

CA certificate byte length

const uint8_t ***prvtkey_pem**

Private key

size_t **prvtkey_len**

Private key byte length

bool **use_ecdsa_peripheral**

Use ECDSA peripheral to use private key

uint8_t **ecdsa_key_efuse_blk**

The efuse block where ECDSA key is stored

httpd_ssl_transport_mode_t **transport_mode**

Transport Mode (default secure)

uint16_t **port_secure**

Port used when transport mode is secure (default 443)

uint16_t **port_insecure**

Port used when transport mode is insecure (default 80)

bool **session_tickets**

Enable tls session tickets

bool **use_secure_element**

Enable secure element for server session

esp_https_server_user_cb ***user_cb**

User callback for esp_https_server

void ***ssl_userdata**

User data to add to the ssl context

esp_tls_handshake_callback **cert_select_cb**

Certificate selection callback to use. The callback is only applicable when CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK is enabled in menuconfig

```
const char **alpn_protos
```

Application protocols the server supports in order of preference. Used for negotiating during the TLS handshake, first one the client supports is selected. The data structure must live as long as the https server itself

Macros

```
HTTPD_SSL_CONFIG_DEFAULT ()
```

Default config struct init Notes:

- port is set when starting the server, according to 'transport_mode'
- one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application

Type Definitions

```
typedef struct esp_https_server_user_cb_arg esp_https_server_user_cb_arg_t
```

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

```
typedef esp_tls_last_error_t esp_https_server_last_error_t
```

```
typedef void esp_https_server_user_cb (esp_https_server_user_cb_arg_t *user_cb)
```

Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.

Param user_cb Callback data struct

```
typedef struct httpd_ssl_config httpd_ssl_config_t
```

Enumerations

```
enum esp_https_server_event_id_t
```

Values:

```
enumerator HTTPS_SERVER_EVENT_ERROR
```

This event occurs when there are any errors during execution

```
enumerator HTTPS_SERVER_EVENT_START
```

This event occurs when HTTPS Server is started

```
enumerator HTTPS_SERVER_EVENT_ON_CONNECTED
```

Once the HTTPS Server has been connected to the client

```
enumerator HTTPS_SERVER_EVENT_ON_DATA
```

Occurs when receiving data from the client

```
enumerator HTTPS_SERVER_EVENT_SENT_DATA
```

Occurs when an ESP HTTPS server sends data to the client

```
enumerator HTTPS_SERVER_EVENT_DISCONNECTED
```

The connection has been disconnected

enumerator **HTTPS_SERVER_EVENT_STOP**

This event occurs when HTTPS Server is stopped

enum **httpd_ssl_transport_mode_t**

Values:

enumerator **HTTPD_SSL_TRANSPORT_SECURE**

enumerator **HTTPD_SSL_TRANSPORT_INSECURE**

enum **httpd_ssl_user_cb_state_t**

Indicates the state at which the user callback is executed, i.e at session creation or session close.

Values:

enumerator **HTTPD_SSL_USER_CB_SESS_CREATE**

enumerator **HTTPD_SSL_USER_CB_SESS_CLOSE**

2.2.11 ICMP 回显

概述

网际控制报文协议 (ICMP) 通常用于诊断或控制目的, 或响应 IP 操作中的错误。常用的网络工具 ping 的应答, 即 Echo Reply, 就是基于类型字段值为 0 的 ICMP 数据包实现的。

在 ping 会话中, 首先由源主机发出请求包 (ICMP echo request), 然后等待应答包 (ICMP echo reply), 等待具有超时限制。通过这一过程, 还能测量出信息的往返用时。收到有效的应答包后, 源主机会生成 IP 链路层的统计数据 (如失包率、运行时间等)。

IoT 设备通常需要检查远程服务器是否可用。如果服务器离线, 设备应向用户发出警告。通过创建 ping 会话, 定期发送或解析 ICMP echo 数据包, 就能实现这一功能。

为简化这一过程方便用户操作, ESP-IDF 提供了一些好用的 API。

创建 ping 会话 要创建 ping 会话, 首先需填写 `esp_ping_config_t`, 指定目标芯片 IP 地址、间隔时间等配置。此外, 还可以通过 `esp_ping_callbacks_t` 注册回调函数。

创建 ping 会话并注册回调函数示例:

```
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
↵addr));
```

(下页继续)

```

    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_
↪time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n",
           recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
↪addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4), ↪
↪seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;

    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, ↪
↪sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_
↪time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted, ↪
↪received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);

    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr;           // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE;    // ping in infinite mode, esp_
↪ping_stop can stop it

    /* set callback functions */
    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
    cbs.cb_args = "foo"; // arguments that will feed to all callback functions, ↪
↪can be NULL
    cbs.cb_args = eth_event_group;

    esp_ping_handle_t ping;

```

```

    esp_ping_new_session(&ping_config, &cbs, &ping);
}

```

启动和停止 ping 会话 使用 `esp_ping_new_session` 返回的句柄可以启动或停止 ping 会话。注意，ping 会话在创建后不会自动启动。如果 ping 会话停止后重启，ICMP 数据包的序号会归零重新计数。

删除 ping 会话 如果不再使用 ping 会话，可用 `esp_ping_delete_session` 将其删除。在删除 ping 会话时，确保该会话已处于停止状态（即已调用了 `esp_ping_stop`，或该会话已完成所有步骤）。

获取运行时间数据 在回调函数中调用 `esp_ping_get_profile`，可获取 ping 会话的不同运行时间数据，如上文代码示例所示。

应用示例

ICMP echo 示例：[protocols/icmp_echo](#)

API 参考

Header File

- `components/lwip/include/apps/ping/ping_sock.h`
- This header file can be included with:

```
#include "ping/ping_sock.h"
```

- This header file is a part of the API provided by the `lwip` component. To declare that your component depends on `lwip`, add the following to your `CMakeLists.txt`:

```
REQUIRES lwip
```

or

```
PRIV_REQUIRES lwip
```

Functions

`esp_err_t esp_ping_new_session` (`const esp_ping_config_t *config`, `const esp_ping_callbacks_t *cbs`, `esp_ping_handle_t *hdl_out`)

Create a ping session.

参数

- **config** -- ping configuration
- **cbs** -- a bunch of callback functions invoked by internal ping task
- **hdl_out** -- handle of ping session

返回

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. configuration is null, etc)
- `ESP_ERR_NO_MEM`: out of memory
- `ESP_FAIL`: other internal error (e.g. socket error)
- `ESP_OK`: create ping session successfully, user can take the ping handle to do follow-on jobs

`esp_err_t esp_ping_delete_session` (`esp_ping_handle_t hdl`)

Delete a ping session.

参数 **hdl** -- handle of ping session

返回

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: delete ping session successfully

esp_err_t **esp_ping_start** (*esp_ping_handle_t* hdl)

Start the ping session.

参数 **hdl** -- handle of ping session

返回

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: start ping session successfully

esp_err_t **esp_ping_stop** (*esp_ping_handle_t* hdl)

Stop the ping session.

参数 **hdl** -- handle of ping session

返回

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: stop ping session successfully

esp_err_t **esp_ping_get_profile** (*esp_ping_handle_t* hdl, *esp_ping_profile_t* profile, void *data, uint32_t size)

Get runtime profile of ping session.

参数

- **hdl** -- handle of ping session
- **profile** -- type of profile
- **data** -- profile data
- **size** -- profile data size

返回

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_ERR_INVALID_SIZE: the actual profile data size doesn't match the "size" parameter
- ESP_OK: get profile successfully

Structures

struct **esp_ping_callbacks_t**

Type of "ping" callback functions.

Public Members

void ***cb_args**

arguments for callback functions

void (***on_ping_success**)(*esp_ping_handle_t* hdl, void *args)

Invoked by internal ping thread when received ICMP echo reply packet.

void (***on_ping_timeout**)(*esp_ping_handle_t* hdl, void *args)

Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (***on_ping_end**)(*esp_ping_handle_t* hdl, void *args)

Invoked by internal ping thread when a ping session is finished.

struct **esp_ping_config_t**

Type of "ping" configuration.

Public Members

uint32_t **count**

A "ping" session contains count procedures

uint32_t **interval_ms**

Milliseconds between each ping procedure

uint32_t **timeout_ms**

Timeout value (in milliseconds) of each ping procedure

uint32_t **data_size**

Size of the data next to ICMP packet header

int **tos**

Type of Service, a field specified in the IP header

int **ttl**

Time to Live, a field specified in the IP header

ip_addr_t **target_addr**

Target IP address, either IPv4 or IPv6

uint32_t **task_stack_size**

Stack size of internal ping task

uint32_t **task_prio**

Priority of internal ping task

uint32_t **interface**

Netif index, interface=0 means NETIF_NO_INDEX

Macros

ESP_PING_DEFAULT_CONFIG ()

Default ping configuration.

ESP_PING_COUNT_INFINITE

Set ping count to zero will ping target infinitely

Type Definitions

typedef void ***esp_ping_handle_t**

Type of "ping" session handle.

Enumerations

enum **esp_ping_profile_t**

Profile of ping session.

Values:

- enumerator **ESP_PING_PROF_SEQNO**
Sequence number of a ping procedure
- enumerator **ESP_PING_PROF_TOS**
Type of service of a ping procedure
- enumerator **ESP_PING_PROF_TTL**
Time to live of a ping procedure
- enumerator **ESP_PING_PROF_REQUEST**
Number of request packets sent out
- enumerator **ESP_PING_PROF_REPLY**
Number of reply packets received
- enumerator **ESP_PING_PROF_IPADDR**
IP address of replied target
- enumerator **ESP_PING_PROF_SIZE**
Size of received packet
- enumerator **ESP_PING_PROF_TIMEGAP**
Elapsed time between request and reply packet
- enumerator **ESP_PING_PROF_DURATION**
Elapsed time of the whole ping session

2.2.12 mDNS 服务

mDNS 是一种组播 UDP 服务，用来提供本地网络服务和主机发现。

自 v5.0 版本起，ESP-IDF 组件 mDNS 已从 ESP-IDF 中迁出至独立的仓库：

- [GitHub 上 mDNS 组件](#)

运行 `idf.py add-dependency espressif/mdns`，在项目中添加 mDNS 组件。

托管的文档

请点击如下链接，查看 mDNS 的相关文档：

- [mDNS 文档](#)

2.2.13 Mbed TLS

[Mbed TLS](#) 是一个 C 代码库，用于实现加密基元、X.509 证书操作以及 SSL/TLS 和 DTLS 协议。该库代码占用空间小，适合嵌入式系统使用。

备注：ESP-IDF 使用的 Mbed TLS [复刻仓库](#) 中包含对原生 Mbed TLS 的补丁。这些补丁与某些模块的硬件例程有关，如 `bignum (MPI)` 和 `ECC`。

Mbed TLS 提供以下功能：

- TCP/IP 通信功能：监听、连接、接收、读/写。
- SSL/TLS 通信功能：初始化、握手、读/写。
- X.509 功能：CRT、CRL 和密钥处理
- 随机数生成
- 哈希
- 加密/解密

TLS 版本支持 SSL 3.0, TLS 1.0、TLS 1.1、TLS 1.2 和 TLS 1.3，但是最新的 ESP-IDF 上 Mbed TLS 已经移除了 SSL 3.0、TLS 1.0 和 TLS 1.1。DTLS 版本支持 DTLS 1.0、DTLS 1.1 和 DTLS 1.2，但最新的 ESP-IDF 上 Mbed TLS 已经移除了 DTLS 1.0。

Mbed TLS 文档

Mbed TLS 文档请参阅以下（上游）指针：

- [API Reference](#)
- [Knowledge Base](#)

ESP-IDF 的 Mbed TLS 支持

请在 [此处](#) 查找 ESP-IDF 不同分支上的 Mbed TLS 版本信息。

备注：参考 [Mbed TLS](#) 从 Mbed TLS 2.x 版本迁移到 3.0 及以上版本。

应用示例

ESP-IDF 中的示例使用 [ESP-TLS](#)，为访问常用的 TLS 功能提供了一个简化 API 接口。

参考示例 [protocols/https_server/simple](#)（简单的 HTTPS 服务器）和 [protocols/https_request](#)（发出 HTTPS 请求）了解更多信息。

如需直接使用 Mbed TLS API，请参考示例 [protocols/https_mbedtls](#)。

其他选项

[ESP-TLS](#) 是底层 SSL/TLS 库的抽象层，因此可以选择使用 Mbed TLS 或 wolfSSL 作为底层库。默认情况下，仅 Mbed TLS 可在 ESP-IDF 中使用，而 wolfSSL 在 <https://github.com/espressif/esp-wolfSSL> 公开，还提供了上游子模块指针的相关信息。

如需了解更多相关信息或比较 Mbed TLS 和 wolfSSL，请参考文档 [ESP-TLS: Underlying SSL/TLS Library Options](#)。

重要配置

Component Config -> mbedtls 中的部分重要配置选项如下表所示。点击 [此处](#) 获取完整配置选项列表。

- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_2`: 支持 TLS 1.2

- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`: 支持 TLS 1.3
- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: 支持受信任的根证书包（更多信息请参考 [ESP x509 证书包](#)）
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`: 支持 TLS 会话恢复：客户端会话票证
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`: 支持 TLS 会话恢复：服务会话票证
- `CONFIG_MBEDTLS_HARDWARE_SHA`: 支持硬件 SHA 加速
- `CONFIG_MBEDTLS_HARDWARE_AES`: 支持硬件 AES 加速
- `CONFIG_MBEDTLS_HARDWARE_MPI`: 支持硬件 MPI (bignum) 加速
- `CONFIG_MBEDTLS_HARDWARE_ECC`: 支持硬件 ECC 加速

备注： Mbed TLS v3.0.0 及其更新版本仅支持 TLS 1.2 和 TLS 1.3，不支持 SSL 3.0、TLS 1.0、TLS 1.1、和 DTLS 1.0)。TLS 1.3 尚在试验阶段，仅支持客户端。要了解更多信息，请点击 [此处](#)。

性能和内存调整

减少内存使用 下表展示了在不同配置下，用 Mbed TLS 作为 SSL/TLS 库运行示例 [protocols/https_request](#) (启用服务器验证) 时，内存的实际使用情况。

Mbed TLS 测试	相关配置	堆使用 (近似)
默认	NA	42196 B
启用 SSL 动态 buffer 长度	<code>CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH</code>	42120 B
禁用保留对端证书	<code>CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE</code>	38533 B
启用动态 buffer 功能	<code>CONFIG_MBEDTLS_DYNAMIC_BUFFER</code> <code>CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA</code> <code>CONFIG_MBEDTLS_DYNAMIC_FREE_CA_CERT</code>	22013 B

备注： 这些值会随着配置选项和 Mbed TLS 版本的变化而变化。

减小固件大小 在 Component Config -> mbedTLS 中，有多个 Mbed TLS 功能默认为启用状态。如果不需要这些功能，可将其禁用以减小固件大小。要了解更多信息，请参考 [Minimizing Binary Size](#) 文档。

此 API 部分的示例代码存放在 ESP-IDF 示例项目的 [protocols](#) 目录下。

2.2.14 IP 网络层协议

IP 网络层协议（应用层协议之下）的文档存放在 [连网 API](#) 目录下。

2.3 错误代码参考

本节列出了 ESP-IDF 中定义的各种错误代码常量。

有关 ESP-IDF 中出错处理的通用信息，请参见 [错误处理](#)。

`ESP_FAIL` (-1): Generic esp_err_t code indicating failure

`ESP_OK` (0): esp_err_t value indicating success (no error)

`ESP_ERR_NO_MEM` (0x101): Out of memory

`ESP_ERR_INVALID_ARG` (0x102): Invalid argument

ESP_ERR_INVALID_STATE (0x103): Invalid state

ESP_ERR_INVALID_SIZE (0x104): Invalid size

ESP_ERR_NOT_FOUND (0x105): Requested resource not found

ESP_ERR_NOT_SUPPORTED (0x106): Operation or feature not supported

ESP_ERR_TIMEOUT (0x107): Operation timed out

ESP_ERR_INVALID_RESPONSE (0x108): Received response was invalid

ESP_ERR_INVALID_CRC (0x109): CRC or checksum was invalid

ESP_ERR_INVALID_VERSION (0x10a): Version was invalid

ESP_ERR_INVALID_MAC (0x10b): MAC address was invalid

ESP_ERR_NOT_FINISHED (0x10c): Operation has not fully completed

ESP_ERR_NOT_ALLOWED (0x10d): Operation is not allowed

ESP_ERR_NVS_BASE (0x1100): Starting number of error codes

ESP_ERR_NVS_NOT_INITIALIZED (0x1101): The storage driver is not initialized

ESP_ERR_NVS_NOT_FOUND (0x1102): A requested entry couldn't be found or namespace doesn't exist yet and mode is NVS_READONLY

ESP_ERR_NVS_TYPE_MISMATCH (0x1103): The type of set or get operation doesn't match the type of value stored in NVS

ESP_ERR_NVS_READ_ONLY (0x1104): Storage handle was opened as read only

ESP_ERR_NVS_NOT_ENOUGH_SPACE (0x1105): There is not enough space in the underlying storage to save the value

ESP_ERR_NVS_INVALID_NAME (0x1106): Namespace name doesn't satisfy constraints

ESP_ERR_NVS_INVALID_HANDLE (0x1107): Handle has been closed or is NULL

ESP_ERR_NVS_REMOVE_FAILED (0x1108): The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

ESP_ERR_NVS_KEY_TOO_LONG (0x1109): Key name is too long

ESP_ERR_NVS_PAGE_FULL (0x110a): Internal error; never returned by nvs API functions

ESP_ERR_NVS_INVALID_STATE (0x110b): NVS is in an inconsistent state due to a previous error. Call `nvs_flash_init` and `nvs_open` again, then retry.

ESP_ERR_NVS_INVALID_LENGTH (0x110c): String or blob length is not sufficient to store data

ESP_ERR_NVS_NO_FREE_PAGES (0x110d): NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call `nvs_flash_init` again.

ESP_ERR_NVS_VALUE_TOO_LONG (0x110e): Value doesn't fit into the entry or string or blob length is longer than supported by the implementation

ESP_ERR_NVS_PART_NOT_FOUND (0x110f): Partition with specified name is not found in the partition table

ESP_ERR_NVS_NEW_VERSION_FOUND (0x1110): NVS partition contains data in new format and cannot be recognized by this version of code

ESP_ERR_NVS_XTS_ENCR_FAILED (0x1111): XTS encryption failed while writing NVS entry

ESP_ERR_NVS_XTS_DECR_FAILED (0x1112): XTS decryption failed while reading NVS entry

ESP_ERR_NVS_XTS_CFG_FAILED (0x1113): XTS configuration setting failed

ESP_ERR_NVS_XTS_CFG_NOT_FOUND (0x1114): XTS configuration not found

ESP_ERR_NVS_ENCR_NOT_SUPPORTED (0x1115): NVS encryption is not supported in this version

ESP_ERR_NVS_KEYS_NOT_INITIALIZED (0x1116): NVS key partition is uninitialized

ESP_ERR_NVS_CORRUPT_KEY_PART (0x1117): NVS key partition is corrupt

ESP_ERR_NVS_CONTENT_DIFFERS (0x1118): Internal error; never returned by nvs API functions. NVS key is different in comparison

ESP_ERR_NVS_WRONG_ENCRYPTION (0x1119): NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

ESP_ERR_ULP_BASE (0x1200): Offset for ULP-related error codes

ESP_ERR_ULP_SIZE_TOO_BIG (0x1201): Program doesn't fit into RTC memory reserved for the ULP

ESP_ERR_ULP_INVALID_LOAD_ADDR (0x1202): Load address is outside of RTC memory reserved for the ULP

ESP_ERR_ULP_DUPLICATE_LABEL (0x1203): More than one label with the same number was defined

ESP_ERR_ULP_UNDEFINED_LABEL (0x1204): Branch instructions references an undefined label

ESP_ERR_ULP_BRANCH_OUT_OF_RANGE (0x1205): Branch target is out of range of B instruction (try replacing with BX)

ESP_ERR_OTA_BASE (0x1500): Base error code for ota_ops api

ESP_ERR_OTA_PARTITION_CONFLICT (0x1501): Error if request was to write or erase the current running partition

ESP_ERR_OTA_SELECT_INFO_INVALID (0x1502): Error if OTA data partition contains invalid content

ESP_ERR_OTA_VALIDATE_FAILED (0x1503): Error if OTA app image is invalid

ESP_ERR_OTA_SMALL_SEC_VER (0x1504): Error if the firmware has a secure version less than the running firmware.

ESP_ERR_OTA_ROLLBACK_FAILED (0x1505): Error if flash does not have valid firmware in passive partition and hence rollback is not possible

ESP_ERR_OTA_ROLLBACK_INVALID_STATE (0x1506): Error if current active firmware is still marked in pending validation state (*ESP_OTA_IMG_PENDING_VERIFY*), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

ESP_ERR_EFUSE (0x1600): Base error code for efuse api.

ESP_OK_EFUSE_CNT (0x1601): OK the required number of bits is set.

ESP_ERR_EFUSE_CNT_IS_FULL (0x1602): Error field is full.

ESP_ERR_EFUSE_REPEATED_PROG (0x1603): Error repeated programming of programmed bits is strictly forbidden.

ESP_ERR_CODING (0x1604): Error while a encoding operation.

ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS (0x1605): Error not enough unused key blocks available

ESP_ERR_DAMAGED_READING (0x1606): Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

ESP_ERR_IMAGE_BASE (0x2000)

ESP_ERR_IMAGE_FLASH_FAIL (0x2001)

ESP_ERR_IMAGE_INVALID (0x2002)

ESP_ERR_WIFI_BASE (0x3000): Starting number of WiFi error codes

ESP_ERR_WIFI_NOT_INIT (0x3001): WiFi driver was not installed by *esp_wifi_init*

ESP_ERR_WIFI_NOT_STARTED (0x3002): WiFi driver was not started by *esp_wifi_start*

ESP_ERR_WIFI_NOT_STOPPED (0x3003): WiFi driver was not stopped by *esp_wifi_stop*

ESP_ERR_WIFI_IF (0x3004): WiFi interface error

ESP_ERR_WIFI_MODE (**0x3005**): WiFi mode error

ESP_ERR_WIFI_STATE (**0x3006**): WiFi internal state error

ESP_ERR_WIFI_CONN (**0x3007**): WiFi internal control block of station or soft-AP error

ESP_ERR_WIFI_NVS (**0x3008**): WiFi internal NVS module error

ESP_ERR_WIFI_MAC (**0x3009**): MAC address is invalid

ESP_ERR_WIFI_SSID (**0x300a**): SSID is invalid

ESP_ERR_WIFI_PASSWORD (**0x300b**): Password is invalid

ESP_ERR_WIFI_TIMEOUT (**0x300c**): Timeout error

ESP_ERR_WIFI_WAKE_FAIL (**0x300d**): WiFi is in sleep state(RF closed) and wakeup fail

ESP_ERR_WIFI_WOULD_BLOCK (**0x300e**): The caller would block

ESP_ERR_WIFI_NOT_CONNECT (**0x300f**): Station still in disconnect status

ESP_ERR_WIFI_POST (**0x3012**): Failed to post the event to WiFi task

ESP_ERR_WIFI_INIT_STATE (**0x3013**): Invalid WiFi state when init/deinit is called

ESP_ERR_WIFI_STOP_STATE (**0x3014**): Returned when WiFi is stopping

ESP_ERR_WIFI_NOT_ASSOC (**0x3015**): The WiFi connection is not associated

ESP_ERR_WIFI_TX_DISALLOW (**0x3016**): The WiFi TX is disallowed

ESP_ERR_WIFI_TWT_FULL (**0x3017**): no available flow id

ESP_ERR_WIFI_TWT_SETUP_TIMEOUT (**0x3018**): Timeout of receiving twt setup response frame, timeout times can be set during twt setup

ESP_ERR_WIFI_TWT_SETUP_TXFAIL (**0x3019**): TWT setup frame tx failed

ESP_ERR_WIFI_TWT_SETUP_REJECT (**0x301a**): The twt setup request was rejected by the AP

ESP_ERR_WIFI_DISCARD (**0x301b**): Discard frame

ESP_ERR_WIFI_ROC_IN_PROGRESS (**0x301c**): ROC op is in progress

ESP_ERR_WIFI_REGISTRAR (**0x3033**): WPS registrar is not supported

ESP_ERR_WIFI_WPS_TYPE (**0x3034**): WPS type error

ESP_ERR_WIFI_WPS_SM (**0x3035**): WPS state machine is not initialized

ESP_ERR_ESPNOW_BASE (**0x3064**): ESPNOW error number base.

ESP_ERR_ESPNOW_NOT_INIT (**0x3065**): ESPNOW is not initialized.

ESP_ERR_ESPNOW_ARG (**0x3066**): Invalid argument

ESP_ERR_ESPNOW_NO_MEM (**0x3067**): Out of memory

ESP_ERR_ESPNOW_FULL (**0x3068**): ESPNOW peer list is full

ESP_ERR_ESPNOW_NOT_FOUND (**0x3069**): ESPNOW peer is not found

ESP_ERR_ESPNOW_INTERNAL (**0x306a**): Internal error

ESP_ERR_ESPNOW_EXIST (**0x306b**): ESPNOW peer has existed

ESP_ERR_ESPNOW_IF (**0x306c**): Interface error

ESP_ERR_ESPNOW_CHAN (**0x306d**): Channel error

ESP_ERR_DPP_FAILURE (**0x3097**): Generic failure during DPP Operation

ESP_ERR_DPP_TX_FAILURE (**0x3098**): DPP Frame Tx failed OR not Acked

ESP_ERR_DPP_INVALID_ATTR (**0x3099**): Encountered invalid DPP Attribute

ESP_ERR_DPP_AUTH_TIMEOUT (**0x309a**): DPP Auth response was not received in time

ESP_ERR_MESH_BASE (**0x4000**): Starting number of MESH error codes

ESP_ERR_MESH_WIFI_NOT_START (**0x4001**)

ESP_ERR_MESH_NOT_INIT (**0x4002**)

ESP_ERR_MESH_NOT_CONFIG (**0x4003**)

ESP_ERR_MESH_NOT_START (**0x4004**)

ESP_ERR_MESH_NOT_SUPPORT (**0x4005**)

ESP_ERR_MESH_NOT_ALLOWED (**0x4006**)

ESP_ERR_MESH_NO_MEMORY (**0x4007**)

ESP_ERR_MESH_ARGUMENT (**0x4008**)

ESP_ERR_MESH_EXCEED_MTU (**0x4009**)

ESP_ERR_MESH_TIMEOUT (**0x400a**)

ESP_ERR_MESH_DISCONNECTED (**0x400b**)

ESP_ERR_MESH_QUEUE_FAIL (**0x400c**)

ESP_ERR_MESH_QUEUE_FULL (**0x400d**)

ESP_ERR_MESH_NO_PARENT_FOUND (**0x400e**)

ESP_ERR_MESH_NO_ROUTE_FOUND (**0x400f**)

ESP_ERR_MESH_OPTION_NULL (**0x4010**)

ESP_ERR_MESH_OPTION_UNKNOWN (**0x4011**)

ESP_ERR_MESH_XON_NO_WINDOW (**0x4012**)

ESP_ERR_MESH_INTERFACE (**0x4013**)

ESP_ERR_MESH_DISCARD_DUPLICATE (**0x4014**)

ESP_ERR_MESH_DISCARD (**0x4015**)

ESP_ERR_MESH_VOTING (**0x4016**)

ESP_ERR_MESH_XMIT (**0x4017**)

ESP_ERR_MESH_QUEUE_READ (**0x4018**)

ESP_ERR_MESH_PS (**0x4019**)

ESP_ERR_MESH_RECV_RELEASE (**0x401a**)

ESP_ERR_ESP_NETIF_BASE (**0x5000**)

ESP_ERR_ESP_NETIF_INVALID_PARAMS (**0x5001**)

ESP_ERR_ESP_NETIF_IF_NOT_READY (**0x5002**)

ESP_ERR_ESP_NETIF_DHCP_START_FAILED (**0x5003**)

ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED (**0x5004**)

ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED (**0x5005**)

ESP_ERR_ESP_NETIF_NO_MEM (**0x5006**)

ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED (**0x5007**)

ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED (**0x5008**)

ESP_ERR_ESP_NETIF_INIT_FAILED (**0x5009**)

ESP_ERR_ESP_NETIF_DNS_NOT_CONFIGURED (**0x500a**)

ESP_ERR_ESP_NETIF_MLD6_FAILED (0x500b)

ESP_ERR_ESP_NETIF_IP6_ADDR_FAILED (0x500c)

ESP_ERR_ESP_NETIF_DHCP_START_FAILED (0x500d)

ESP_ERR_FLASH_BASE (0x6000): Starting number of flash error codes

ESP_ERR_FLASH_OP_FAIL (0x6001)

ESP_ERR_FLASH_OP_TIMEOUT (0x6002)

ESP_ERR_FLASH_NOT_INITIALISED (0x6003)

ESP_ERR_FLASH_UNSUPPORTED_HOST (0x6004)

ESP_ERR_FLASH_UNSUPPORTED_CHIP (0x6005)

ESP_ERR_FLASH_PROTECTED (0x6006)

ESP_ERR_HTTP_BASE (0x7000): Starting number of HTTP error codes

ESP_ERR_HTTP_MAX_REDIRECT (0x7001): The error exceeds the number of HTTP redirects

ESP_ERR_HTTP_CONNECT (0x7002): Error open the HTTP connection

ESP_ERR_HTTP_WRITE_DATA (0x7003): Error write HTTP data

ESP_ERR_HTTP_FETCH_HEADER (0x7004): Error read HTTP header from server

ESP_ERR_HTTP_INVALID_TRANSPORT (0x7005): There are no transport support for the input scheme

ESP_ERR_HTTP_CONNECTING (0x7006): HTTP connection hasn't been established yet

ESP_ERR_HTTP_EAGAIN (0x7007): Mapping of errno EAGAIN to esp_err_t

ESP_ERR_HTTP_CONNECTION_CLOSED (0x7008): Read FIN from peer and the connection closed

ESP_ERR_ESP_TLS_BASE (0x8000): Starting number of ESP-TLS error codes

ESP_ERR_ESP_TLS_CANNOT_RESOLVE_HOSTNAME (0x8001): Error if hostname couldn't be resolved upon tls connection

ESP_ERR_ESP_TLS_CANNOT_CREATE_SOCKET (0x8002): Failed to create socket

ESP_ERR_ESP_TLS_UNSUPPORTED_PROTOCOL_FAMILY (0x8003): Unsupported protocol family

ESP_ERR_ESP_TLS_FAILED_CONNECT_TO_HOST (0x8004): Failed to connect to host

ESP_ERR_ESP_TLS_SOCKET_SETOPT_FAILED (0x8005): failed to set/get socket option

ESP_ERR_ESP_TLS_CONNECTION_TIMEOUT (0x8006): new connection in esp_tls_low_level_conn connection timeout

ESP_ERR_ESP_TLS_SE_FAILED (0x8007)

ESP_ERR_ESP_TLS_TCP_CLOSED_FIN (0x8008)

ESP_ERR_MBEDTLS_CERT_PARTLY_OK (0x8010): mbedtls parse certificates was partly successful

ESP_ERR_MBEDTLS_CTR_DRBG_SEED_FAILED (0x8011): mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_SET_HOSTNAME_FAILED (0x8012): mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONFIG_DEFAULTS_FAILED (0x8013): mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONF_ALPN_PROTOCOLS_FAILED (0x8014): mbedtls api returned error

ESP_ERR_MBEDTLS_X509_CERT_PARSE_FAILED (0x8015): mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONF_OWN_CERT_FAILED (0x8016): mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_SETUP_FAILED (0x8017): mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_WRITE_FAILED (0x8018): mbedtls api returned error

ESP_ERR_MBEDTLS_PK_PARSE_KEY_FAILED (0x8019): mbedtls api returned failed

ESP_ERR_MBEDTLS_SSL_HANDSHAKE_FAILED (0x801a): mbedtls api returned failed

ESP_ERR_MBEDTLS_SSL_CONF_PSK_FAILED (0x801b): mbedtls api returned failed

ESP_ERR_MBEDTLS_SSL_TICKET_SETUP_FAILED (0x801c): mbedtls api returned failed

ESP_ERR_WOLFSSL_SSL_SET_HOSTNAME_FAILED (0x8031): wolfSSL api returned error

ESP_ERR_WOLFSSL_SSL_CONF_ALPN_PROTOCOLS_FAILED (0x8032): wolfSSL api returned error

ESP_ERR_WOLFSSL_CERT_VERIFY_SETUP_FAILED (0x8033): wolfSSL api returned error

ESP_ERR_WOLFSSL_KEY_VERIFY_SETUP_FAILED (0x8034): wolfSSL api returned error

ESP_ERR_WOLFSSL_SSL_HANDSHAKE_FAILED (0x8035): wolfSSL api returned failed

ESP_ERR_WOLFSSL_CTX_SETUP_FAILED (0x8036): wolfSSL api returned failed

ESP_ERR_WOLFSSL_SSL_SETUP_FAILED (0x8037): wolfSSL api returned failed

ESP_ERR_WOLFSSL_SSL_WRITE_FAILED (0x8038): wolfSSL api returned failed

ESP_ERR_HTTPS_OTA_BASE (0x9000)

ESP_ERR_HTTPS_OTA_IN_PROGRESS (0x9001)

ESP_ERR_PING_BASE (0xa000)

ESP_ERR_PING_INVALID_PARAMS (0xa001)

ESP_ERR_PING_NO_MEM (0xa002)

ESP_ERR_HTTPD_BASE (0xb000): Starting number of HTTPD error codes

ESP_ERR_HTTPD_HANDLERS_FULL (0xb001): All slots for registering URI handlers have been consumed

ESP_ERR_HTTPD_HANDLER_EXISTS (0xb002): URI handler with same method and target URI already registered

ESP_ERR_HTTPD_INVALID_REQ (0xb003): Invalid request pointer

ESP_ERR_HTTPD_RESULT_TRUNC (0xb004): Result string truncated

ESP_ERR_HTTPD_RESP_HDR (0xb005): Response header field larger than supported

ESP_ERR_HTTPD_RESP_SEND (0xb006): Error occurred while sending response packet

ESP_ERR_HTTPD_ALLOC_MEM (0xb007): Failed to dynamically allocate memory for resource

ESP_ERR_HTTPD_TASK (0xb008): Failed to launch server task/thread

ESP_ERR_HW_CRYPTO_BASE (0xc000): Starting number of HW cryptography module error codes

ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL (0xc001): HMAC peripheral problem

ESP_ERR_HW_CRYPTO_DS_INVALID_KEY (0xc002)

ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST (0xc004)

ESP_ERR_HW_CRYPTO_DS_INVALID_PADDING (0xc005)

ESP_ERR_MEMPROT_BASE (0xd000): Starting number of Memory Protection API error codes

ESP_ERR_MEMPROT_MEMORY_TYPE_INVALID (0xd001)

ESP_ERR_MEMPROT_SPLIT_ADDR_INVALID (0xd002)

ESP_ERR_MEMPROT_SPLIT_ADDR_OUT_OF_RANGE (0xd003)

ESP_ERR_MEMPROT_SPLIT_ADDR_UNALIGNED (0xd004)

ESP_ERR_MEMPROT_UNIMGMT_BLOCK_INVALID (0xd005)

ESP_ERR_MEMPROT_WORLD_INVALID (0xd006)

ESP_ERR_MEMPROT_AREA_INVALID (0xd007)

ESP_ERR_MEMPROT_CPUID_INVALID (0xd008)

ESP_ERR_TCP_TRANSPORT_BASE (0xe000): Starting number of TCP Transport error codes

ESP_ERR_TCP_TRANSPORT_CONNECTION_TIMEOUT (0xe001): Connection has timed out

ESP_ERR_TCP_TRANSPORT_CONNECTION_CLOSED_BY_FIN (0xe002): Read FIN from peer and the connection has closed (in a clean way)

ESP_ERR_TCP_TRANSPORT_CONNECTION_FAILED (0xe003): Failed to connect to the peer

ESP_ERR_TCP_TRANSPORT_NO_MEM (0xe004): Memory allocation failed

ESP_ERR_NVS_SEC_BASE (0xf000): Starting number of error codes

ESP_ERR_NVS_SEC_HMAC_KEY_NOT_FOUND (0xf001): HMAC Key required to generate the NVS encryption keys not found

ESP_ERR_NVS_SEC_HMAC_KEY_BLK_ALREADY_USED (0xf002): Provided eFuse block for HMAC key generation is already in use

ESP_ERR_NVS_SEC_HMAC_KEY_GENERATION_FAILED (0xf003): Failed to generate/write the HMAC key to eFuse

ESP_ERR_NVS_SEC_HMAC_XTS_KEYS_DERIV_FAILED (0xf004): Failed to derive the NVS encryption keys based on the HMAC-based scheme

警告: This document is not updated for ESP32P4 yet, so some of the content may not be correct.

2.4 连网 API

2.4.1 以太网

以太网

概述 ESP-IDF 提供一系列灵活度高且兼具一致性的 API，为内部以太网 MAC (EMAC) 控制器和外部 SPI-Ethernet 模块提供支持。

本编程指南分为以下几个部分：

1. 以太网基本概念
2. 配置 MAC 和 PHY
3. 连接驱动程序至 TCP/IP 协议栈
4. 以太网驱动程序的杂项控制

以太网基本概念 以太网是一种异步的带冲突检测的载波侦听多路访问 (CSMA/CD) 协议/接口。通常来说，以太网不太适用于低功耗应用。然而，得益于其广泛的部署、高效的网络连接、高数据率以及范围不限的可扩展性，几乎所有的有线通信都可以通过以太网进行。

符合 IEEE 802.3 标准的正常以太网帧的长度在 64 至 1518 字节之间，由五个或六个不同的字段组成：目的地 MAC 地址 (DA)、源 MAC 地址 (SA)、类型/长度字段、数据有效载荷字段、可选的填充字段和帧校验序列字段 (CRC)。此外，在以太网上传输时，以太网数据包的开头需附加 7 字节的前导码和 1 字节的帧起始符 (SOF)。

因此，双绞线上的通信如图所示：

图 1: 以太网数据帧格式

前导码和帧起始符 前导码包含 7 字节的 55H，作用是使接收器在实际帧到达之前锁定数据流。帧前界定符 (SFD) 为二进制序列 10101011（物理介质层可见）。有时它也被视作前导码的一部分。在传输和接收数据时，协议将自动从数据包中生成/移除前导码和帧起始符。

目的地址 (DA) 目的地址字段包含一个 6 字节长的设备 MAC 地址，数据包将发送到该地址。如果 MAC 地址第一个字节中的最低有效位是 1，则该地址为组播地址。例如，01-00-00-F0-00 和 33-45-67-89-AB-CD 是组播地址，而 00-00-00-F0-00 和 32-45-67-89-AB-CD 不是。

带有组播地址的数据包将到达选定的一组以太网节点，并发挥重要作用。如果目的地址字段是保留的多播地址，即 FF-FF-FF-FF-FF-FF，则该数据包是一个广播数据包，指向共享网络中的每个对象。如果 MAC 地址的第一个字节中的最低有效位为 0，则该地址为单播地址，仅供寻址节点使用。

通常，EMAC 控制器会集成接收过滤器，用于丢弃或接收带有组播、广播和/或单播目的地址的数据包。传输数据包时，由主机控制器将所需的目标地址写入传输缓冲区。

源地址 (SA) 源地址字段包含一个 6 字节长的节点 MAC 地址，以太网数据包通过该节点创建。以太网的用户需为所使用的任意控制器生成唯一的 MAC 地址。MAC 地址由两部分组成：前三个字节称为组织唯一标识符 (OUI)，由 IEEE 分配；后三个字节是地址字节，由购买 OUI 的公司配置。有关 ESP-IDF 中使用的 MAC 地址的详细信息，请参见 [MAC 地址分配](#)。

传输数据包时，由主机控制器将分配的源 MAC 地址写入传输缓冲区。

类型/长度 类型/长度字段长度为 2 字节。如果其值 ≤ 1500 (十进制), 则该字段为长度字段, 指定在数据字段后的非填充数据量; 如果其值 ≥ 1536 , 则该字段值表示后续数据包所属的协议。以下为该字段的常见值:

- IPv4 = 0800H
- IPv6 = 86DDH
- ARP = 0806H

使用专有网络的用户可以将此字段配置为长度字段。然而, 对于使用互联网协议 (IP) 或地址解析协议 (ARP) 等协议的应用程序, 在传输数据包时, 应将该字段配置为协议规范定义的适当类型。

数据有效载荷 数据有效载荷字段是一个可变长度的字段, 长度从 0 到 1500 字节不等。更大的数据包会因违反以太网标准而被大多数以太网节点丢弃。

数据有效载荷字段包含客户端数据, 如 IP 数据报。

填充及帧校验序列 (FCS) 填充字段是一个可变长度的字段。数据有效载荷较小时, 将添加填充字段以满足 IEEE 802.3 规范的要求。

以太网数据包的 DA、SA、类型、数据有效载荷和填充字段共计必须不小于 60 字节。加上所需的 4 字节 FCS 字段, 数据包的长度必须不小于 64 字节。如果数据有效载荷字段小于 46 字节, 则需要加上一个填充字段。

帧校验序列字段 (FCS) 长度为 4 字节, 其中包含一个行业标准的 32 位 CRC, 该 CRC 是根据 DA、SA、类型、数据有效载荷和填充字段的数据计算的。鉴于计算 CRC 的复杂性, 硬件通常会自动生成一个有效的 CRC 进行传输。否则, 需由主机控制器生成 CRC 并将其写入传输缓冲区。

通常情况下, 主机控制器无需关注填充字段和 CRC 字段, 因为这两部分可以在传输或接收时由硬件 EMAC 自动生成或验证。然而, 当数据包到达时, 填充字段和 CRC 字段将被写入接收缓冲区。因此, 如果需要的话, 主机控制器也可以对它们进行评估。

备注: 除了上述的基本数据帧, 在 10/100 Mbps 以太网中还有两种常见的帧类型: 控制帧和 VLAN 标记帧。ESP-IDF 不支持这两种帧类型。

配置 MAC 和 PHY 以太网驱动器由两部分组成: MAC 和 PHY。

MAC 和 PHY 之间的通信可以通过多种方式进行, 如: **MII** (媒体独立接口)、**RMII** (简化媒体独立接口) 等。

MII 和 RMII 的一个明显区别在于其所需的信号数。MII 通常需要多达 18 个信号, RMII 接口则仅需要 9 个信号。

备注: ESP-IDF 只支持 RMII 接口, 所以请将 `eth_esp32_emac_config_t::interface` 设置为 `eth_data_interface_t::EMAC_DATA_INTERFACE_RMII`。

在 RMII 模式下, 接收器和发射器信号的参考时钟为 REF_CLK。在访问 PHY 和 MAC 时, REF_CLK 必须保持稳定。一般来说, 根据设计中 PHY 设备的特征, 可通过以下三种方式生成 REF_CLK:

- 一些 PHY 芯片可以从其外部连接的 25 MHz 晶体振荡器中衍生出 REF_CLK (如图中的选项 a 所示)。对于此类芯片, 请将 `eth_esp32_emac_config_t::clock_config` 中的 `eth_mac_clock_config_t::clock_mode` 设置为 `emac_rmii_clock_mode_t::EMAC_CLK_EXT_IN`。
- 一些 PHY 芯片使用外接的 50 MHz 晶体振荡器或其他时钟源作为 MAC 端的 REF_CLK (如图中的选项 b 所示)。对于此类芯片, 请同样将 `eth_esp32_emac_config_t::clock_config` 中的 `eth_mac_clock_config_t::clock_mode` 设置为 `emac_rmii_clock_mode_t::EMAC_CLK_EXT_IN`。
- 一些 EMAC 控制器可以使用其内部的高精度 PLL 生成 REF_CLK (如图中的选项 c 所示)。此种情况下, 请将 `eth_esp32_emac_config_t::clock_config` 中的 `eth_mac_clock_config_t::clock_mode` 设置为 `emac_rmii_clock_mode_t::EMAC_CLK_OUT`。

图 2: 以太网 RMIi 接口

备注： 如果 RMII 时钟模式配置为 `emac_rmii_clock_mode_t::EMAC_CLK_OUT`，则可以通过 IO_MUX 将 GPIO23 and GPIO39 选择为 REF_CLK 信号的输出管脚。

如果 RMII 时钟模式配置为 `emac_rmii_clock_mode_t::EMAC_CLK_EXT_IN`，则可以通过 IO_MUX 将 GPIO32, GPIO44 and GPIO50 选择为 REF_CLK 信号的输入管脚。

警告： 如果 RMII 时钟模式配置为 `emac_rmii_clock_mode_t::EMAC_CLK_OUT`，则必须从外部将 REF_CLK 输出信号回环到 EMAC。请将 `eth_esp32_emac_config_t::clock_config_out_in` 中的 `eth_mac_clock_config_t::clock_mode` 配置为 `emac_rmii_clock_mode_t::EMAC_CLK_EXT_IN`，并选择与 REF_CLK 输入 GPIO (GPIO32, GPIO44 and GPIO50) 相关联的 GPIO 编号。

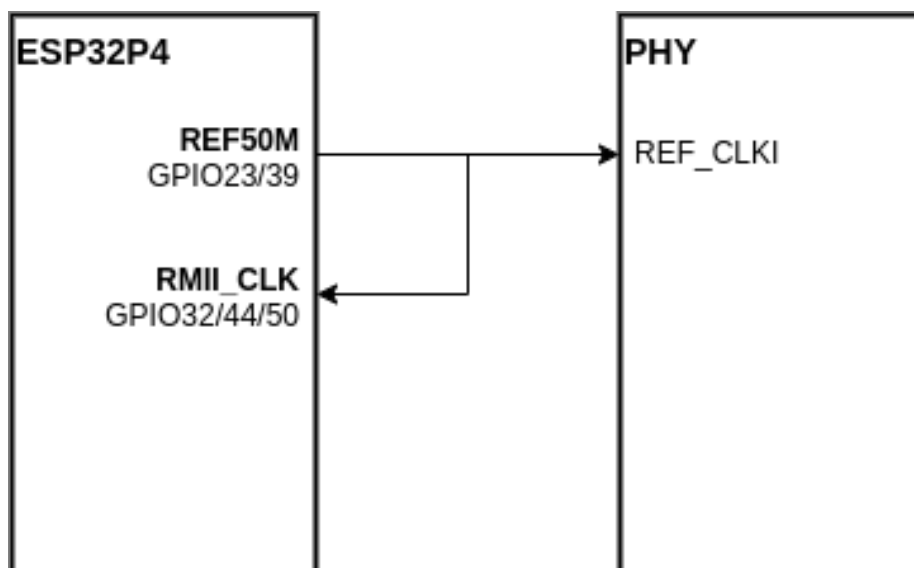

图 3: RMII REF_CKL 输出回环

无论选择哪种 RMII 时钟模式，都请确保硬件设计中 REF_CLK 的信号完整性！信号线越短越好，并远离 RF 设备和电感。

备注： 数据平面中使用的信号可以通过 IO_MUX 配置为 RMII 预定义的 GPIO，请参阅下表。数据平面 GPIO 配置由驱动程序根据 `eth_esp32_emac_config_t::emac_dataif_gpio` 的内容执行。控制平面中使用的信号可以通过 GPIO 矩阵路由到任何空闲的 GPIO。

表 2: ESP32-P4 RMII 数据平面 GPIO

管脚名	GPIO 编号
TX_EN	GPIO33, GPIO40 and GPIO49
TXD0	GPIO34 and GPIO41
TXD1	GPIO35 and GPIO42
CRS_DV	GPIO28, GPIO45 and GPIO51
RXD0	GPIO29, GPIO46 and GPIO52
RXD1	GPIO30, GPIO47 and GPIO53

根据以太网板设计，需要分别为 MAC 和 PHY 配置必要的参数，通过两者完成驱动程序的安装。

MAC 的相关配置可以在 `eth_mac_config_t` 中找到，具体包括：

- `eth_mac_config_t::sw_reset_timeout_ms`: 软件复位超时值，单位为毫秒。通常，MAC 复位应在 100 ms 内完成。
- `eth_mac_config_t::rx_task_stack_size` 和 `eth_mac_config_t::rx_task_prio`: MAC 驱动会创建一个专门的任务来处理传入的数据包，这两个参数用于设置该任务的堆栈大小和优先级。
- `eth_mac_config_t::flags`: 指定 MAC 驱动应支持的额外功能，尤其适用于某些特殊情况。这个字段的值支持与以 `ETH_MAC_FLAG_` 为前缀的宏进行 OR 运算。例如，如果要求 MAC 驱动程序在 cache 禁用时仍能正常工作，那么则需要用 `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE` 配置这个字段。

`eth_esp32_emac_config_t` 描述了 **内部 MAC 模块** 的特定配置，其中包括：

- `eth_esp32_emac_config_t::smi_mdc_gpio_num` 和 `eth_esp32_emac_config_t::smi_mdio_gpio_num`: 连接 SMI 信号的 GPIO 编号。
- `eth_esp32_emac_config_t::interface`: 配置到 PHY (MII/RMII) 的 MAC 数据接口。
- `eth_esp32_emac_config_t::clock_config`: 配置 EMAC 接口时钟 (RMII 模式下的 REF_CLK 模式以及 GPIO 编号)。
- `eth_esp32_emac_config_t::intr_priority`: 设置 MAC 中断的优先级。如果设置为 0 或负值，则驱动程序将分配一个具有默认优先级的中断。否则，驱动程序将使用给定的优先级。请注意，可以设置低、中中断优先级 (1 到 3)，因为这可以在 C 中处理。
- `eth_esp32_emac_config_t::emac_dataif_gpio`: EMAC MII/RMII 数据平面 GPIO 编号配置。
- `eth_esp32_emac_config_t::clock_config_out_in`: 当 REF_CLK 信号在内部生成并从外部回环到 EMAC 时，配置 EMAC 输入接口时钟。必须始终将 EMAC 的模式配置为 `emac_rmii_clock_mode_t::EMAC_CLK_EXT_IN`。此选项仅在 `eth_esp32_emac_config_t::clock_config` 的配置设置为 `emac_rmii_clock_mode_t::EMAC_CLK_OUT` 时有效。

PHY 的相关配置可以在 `eth_phy_config_t` 中找到，具体包括：

- `eth_phy_config_t::phy_addr`: 同一条 SMI 总线上可以存在多个 PHY 设备，所以有必要为各个 PHY 设备分配唯一地址。通常，这个地址是在硬件设计期间，通过拉高/拉低一些 PHY strapping 管脚来配置的。根据不同的以太网开发板，可配置值为 0 到 15。需注意，如果 SMI 总线上仅有一个 PHY 设备，将该值配置为 -1，即可使驱动程序自动检测 PHY 地址。
- `eth_phy_config_t::reset_timeout_ms`: 复位超时值，单位为毫秒。通常，PHY 复位应在 100 ms 内完成。
- `eth_phy_config_t::autonego_timeout_ms`: 自动协商超时值，单位为毫秒。以太网驱动程序会与链路另一端的设备进行自协商，以确定连接的最佳双工模式和速率。此值通常取决于电路板上 PHY 设备的性能。
- `eth_phy_config_t::reset_gpio_num`: 如果开发板同时将 PHY 复位管脚连接至了任意 GPIO 管脚，请使用该字段进行配置。否则，配置为 -1。

ESP-IDF 在宏 `ETH_MAC_DEFAULT_CONFIG` 和 `ETH_PHY_DEFAULT_CONFIG` 中为 MAC 和 PHY 提供了默认配置。

创建 MAC 和 PHY 实例 以太网驱动是以面向对象的方式实现的。对 MAC 和 PHY 的任何操作都应基于实例。

内部 EMAC + 外部 PHY

```
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // 应用默认的通用 MAC 配置
eth_esp32_emac_config_t esp32_emac_config = ETH_ESP32_EMAC_DEFAULT_CONFIG(); // 应用默认的供应商特定 MAC 配置
esp32_emac_config.smi_mdc_gpio_num = CONFIG_EXAMPLE_ETH_MDC_GPIO; // 更改用于 MDC 信号的 GPIO
esp32_emac_config.smi_mdio_gpio_num = CONFIG_EXAMPLE_ETH_MDIO_GPIO; // 更改用于 MDIO 信号的 GPIO
```

(下页继续)

(续上页)

```

esp_eth_mac_t *mac = esp_eth_mac_new_esp32(&esp32_emac_config, &mac_config); // 创建 MAC 实例
↳创建 MAC 实例

eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // 应用默认的 PHY 配置
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // 根据开发板设计更改
↳PHY 地址

phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // 更改用于 PHY
↳复位的 GPIO

esp_eth_phy_t *phy = esp_eth_phy_new_ip101(&phy_config); // 创建 PHY 实例
// ESP-IDF 为多种以太网 PHY 芯片驱动提供官方支持
// esp_eth_phy_t *phy = esp_eth_phy_new_rt18201(&phy_config);
// esp_eth_phy_t *phy = esp_eth_phy_new_lan8720(&phy_config);
// esp_eth_phy_t *phy = esp_eth_phy_new_dp83848(&phy_config);

```

可选的运行时 MAC 时钟配置 可以通过用户应用程序代码，选择性配置 EMAC 中的 REF_CLK。

```

eth_esp32_emac_config_t esp32_emac_config = ETH_ESP32_EMAC_DEFAULT_CONFIG(); // 应用默认的供应商特定 MAC 配置
↳应用默认的供应商特定 MAC 配置

// ...

esp32_emac_config.interface = EMAC_DATA_INTERFACE_RMII; // 更改 EMAC 数据接口
↳更改 EMAC 数据接口

esp32_emac_config.clock_config.rmii.clock_mode = EMAC_CLK_OUT; // 配置 EMAC REF_CLK 模式
↳配置 EMAC REF_CLK 模式

esp32_emac_config.clock_config.rmii.clock_gpio = EMAC_CLK_OUT_GPIO; // 配置用于输入/输出 EMAC REF_CLK 的 GPIO 编号
↳配置用于输入/输出 EMAC REF_CLK 的 GPIO 编号

esp_eth_mac_t *mac = esp_eth_mac_new_esp32(&esp32_emac_config, &mac_config); // 创建 MAC 实例
↳创建 MAC 实例

```

SPI-Ethernet 模块

```

eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // 应用默认的通用 MAC
↳配置

eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // 应用默认的 PHY 配置
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // 根据开发板设计更改
↳PHY 地址

phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // 更改用于 PHY
↳复位的 GPIO

// 安装 GPIO 中断服务 (因为 SPI-Ethernet 模块为中断驱动)
gpio_install_isr_service(0);
// 配置 SPI 总线

spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
    .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
    .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
    .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
    .quadwp_io_num = -1,
    .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));
// 配置 SPI 从机设备

spi_device_interface_config_t spi_devcfg = {
    .mode = 0,
    .clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
    .spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
    .queue_size = 20
};
/* dm9051 ethernet driver is based on spi driver */

```

(下页继续)

(续上页)

```
eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(CONFIG_EXAMPLE_ETH_
↳SPI_HOST, &spi_devcfg);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(&dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(&phy_config);
```

备注:

- 当为 SPI-Ethernet 模块 (例如 DM9051) 创建 MAC 和 PHY 实例时, 由于 PHY 是集成在模块中的, 因此调用的实例创建函数的后缀须保持一致 (例如 `esp_eth_mac_new_dm9051` 和 `esp_eth_phy_new_dm9051` 搭配使用)。
- 针对不同的以太网模块, 或是为了满足特定 PCB 上的 SPI 时序, SPI 从机设备配置 (即 `spi_device_interface_config_t`) 可能略有不同。具体配置请查看模块规格以及 ESP-IDF 中的示例。

安装驱动程序 安装以太网驱动程序需要结合 MAC 和 PHY 实例, 并在 `esp_eth_config_t` 中配置一些额外的高级选项 (即不仅限于 MAC 或 PHY 的选项):

- `esp_eth_config_t::mac`: 由 MAC 生成器创建的实例 (例如 `esp_eth_mac_new_esp32()`)。
- `esp_eth_config_t::phy`: 由 PHY 生成器创建的实例 (例如 `esp_eth_phy_new_ip101()`)。
- `esp_eth_config_t::check_link_period_ms`: 以太网驱动程序会启用操作系统定时器来定期检查链接状态。该字段用于设置间隔时间, 单位为毫秒。
- `esp_eth_config_t::stack_input`: 在大多数的以太网物联网应用中, 驱动器接收的以太网帧会被传递到上层 (如 TCP/IP 栈)。经配置, 该字段为负责处理传入帧的函数。可以在安装驱动程序后, 通过函数 `esp_eth_update_input_path()` 更新该字段。该字段支持在运行过程中进行更新。
- `esp_eth_config_t::on_lowlevel_init_done` 和 `esp_eth_config_t::on_lowlevel_deinit_done`: 这两个字段用于指定钩子函数, 当去初始化或初始化低级别硬件时, 会调用钩子函数。

ESP-IDF 在宏 `ETH_DEFAULT_CONFIG` 中为安装驱动程序提供了一个默认配置。

```
esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // 应用默认驱动程序配置
esp_eth_handle_t eth_handle = NULL; // 驱动程序安装完毕后, 将得到驱动程序的句柄
esp_eth_driver_install(&config, &eth_handle); // 安装驱动程序
```

以太网驱动程序包含事件驱动模型, 该模型会向用户空间发送有用及重要的事件。安装以太网驱动程序之前, 需要首先初始化事件循环。有关事件驱动编程的更多信息, 请参考 [事件循环库](#)。

```
/** 以太网事件的事件处理程序 */
static void eth_event_handler(void *arg, esp_event_base_t event_base,
                              int32_t event_id, void *event_data)
{
    uint8_t mac_addr[6] = {0};
    /* 可从事件数据中获得以太网驱动句柄 */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id) {
        case ETHERNET_EVENT_CONNECTED:
            esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
            ESP_LOGI(TAG, "Ethernet Link Up");
            ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x",
                    mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_
↳addr[4], mac_addr[5]);
            break;
        case ETHERNET_EVENT_DISCONNECTED:
            ESP_LOGI(TAG, "Ethernet Link Down");
            break;
        case ETHERNET_EVENT_START:
            ESP_LOGI(TAG, "Ethernet Started");
    }
}
```

(下页继续)

```

        break;
    case ETHERNET_EVENT_STOP:
        ESP_LOGI(TAG, "Ethernet Stopped");
        break;
    default:
        break;
    }
}

esp_event_loop_create_default(); // 创建一个在后台运行的默认事件循环
esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL);
↳// 注册以太网事件处理程序 (用于在发生 link up/down
↳等事件时, 处理特定的用户相关内容)

```

启动以太网驱动程序 安装驱动程序后, 可以立即启动以太网。

```
esp_eth_start(eth_handle); // 启动以太网驱动程序状态机
```

连接驱动程序至 TCP/IP 协议栈 现在, 以太网驱动程序已经完成安装。但对应 OSI (开放式系统互连模型) 来看, 目前阶段仍然属于第二层 (即数据链路层)。这意味着可以检测到 link up/down 事件, 获得用户空间的 MAC 地址, 但无法获得 IP 地址, 当然也无法发送 HTTP 请求。ESP-IDF 中使用的 TCP/IP 协议栈是 LwIP, 关于 LwIP 的更多信息, 请参考 [LwIP](#)。

要将以太网驱动程序连接至 TCP/IP 协议栈, 需要以下三步:

1. 为以太网驱动程序创建网络接口
2. 将网络接口连接到以太网驱动程序
3. 注册 IP 事件处理程序

有关网络接口的更多信息, 请参考 [Network Interface](#)。

```

/** IP_EVENT_ETH_GOT_IP 的事件处理程序 */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base,
                                int32_t event_id, void *event_data)
{
    ip_event_got_ip_t *event = (ip_event_got_ip_t *) event_data;
    const esp_netif_ip_info_t *ip_info = &event->ip_info;

    ESP_LOGI(TAG, "Ethernet Got IP Address");
    ESP_LOGI(TAG, "~~~~~");
    ESP_LOGI(TAG, "ETHIP:" IPSTR, IP2STR(&ip_info->ip));
    ESP_LOGI(TAG, "ETHMASK:" IPSTR, IP2STR(&ip_info->netmask));
    ESP_LOGI(TAG, "ETHGW:" IPSTR, IP2STR(&ip_info->gw));
    ESP_LOGI(TAG, "~~~~~");
}

esp_netif_init(); // 初始化 TCP/IP 网络接口 (在应用程序中应仅调用一次)
esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // 应用以太网的默认网络接口配置
esp_netif_t *eth_netif = esp_netif_new(&cfg); // 为以太网驱动程序创建网络接口

esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle));
↳将以太网驱动程序连接至 TCP/IP 协议栈
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler,
↳NULL); // 注册用户定义的 IP 事件处理程序
esp_eth_start(eth_handle); // 启动以太网驱动程序状态机

```

警告： 推荐在完成整个以太网驱动和网络接口的初始化后，再注册用户定义的以太网/IP 事件处理程序，也就是把注册事件处理程序作为启动以太网驱动程序的最后一步。这样可以确保以太网驱动程序或网络接口将首先执行以太网/IP 事件，从而保证在执行用户定义的处理程序时，系统处于预期状态。

以太网驱动程序的杂项控制 以下功能只支持在安装以太网驱动程序后调用。

- 关闭以太网驱动程序: `esp_eth_stop()`
- 更新以太网数据输入路径: `esp_eth_update_input_path()`
- 获取/设置以太网驱动程序杂项内容: `esp_eth_ioctl()`

```
/* 获取 MAC 地址 */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
          mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_
          ↪addr[5]);

/* 获取 PHY 地址 */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);
```

数据流量控制 受 RAM 大小限制，在网络拥堵时，MCU 上的以太网通常仅能处理有限数量的帧。发送站的数据传输速度可能快于对等端的接收能力。以太网数据流量控制机制允许接收节点向发送方发出信号，要求暂停传输，直到接收方跟上。这项功能是通过暂停帧实现的，该帧定义在 IEEE 802.3x 中。

暂停帧是一种特殊的以太网帧，用于携带暂停命令，其 EtherType 字段为 0x8808，控制操作码为 0x0001。只有配置为全双工操作的节点组可以发送暂停帧。当节点组希望暂停链路的另一端时，它会发送一个暂停帧到 48 位的保留组播地址 01-80-C2-00-00-01。暂停帧中也包括请求暂停的时间段，以两字节的整数形式发送，值的范围从 0 到 65535。

安装以太网驱动程序后，数据流量控制功能默认禁用，可以通过以下方式启用此功能：

```
bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);
```

需注意，暂停帧是在自动协商期间由 PHY 向对等端公布的。只有当链路两端都支持暂停帧时，以太网驱动程序才会发送暂停帧。

应用示例

- 以太网基本示例: [ethernet/basic](#)
- 以太网 iperf 示例: [ethernet/iperf](#)
- 以太网到 Wi-Fi AP “路由器”: [network/eth2ap](#)
- Wi-Fi station 到以太网 “网桥”: [network/sta2eth](#)
- 大多数协议示例也适用于以太网: [protocols](#)

进阶操作

自定义 PHY 驱动程序 市面上有多家 PHY 芯片制造商提供各种类型的芯片。ESP-IDF 现已支持数种 PHY 芯片，但是由于价格、功能、库存等原因，有时用户还是无法找到一款能满足其实际需求的芯片。

好在 IEEE 802.3 在其 22.2.4 管理功能部分对 EMAC 和 PHY 之间的管理接口进行了标准化。该部分定义了所谓的“MII 管理接口”规范，用于控制 PHY 和收集 PHY 的状态，还定义了一组管理寄存器来控制芯片行为、链接属性、自动协商配置等。在 ESP-IDF 中，这项基本的管理功能是由 `esp_eth/src/phy/esp_eth_phy_802_3.c` 实现的，这也大大降低了创建新的自定义 PHY 芯片驱动的难度。

备注： 由于一些 PHY 芯片可能不符合 IEEE 802.3 第 22.2.4 节的规定，所以请首先查看 PHY 数据手册。不过，就算芯片不符合规定，依旧可以创建自定义 PHY 驱动程序，只是由于需要自行定义所有的 PHY 管理功能，这个过程将变得较为复杂。

ESP-IDF 以太网驱动程序所需的大部分 PHY 管理功能都已涵盖在 `esp_eth/src/phy/esp_eth_phy_802_3.c` 中。不过对于以下几项，可能仍需针对不同芯片开发具体的管理功能：

- 链接状态。此项总是由使用的具体芯片决定
- 芯片初始化。即使不存在严格的限制，也应进行自定义，以确保使用的是符合预期的芯片
- 芯片的具体功能配置

创建自定义 PHY 驱动程序的步骤：

1. 请根据 PHY 数据手册，定义针对供应商的特定注册表布局。示例请参见 `esp_eth/src/phy/esp_eth_phy_ip101.c`。
2. 准备衍生的 PHY 管理对象信息结构，该结构：
 - 必须至少包含 IEEE 802.3 `phy_802_3_t` 父对象
 - 可选择包含额外的变量，以支持非 IEEE 802.3 或定制功能。示例请参见 `esp_eth/src/phy/esp_eth_phy_ksz80xx.c`。
3. 定义针对芯片的特定管理回调功能。
4. 初始化 IEEE 802.3 父对象并重新分配针对芯片的特定管理回调功能。

实现新的自定义 PHY 驱动程序后，你可以通过 [ESP-IDF 组件管理中心](#) 将驱动分享给其他用户。

API 参考

Header File

- `components/hal/include/hal/eth_types.h`
- This header file can be included with:

```
#include "hal/eth_types.h"
```

Enumerations

enum `eth_data_interface_t`

Ethernet interface.

Values:

enumerator `EMAC_DATA_INTERFACE_RMII`

Reduced Media Independent Interface

enumerator `EMAC_DATA_INTERFACE_MII`

Media Independent Interface

enum `eth_link_t`

Ethernet link status.

Values:

enumerator `ETH_LINK_UP`

Ethernet link is up

enumerator **ETH_LINK_DOWN**

Ethernet link is down

enum **eth_speed_t**

Ethernet speed.

Values:

enumerator **ETH_SPEED_10M**

Ethernet speed is 10Mbps

enumerator **ETH_SPEED_100M**

Ethernet speed is 100Mbps

enumerator **ETH_SPEED_MAX**

Max speed mode (for checking purpose)

enum **eth_duplex_t**

Ethernet duplex mode.

Values:

enumerator **ETH_DUPLEX_HALF**

Ethernet is in half duplex

enumerator **ETH_DUPLEX_FULL**

Ethernet is in full duplex

enum **eth_checksum_t**

Ethernet Checksum.

Values:

enumerator **ETH_CHECKSUM_SW**

Ethernet checksum calculate by software

enumerator **ETH_CHECKSUM_HW**

Ethernet checksum calculate by hardware

enum **eth_mac_dma_burst_len_t**

Internal ethernet EMAC's DMA available burst sizes.

Values:

enumerator **ETH_DMA_BURST_LEN_32**

enumerator **ETH_DMA_BURST_LEN_16**

enumerator **ETH_DMA_BURST_LEN_8**

enumerator **ETH_DMA_BURST_LEN_4**

enumerator **ETH_DMA_BURST_LEN_2**

enumerator **ETH_DMA_BURST_LEN_1**

PRIV_REQUIRES esp_eth
```

Functions

esp_err_t **esp_eth_driver_install** (const *esp_eth_config_t* *config, *esp_eth_handle_t* *out_hdl)

Install Ethernet driver.

参数

- **config** -- [in] configuration of the Ethernet driver
- **out_hdl** -- [out] handle of Ethernet driver

返回

- **ESP_OK**: install `esp_eth` driver successfully
- **ESP_ERR_INVALID_ARG**: install `esp_eth` driver failed because of some invalid argument
- **ESP_ERR_NO_MEM**: install `esp_eth` driver failed because there's no memory for driver
- **ESP_FAIL**: install `esp_eth` driver failed because some other error occurred

esp_err_t **esp_eth_driver_uninstall** (*esp_eth_handle_t* hdl)

Uninstall Ethernet driver.

备注: It's not recommended to uninstall Ethernet driver unless it won't get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

参数 **hdl** -- [in] handle of Ethernet driver

返回

- ESP_OK: uninstall esp_eth driver successfully
- ESP_ERR_INVALID_ARG: uninstall esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: uninstall esp_eth driver failed because it has more than one reference
- ESP_FAIL: uninstall esp_eth driver failed because some other error occurred

esp_err_t **esp_eth_start** (*esp_eth_handle_t* hdl)

Start Ethernet driver **ONLY** in standalone mode (i.e. without TCP/IP stack)

备注: This API will start driver state machine and internal software timer (for checking link status).

参数 **hdl** -- **[in]** handle of Ethernet driver

返回

- ESP_OK: start esp_eth driver successfully
- ESP_ERR_INVALID_ARG: start esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: start esp_eth driver failed because driver has started already
- ESP_FAIL: start esp_eth driver failed because some other error occurred

esp_err_t **esp_eth_stop** (*esp_eth_handle_t* hdl)

Stop Ethernet driver.

备注: This function does the oppsite operation of esp_eth_start.

参数 **hdl** -- **[in]** handle of Ethernet driver

返回

- ESP_OK: stop esp_eth driver successfully
- ESP_ERR_INVALID_ARG: stop esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: stop esp_eth driver failed because driver has not started yet
- ESP_FAIL: stop esp_eth driver failed because some other error occurred

esp_err_t **esp_eth_update_input_path** (*esp_eth_handle_t* hdl, *esp_err_t* (*stack_input)(*esp_eth_handle_t* hdl, uint8_t *buffer, uint32_t length, void *priv), void *priv)

Update Ethernet data input path (i.e. specify where to pass the input buffer)

备注: After install driver, Ethernet still don't know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

参数

- **hdl** -- **[in]** handle of Ethernet driver
- **stack_input** -- **[in]** function pointer, which does the actual process on incoming packets
- **priv** -- **[in]** private resource, which gets passed to stack_input callback without any modification

返回

- ESP_OK: update input path successfully
- ESP_ERR_INVALID_ARG: update input path failed because of some invalid argument
- ESP_FAIL: update input path failed because some other error occurred

esp_err_t **esp_eth_transmit** (*esp_eth_handle_t* hdl, void *buf, size_t length)

General Transmit.

参数

- **hdl** -- **[in]** handle of Ethernet driver
- **buf** -- **[in]** buffer of the packet to transfer
- **length** -- **[in]** length of the buffer to transfer

返回

- **ESP_OK**: transmit frame buffer successfully
- **ESP_ERR_INVALID_ARG**: transmit frame buffer failed because of some invalid argument
- **ESP_ERR_INVALID_STATE**: invalid driver state (e.i. driver is not started)
- **ESP_ERR_TIMEOUT**: transmit frame buffer failed because HW was not get available in predefined period
- **ESP_FAIL**: transmit frame buffer failed because some other error occurred

esp_err_t **esp_eth_transmit_vargs** (*esp_eth_handle_t* hdl, uint32_t argc, ...)

Special Transmit with variable number of arguments.

参数

- **hdl** -- **[in]** handle of Ethernet driver
- **argc** -- **[in]** number variable arguments
- ... -- variable arguments

返回

- **ESP_OK**: transmit successful
- **ESP_ERR_INVALID_STATE**: invalid driver state (e.i. driver is not started)
- **ESP_ERR_TIMEOUT**: transmit frame buffer failed because HW was not get available in predefined period
- **ESP_FAIL**: transmit frame buffer failed because some other error occurred

esp_err_t **esp_eth_ioctl** (*esp_eth_handle_t* hdl, *esp_eth_io_cmd_t* cmd, void *data)

Misc IO function of Ethernet driver.

The following common IO control commands are supported:

- **ETH_CMD_S_MAC_ADDR** sets Ethernet interface MAC address. *data* argument is pointer to MAC address buffer with expected size of 6 bytes.
- **ETH_CMD_G_MAC_ADDR** gets Ethernet interface MAC address. *data* argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- **ETH_CMD_S_PHY_ADDR** sets PHY address in range of <0-31>. *data* argument is pointer to memory of *uint32_t* datatype from where the configuration option is read.
- **ETH_CMD_G_PHY_ADDR** gets PHY address. *data* argument is pointer to memory of *uint32_t* datatype to which the PHY address is to be stored.
- **ETH_CMD_S_AUTONEGO** enables or disables Ethernet link speed and duplex mode autonegotiation. *data* argument is pointer to memory of *bool* datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.
- **ETH_CMD_G_AUTONEGO** gets current configuration of the Ethernet link speed and duplex mode autonegotiation. *data* argument is pointer to memory of *bool* datatype to which the current configuration is to be stored.
- **ETH_CMD_S_SPEED** sets the Ethernet link speed. *data* argument is pointer to memory of *eth_speed_t* datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- **ETH_CMD_G_SPEED** gets current Ethernet link speed. *data* argument is pointer to memory of *eth_speed_t* datatype to which the speed is to be stored.
- **ETH_CMD_S_PROMISCUOUS** sets/resets Ethernet interface promiscuous mode. *data* argument is pointer to memory of *bool* datatype from which the configuration option is read.
- **ETH_CMD_S_FLOW_CTRL** sets/resets Ethernet interface flow control. *data* argument is pointer to memory of *bool* datatype from which the configuration option is read.

- `ETH_CMD_S_DUPLEX_MODE` sets the Ethernet duplex mode. `data` argument is pointer to memory of `eth_duplex_t` datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- `ETH_CMD_G_DUPLEX_MODE` gets current Ethernet link duplex mode. `data` argument is pointer to memory of `eth_duplex_t` datatype to which the duplex mode is to be stored.
- `ETH_CMD_S_PHY_LOOPBACK` sets/resets PHY to/from loopback mode. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.
- Note that additional control commands may be available for specific MAC or PHY chips. Please consult specific MAC or PHY documentation or driver code.

参数

- **hdl** -- **[in]** handle of Ethernet driver
- **cmd** -- **[in]** IO control command
- **data** -- **[inout]** address of data for `set` command or address where to store the data when used with `get` command

返回

- `ESP_OK`: process io command successfully
- `ESP_ERR_INVALID_ARG`: process io command failed because of some invalid argument
- `ESP_FAIL`: process io command failed because some other error occurred
- `ESP_ERR_NOT_SUPPORTED`: requested feature is not supported

esp_err_t **esp_eth_get_phy_instance** (*esp_eth_handle_t* hdl, *esp_eth_phy_t* **phy)

Get PHY instance memory address.

参数

- **hdl** -- **[in]** handle of Ethernet driver
- **phy** -- **[out]** pointer to memory to store the instance

返回 *esp_err_t*

- `ESP_OK`: success
- `ESP_ERR_INVALID_ARG`: failed because of some invalid argument

esp_err_t **esp_eth_get_mac_instance** (*esp_eth_handle_t* hdl, *esp_eth_mac_t* **mac)

Get MAC instance memory address.

参数

- **hdl** -- **[in]** handle of Ethernet driver
- **mac** -- **[out]** pointer to memory to store the instance

返回 *esp_err_t*

- `ESP_OK`: success
- `ESP_ERR_INVALID_ARG`: failed because of some invalid argument

esp_err_t **esp_eth_increase_reference** (*esp_eth_handle_t* hdl)

Increase Ethernet driver reference.

备注: Ethernet driver handle can be obtained by `os timer`, `netif`, etc. It's dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won't be uninstalled during your using time.

参数 **hdl** -- **[in]** handle of Ethernet driver

返回

- `ESP_OK`: increase reference successfully
- `ESP_ERR_INVALID_ARG`: increase reference failed because of some invalid argument

esp_err_t **esp_eth_decrease_reference** (*esp_eth_handle_t* hdl)

Decrease Ethernet driver reference.

参数 **hdl** -- [in] handle of Ethernet driver

返回

- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

Structures

struct **esp_eth_config_t**

Configuration of Ethernet driver.

Public Members

esp_eth_mac_t ***mac**

Ethernet MAC object.

esp_eth_phy_t ***phy**

Ethernet PHY object.

uint32_t **check_link_period_ms**

Period time of checking Ethernet link status.

esp_err_t (***stack_input**)(*esp_eth_handle_t* eth_handle, uint8_t *buffer, uint32_t length, void *priv)

Input frame buffer to user's stack.

Param eth_handle [in] handle of Ethernet driver

Param buffer [in] frame buffer that will get input to upper stack

Param length [in] length of the frame buffer

Return

- ESP_OK: input frame buffer to upper stack successfully
- ESP_FAIL: error occurred when inputting buffer to upper stack

esp_err_t (***on_lowlevel_init_done**)(*esp_eth_handle_t* eth_handle)

Callback function invoked when lowlevel initialization is finished.

Param eth_handle [in] handle of Ethernet driver

Return

- ESP_OK: process extra lowlevel initialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel initialization

esp_err_t (***on_lowlevel_deinit_done**)(*esp_eth_handle_t* eth_handle)

Callback function invoked when lowlevel deinitialization is finished.

Param eth_handle [in] handle of Ethernet driver

Return

- ESP_OK: process extra lowlevel deinitialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel deinitialization

esp_err_t (***read_phy_reg**)(*esp_eth_handle_t* eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

备注: Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding

read/write. Setting this to NULL means your PHY device is managed by MAC's SMI interface.

Param eth_handle [in] handle of Ethernet driver

Param phy_addr [in] PHY chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [out] PHY register value

Return

- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

```
esp_err_t (*write_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg,
uint32_t reg_value)
```

Write PHY register.

备注: Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC's SMI interface.

Param eth_handle [in] handle of Ethernet driver

Param phy_addr [in] PHY chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [in] PHY register value

Return

- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

```
struct esp_eth_phy_reg_rw_data_t
```

Data structure to Read/Write PHY register via ioctl API.

Public Members

```
uint32_t reg_addr
```

PHY register address

```
uint32_t *reg_value_p
```

Pointer to a memory where the register value is read/written

Macros

```
ETH_DEFAULT_CONFIG (emac, ephy)
```

Default configuration for Ethernet driver.

Type Definitions

```
typedef void *esp_eth_handle_t
```

Handle of Ethernet driver.

Enumerations

enum **esp_eth_io_cmd_t**

Command list for ioctl API.

Values:

enumerator **ETH_CMD_G_MAC_ADDR**

Get MAC address

enumerator **ETH_CMD_S_MAC_ADDR**

Set MAC address

enumerator **ETH_CMD_G_PHY_ADDR**

Get PHY address

enumerator **ETH_CMD_S_PHY_ADDR**

Set PHY address

enumerator **ETH_CMD_G_AUTONEGO**

Get PHY Auto Negotiation

enumerator **ETH_CMD_S_AUTONEGO**

Set PHY Auto Negotiation

enumerator **ETH_CMD_G_SPEED**

Get Speed

enumerator **ETH_CMD_S_SPEED**

Set Speed

enumerator **ETH_CMD_S_PROMISCUOUS**

Set promiscuous mode

enumerator **ETH_CMD_S_FLOW_CTRL**

Set flow control

enumerator **ETH_CMD_G_DUPLEX_MODE**

Get Duplex mode

enumerator **ETH_CMD_S_DUPLEX_MODE**

Set Duplex mode

enumerator **ETH_CMD_S_PHY_LOOPBACK**

Set PHY loopback

enumerator **ETH_CMD_READ_PHY_REG**

Read PHY register

enumerator **ETH_CMD_WRITE_PHY_REG**

Write PHY register

enumerator **ETH_CMD_CUSTOM_MAC_CMDS**

enumerator **ETH_CMD_CUSTOM_PHY_CMDS**

Header File

- [components/esp_eth/include/esp_eth_com.h](#)
- This header file can be included with:

```
#include "esp_eth_com.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

Structures

struct **esp_eth_mediator_s**

Ethernet mediator.

Public Members

esp_err_t (***phy_reg_read**)(*esp_eth_mediator_t* *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

Param eth [in] mediator of Ethernet driver

Param phy_addr [in] PHY Chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [out] PHY register value

Return

- ESP_OK: read PHY register successfully
- ESP_FAIL: read PHY register failed because some error occurred

esp_err_t (***phy_reg_write**)(*esp_eth_mediator_t* *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)

Write PHY register.

Param eth [in] mediator of Ethernet driver

Param phy_addr [in] PHY Chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [in] PHY register value

Return

- ESP_OK: write PHY register successfully
- ESP_FAIL: write PHY register failed because some error occurred

esp_err_t (***stack_input**)(*esp_eth_mediator_t* *eth, uint8_t *buffer, uint32_t length)

Deliver packet to upper stack.

Param eth [in] mediator of Ethernet driver

Param buffer [in] packet buffer

Param length [in] length of the packet

Return

- ESP_OK: deliver packet to upper stack successfully
- ESP_FAIL: deliver packet failed because some error occurred

esp_err_t (***on_state_changed**)(*esp_eth_mediator_t* *eth, *esp_eth_state_t* state, void *args)

Callback on Ethernet state changed.

Param eth [in] mediator of Ethernet driver

Param state [in] new state

Param args [in] optional argument for the new state

Return

- ESP_OK: process the new state successfully
- ESP_FAIL: process the new state failed because some error occurred

Macros

ETH_CMD_CUSTOM_MAC_CMDS_OFFSET

Offset for start of MAC custom ioctl commands.

ETH_CMD_CUSTOM_PHY_CMDS_OFFSET

Offset for start of PHY custom ioctl commands.

Type Definitions

typedef struct *esp_eth_mediator_s* **esp_eth_mediator_t**

Ethernet mediator.

Enumerations

enum **esp_eth_state_t**

Ethernet driver state.

Values:

enumerator **ETH_STATE_LLINIT**

Lowlevel init done

enumerator **ETH_STATE_DEINIT**

Deinit done

enumerator **ETH_STATE_LINK**

Link status changed

enumerator **ETH_STATE_SPEED**

Speed updated

enumerator **ETH_STATE_DUPLEX**

Duplex updated

enumerator **ETH_STATE_PAUSE**

Pause ability updated

enum **eth_event_t**

Ethernet event declarations.

Values:

enumerator **ETHERNET_EVENT_START**

Ethernet driver start

enumerator **ETHERNET_EVENT_STOP**

Ethernet driver stop

enumerator **ETHERNET_EVENT_CONNECTED**

Ethernet got a valid link

enumerator **ETHERNET_EVENT_DISCONNECTED**

Ethernet lost a valid link

Header File

- [components/esp_eth/include/esp_eth_mac.h](#)
- This header file can be included with:

```
#include "esp_eth_mac.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

Structures

struct **esp_eth_mac_s**

Ethernet MAC.

Public Members

esp_err_t (***set_mediator**)(*esp_eth_mac_t* *mac, *esp_eth_mediator_t* *eth)

Set mediator for Ethernet MAC.

Param mac [in] Ethernet MAC instance

Param eth [in] Ethernet mediator

Return

- `ESP_OK`: set mediator for Ethernet MAC successfully
- `ESP_ERR_INVALID_ARG`: set mediator for Ethernet MAC failed because of invalid argument

esp_err_t (***init**)(*esp_eth_mac_t* *mac)

Initialize Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

- ESP_OK: initialize Ethernet MAC successfully
- ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

esp_err_t (***deinit**)(*esp_eth_mac_t* *mac)

Deinitialize Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

- ESP_OK: deinitialize Ethernet MAC successfully
- ESP_FAIL: deinitialize Ethernet MAC failed because some error occurred

esp_err_t (***start**)(*esp_eth_mac_t* *mac)

Start Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

- ESP_OK: start Ethernet MAC successfully
- ESP_FAIL: start Ethernet MAC failed because some other error occurred

esp_err_t (***stop**)(*esp_eth_mac_t* *mac)

Stop Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

- ESP_OK: stop Ethernet MAC successfully
- ESP_FAIL: stop Ethernet MAC failed because some error occurred

esp_err_t (***transmit**)(*esp_eth_mac_t* *mac, uint8_t *buf, uint32_t length)

Transmit packet from Ethernet MAC.

备注: Returned error codes may differ for each specific MAC chip.

Param mac [in] Ethernet MAC instance

Param buf [in] packet buffer to transmit

Param length [in] length of packet

Return

- ESP_OK: transmit packet successfully
- ESP_ERR_INVALID_SIZE: number of actually sent bytes differs to expected
- ESP_FAIL: transmit packet failed because some other error occurred

esp_err_t (***transmit_vargs**)(*esp_eth_mac_t* *mac, uint32_t argc, va_list args)

Transmit packet from Ethernet MAC constructed with special parameters at Layer2.

备注: Typical intended use case is to make possible to construct a frame from multiple higher layer buffers without a need of buffer reallocations. However, other use cases are not limited.

备注: Returned error codes may differ for each specific MAC chip.

Param mac [in] Ethernet MAC instance

Param argc [in] number variable arguments

Param args [in] variable arguments

Return

- ESP_OK: transmit packet successfully
- ESP_ERR_INVALID_SIZE: number of actually sent bytes differs to expected
- ESP_FAIL: transmit packet failed because some other error occurred

esp_err_t (***receive**)(*esp_eth_mac_t* *mac, uint8_t *buf, uint32_t *length)

Receive packet from Ethernet MAC.

备注: Memory of buf is allocated in the Layer2, make sure it get free after process.

备注: Before this function got invoked, the value of "length" should set by user, equals the size of buffer. After the function returned, the value of "length" means the real length of received data.

Param mac [in] Ethernet MAC instance

Param buf [out] packet buffer which will preserve the received frame

Param length [out] length of the received packet

Return

- ESP_OK: receive packet successfully
- ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned "length" indicates the real size of incoming data.
- ESP_FAIL: receive packet failed because some other error occurred

esp_err_t (***read_phy_reg**)(*esp_eth_mac_t* *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

Param mac [in] Ethernet MAC instance

Param phy_addr [in] PHY chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [out] PHY register value

Return

- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

esp_err_t (***write_phy_reg**)(*esp_eth_mac_t* *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)

Write PHY register.

Param mac [in] Ethernet MAC instance

Param phy_addr [in] PHY chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [in] PHY register value

Return

- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

esp_err_t (***set_addr**)(*esp_eth_mac_t* *mac, uint8_t *addr)

Set MAC address.

Param mac [in] Ethernet MAC instance

Param addr [in] MAC address

Return

- ESP_OK: set MAC address successfully
- ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument
- ESP_FAIL: set MAC address failed because some other error occurred

esp_err_t (***get_addr**)(*esp_eth_mac_t* *mac, uint8_t *addr)

Get MAC address.

Param mac [in] Ethernet MAC instance

Param addr [out] MAC address

Return

- ESP_OK: get MAC address successfully
- ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument
- ESP_FAIL: get MAC address failed because some other error occurred

esp_err_t (***set_speed**)(*esp_eth_mac_t* *mac, *eth_speed_t* speed)

Set speed of MAC.

Param mac [in] Ethernet MAC instance

Param speed [in] MAC speed

Return

- ESP_OK: set MAC speed successfully
- ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
- ESP_FAIL: set MAC speed failed because some other error occurred

esp_err_t (***set_duplex**)(*esp_eth_mac_t* *mac, *eth_duplex_t* duplex)

Set duplex mode of MAC.

Param mac [in] Ethernet MAC instance

Param duplex [in] MAC duplex

Return

- ESP_OK: set MAC duplex mode successfully
- ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
- ESP_FAIL: set MAC duplex failed because some other error occurred

esp_err_t (***set_link**)(*esp_eth_mac_t* *mac, *eth_link_t* link)

Set link status of MAC.

Param mac [in] Ethernet MAC instance

Param link [in] Link status

Return

- ESP_OK: set link status successfully
- ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
- ESP_FAIL: set link status failed because some other error occurred

esp_err_t (***set_promiscuous**)(*esp_eth_mac_t* *mac, bool enable)

Set promiscuous of MAC.

Param mac [in] Ethernet MAC instance

Param enable [in] set true to enable promiscuous mode; set false to disable promiscuous mode

Return

- ESP_OK: set promiscuous mode successfully
- ESP_FAIL: set promiscuous mode failed because some error occurred

esp_err_t (***enable_flow_ctrl**)(*esp_eth_mac_t* *mac, bool enable)

Enable flow control on MAC layer or not.

Param mac [in] Ethernet MAC instance

Param enable [in] set true to enable flow control; set false to disable flow control

Return

- ESP_OK: set flow control successfully
- ESP_FAIL: set flow control failed because some error occurred

esp_err_t (***set_peer_pause_ability**)(*esp_eth_mac_t* *mac, uint32_t ability)

Set the PAUSE ability of peer node.

Param mac [in] Ethernet MAC instance

Param ability [in] zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

Return

- ESP_OK: set peer pause ability successfully
- ESP_FAIL: set peer pause ability failed because some error occurred

esp_err_t (***custom_ioctl**)(*esp_eth_mac_t* *mac, int cmd, void *data)

Custom IO function of MAC driver. This function is intended to extend common options of *esp_eth_ioctl* to cover specifics of MAC chip.

备注: This function may not be assigned when the MAC chip supports only most common set of configuration options.

Param mac [in] Ethernet MAC instance

Param cmd [in] IO control command

Param data [inout] address of data for *set* command or address where to store the data when used with *get* command

Return

- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

esp_err_t (***del**)(*esp_eth_mac_t* *mac)

Free memory of Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

- ESP_OK: free Ethernet MAC instance successfully
- ESP_FAIL: free Ethernet MAC instance failed because some error occurred

struct **eth_mac_config_t**

Configuration of Ethernet MAC object.

Public Members

uint32_t **sw_reset_timeout_ms**

Software reset timeout value (Unit: ms)

uint32_t **rx_task_stack_size**

Stack size of the receive task

uint32_t **rx_task_prio**

Priority of the receive task

uint32_t **flags**

Flags that specify extra capability for mac driver

Macros

ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE

MAC driver can work when cache is disabled

ETH_MAC_FLAG_PIN_TO_CORE

Pin MAC task to the CPU core where driver installation happened

ETH_MAC_DEFAULT_CONFIG()

Default configuration for Ethernet MAC object.

Type Definitions

typedef struct *esp_eth_mac_s* **esp_eth_mac_t**

Ethernet MAC.

Header File

- [components/esp_eth/include/esp_eth_mac_esp.h](#)
- This header file can be included with:

```
#include "esp_eth_mac_esp.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

Functions

esp_eth_mac_t ***esp_eth_mac_new_esp32** (const *eth_esp32_emac_config_t* *esp32_config, const *eth_mac_config_t* *config)

Create ESP32 Ethernet MAC instance.

参数

- **esp32_config** -- EMAC specific configuration
- **config** -- Ethernet MAC configuration

返回

- instance: create MAC instance successfully
- NULL: create MAC instance failed because some error occurred

Unions

union **eth_mac_clock_config_t**

#include <esp_eth_mac_esp.h> Ethernet MAC Clock Configuration.

Public Members

struct *eth_mac_clock_config_t::*[anonymous] **mii**

EMAC MII Clock Configuration

emac_rmii_clock_mode_t **clock_mode**

RMII Clock Mode Configuration

emac_rmii_clock_gpio_t **clock_gpio**

RMII Clock GPIO Configuration

struct *eth_mac_clock_config_t::*[anonymous] **rmii**

EMAC RMII Clock Configuration

union **eth_mac_dataif_gpio_config_t**

#include <esp_eth_mac_esp.h> Ethernet MAC MII/RMII data plane GPIO configuration.

Public Members

eth_mac_mii_gpio_config_t **mii**

EMAC MII Data GPIO Configuration

eth_mac_rmii_gpio_config_t **rmii**

EMAC RMII Data GPIO Configuration

Structures

struct **emac_esp_smi_gpio_config_t**

EMAC SMI GPIO configuration.

Public Members

int **mdc_num**

SMI MDC GPIO number, set to -1 could bypass the SMI GPIO configuration

int **mdio_num**

SMI MDIO GPIO number, set to -1 could bypass the SMI GPIO configuration

struct **eth_mac_mii_gpio_config_t**

EMAC MII data interface GPIO configuration.

Public Members

int **tx_clk_num**
TX_CLK GPIO number

int **tx_en_num**
TX_EN GPIO number

int **txd0_num**
TXD0 GPIO number

int **txd1_num**
TXD1 GPIO number

int **txd2_num**
TXD2 GPIO number

int **txd3_num**
TXD3 GPIO number

int **rx_clk_num**
RX_CLK GPIO number

int **rx_dv_num**
RX_DV GPIO number

int **rx_d0_num**
RXD0 GPIO number

int **rx_d1_num**
RXD1 GPIO number

int **rx_d2_num**
RXD2 GPIO number

int **rx_d3_num**
RXD3 GPIO number

int **col_in_num**
COL_IN GPIO number

int **crs_in_num**
CRS_IN GPIO number

int **tx_er_num**
TX_ER GPIO number

int **rx_er_num**
RX_ER GPIO number

struct **eth_mac_rmii_gpio_config_t**
EMAC RMII data interface GPIO configuration.

Public Members

int **tx_en_num**
TX_EN GPIO number

int **txd0_num**
TXD0 GPIO number

int **txd1_num**
TXD1 GPIO number

int **crs_dv_num**
CRS_DV GPIO number

int **rxd0_num**
RXD0 GPIO number

int **rxd1_num**
RXD1 GPIO number

struct **eth_esp32_emac_config_t**
EMAC specific configuration.

Public Members

[*eth_esp32_emac_config_t*](#) **smi_gpio**
SMI GPIO numbers

int **smi_mdc_gpio_num**
SMI MDC GPIO number, set to -1 could bypass the SMI GPIO configuration

int **smi_mdio_gpio_num**
SMI MDIO GPIO number, set to -1 could bypass the SMI GPIO configuration

[*eth_data_interface_t*](#) **interface**
EMAC Data interface to PHY (MII/RMII)

[*eth_mac_clock_config_t*](#) **clock_config**
EMAC Interface clock configuration

[*eth_mac_dma_burst_len_t*](#) **dma_burst_len**
EMAC DMA burst length for both Tx and Rx

int **intr_priority**

EMAC interrupt priority, if set to 0 or a negative value, the driver will try to allocate an interrupt with a default priority

eth_mac_dataif_gpio_config_t **emac_dataif_gpio**

EMAC MII/RMII data plane GPIO configuration

eth_mac_clock_config_t **clock_config_out_in**

EMAC input clock configuration for internally generated output clock (when output clock is looped back externally)

Macros

ETH_ESP32_EMAC_DEFAULT_CONFIG ()

Default ESP32's EMAC specific configuration.

Type Definitions

typedef int **emac_rmii_clock_gpio_t**

RMII Clock GPIO number.

Enumerations

enum **emac_rmii_clock_mode_t**

RMII Clock Mode Options.

Values:

enumerator **EMAC_CLK_DEFAULT**

Default values configured using Kconfig are going to be used when "Default" selected.

警告: Deprecated option. Clock configuration using Kconfig is limitedly supported only for ESP32 SoC via `ETH_ESP32_EMAC_DEFAULT_CONFIG` and is going to be reevaluated in the next major release. Clock mode and clock GPIO number is supposed to be defined in `EMAC specific configuration` structure from user's code.

enumerator **EMAC_CLK_EXT_IN**

Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.

备注: MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.

enumerator **EMAC_CLK_OUT**

Output RMII Clock from internal (A/M)PLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

enum **eth_mac_esp_io_cmd_t**

List of ESP EMAC specific commands for ioctl API.

Values:

enumerator **ETH_MAC_ESP_CMD_SET_TDES0_CFG_BITS**
Set Transmit Descriptor Word 0 control bit mask (debug option)

enumerator **ETH_MAC_ESP_CMD_CLEAR_TDES0_CFG_BITS**
Clear Transmit Descriptor Word 0 control bit mask (debug option)

enumerator **ETH_MAC_ESP_CMD_PTP_ENABLE**
Enable IEEE1588 Time stamping

Header File

- This header file can be included with:

```
#include "esp_eth_mac_spi.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

Structures

struct **eth_spi_custom_driver_config_t**

Custom SPI Driver Configuration. This structure declares configuration and callback functions to access Ethernet SPI module via user's custom SPI driver.

Public Members

void ***config**

Custom driver specific configuration data used by `init()` function.

备注: Type and its content is fully under user's control

void *(***init**)(const void *spi_config)

Custom driver SPI Initialization.

备注: return type and its content is fully under user's control

Param spi_config [in] Custom driver specific configuration

Return

- `spi_ctx`: when initialization is successful, a pointer to context structure holding all variables needed for subsequent SPI access operations (e.g. SPI bus identification, mutexes, etc.)
- `NULL`: driver initialization failed

esp_err_t (***deinit**)(void *spi_ctx)

Custom driver De-initialization.

Param spi_ctx [in] a pointer to driver specific context structure

Return

- ESP_OK: driver de-initialization was successful
- ESP_FAIL: driver de-initialization failed
- any other failure codes are allowed to be used to provide failure isolation

esp_err_t (***read**)(void *spi_ctx, uint32_t cmd, uint32_t addr, void *data, uint32_t data_len)

Custom driver SPI read.

备注: The read function is responsible to construct command, address and data fields of the SPI frame in format expected by particular SPI Ethernet module

Param spi_ctx [in] a pointer to driver specific context structure

Param cmd [in] command

Param addr [in] register address

Param data [out] read data

Param data_len [in] read data length in bytes

Return

- ESP_OK: read was successful
- ESP_FAIL: read failed
- any other failure codes are allowed to be used to provide failure isolation

esp_err_t (***write**)(void *spi_ctx, uint32_t cmd, uint32_t addr, const void *data, uint32_t data_len)

Custom driver SPI write.

备注: The write function is responsible to construct command, address and data fields of the SPI frame in format expected by particular SPI Ethernet module

Param spi_ctx [in] a pointer to driver specific context structure

Param cmd [in] command

Param addr [in] register address

Param data [in] data to write

Param data_len [in] length of data to write in bytes

Return

- ESP_OK: write was successful
- ESP_FAIL: write failed
- any other failure codes are allowed to be used to provide failure isolation

Macros

ETH_DEFAULT_SPI

Default configuration of the custom SPI driver. Internal ESP-IDF SPI Master driver is used by default.

Header File

- [components/esp_eth/include/esp_eth_phy.h](#)
- This header file can be included with:

```
#include "esp_eth_phy.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

Functions

`esp_eth_phy_t *esp_eth_phy_new_ip101` (const `eth_phy_config_t *config`)

Create a PHY instance of IP101.

参数 `config` -- [in] configuration of PHY

返回

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

`esp_eth_phy_t *esp_eth_phy_new_rt18201` (const `eth_phy_config_t *config`)

Create a PHY instance of RTL8201.

参数 `config` -- [in] configuration of PHY

返回

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

`esp_eth_phy_t *esp_eth_phy_new_lan87xx` (const `eth_phy_config_t *config`)

Create a PHY instance of LAN87xx.

参数 `config` -- [in] configuration of PHY

返回

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

`esp_eth_phy_t *esp_eth_phy_new_dp83848` (const `eth_phy_config_t *config`)

Create a PHY instance of DP83848.

参数 `config` -- [in] configuration of PHY

返回

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

`esp_eth_phy_t *esp_eth_phy_new_ksz80xx` (const `eth_phy_config_t *config`)

Create a PHY instance of KSZ80xx.

The phy model from the KSZ80xx series is detected automatically. If the driver is unable to detect a supported model, `NULL` is returned.

Currently, the following models are supported: KSZ8001, KSZ8021, KSZ8031, KSZ8041, KSZ8051, KSZ8061, KSZ8081, KSZ8091

参数 `config` -- [in] configuration of PHY

返回

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Structures

struct `esp_eth_phy_s`

Ethernet PHY.

Public Members

esp_err_t (***set_mediator**)(*esp_eth_phy_t* *phy, *esp_eth_mediator_t* *mediator)

Set mediator for PHY.

Param phy [in] Ethernet PHY instance

Param mediator [in] mediator of Ethernet driver

Return

- ESP_OK: set mediator for Ethernet PHY instance successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

esp_err_t (***reset**)(*esp_eth_phy_t* *phy)

Software Reset Ethernet PHY.

Param phy [in] Ethernet PHY instance

Return

- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

esp_err_t (***reset_hw**)(*esp_eth_phy_t* *phy)

Hardware Reset Ethernet PHY.

备注: Hardware reset is mostly done by pull down and up PHY's nRST pin

Param phy [in] Ethernet PHY instance

Return

- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

esp_err_t (***init**)(*esp_eth_phy_t* *phy)

Initialize Ethernet PHY.

Param phy [in] Ethernet PHY instance

Return

- ESP_OK: initialize Ethernet PHY successfully
- ESP_FAIL: initialize Ethernet PHY failed because some error occurred

esp_err_t (***deinit**)(*esp_eth_phy_t* *phy)

Deinitialize Ethernet PHY.

Param phy [in] Ethernet PHY instance

Return

- ESP_OK: deinitialize Ethernet PHY successfully
- ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

esp_err_t (***autonego_ctrl**)(*esp_eth_phy_t* *phy, *eth_phy_autoneg_cmd_t* cmd, bool *autonego_en_stat)

Configure auto negotiation.

Param phy [in] Ethernet PHY instance

Param cmd [in] Configuration command, it is possible to Enable (restart), Disable or get current status of PHY auto negotiation

Param autonego_en_stat [out] Address where to store current status of auto negotiation configuration

Return

- ESP_OK: restart auto negotiation successfully
- ESP_FAIL: restart auto negotiation failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid command

esp_err_t (***get_link**)(*esp_eth_phy_t* *phy)

Get Ethernet PHY link status.

Param phy [in] Ethernet PHY instance

Return

- ESP_OK: get Ethernet PHY link status successfully
- ESP_FAIL: get Ethernet PHY link status failed because some error occurred

esp_err_t (***set_link**)(*esp_eth_phy_t* *phy, *eth_link_t* link)

Set Ethernet PHY link status.

Param phy [in] Ethernet PHY instance

Param link [in] new link status

Return

- ESP_OK: set Ethernet PHY link status successfully
- ESP_FAIL: set Ethernet PHY link status failed because some error occurred

esp_err_t (***pwrcctl**)(*esp_eth_phy_t* *phy, bool enable)

Power control of Ethernet PHY.

Param phy [in] Ethernet PHY instance

Param enable [in] set true to power on Ethernet PHY; ser false to power off Ethernet PHY

Return

- ESP_OK: control Ethernet PHY power successfully
- ESP_FAIL: control Ethernet PHY power failed because some error occurred

esp_err_t (***set_addr**)(*esp_eth_phy_t* *phy, uint32_t addr)

Set PHY chip address.

Param phy [in] Ethernet PHY instance

Param addr [in] PHY chip address

Return

- ESP_OK: set Ethernet PHY address successfully
- ESP_FAIL: set Ethernet PHY address failed because some error occurred

esp_err_t (***get_addr**)(*esp_eth_phy_t* *phy, uint32_t *addr)

Get PHY chip address.

Param phy [in] Ethernet PHY instance

Param addr [out] PHY chip address

Return

- ESP_OK: get Ethernet PHY address successfully
- ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument

esp_err_t (***advertise_pause_ability**)(*esp_eth_phy_t* *phy, uint32_t ability)

Advertise pause function supported by MAC layer.

Param phy [in] Ethernet PHY instance

Param addr [out] Pause ability

Return

- ESP_OK: Advertise pause ability successfully
- ESP_ERR_INVALID_ARG: Advertise pause ability failed because of invalid argument

esp_err_t (***loopback**)(*esp_eth_phy_t* *phy, bool enable)

Sets the PHY to loopback mode.

Param phy [in] Ethernet PHY instance

Param enable [in] enables or disables PHY loopback

Return

- ESP_OK: PHY instance loopback mode has been configured successfully
- ESP_FAIL: PHY instance loopback configuration failed because some error occurred

esp_err_t (***set_speed**)(*esp_eth_phy_t* *phy, *eth_speed_t* speed)

Sets PHY speed mode.

备注: Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

Param phy [in] Ethernet PHY instance

Param speed [in] Speed mode to be set

Return

- ESP_OK: PHY instance speed mode has been configured successfully
- ESP_FAIL: PHY instance speed mode configuration failed because some error occurred

esp_err_t (***set_duplex**)(*esp_eth_phy_t* *phy, *eth_duplex_t* duplex)

Sets PHY duplex mode.

备注: Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

Param phy [in] Ethernet PHY instance

Param duplex [in] Duplex mode to be set

Return

- ESP_OK: PHY instance duplex mode has been configured successfully
- ESP_FAIL: PHY instance duplex mode configuration failed because some error occurred

esp_err_t (***custom_ioctl**)(*esp_eth_phy_t* *phy, int cmd, void *data)

Custom IO function of PHY driver. This function is intended to extend common options of *esp_eth_ioctl* to cover specifics of PHY chip.

备注: This function may not be assigned when the PHY chip supports only most common set of configuration options.

Param phy [in] Ethernet PHY instance

Param cmd [in] IO control command

Param data [inout] address of data for *set* command or address where to store the data when used with *get* command

Return

- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

esp_err_t (*del)(*esp_eth_phy_t* *phy)

Free memory of Ethernet PHY instance.

Param phy [in] Ethernet PHY instance

Return

- ESP_OK: free PHY instance successfully
- ESP_FAIL: free PHY instance failed because some error occurred

struct **eth_phy_config_t**

Ethernet PHY configuration.

Public Members

int32_t **phy_addr**

PHY address, set -1 to enable PHY address detection at initialization stage

uint32_t **reset_timeout_ms**

Reset timeout value (Unit: ms)

uint32_t **autonego_timeout_ms**

Auto-negotiation timeout value (Unit: ms)

int **reset_gpio_num**

Reset GPIO number, -1 means no hardware reset

Macros

ESP_ETH_PHY_ADDR_AUTO

ETH_PHY_DEFAULT_CONFIG ()

Default configuration for Ethernet PHY object.

Type Definitions

typedef struct *esp_eth_phy_s* **esp_eth_phy_t**

Ethernet PHY.

Enumerations

enum **eth_phy_autoneg_cmd_t**

Auto-negotiation control commands.

Values:

enumerator **ESP_ETH_PHY_AUTONEGO_RESTART**

enumerator **ESP_ETH_PHY_AUTONEGO_EN**

enumerator **ESP_ETH_PHY_AUTONEGO_DIS**

enumerator **ESP_ETH_PHY_AUTONEGO_G_STAT**

Header File

- `components/esp_eth/include/esp_eth_phy_802_3.h`
- This header file can be included with:

```
#include "esp_eth_phy_802_3.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

Functions

`esp_err_t esp_eth_phy_802_3_set_mediator` (`phy_802_3_t *phy_802_3`, `esp_eth_mediator_t *eth`)

Set Ethernet mediator.

参数

- **phy_802_3** -- IEEE 802.3 PHY object infostructure
- **eth** -- Ethernet mediator pointer

返回

- `ESP_OK`: Ethernet mediator set successfully
- `ESP_ERR_INVALID_ARG`: if `eth` is `NULL`

`esp_err_t esp_eth_phy_802_3_reset` (`phy_802_3_t *phy_802_3`)

Reset PHY.

参数 **phy_802_3** -- IEEE 802.3 PHY object infostructure

返回

- `ESP_OK`: Ethernet PHY reset successfully
- `ESP_FAIL`: reset Ethernet PHY failed because some error occurred

`esp_err_t esp_eth_phy_802_3_autonego_ctrl` (`phy_802_3_t *phy_802_3`, `eth_phy_autonego_cmd_t cmd`, `bool *autonego_en_stat`)

Control autonegotiation mode of Ethernet PHY.

参数

- **phy_802_3** -- IEEE 802.3 PHY object infostructure
- **cmd** -- autonegotiation command enumeration
- **autonego_en_stat** -- [out] autonegotiation enabled flag

返回

- `ESP_OK`: Ethernet PHY autonegotiation configured successfully
- `ESP_FAIL`: Ethernet PHY autonegotiation configuration fail because some error occurred
- `ESP_ERR_INVALID_ARG`: invalid value of `cmd`

`esp_err_t esp_eth_phy_802_3_pwrctl` (`phy_802_3_t *phy_802_3`, `bool enable`)

Power control of Ethernet PHY.

参数

- **phy_802_3** -- IEEE 802.3 PHY object infostructure
- **enable** -- set true to power ON Ethernet PHY; set false to power OFF Ethernet PHY

返回

- `ESP_OK`: Ethernet PHY power down mode set successfully
- `ESP_FAIL`: Ethernet PHY power up or power down failed because some error occurred

`esp_err_t esp_eth_phy_802_3_set_addr` (`phy_802_3_t *phy_802_3`, `uint32_t addr`)

Set Ethernet PHY address.

参数

- **phy_802_3** -- IEEE 802.3 PHY object infostructure

- **addr** -- new PHY address
- 返回
- ESP_OK: Ethernet PHY address set

esp_err_t **esp_eth_phy_802_3_get_addr** (*phy_802_3_t* *phy_802_3, uint32_t *addr)

Get Ethernet PHY address.

参数

- **phy_802_3** -- IEEE 802.3 PHY object infostructure
- **addr** -- [out] Ethernet PHY address

返回

- ESP_OK: Ethernet PHY address read successfully
- ESP_ERR_INVALID_ARG: addr pointer is NULL

esp_err_t **esp_eth_phy_802_3_advertise_pause_ability** (*phy_802_3_t* *phy_802_3, uint32_t ability)

Advertise pause function ability.

参数

- **phy_802_3** -- IEEE 802.3 PHY object infostructure
- **ability** -- enable or disable pause ability

返回

- ESP_OK: pause ability set successfully
- ESP_FAIL: Advertise pause function ability failed because some error occurred

esp_err_t **esp_eth_phy_802_3_loopback** (*phy_802_3_t* *phy_802_3, bool enable)

Set Ethernet PHY loopback mode.

参数

- **phy_802_3** -- IEEE 802.3 PHY object infostructure
- **enable** -- set true to enable loopback; set false to disable loopback

返回

- ESP_OK: Ethernet PHY loopback mode set successfully
- ESP_FAIL: Ethernet PHY loopback configuration failed because some error occurred

esp_err_t **esp_eth_phy_802_3_set_speed** (*phy_802_3_t* *phy_802_3, *eth_speed_t* speed)

Set Ethernet PHY speed.

参数

- **phy_802_3** -- IEEE 802.3 PHY object infostructure
- **speed** -- new speed of Ethernet PHY link

返回

- ESP_OK: Ethernet PHY speed set successfully
- ESP_FAIL: Set Ethernet PHY speed failed because some error occurred

esp_err_t **esp_eth_phy_802_3_set_duplex** (*phy_802_3_t* *phy_802_3, *eth_duplex_t* duplex)

Set Ethernet PHY duplex mode.

参数

- **phy_802_3** -- IEEE 802.3 PHY object infostructure
- **duplex** -- new duplex mode for Ethernet PHY link

返回

- ESP_OK: Ethernet PHY duplex mode set successfully
- ESP_ERR_INVALID_STATE: unable to set duplex mode to Half if loopback is enabled
- ESP_FAIL: Set Ethernet PHY duplex mode failed because some error occurred

esp_err_t **esp_eth_phy_802_3_set_link** (*phy_802_3_t* *phy_802_3, *eth_link_t* link)

Set Ethernet PHY link status.

参数

- **phy_802_3** -- IEEE 802.3 PHY object infostructure
- **link** -- new link status

返回

- ESP_OK: Ethernet PHY link set successfully

esp_err_t **esp_eth_phy_802_3_init** (*phy_802_3_t* *phy_802_3)

Initialize Ethernet PHY.

参数 **phy_802_3** -- IEEE 802.3 PHY object infostructure
返回

- ESP_OK: Ethernet PHY initialized successfully

esp_err_t **esp_eth_phy_802_3_deinit** (*phy_802_3_t* *phy_802_3)

Power off Ethernet PHY.

参数 **phy_802_3** -- IEEE 802.3 PHY object infostructure
返回

- ESP_OK: Ethernet PHY powered off successfully

esp_err_t **esp_eth_phy_802_3_del** (*phy_802_3_t* *phy_802_3)

Delete Ethernet PHY infostructure.

参数 **phy_802_3** -- IEEE 802.3 PHY object infostructure
返回

- ESP_OK: Ethernet PHY infostructure deleted

esp_err_t **esp_eth_phy_802_3_reset_hw** (*phy_802_3_t* *phy_802_3, uint32_t reset_assert_us)

Performs hardware reset with specific reset pin assertion time.

参数

- **phy_802_3** -- IEEE 802.3 PHY object infostructure
- **reset_assert_us** -- Hardware reset pin assertion time

返回

- ESP_OK: reset Ethernet PHY successfully

esp_err_t **esp_eth_phy_802_3_detect_phy_addr** (*esp_eth_mediator_t* *eth, int *detected_addr)

Detect PHY address.

参数

- **eth** -- Mediator of Ethernet driver
- **detected_addr** -- [out] a valid address after detection

返回

- ESP_OK: detect phy address successfully
- ESP_ERR_INVALID_ARG: invalid parameter
- ESP_ERR_NOT_FOUND: can't detect any PHY device
- ESP_FAIL: detect phy address failed because some error occurred

esp_err_t **esp_eth_phy_802_3_basic_phy_init** (*phy_802_3_t* *phy_802_3)

Performs basic PHY chip initialization.

备注: It should be called as the first function in PHY specific driver instance

参数 **phy_802_3** -- IEEE 802.3 PHY object infostructure
返回

- ESP_OK: initialized Ethernet PHY successfully
- ESP_FAIL: initialization of Ethernet PHY failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: PHY device not detected
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

esp_err_t **esp_eth_phy_802_3_basic_phy_deinit** (*phy_802_3_t* *phy_802_3)

Performs basic PHY chip de-initialization.

备注: It should be called as the last function in PHY specific driver instance

参数 *phy_802_3* -- IEEE 802.3 PHY object infostructure

返回

- **ESP_OK**: de-initialized Ethernet PHY successfully
- **ESP_FAIL**: de-initialization of Ethernet PHY failed because some error occurred
- **ESP_ERR_TIMEOUT**: MII Management read/write operation timeout
- **ESP_ERR_INVALID_STATE**: PHY is in invalid state to perform requested operation

esp_err_t **esp_eth_phy_802_3_read_oui** (*phy_802_3_t* *phy_802_3, uint32_t *oui)

Reads raw content of OUI field.

参数

- **phy_802_3** -- IEEE 802.3 PHY object infostructure
- **oui** -- **[out]** OUI value

返回

- **ESP_OK**: OUI field read successfully
- **ESP_FAIL**: OUI field read failed because some error occurred
- **ESP_ERR_INVALID_ARG**: invalid *oui* argument
- **ESP_ERR_TIMEOUT**: MII Management read/write operation timeout
- **ESP_ERR_INVALID_STATE**: PHY is in invalid state to perform requested operation

esp_err_t **esp_eth_phy_802_3_read_manufac_info** (*phy_802_3_t* *phy_802_3, uint8_t *model, uint8_t *rev)

Reads manufacturer's model and revision number.

参数

- **phy_802_3** -- IEEE 802.3 PHY object infostructure
- **model** -- **[out]** Manufacturer's model number (can be NULL when not required)
- **rev** -- **[out]** Manufacturer's revision number (can be NULL when not required)

返回

- **ESP_OK**: Manufacturer's info read successfully
- **ESP_FAIL**: Manufacturer's info read failed because some error occurred
- **ESP_ERR_TIMEOUT**: MII Management read/write operation timeout
- **ESP_ERR_INVALID_STATE**: PHY is in invalid state to perform requested operation

esp_err_t **esp_eth_phy_802_3_get_mmd_addr** (*phy_802_3_t* *phy_802_3, uint8_t devaddr, uint16_t *mmd_addr)

Reads MDIO device's internal address register.

参数

- **phy_802_3** -- IEEE 802.3 PHY object infostructure
- **devaddr** -- Address of MDIO device
- **mmd_addr** -- **[out]** Current address stored in device's register

返回

- **ESP_OK**: Address register read successfully
- **ESP_FAIL**: Address register read failed because of some error occurred
- **ESP_ERR_INVALID_ARG**: Device address provided is out of range (hardware limits device address to 5 bits)

esp_err_t **esp_eth_phy_802_3_set_mmd_addr** (*phy_802_3_t* *phy_802_3, uint8_t devaddr, uint16_t mmd_addr)

Write to DIO device's internal address register.

参数

- **phy_802_3** -- IEEE 802.3 PHY object infostructure

- **devaddr** -- Address of MDIO device
- **mmd_addr** -- [out] New value of MDIO device's address register value

返回

- ESP_OK: Address register written to successfully
- ESP_FAIL: Address register write failed because of some error occurred
- ESP_ERR_INVALID_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

esp_err_t **esp_eth_phy_802_3_read_mmd_data** (*phy_802_3_t* *phy_802_3, uint8_t devaddr, *esp_eth_phy_802_3_mmd_func_t* function, uint32_t *data)

Read data of MDIO device's memory at address register.

参数

- **phy_802_3** -- IEEE 802.3 PHY object infostructure
- **devaddr** -- Address of MDIO device
- **function** -- MMD function
- **data** -- [out] Data read from the device's memory

返回

- ESP_OK: Memory read successfully
- ESP_FAIL: Memory read failed because of some error occurred
- ESP_ERR_INVALID_ARG: Device address provided is out of range (hardware limits device address to 5 bits) or MMD access function is invalid

esp_err_t **esp_eth_phy_802_3_write_mmd_data** (*phy_802_3_t* *phy_802_3, uint8_t devaddr, *esp_eth_phy_802_3_mmd_func_t* function, uint32_t data)

Write data to MDIO device's memory at address register.

参数

- **phy_802_3** -- IEEE 802.3 PHY object infostructure
- **devaddr** -- Address of MDIO device
- **function** -- MMD function
- **data** -- [out] Data to write to the device's memory

返回

- ESP_OK: Memory written successfully
- ESP_FAIL: Memory write failed because of some error occurred
- ESP_ERR_INVALID_ARG: Device address provided is out of range (hardware limits device address to 5 bits) or MMD access function is invalid

esp_err_t **esp_eth_phy_802_3_read_mmd_register** (*phy_802_3_t* *phy_802_3, uint8_t devaddr, uint16_t mmd_addr, uint32_t *data)

Set MMD address to mmd_addr with function MMD_FUNC_NOINCR and read contents to *data.

参数

- **phy_802_3** -- IEEE 802.3 PHY object infostructure
- **devaddr** -- Address of MDIO device
- **mmd_addr** -- Address of MDIO device register
- **data** -- [out] Data read from the device's memory

返回

- ESP_OK: Memory read successfully
- ESP_FAIL: Memory read failed because of some error occurred
- ESP_ERR_INVALID_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

esp_err_t **esp_eth_phy_802_3_write_mmd_register** (*phy_802_3_t* *phy_802_3, uint8_t devaddr, uint16_t mmd_addr, uint32_t data)

Set MMD address to mmd_addr with function MMD_FUNC_NOINCR and write data.

参数

- **phy_802_3** -- IEEE 802.3 PHY object infostructure

- **devaddr** -- Address of MDIO device
- **mmd_addr** -- Address of MDIO device register
- **data** -- [out] Data to write to the device's memory

返回

- ESP_OK: Memory written to successfully
- ESP_FAIL: Memory write failed because of some error occurred
- ESP_ERR_INVALID_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

inline *phy_802_3_t* ***esp_eth_phy_into_phy_802_3** (*esp_eth_phy_t* *phy)

Returns address to parent IEEE 802.3 PHY object infostructure.

参数 *phy* -- Ethernet PHY instance

返回 *phy_802_3_t**

- address to parent IEEE 802.3 PHY object infostructure

esp_err_t **esp_eth_phy_802_3_obj_config_init** (*phy_802_3_t* *phy_802_3, const *eth_phy_config_t* *config)

Initializes configuration of parent IEEE 802.3 PHY object infostructure.

参数

- **phy_802_3** -- Address to IEEE 802.3 PHY object infostructure
- **config** -- Configuration of the IEEE 802.3 PHY object

返回

- ESP_OK: configuration initialized successfully
- ESP_ERR_INVALID_ARG: invalid `config` argument

Structures

struct **phy_802_3_t**

IEEE 802.3 PHY object infostructure.

Public Members

esp_eth_phy_t **parent**

Parent Ethernet PHY instance

esp_eth_mediator_t ***eth**

Mediator of Ethernet driver

int **addr**

PHY address

uint32_t **reset_timeout_ms**

Reset timeout value (Unit: ms)

uint32_t **autonego_timeout_ms**

Auto-negotiation timeout value (Unit: ms)

eth_link_t **link_status**

Current Link status

int **reset_gpio_num**

Reset GPIO number, -1 means no hardware reset

Enumerations

enum **esp_eth_phy_802_3_mmd_func_t**

IEEE 802.3 MMD modes enumeration.

Values:

enumerator **MMD_FUNC_ADDRESS**

enumerator **MMD_FUNC_DATA_NOINCR**

enumerator **MMD_FUNC_DATA_RWINCR**

enumerator **MMD_FUNC_DATA_WINCR**

Header File

- [components/esp_eth/include/esp_eth_netif_glue.h](#)
- This header file can be included with:

```
#include "esp_eth_netif_glue.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

Functions

esp_eth_netif_glue_handle_t **esp_eth_new_netif_glue** (*esp_eth_handle_t* eth_hdl)

Create a netif glue for Ethernet driver.

备注: netif glue is used to attach io driver to TCP/IP netif

参数 `eth_hdl` -- Ethernet driver handle

返回 glue object, which inherits `esp_netif_driver_base_t`

esp_err_t **esp_eth_del_netif_glue** (*esp_eth_netif_glue_handle_t* eth_netif_glue)

Delete netif glue of Ethernet driver.

参数 `eth_netif_glue` -- netif glue

返回 `-ESP_OK`: delete netif glue successfully

Type Definitions

typedef struct esp_eth_netif_glue_t ***esp_eth_netif_glue_handle_t**

Handle of netif glue - an intermediate layer between netif and Ethernet driver.
本部分的以太网 API 示例代码存放在 ESP-IDF 示例项目的 [ethernet](#) 目录下。

2.4.2 Thread

Thread

概述 Thread 是一个基于 IP 的网状网络协议，它基于 802.15.4 物理层和 MAC 层。

应用示例 ESP-IDF 示例目录 `openthread` 包含以下应用程序：

- OpenThread 交互 shell: `openthread/ot_cli`
- 边界路由器 (Thread Border Router): `openthread/ot_br`
- Thread 无线电协处理器 (Thread Radio Co-Processor): `openthread/ot_rcp`

API 参考 应使用 OpenThread API 操作 Thread 网络。请参考 [OpenThread API 文档](#)。

ESP-IDF 提供额外的 API，用于启动和管理 OpenThread 实现执行网络接口绑定和边界路由功能。

Header File

- `components/openthread/include/esp_openthread.h`
- This header file can be included with:

```
#include "esp_openthread.h"
```

- This header file is a part of the API provided by the `openthread` component. To declare that your component depends on `openthread`, add the following to your `CMakeLists.txt`:

```
REQUIRES openthread
```

or

```
PRIV_REQUIRES openthread
```

Functions

`esp_err_t esp_openthread_init` (const `esp_openthread_platform_config_t` *init_config)

Initializes the full OpenThread stack.

备注: The OpenThread instance will also be initialized in this function.

参数 `init_config` -- **[in]** The initialization configuration.

返回

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_ARG if radio or host connection mode not supported
- ESP_ERR_INVALID_STATE if already initialized

`esp_err_t esp_openthread_auto_start` (otOperationalDatasetTlvs *datasetTlvs)

Starts the Thread protocol operation and attaches to a Thread network.

参数 `datasetTlvs` -- **[in]** The operational dataset (TLV encoded), if it's NULL, the function will generate the dataset based on the configurations from `kconfig`.

返回

- ESP_OK on success
- ESP_FAIL on failures

esp_err_t **esp_openthread_launch_mainloop** (void)

Launches the OpenThread main loop.

备注: This function will not return unless error happens when running the OpenThread stack.

返回

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_FAIL on other failures

esp_err_t **esp_openthread_deinit** (void)

This function performs OpenThread stack and platform driver deinitialization.

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized

otInstance ***esp_openthread_get_instance** (void)

This function acquires the underlying OpenThread instance.

备注: This function can be called on other tasks without lock.

返回 The OpenThread instance pointer

Header File

- [components/openthread/include/esp_openthread_types.h](#)
- This header file can be included with:

```
#include "esp_openthread_types.h"
```

- This header file is a part of the API provided by the `openthread` component. To declare that your component depends on `openthread`, add the following to your `CMakeLists.txt`:

```
REQUIRES openthread
```

or

```
PRIV_REQUIRES openthread
```

Structures

struct **esp_openthread_role_changed_event_t**

OpenThread role changed event data.

Public Members

otDeviceRole **previous_role**

Previous Thread role

otDeviceRole **current_role**

Current Thread role

struct **esp_openthread_mainloop_context_t**

This structure represents a context for a select() based mainloop.

Public Members

fd_set **read_fds**

The read file descriptors

fd_set **write_fds**

The write file descriptors

fd_set **error_fds**

The error file descriptors

int **max_fd**

The max file descriptor

struct timeval **timeout**

The timeout

struct **esp_openthread_uart_config_t**

The uart port config for OpenThread.

Public Members

uart_port_t **port**

UART port number

uart_config_t **uart_config**

UART configuration, see *uart_config_t* docs

gpio_num_t **rx_pin**

UART RX pin

gpio_num_t **tx_pin**

UART TX pin

struct **esp_openthread_spi_host_config_t**

The spi port config for OpenThread.

Public Members

spi_host_device_t **host_device**

SPI host device

spi_dma_chan_t **dma_channel**

DMA channel

spi_bus_config_t **spi_interface**

SPI bus

spi_device_interface_config_t **spi_device**

SPI peripheral device

gpio_num_t **intr_pin**

SPI interrupt pin

struct **esp_openthread_spi_slave_config_t**

The spi slave config for OpenThread.

Public Members

spi_host_device_t **host_device**

SPI host device

spi_bus_config_t **bus_config**

SPI bus config

spi_slave_interface_config_t **slave_config**

SPI slave config

gpio_num_t **intr_pin**

SPI interrupt pin

struct **esp_openthread_radio_config_t**

The OpenThread radio configuration.

Public Members

esp_openthread_radio_mode_t **radio_mode**

The radio mode

esp_openthread_uart_config_t **radio_uart_config**

The uart configuration to RCP

esp_openthread_spi_host_config_t **radio_spi_config**

The spi configuration to RCP

struct **esp_openthread_host_connection_config_t**

The OpenThread host connection configuration.

Public Members

esp_openthread_host_connection_mode_t **host_connection_mode**

The host connection mode

esp_openthread_uart_config_t **host_uart_config**

The uart configuration to host

usb_serial_jtag_driver_config_t **host_usb_config**

The usb configuration to host

esp_openthread_spi_slave_config_t **spi_slave_config**

The spi configuration to host

struct **esp_openthread_port_config_t**

The OpenThread port specific configuration.

Public Members

const char ***storage_partition_name**

The partition for storing OpenThread dataset

uint8_t **netif_queue_size**

The packet queue size for the network interface

uint8_t **task_queue_size**

The task queue size

struct **esp_openthread_platform_config_t**

The OpenThread platform configuration.

Public Members

esp_openthread_radio_config_t **radio_config**

The radio configuration

esp_openthread_host_connection_config_t **host_config**

The host connection configuration

esp_openthread_port_config_t **port_config**

The port configuration

Type Definitions

typedef void (***esp_openthread_rcp_failure_handler**)(void)

Enumerations

enum **esp_openthread_event_t**

OpenThread event declarations.

Values:

enumerator **OPENTHREAD_EVENT_START**

OpenThread stack start

enumerator **OPENTHREAD_EVENT_STOP**

OpenThread stack stop

enumerator **OPENTHREAD_EVENT_DETACHED**

OpenThread detached

enumerator **OPENTHREAD_EVENT_ATTACHED**

OpenThread attached

enumerator **OPENTHREAD_EVENT_ROLE_CHANGED**

OpenThread role changed

enumerator **OPENTHREAD_EVENT_IF_UP**

OpenThread network interface up

enumerator **OPENTHREAD_EVENT_IF_DOWN**

OpenThread network interface down

enumerator **OPENTHREAD_EVENT_GOT_IP6**

OpenThread stack added IPv6 address

enumerator **OPENTHREAD_EVENT_LOST_IP6**

OpenThread stack removed IPv6 address

enumerator **OPENTHREAD_EVENT_MULTICAST_GROUP_JOIN**

OpenThread stack joined IPv6 multicast group

enumerator **OPENTHREAD_EVENT_MULTICAST_GROUP_LEAVE**

OpenThread stack left IPv6 multicast group

enumerator **OPENTHREAD_EVENT_TREL_ADD_IP6**

OpenThread stack added TREL IPv6 address

enumerator **OPENTHREAD_EVENT_TREL_REMOVE_IP6**

OpenThread stack removed TREL IPv6 address

enumerator **OPENTHREAD_EVENT_TREL_MULTICAST_GROUP_JOIN**

OpenThread stack joined TREL IPv6 multicast group

enumerator **OPENTHREAD_EVENT_SET_DNS_SERVER**

OpenThread stack set DNS server >

enumerator **OPENTHREAD_EVENT_PUBLISH_MESHCOPE**

OpenThread stack start to publish meshcop-e service >

enumerator **OPENTHREAD_EVENT_REMOVE_MESHCOPE**

OpenThread stack start to remove meshcop-e service >

enum **esp_openthread_radio_mode_t**

The radio mode of OpenThread.

Values:

enumerator **RADIO_MODE_NATIVE**

Use the native 15.4 radio

enumerator **RADIO_MODE_UART_RCP**

UART connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO_MODE_SPI_RCP**

SPI connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO_MODE_MAX**

Using for parameter check

enum **esp_openthread_host_connection_mode_t**

How OpenThread connects to the host.

Values:

enumerator **HOST_CONNECTION_MODE_NONE**

Disable host connection

enumerator **HOST_CONNECTION_MODE_CLI_UART**

CLI UART connection to the host

enumerator **HOST_CONNECTION_MODE_CLI_USB**

CLI USB connection to the host

enumerator **HOST_CONNECTION_MODE_RCP_UART**

RCP UART connection to the host

enumerator **HOST_CONNECTION_MODE_RCP_SPI**

RCP SPI connection to the host

enumerator **HOST_CONNECTION_MODE_MAX**

Using for parameter check

Header File

- [components/openthread/include/esp_openthread_lock.h](#)
- This header file can be included with:

```
#include "esp_openthread_lock.h"
```

- This header file is a part of the API provided by the `openthread` component. To declare that your component depends on `openthread`, add the following to your `CMakeLists.txt`:

```
REQUIRES openthread
```

or

```
PRIV_REQUIRES openthread
```

Functions

esp_err_t **esp_openthread_lock_init** (void)

This function initializes the OpenThread API lock.

返回

- `ESP_OK` on success
- `ESP_ERR_NO_MEM` if allocation has failed
- `ESP_ERR_INVALID_STATE` if already initialized

void **esp_openthread_lock_deinit** (void)

This function deinitializes the OpenThread API lock.

bool **esp_openthread_lock_acquire** (TickType_t block_ticks)

This function acquires the OpenThread API lock.

备注: Every OpenThread APIs that takes an `otInstance` argument MUST be protected with this API lock except that the call site is in OpenThread callbacks.

参数 `block_ticks` -- [in] The maximum number of RTOS ticks to wait for the lock.

返回

- True on lock acquired
- False on failing to acquire the lock with the timeout.

void **esp_openthread_lock_release** (void)

This function releases the OpenThread API lock.

bool **esp_openthread_task_switching_lock_acquire** (TickType_t block_ticks)

This function acquires the OpenThread API task switching lock.

备注: In OpenThread API context, it waits for some actions to be done in other tasks (like lwip), after task switching, it needs to call OpenThread API again. Normally it's not allowed, since the previous OpenThread API lock is not released yet. This task_switching lock allows the OpenThread API can be called in this case.

备注: Please use `esp_openthread_lock_acquire()` for normal cases.

参数 `block_ticks` -- [in] The maximum number of RTOS ticks to wait for the lock.

返回

- True on lock acquired
- False on failing to acquire the lock with the timeout.

void **esp_openthread_task_switching_lock_release** (void)

This function releases the OpenThread API task switching lock.

备注: This API must be called after `esp_openthread_task_switching_lock_acquire` or `esp_openthread_lock_acquire` and will cause a crash if the current task is not the task switching lock holder. This error could be caused by calling OpenThread APIs without locking OpenThread stack.

Header File

- `components/openthread/include/esp_openthread_netif_glue.h`
- This header file can be included with:

```
#include "esp_openthread_netif_glue.h"
```

- This header file is a part of the API provided by the `openthread` component. To declare that your component depends on `openthread`, add the following to your `CMakeLists.txt`:

```
REQUIRES openthread
```

or

```
PRIV_REQUIRES openthread
```

Functions

void `*esp_openthread_netif_glue_init` (const `esp_openthread_platform_config_t` *config)

This function initializes the OpenThread network interface glue.

参数 `config` -- [in] The platform configuration.

返回

- glue pointer on success
- NULL on failure

void `esp_openthread_netif_glue_deinit` (void)

This function deinitializes the OpenThread network interface glue.

`esp_netif_t` *`esp_openthread_get_netif` (void)

This function acquires the OpenThread netif.

返回 The OpenThread netif or NULL if not initialized.

void `esp_openthread_register_meshcop_e_handler` (`esp_event_handler_t` handler, bool for_publish)

This function register a handler for meshcop-e service publish event and remove event.

参数

- **handler** -- [in] The handler.
- **for_publish** -- [in] The usage of handler, true for publish event and false for remove event.

Macros

`ESP_NETIF_INHERENT_DEFAULT_OPENTHREAD` ()

Default configuration reference of OpenThread esp-netif.

`ESP_NETIF_DEFAULT_OPENTHREAD` ()

Header File

- `components/openthread/include/esp_openthread_border_router.h`
- This header file can be included with:

```
#include "esp_openthread_border_router.h"
```

- This header file is a part of the API provided by the `openthread` component. To declare that your component depends on `openthread`, add the following to your `CMakeLists.txt`:

```
REQUIRES openthread
```

or

```
PRIV_REQUIRES openthread
```

Functions

void **esp_openthread_set_backbone_netif** (*esp_netif_t* *backbone_netif)

Sets the backbone interface used for border routing.

备注: This function must be called before `esp_openthread_init`

参数 `backbone_netif` -- [in] The backbone network interface (WiFi or ethernet)

esp_err_t **esp_openthread_border_router_init** (void)

Initializes the border router features of OpenThread.

备注: Calling this function will make the device behave as an OpenThread border router. Kconfig option `CONFIG_OPENTHREAD_BORDER_ROUTER` is required.

返回

- `ESP_OK` on success
- `ESP_ERR_NOT_SUPPORTED` if feature not supported
- `ESP_ERR_INVALID_STATE` if already initialized
- `ESP_FIAL` on other failures

esp_err_t **esp_openthread_border_router_deinit** (void)

Deinitializes the border router features of OpenThread.

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if not initialized
- `ESP_FIAL` on other failures

esp_netif_t ***esp_openthread_get_backbone_netif** (void)

Gets the backbone interface of OpenThread border router.

返回 The backbone interface or `NULL` if border router not initialized.

void **esp_openthread_register_rcp_failure_handler** (*esp_openthread_rcp_failure_handler* handler)

Registers the callback for RCP failure.

esp_err_t **esp_openthread_rcp_deinit** (void)

Deinitializes the connection to RCP.

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if fail to deinitialize RCP

esp_err_t **esp_openthread_rcp_init** (void)

Initializes the connection to RCP.

返回

- `ESP_OK` on success

- ESP_FAIL if fail to initialize RCP

`esp_err_t esp_openthread_set_meshcop_instance_name` (const char *instance_name)

Sets the meshcop(e) instance name.

备注: This function can only be called before `esp_openthread_border_router_init`. If `instance_name` is NULL, then the service will use the `hostname` as instance name.

参数 `instance_name` -- [in] The instance name, can be NULL.
返回

- ESP_OK on success
- ESP_FAIL if fail to initialize RCP

Thread 是一种基于 IPv6 的物联网网状网络技术。

本部分的 Thread API 示例代码存放在 ESP-IDF 示例项目的 `openthread` 目录下。

2.4.3 ESP-NETIF

ESP-NETIF

ESP-NETIF 库的作用主要体现在以下两方面：

- 在 TCP/IP 协议栈之上为应用程序提供抽象层，允许应用程序在 IP 栈间选择。
- 在底层 TCP/IP 协议栈 API 非线程安全的情况下，也能提供线程安全的 API。

ESP-IDF 目前只为 lwIP TCP/IP 协议栈实现了 ESP-NETIF。然而，该适配器本身不依赖特定 TCP/IP 实现，因而支持不同实现方式。

ESP-IDF 支持实现了 BSD API 的自定义 TCP/IP 协议栈。有关不使用 lwIP 时构建 ESP-IDF 的详细信息，请参阅 [components/esp_netif_stack/README.md](#)。

部分 ESP-NETIF 的 API 函数可以被应用程序直接调用，如：获取或设置接口 IP 地址、配置 DHCP 等。其他 ESP-NETIF 的 API 函数则供网络驱动层在 ESP-IDF 内部调用。

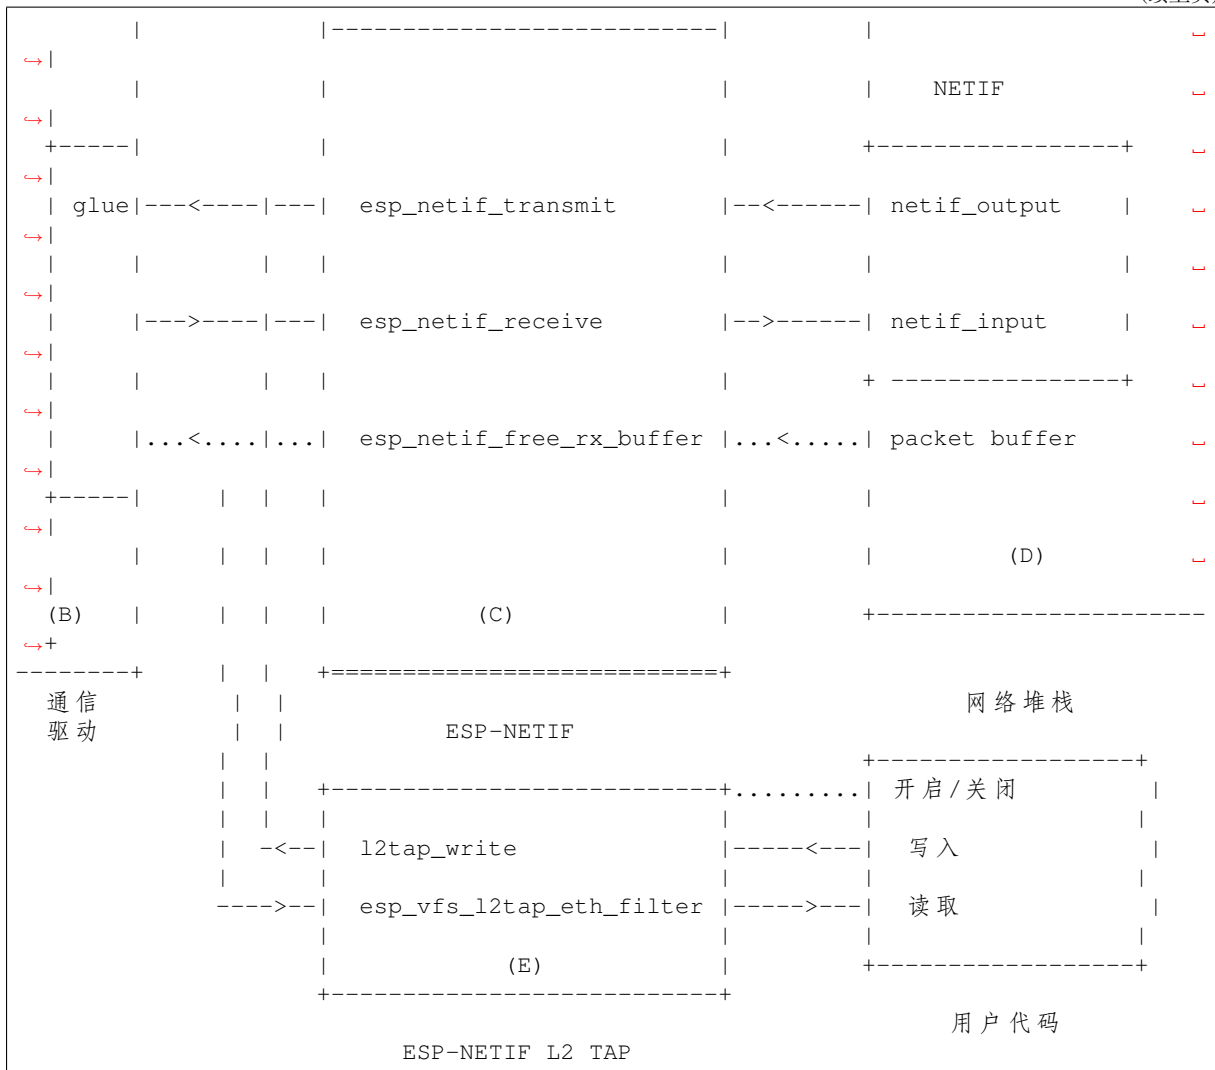

应用程序通常无需直接调用 ESP-NETIF 的 API，它们会由默认网络事件句柄调用。

ESP-NETIF 架构

(下页继续)

(续上页)

图中不同线段对应的数据流和事件流

- 从用户代码到 ESP-NETIF 和通信驱动的初始化线。
- --<---->-- 数据包在通信媒介与 TCP/IP 协议栈之间往返。
- ***** 聚集在 ESP-NETIF 中的事件传递到驱动程序、用户代码和网络堆栈中。
- | 用户设置及运行时间配置。

ESP-NETIF 交互

A) 用户代码样板 通过使用 ESP-NETIF API 抽象，应用程序与用于通信介质的特定 IO 驱动程序以及配置的 TCP/IP 网络栈之间的交互可以概括如下：

A) 初始化代码

- 1) 初始化 IO 驱动
- 2) 创建新的 ESP-NETIF 实例，并完成以下配置：
 - ESP-NETIF 的特定选项 (flags、行为、名称)
 - 网络栈堆选项 (netif init 和 input 函数，非公开信息)
 - IO 驱动的特定选项 (发送、释放 rx 缓冲区功能、IO 驱动句柄)
- 3) 将 IO 驱动句柄附加到上述步骤所创建的 ESP-NETIF 实例
- 4) 配置事件句柄

- 对 IO 驱动定义的公共接口使用默认句柄；或为定制的行为或新接口定义特定的句柄
- 为应用程序相关事件（如 IP 丢失或获取）注册句柄

B) 通过 ESP-NETIF API 与网络接口交互

- 1) 获取、设置 TCP/IP 相关参数（如 DHCP, IP 等）
- 2) 接收 IP 事件（连接或断连）
- 3) 控制应用程序生命周期（启用或禁用接口）

B) 通信驱动、IO 驱动和媒介驱动 对于 ESP-NETIF，通信驱动具有以下两个重要作用：

- 1) 事件句柄：定义与 ESP-NETIF 交互的行为模式（如：连接以太网 -> 开启 netif）
- 2) 胶合 IO 层：调整输入或输出函数以使用 ESP-NETIF 的传输、接收，并清空接收缓冲区
 - 给适当的 ESP-NETIF 对象安装 `driver_transmit`，以便将网络堆栈中传出的数据包传输给 IO 驱动
 - 调用函数 `esp_netif_receive()` 以便将传入的数据传输给网络堆栈

C) ESP-NETIF ESP-NETIF 是 IO 驱动和网络堆栈间的媒介，用于连通两者之间的数据包传输路径。它提供了一组接口，用于在运行时将驱动程序附加到 ESP-NETIF 对象并在编译期间配置网络堆栈。此外，ESP-NETIF 还提供了一组 API，用于控制网络接口的生命周期及其 TCP/IP 属性。ESP-NETIF 的公共接口大体上可以分为以下六组：

- 1) 初始化 API（用于创建并配置 ESP-NETIF 实例）
- 2) 输入或输出 API（用于在 IO 驱动和网络堆栈间传输数据）
- 3) 事件或行为 API
 - 管理网络接口生命周期
 - ESP-NETIF 为设计事件句柄提供了构建模块
- 4) 基本网络接口属性设置器和获取器 API
- 5) 网络堆栈抽象 API：实现用户与 TCP/IP 堆栈交互
 - 启用或禁用接口
 - DHCP 服务器和客户端 API
 - DNS API
 - [SNTP API](#)
- 6) 驱动转换工具 API

D) 网络堆栈 网络堆栈与应用程序代码在公共接口方面无公开交互，需通过 ESP-NETIF API 实现完全抽象。

E) ESP-NETIF L2 TAP 接口 ESP-NETIF L2 TAP 接口是 ESP-IDF 访问用户应用程序中的数据链路层 (OSI/ISO 中的 L2) 以进行帧接收和传输的机制。在嵌入式开发中，它通常用于实现非 IP 相关协议，如 PTP 和 Wake on LAN 等。请注意，目前 ESP-NETIF L2 TAP 接口仅支持以太网 (IEEE 802.3)。

使用 VFS 的文件描述符访问 ESP-NETIF L2 TAP 接口，VFS 文件描述符会提供类似文件的接口（调用 `open()`、`read()`、`write()` 等函数访问），详情请参阅[虚拟文件系统组件](#)。

ESP-NETIF 只提供一个 L2 TAP 接口设备（路径名），但由于 ESP-NETIF L2 TAP 接口也可作为第二层基础设施的通用入口点，因此可以同时打开多个不同配置的文件描述符。特定文件描述符的具体配置很关键，它可以配置为仅允许访问由 `if_key`（如 `ETH_DEF`）标识的特定网络接口，并根据帧类型（如 IEEE 802.3 中的以太网类型）过滤特定帧。由于 ESP-NETIF L2 TAP 需要与 IP 堆栈同时存在，因此不应将 IP 相关流量（IP、ARP 等）直接传递给用户应用程序，此时则需要通过配置过滤特定帧实现这一点。在未过滤的情况下，即使该选项仍可配置，也不建议在标准用例中使用。过滤的另一优势在于，过滤后，用户应用程序只能访问它感兴趣的帧类型，其余的流量会传递到其他 L2 TAP 文件描述符或 IP 堆栈。

ESP-NETIF L2 TAP 接口使用手册

初始化 要使用 ESP-NETIF L2 TAP 接口，需要首先通过 Kconfig 配置 `CONFIG_ESP_NETIF_L2_TAP` 启用接口，随后通过 `esp_vfs_l2tap_intf_register()` 注册。请在完成上述步骤后再使用 VFS 函数。

open() ESP-NETIF L2 TAP 注册完成后，可使用路径名 `"/dev/net/tap"` 访问。同一路径名最多可以被打开 `CONFIG_ESP_NETIF_L2_TAP_MAX_FDS` 次，多个具有不同配置的文件描述符可以访问数据链路层的各个帧。

ESP-NETIF L2 TAP 可以使用 `O_NONBLOCK` 文件状态标志打开，确保 `read()` 不会阻塞。请注意，在当前实现中，当访问网络接口时，由于网络接口被多个 ESP-NETIF L2 TAP 文件描述符和 IP 栈共享，且缺乏队列机制，因此 `write()` 可能会受阻塞。使用 `fcntl()` 检索和修改文件状态标志。

成功时，`open()` 返回新的文件描述符（非负整数）。出错时，返回 `-1`，并设置 `errno` 以标识错误。

ioctl() 由于新打开的 ESP-NETIF L2 TAP 文件描述符尚未绑定任意网络接口或配置任意帧类型过滤器，使用前，用户需通过以下选项完成配置：

- `L2TAP_S_INTF_DEVICE` - 将文件描述符绑定到特定网络接口的选项，该网络接口由其 `if_key` 标识。ESP-NETIF 网络接口的 `if_key` 作为第三个参数传输给 `ioctl()`。ESP-IDF 中，默认网络接口 `if_key` 的使用存放在 `esp_netif/include/esp_netif_defaults.h` 头文件中。
- `L2TAP_S_DEVICE_DRV_HNDL` - 将文件描述符绑定到特定网络接口的另一选项。此时，网络接口直接由其 IO 驱动句柄（例如以太网中的 `esp_eth_handle_t`）标识。IO 驱动句柄将作为第三个参数传输给 `ioctl()`。
- `L2TAP_S_RCV_FILTER` - 设置过滤器，将特定类型的帧传递到文件描述符。在以太网中，帧是基于长度和以太网类型字段过滤的。如果过滤器值设置为小于或等于 `0x05DC`，则将以太网类型字段视作 IEEE802.3 长度字段，并将该字段中所有值在 `<0, 0x05DC>` 区间内的帧传递到文件描述符中。随后，由用户应用程序执行 IEEE802.2 逻辑链路控制 (LLC) 的解析。如果过滤器值设置为大于 `0x05DC`，则将以太网类型字段视为代表协议标识，仅将与设置值相等的帧传递到文件描述符中。

上述配置选项都支持通过对应获取器选项读取当前配置。

警告： 首先调用 `L2TAP_S_INTF_DEVICE` 或 `L2TAP_S_DEVICE_DRV_HNDL` 将文件描述符绑定到特定网络接口，随后方可调用 `L2TAP_S_RCV_FILTER` 选项。

备注： 当前不支持识别 VLAN 标记帧。如果用户需要处理 VLAN 标记帧，应将过滤器设置为等于 VLAN 标记（即 `0x8100` 或 `0x88A8`），并在用户应用程序中处理 VLAN 标记帧。

备注： 当用户应用程序不需要使用 IP 栈时，`L2TAP_S_DEVICE_DRV_HNDL` 将非常适用，也无需初始化 ESP-NETIF。但在此情况下，网络接口无法通过 `if_key` 来识别，需要通过 IO 驱动程序句柄直接标识网络接口。

成功时，`ioctl()` 返回 `0`。出错时，返回 `-1`，并设置 `errno` 以指示错误类型：

- * `EBADF` - 文件描述符无效。
- * `EACCES` - 此状态下无法改变选项（例如文件描述符尚未绑定到网络接口）。
- * `EINVAL` - 配置参数无效。同一网络接口上的其他文件描述符已经使用了以太网类型过滤器。
- * `ENODEV` - 此文件描述符尝试分配给的网络接口不存在。
- * `ENOSYS` - 不支持该操作，传递的配置选项不存在。

fcntl() `fcntl()` 配置已开启的 ESP-NETIF L2 TAP 文件描述符属性。

以下命令调控与文件描述符相关的状态标志：

- `F_GETFD` - 函数返回文件描述符标志，忽略第三个参数。

- `F_SETFD` - 将文件描述符标志设置为第三个参数的指定值。返回零。

成功时, `ioctl()` 返回 0。出错时, 返回 -1, 并设置 `errno` 以指示错误类型。

- * `EBADF` - 文件描述符无效。
- * `ENOSYS` - 不支持该命令。

read() 已开启并完成配置的 ESP-NETIF L2 TAP 文件描述符可通过 `read()` 获取入站帧。读取可以是阻塞或非阻塞的, 具体取决于 `O_NONBLOCK` 文件状态标志的实际状态。当文件状态标志设置为阻塞时, 读取程序将等待, 直到接收到帧, 并将上下文切换到其他任务。当文件状态标志设置为非阻塞时, 立即返回读取程序。在此情况下, 如果已经帧已经入队, 则返回一帧, 否则函数指示队列为空。与文件描述符关联的队列帧数量受 `CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE` Kconfig 选项限制。一旦队列里帧的数量达到配置的阈值, 新到达的帧将被丢弃, 直到队列有足够的空间接受传入的流量 (队尾丢弃队列管理)。

成功时, `read()` 函数返回读取的字节数。当目标缓冲区的大小为 0 时, 函数返回 0。出错时, 函数返回 -1, 并设置 `errno` 以指示错误类型。

- * `EBADF` - 文件描述符无效。
- * `EAGAIN` - 文件描述符标记为非阻塞 (`O_NONBLOCK`), 但读取受阻塞。

write() 通过已开启并完成配置的 ESP-NETIF L2 TAP 文件描述符可以将原始数据链路层帧发送到网络接口, 用户应用程序负责构建除物理接口设备自动添加的字段外的整个帧。在以太网链路中, 用户应用程序需要构建以下字段: 源或目的 MAC 地址、以太网类型、实际协议头和用户数据, 字段长度如下表:

目的 MAC	源 MAC	类型/长度	负载 (协议头/数据)
6 B	6 B	2 B	0-1486 B

换句话说, ESP-NETIF L2 TAP 接口不会对数据帧进行额外处理, 只会检查数据帧的以太网类型是否与文件描述符配置的过滤器相同。如果以太网类型不同, 则会返回错误, 并且不发送数据帧。需要注意的是, 由于网络接口是由多个 ESP-NETIF L2 TAP 文件描述符和 IP 栈共享的资源, 且当前缺乏列队机制, 当前实现中的 `write()` 在进入网络接口时可能会受阻塞,。

成功时, `write()` 返回已写入的字节数。如果输入缓冲区的大小为 0, 则返回 0。出错时, 则返回 -1, 并设置 `errno` 以指示错误类型。

- * `EBADF` - 文件描述符无效。
- * `EBADMSG` - 帧的以太网类型与文件描述符配置的过滤器不同。
- * `EIO` - 网络接口不可用或正忙。

close() 已开启的 ESP-NETIF L2 TAP 文件描述符可以通过 `close()` 函数关闭, 释放其分配到的资源。ESP-NETIF L2 TAP 实现的 `close()` 函数可能会受阻塞, 但它是线程安全的, 可以从与实际使用文件描述符的任务不同的任务中调用。如果出现一个任务在 I/O 操作中被阻塞、另一个任务试图关闭文件描述符的情况, 则第一个任务会解除阻塞, 其读取程序以错误结束。

成功时, `close()` 返回 0。出错时, 则返回 -1, 并设置 `errno` 以指示错误类型。

- * `EBADF` - 文件描述符无效。

select() `select()` 函数按标准方法使用, 启用 `CONFIG_VFS_SUPPORT_SELECT` 即可使用该函数。

SNTP API SNTP 的简要介绍、初始化代码和基本模式请参阅[系统时间](#)的[SNTP 时间同步](#)小节。

本节介绍了使用 SNTP 服务特定用例的详细信息，包括静态配置的服务器、使用 DHCP 提供的服务器或两者兼备的情况，操作流程如下：

- 1) 调用 `esp_netif_sntp_init()` 初始化服务并完成配置。此操作只能执行一次（除非已调用 `esp_netif_sntp_deinit()` 销毁 SNTP 服务）。
- 2) 调用 `esp_netif_sntp_start()` 启动服务。如果在前一步中已经默认启动了服务，则不需要此步骤。如果需使用通过 DHCP 获取的 NTP 服务器，推荐在完成连接后显式启动该服务。注意，应在连接前启用通过 DHCP 获取的 NTP 服务器选项，并在连接后再启用 SNTP 服务。
- 3) 需要时，可调用 `esp_netif_sntp_sync_wait()` 等待系统时间同步。
- 4) 调用 `esp_netif_sntp_deinit()` 停止并销毁服务。

使用静态定义服务器的基本模式 连接到网络后，使用默认配置初始化该模块。注意，在配置结构体中可提供多个 NTP 服务器：

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(2,
    ESP_SNTP_SERVER_LIST("time.windows.com", "pool.ntp.org"
↪) );
esp_netif_sntp_init(&config);
```

备注：要配置多个 SNTP 服务器，需要更新 lwIP 配置，请参阅[CONFIG_LWIP_SNTP_MAX_SERVERS](#)。

使用 DHCP 获取的 SNTP 服务器 首先，激活 lwIP 配置选项，相关配置请参阅[CONFIG_LWIP_DHCP_GET_NTP_SRV](#)。其次，在使用 DHCP 选项、且不使用 NTP 服务器的情况下初始化 SNTP 模块，代码如下：

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(0, {});
config.start = false; // 启动 SNTP 服务
config.server_from_dhcp = true; // 接收来自 DHCP 服务器的 NTP
↪服务提供方案
esp_netif_sntp_init(&config);
```

连接成功后，可通过以下代码启动服务器：

```
esp_netif_sntp_start();
```

备注：也可选择在初始化期间启动服务（即默认 `config.start=true`）。注意，此时连接尚未完成，可能导致初始 SNTP 请求失败，并增加后续各次请求之间的延迟时间。

同时使用静态和动态服务器 同时使用静态和动态服务器的流程与使用 DHCP 获取的 SNTP 服务器基本相同。配置时，用户应确保在通过 DHCP 获取 NTP 服务器时刷新静态服务器配置。底层 lwIP 代码会在接受 DHCP 提供的信息时清理其余的 NTP 服务器列表。因此，ESP-NETIF SNTP 模块会保存静态配置的服务器，并在获取 DHCP 租约后对其重新配置。

典型配置依次如下，提供特定 IP_EVENT 更新配置，并提供第一个服务器的索引完成重新配置（例如，设置 `config.index_of_first_server=1` 会将 DHCP 提供的服务器保留在索引 0，而将静态配置的服务器保留在索引 1）。

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG("pool.ntp.org");
config.start = false; // 启动 SNTP 服务（连接成功后）
config.server_from_dhcp = true; // 接收来自 DHCP 服务器的 NTP
↪服务提供方案
config.renew_servers_after_new_IP = true; // 让 esp-netif 在接收到 DHCP
↪租约后更新配置的 SNTP 服务器
```

(下页继续)

(续上页)

```
config.index_of_first_server = 1; // 服务器 1 开始更新, 保留从 DHCP
↳ 获取的服务器 0 的设置
config.ip_event_to_renew = IP_EVENT_STA_GOT_IP; // 基于 IP 事件刷新配置
```

随后, 调用 `esp_netif_sntp_start()` 启用服务。

ESP-NETIF 编程手册 请参阅示例部分, 了解默认接口的基本初始化:

- 以太网 `ethernet/basic/main/ethernet_example_main.c`
- L2 TAP `protocols/l2tap/main/l2tap_main.c`

更多示例请参阅 *ESP-NETIF 自定义 I/O 驱动程序*。

API 参考

Header File

- `components/esp_netif/include/esp_netif.h`
- This header file can be included with:

```
#include "esp_netif.h"
```

- This header file is a part of the API provided by the `esp_netif` component. To declare that your component depends on `esp_netif`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_netif
```

or

```
PRIV_REQUIRES esp_netif
```

Functions

`esp_err_t esp_netif_init` (void)

Initialize the underlying TCP/IP stack.

备注: This function should be called exactly once from application code, when the application starts up.

返回

- `ESP_OK` on success
- `ESP_FAIL` if initializing failed

`esp_err_t esp_netif_deinit` (void)

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

```
Note: Deinitialization is not supported yet
```

返回

- `ESP_ERR_INVALID_STATE` if `esp_netif` not initialized
- `ESP_ERR_NOT_SUPPORTED` otherwise

`esp_netif_t *esp_netif_new` (const `esp_netif_config_t` *`esp_netif_config`)

Creates an instance of new esp-netif object based on provided config.

参数 `esp_netif_config` -- [in] pointer esp-netif configuration

返回

- pointer to esp-netif object on success

- NULL otherwise

void **esp_netif_destroy** (*esp_netif_t* *esp_netif)

Destroys the esp_netif object.

参数 **esp_netif** -- [in] pointer to the object to be deleted

esp_err_t **esp_netif_set_driver_config** (*esp_netif_t* *esp_netif, const *esp_netif_driver_ifconfig_t* *driver_config)

Configures driver related options of esp_netif object.

参数

- **esp_netif** -- [inout] pointer to the object to be configured
- **driver_config** -- [in] pointer esp-netif io driver related configuration

返回

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

esp_err_t **esp_netif_attach** (*esp_netif_t* *esp_netif, *esp_netif_io_driver_handle_t* driver_handle)

Attaches esp_netif instance to the io driver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver)

参数

- **esp_netif** -- [inout] pointer to esp_netif object to be attached
- **driver_handle** -- [in] pointer to the driver handle

返回

- ESP_OK on success
- ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver's post_attach callback failed

esp_err_t **esp_netif_receive** (*esp_netif_t* *esp_netif, void *buffer, size_t len, void *eb)

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

参数

- **esp_netif** -- [in] Handle to esp-netif instance
- **buffer** -- [in] Received data
- **len** -- [in] Length of the data frame
- **eb** -- [in] Pointer to internal buffer (used in Wi-Fi driver)

返回

- ESP_OK

void **esp_netif_action_start** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver start event Creates network interface, if AUTOUP enabled turns the interface on, if DHCP enabled starts dhcp server.

备注: This API can be directly used as event handler

参数

- **esp_netif** -- [in] Handle to esp-netif instance
- **base** -- The base type of the event
- **event_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp_netif_action_stop** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver stop event.

备注: This API can be directly used as event handler

参数

- **esp_netif** -- **[in]** Handle to esp-netif instance
- **base** -- The base type of the event
- **event_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp_netif_action_connected** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver connected event.

备注: This API can be directly used as event handler

参数

- **esp_netif** -- **[in]** Handle to esp-netif instance
- **base** -- The base type of the event
- **event_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp_netif_action_disconnected** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver disconnected event.

备注: This API can be directly used as event handler

参数

- **esp_netif** -- **[in]** Handle to esp-netif instance
- **base** -- The base type of the event
- **event_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp_netif_action_got_ip** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon network got IP event.

备注: This API can be directly used as event handler

参数

- **esp_netif** -- **[in]** Handle to esp-netif instance
- **base** -- The base type of the event
- **event_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp_netif_action_join_ip6_multicast_group** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group join.

备注: This API can be directly used as event handler

参数

- **esp_netif** -- [in] Handle to esp-netif instance
- **base** -- The base type of the event
- **event_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp_netif_action_leave_ip6_multicast_group** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group leave.

备注: This API can be directly used as event handler

参数

- **esp_netif** -- [in] Handle to esp-netif instance
- **base** -- The base type of the event
- **event_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp_netif_action_add_ip6_address** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address added by the underlying stack.

备注: This API can be directly used as event handler

参数

- **esp_netif** -- [in] Handle to esp-netif instance
- **base** -- The base type of the event
- **event_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp_netif_action_remove_ip6_address** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address removed by the underlying stack.

备注: This API can be directly used as event handler

参数

- **esp_netif** -- [in] Handle to esp-netif instance
- **base** -- The base type of the event
- **event_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

esp_err_t **esp_netif_set_default_netif** (*esp_netif_t* *esp_netif)

Manual configuration of the default netif.

This API overrides the automatic configuration of the default interface based on the route_prio. If the selected netif is set default using this API, no other interface could be set-default disregarding its route_prio number (unless the selected netif gets destroyed).

参数 `esp_netif` -- **[in]** Handle to esp-netif instance
返回 ESP_OK on success

`esp_netif_t *esp_netif_get_default_netif` (void)

Getter function of the default netif.

This API returns the selected default netif.

返回 Handle to esp-netif instance of the default netif.

`esp_err_t esp_netif_join_ip6_multicast_group` (`esp_netif_t *esp_netif`, const `esp_ip6_addr_t *addr`)

Cause the TCP/IP stack to join a IPv6 multicast group.

参数

- `esp_netif` -- **[in]** Handle to esp-netif instance
- `addr` -- **[in]** The multicast group to join

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_MLD6_FAILED
- ESP_ERR_NO_MEM

`esp_err_t esp_netif_leave_ip6_multicast_group` (`esp_netif_t *esp_netif`, const `esp_ip6_addr_t *addr`)

Cause the TCP/IP stack to leave a IPv6 multicast group.

参数

- `esp_netif` -- **[in]** Handle to esp-netif instance
- `addr` -- **[in]** The multicast group to leave

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_MLD6_FAILED
- ESP_ERR_NO_MEM

`esp_err_t esp_netif_set_mac` (`esp_netif_t *esp_netif`, `uint8_t mac[]`)

Set the mac address for the interface instance.

参数

- `esp_netif` -- **[in]** Handle to esp-netif instance
- `mac` -- **[in]** Desired mac address for the related network interface

返回

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

`esp_err_t esp_netif_get_mac` (`esp_netif_t *esp_netif`, `uint8_t mac[]`)

Get the mac address for the interface instance.

参数

- `esp_netif` -- **[in]** Handle to esp-netif instance
- `mac` -- **[out]** Resultant mac address for the related network interface

返回

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

`esp_err_t esp_netif_set_hostname` (`esp_netif_t *esp_netif`, const char *hostname)

Set the hostname of an interface.

The configured hostname overrides the default configuration value CONFIG_LWIP_LOCAL_HOSTNAME. Please note that when the hostname is altered after interface started/connected the changes would only be

reflected once the interface restarts/reconnects

参数

- **esp_netif** -- [in] Handle to esp-netif instance
- **hostname** -- [in] New hostname for the interface. Maximum length 32 bytes.

返回

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

esp_err_t **esp_netif_get_hostname** (*esp_netif_t* *esp_netif, const char **hostname)

Get interface hostname.

参数

- **esp_netif** -- [in] Handle to esp-netif instance
- **hostname** -- [out] Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

返回

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

bool **esp_netif_is_netif_up** (*esp_netif_t* *esp_netif)

Test if supplied interface is up or down.

参数 **esp_netif** -- [in] Handle to esp-netif instance

返回

- true - Interface is up
- false - Interface is down

esp_err_t **esp_netif_get_ip_info** (*esp_netif_t* *esp_netif, *esp_netif_ip_info_t* *ip_info)

Get interface's IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

参数

- **esp_netif** -- [in] Handle to esp-netif instance
- **ip_info** -- [out] If successful, IP information will be returned in this argument.

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t **esp_netif_get_old_ip_info** (*esp_netif_t* *esp_netif, *esp_netif_ip_info_t* *ip_info)

Get interface's old IP information.

Returns an "old" IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

参数

- **esp_netif** -- [in] Handle to esp-netif instance
- **ip_info** -- [out] If successful, IP information will be returned in this argument.

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t **esp_netif_set_ip_info** (*esp_netif_t* *esp_netif, const *esp_netif_ip_info_t* *ip_info)

Set interface's IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

备注: DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

备注: Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

参数

- **esp_netif** -- [in] Handle to esp-netif instance
- **ip_info** -- [in] IP information to set on the specified interface

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still running

esp_err_t **esp_netif_set_old_ip_info** (*esp_netif_t* *esp_netif, const *esp_netif_ip_info_t* *ip_info)

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the "IP lost timer" will expire (after the configured interval) and set the old IP information to zero.

参数

- **esp_netif** -- [in] Handle to esp-netif instance
- **ip_info** -- [in] Store the old IP information for the specified interface

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

int **esp_netif_get_netif_impl_index** (*esp_netif_t* *esp_netif)

Get net interface index from network stack implementation.

备注: This index could be used in `setsockopt()` to bind socket with multicast interface

参数 **esp_netif** -- [in] Handle to esp-netif instance

返回 implementation specific index of interface represented with supplied esp_netif

esp_err_t **esp_netif_get_netif_impl_name** (*esp_netif_t* *esp_netif, char *name)

Get net interface name from network stack implementation.

备注: This name could be used in `setsockopt()` to bind socket with appropriate interface

参数

- **esp_netif** -- [in] Handle to esp-netif instance

- **name** -- **[out]** Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t **esp_netif_napt_enable** (*esp_netif_t* *esp_netif)

Enable NAPT on an interface.

备注: Enable operation can be performed only on one interface at a time. NAPT cannot be enabled on multiple interfaces according to this implementation.

参数 **esp_netif** -- **[in]** Handle to esp-netif instance

返回

- ESP_OK
- ESP_FAIL
- ESP_ERR_NOT_SUPPORTED

esp_err_t **esp_netif_napt_disable** (*esp_netif_t* *esp_netif)

Disable NAPT on an interface.

参数 **esp_netif** -- **[in]** Handle to esp-netif instance

返回

- ESP_OK
- ESP_FAIL
- ESP_ERR_NOT_SUPPORTED

esp_err_t **esp_netif_dhcps_option** (*esp_netif_t* *esp_netif, *esp_netif_dhcp_option_mode_t* opt_op, *esp_netif_dhcp_option_id_t* opt_id, void *opt_val, uint32_t opt_len)

Set or Get DHCP server option.

参数

- **esp_netif** -- **[in]** Handle to esp-netif instance
- **opt_op** -- **[in]** ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- **opt_id** -- **[in]** Option index to get or set, must be one of the supported enum values.
- **opt_val** -- **[inout]** Pointer to the option parameter.
- **opt_len** -- **[in]** Length of the option parameter.

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

esp_err_t **esp_netif_dhcpc_option** (*esp_netif_t* *esp_netif, *esp_netif_dhcp_option_mode_t* opt_op, *esp_netif_dhcp_option_id_t* opt_id, void *opt_val, uint32_t opt_len)

Set or Get DHCP client option.

参数

- **esp_netif** -- **[in]** Handle to esp-netif instance
- **opt_op** -- **[in]** ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- **opt_id** -- **[in]** Option index to get or set, must be one of the supported enum values.
- **opt_val** -- **[inout]** Pointer to the option parameter.
- **opt_len** -- **[in]** Length of the option parameter.

返回

- ESP_OK

- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

esp_err_t **esp_netif_dhcpc_start** (*esp_netif_t* *esp_netif)

Start DHCP client (only if enabled in interface object)

备注: The default event handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events call this function.

参数 *esp_netif* -- [in] Handle to esp-netif instance
返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
- ESP_ERR_ESP_NETIF_DHCPC_START_FAILED

esp_err_t **esp_netif_dhcpc_stop** (*esp_netif_t* *esp_netif)

Stop DHCP client (only if enabled in interface object)

备注: Calling action_netif_stop() will also stop the DHCP Client if it is running.

参数 *esp_netif* -- [in] Handle to esp-netif instance
返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

esp_err_t **esp_netif_dhcpc_get_status** (*esp_netif_t* *esp_netif, *esp_netif_dhcp_status_t* *status)

Get DHCP client status.

参数

- *esp_netif* -- [in] Handle to esp-netif instance
- *status* -- [out] If successful, the status of DHCP client will be returned in this argument.

返回

- ESP_OK

esp_err_t **esp_netif_dhcps_get_status** (*esp_netif_t* *esp_netif, *esp_netif_dhcp_status_t* *status)

Get DHCP Server status.

参数

- *esp_netif* -- [in] Handle to esp-netif instance
- *status* -- [out] If successful, the status of the DHCP server will be returned in this argument.

返回

- ESP_OK

esp_err_t **esp_netif_dhcps_start** (*esp_netif_t* *esp_netif)

Start DHCP server (only if enabled in interface object)

参数 *esp_netif* -- [in] Handle to esp-netif instance
返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

esp_err_t **esp_netif_dhcps_stop** (*esp_netif_t* *esp_netif)

Stop DHCP server (only if enabled in interface object)

参数 **esp_netif** -- **[in]** Handle to esp-netif instance

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

esp_err_t **esp_netif_dhcps_get_clients_by_mac** (*esp_netif_t* *esp_netif, int num, *esp_netif_pair_mac_ip_t* *mac_ip_pair)

Populate IP addresses of clients connected to DHCP server listed by their MAC addresses.

参数

- **esp_netif** -- **[in]** Handle to esp-netif instance
- **num** -- **[in]** Number of clients with specified MAC addresses in the array of pairs
- **mac_ip_pair** -- **[inout]** Array of pairs of MAC and IP addresses (MAC are inputs, IP outputs)

返回

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS on invalid params
- ESP_ERR_NOT_SUPPORTED if DHCP server not enabled

esp_err_t **esp_netif_set_dns_info** (*esp_netif_t* *esp_netif, *esp_netif_dns_type_t* type, *esp_netif_dns_info_t* *dns)

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the DHCP server itself.
- This function can override it by setting server type ESP_NETIF_DNS_MAIN.
- Other DNS Server types are not supported for the DHCP server.
- To propagate the DNS info to client, please stop the DHCP server before using this API.

参数

- **esp_netif** -- **[in]** Handle to esp-netif instance
- **type** -- **[in]** Type of DNS Server to set: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- **dns** -- **[in]** DNS Server address to set

返回

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

esp_err_t **esp_netif_get_dns_info** (*esp_netif_t* *esp_netif, *esp_netif_dns_type_t* type, *esp_netif_dns_info_t* *dns)

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to *esp_netif_set_dns_info()*. If the interface's DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

参数

- **esp_netif** -- **[in]** Handle to esp-netif instance

- **type** -- **[in]** Type of DNS Server to get: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- **dns** -- **[out]** DNS Server result is written here on success

返回

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

esp_err_t **esp_netif_create_ip6_linklocal** (*esp_netif_t* *esp_netif)

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM_EVENT_GOT_IP6 event will be sent.

参数 **esp_netif** -- **[in]** Handle to esp-netif instance

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t **esp_netif_get_ip6_linklocal** (*esp_netif_t* *esp_netif, *esp_ip6_addr_t* *if_ip6)

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

参数

- **esp_netif** -- **[in]** Handle to esp-netif instance
- **if_ip6** -- **[out]** IPv6 information will be returned in this argument if successful.

返回

- ESP_OK
- ESP_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

esp_err_t **esp_netif_get_ip6_global** (*esp_netif_t* *esp_netif, *esp_ip6_addr_t* *if_ip6)

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

参数

- **esp_netif** -- **[in]** Handle to esp-netif instance
- **if_ip6** -- **[out]** IPv6 information will be returned in this argument if successful.

返回

- ESP_OK
- ESP_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

int **esp_netif_get_all_ip6** (*esp_netif_t* *esp_netif, *esp_ip6_addr_t* if_ip6[])

Get all IPv6 addresses of the specified interface.

参数

- **esp_netif** -- **[in]** Handle to esp-netif instance
- **if_ip6** -- **[out]** Array of IPv6 addresses will be copied to the argument

返回 number of returned IPv6 addresses

esp_err_t **esp_netif_add_ip6_address** (*esp_netif_t* *esp_netif, const *esp_ip6_addr_t* addr, bool preferred)

Cause the TCP/IP stack to add an IPv6 address to the interface.

参数

- **esp_netif** -- **[in]** Handle to esp-netif instance
- **addr** -- **[in]** The address to be added
- **preferred** -- **[in]** The preferred status of the address

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_IP6_ADDR_FAILED
- ESP_ERR_NO_MEM

esp_err_t **esp_netif_remove_ip6_address** (*esp_netif_t* *esp_netif, const *esp_ip6_addr_t* *addr)

Cause the TCP/IP stack to remove an IPv6 address from the interface.

参数

- **esp_netif** -- [in] Handle to esp-netif instance
- **addr** -- [in] The address to be removed

返回

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_IP6_ADDR_FAILED
- ESP_ERR_NO_MEM

void **esp_netif_set_ip4_addr** (*esp_ip4_addr_t* *addr, uint8_t a, uint8_t b, uint8_t c, uint8_t d)

Sets IPv4 address to the specified octets.

参数

- **addr** -- [out] IP address to be set
- **a** -- the first octet (127 for IP 127.0.0.1)
- **b** --
- **c** --
- **d** --

char ***esp_ip4addr_ntoa** (const *esp_ip4_addr_t* *addr, char *buf, int buflen)

Converts numeric IP address into decimal dotted ASCII representation.

参数

- **addr** -- ip address in network order to convert
- **buf** -- target buffer where the string is stored
- **buflen** -- length of buf

返回 either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

uint32_t **esp_ip4addr_aton** (const char *addr)

Ascii internet address interpretation routine The value returned is in network order.

参数 **addr** -- IP address in ascii representation (e.g. "127.0.0.1")

返回 ip address in network order

esp_err_t **esp_netif_str_to_ip4** (const char *src, *esp_ip4_addr_t* *dst)

Converts Ascii internet IPv4 address into esp_ip4_addr_t.

参数

- **src** -- [in] IPv4 address in ascii representation (e.g. "127.0.0.1")
- **dst** -- [out] Address of the target esp_ip4_addr_t structure to receive converted address

返回

- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into

esp_err_t **esp_netif_str_to_ip6** (const char *src, *esp_ip6_addr_t* *dst)

Converts Ascii internet IPv6 address into esp_ip4_addr_t Zeros in the IP address can be stripped or completely omitted: "2001:db8:85a3:0:0:0:2:1" or "2001:db8::2:1")

参数

- **src** -- [in] IPv6 address in ascii representation (e.g. ""2001:0db8:85a3:0000:0000:0000:0002:0001")
- **dst** -- [out] Address of the target esp_ip6_addr_t structure to receive converted address

返回

- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into

esp_netif_iodriver_handle **esp_netif_get_io_driver** (*esp_netif_t* *esp_netif)

Gets media driver handle for this esp-netif instance.

参数 *esp_netif* -- [in] Handle to esp-netif instance

返回 opaque pointer of related IO driver

esp_netif_t ***esp_netif_get_handle_from_ifkey** (const char *if_key)

Searches over a list of created objects to find an instance with supplied if key.

参数 *if_key* -- Textual description of network interface

返回 Handle to esp-netif instance

esp_netif_flags_t **esp_netif_get_flags** (*esp_netif_t* *esp_netif)

Returns configured flags for this interface.

参数 *esp_netif* -- [in] Handle to esp-netif instance

返回 Configuration flags

const char ***esp_netif_get_ifkey** (*esp_netif_t* *esp_netif)

Returns configured interface key for this esp-netif instance.

参数 *esp_netif* -- [in] Handle to esp-netif instance

返回 Textual description of related interface

const char ***esp_netif_get_desc** (*esp_netif_t* *esp_netif)

Returns configured interface type for this esp-netif instance.

参数 *esp_netif* -- [in] Handle to esp-netif instance

返回 Enumerated type of this interface, such as station, AP, ethernet

int **esp_netif_get_route_prio** (*esp_netif_t* *esp_netif)

Returns configured routing priority number.

参数 *esp_netif* -- [in] Handle to esp-netif instance

返回 Integer representing the instance's route-prio, or -1 if invalid paramters

int32_t **esp_netif_get_event_id** (*esp_netif_t* *esp_netif, *esp_netif_ip_event_type_t* event_type)

Returns configured event for this esp-netif instance and supplied event type.

参数

- *esp_netif* -- [in] Handle to esp-netif instance
- *event_type* -- (either get or lost IP)

返回 specific event id which is configured to be raised if the interface lost or acquired IP address
-1 if supplied event_type is not known

esp_netif_t ***esp_netif_next** (*esp_netif_t* *esp_netif)

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

备注: This API doesn't lock the list, nor the TCPIP context, as this it's usually required to get atomic access between iteration steps rather than within a single iteration. Therefore it is recommended to iterate over the interfaces inside *esp_netif_tcpip_exec()*

备注: This API is deprecated. Please use *esp_netif_next_unsafe()* directly if all the system interfaces are under your control and you can safely iterate over them. Otherwise, iterate over interfaces using *esp_netif_tcpip_exec()*, or use *esp_netif_find_if()* to search in the list of netifs with defined predicate.

参数 `esp_netif` -- [in] Handle to esp-netif instance
返回 First netif from the list if supplied parameter is NULL, next one otherwise

`esp_netif_t *esp_netif_next_unsafe (esp_netif_t *esp_netif)`

Iterates over list of interfaces without list locking. Returns first netif if NULL given as parameter.

Used for bulk search loops within TCPIP context, e.g. using `esp_netif_tcpip_exec()`, or if we're sure that the iteration is safe from our application perspective (e.g. no interface is removed between iterations)

参数 `esp_netif` -- [in] Handle to esp-netif instance
返回 First netif from the list if supplied parameter is NULL, next one otherwise

`esp_netif_t *esp_netif_find_if (esp_netif_find_predicate_t fn, void *ctx)`

Return a netif pointer for the first interface that meets criteria defined by the callback.

参数

- **fn** -- Predicate function returning true for the desired interface
- **ctx** -- Context pointer passed to the predicate, typically a descriptor to compare with

返回 valid netif pointer if found, NULL if not

`size_t esp_netif_get_nr_of_ifs (void)`

Returns number of registered esp_netif objects.

返回 Number of esp_netifs

`void esp_netif_netstack_buf_ref (void *netstack_buf)`

increase the reference counter of net stack buffer

参数 `netstack_buf` -- [in] the net stack buffer

`void esp_netif_netstack_buf_free (void *netstack_buf)`

free the netstack buffer

参数 `netstack_buf` -- [in] the net stack buffer

`esp_err_t esp_netif_tcpip_exec (esp_netif_callback_fn fn, void *ctx)`

Utility to execute the supplied callback in TCP/IP context.

参数

- **fn** -- Pointer to the callback
- **ctx** -- Parameter to the callback

返回 The error code (`esp_err_t`) returned by the callback

Type Definitions

`typedef bool (*esp_netif_find_predicate_t)(esp_netif_t *netif, void *ctx)`

Predicate callback for `esp_netif_find_if()` used to find interface which meets defined criteria.

`typedef esp_err_t (*esp_netif_callback_fn)(void *ctx)`

TCPIP thread safe callback used with `esp_netif_tcpip_exec()`

Header File

- [components/esp_netif/include/esp_netif_sntp.h](#)
- This header file can be included with:

```
#include "esp_netif_sntp.h"
```

- This header file is a part of the API provided by the `esp_netif` component. To declare that your component depends on `esp_netif`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_netif
```

or

PRIV_REQUIRES esp_netif

Functions

esp_err_t **esp_netif_sntp_init** (const *esp_sntp_config_t* *config)

Initialize SNTP with supplied config struct.

参数 **config** -- Config struct

返回 ESP_OK on success

esp_err_t **esp_netif_sntp_start** (void)

Start SNTP service if it wasn't started during init (config.start = false) or restart it if already started.

返回 ESP_OK on success

void **esp_netif_sntp_deinit** (void)

Deinitialize esp_netif SNTP module.

esp_err_t **esp_netif_sntp_sync_wait** (TickType_t tout)

Wait for time sync event.

参数 **tout** -- Specified timeout in RTOS ticks

返回 ESP_TIMEOUT if sync event didn't come within the timeout ESP_ERR_NOT_FINISHED if the sync event came, but we're in smooth update mode and still in progress (SNTP_SYNC_STATUS_IN_PROGRESS) ESP_OK if time sync'ed

esp_err_t **esp_netif_sntp_reachability** (unsigned int index, unsigned int *reachability)

Returns SNTP server's reachability shift register as described in RFC 5905.

参数

- **index** -- Index of the SERVER
- **reachability** -- reachability shift register

返回 ESP_OK on success, ESP_ERR_INVALID_STATE if SNTP not initialized
ESP_ERR_INVALID_ARG if invalid arguments

Structures

struct **esp_sntp_config**

SNTP configuration struct.

Public Members

bool **smooth_sync**

set to true if smooth sync required

bool **server_from_dhcp**

set to true to request NTP server config from DHCP

bool **wait_for_sync**

if true, we create a semaphore to signal time sync event

bool **start**

set to true to automatically start the SNTP service

esp_sntp_time_cb_t **sync_cb**

optionally sets callback function on time sync event

bool **renew_servers_after_new_IP**

this is used to refresh server list if NTP provided by DHCP (which cleans other pre-configured servers)

ip_event_t **ip_event_to_renew**

set the IP event id on which we refresh server list (if `renew_servers_after_new_IP=true`)

size_t **index_of_first_server**

refresh server list after this server (if `renew_servers_after_new_IP=true`)

size_t **num_of_servers**

number of preconfigured NTP servers

const char ***servers**[1]

list of servers

Macros

ESP_SNTP_SERVER_LIST (...)

Utility macro for providing multiple servers in parentheses.

ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE (servers_in_list, list_of_servers)

Default configuration to init SNTP with multiple servers.

参数

- **servers_in_list** -- Number of servers in the list
- **list_of_servers** -- List of servers (use `ESP_SNTP_SERVER_LIST(...)`)

ESP_NETIF_SNTP_DEFAULT_CONFIG (server)

Default configuration with a single server.

Type Definitions

typedef void (***esp_sntp_time_cb_t**)(struct timeval *tv)

Time sync notification function.

typedef struct *esp_sntp_config* **esp_sntp_config_t**

SNTP configuration struct.

Header File

```
REQUIRES esp_netif
```

or

```
PRIV_REQUIRES esp_netif
```

Structures

struct **esp_netif_dns_info_t**

DNS server info.

Public Members

esp_ip_addr_t **ip**

IPV4 address of DNS server

struct **esp_netif_ip_info_t**

Event structure for IP_EVENT_STA_GOT_IP, IP_EVENT_ETH_GOT_IP events

Public Members

esp_ip4_addr_t **ip**

Interface IPV4 address

esp_ip4_addr_t **netmask**

Interface IPV4 netmask

esp_ip4_addr_t **gw**

Interface IPV4 gateway address

struct **esp_netif_ip6_info_t**

IPV6 IP address information.

Public Members

esp_ip6_addr_t **ip**

Interface IPV6 address

struct **ip_event_got_ip_t**

Event structure for IP_EVENT_GOT_IP event.

Public Members

esp_netif_t ***esp_netif**

Pointer to corresponding esp-netif object

esp_netif_ip_info_t **ip_info**

IP address, netmask, gateway IP address

bool **ip_changed**

Whether the assigned IP has changed or not

struct **ip_event_got_ip6_t**

Event structure for IP_EVENT_GOT_IP6 event

Public Members

esp_netif_t ***esp_netif**

Pointer to corresponding esp-netif object

esp_netif_ip6_info_t **ip6_info**

IPv6 address of the interface

int **ip_index**

IPv6 address index

struct **ip_event_add_ip6_t**

Event structure for ADD_IP6 event

Public Members

esp_ip6_addr_t **addr**

The address to be added to the interface

bool **preferred**

The default preference of the address

struct **ip_event_ap_staipassigned_t**

Event structure for IP_EVENT_AP_STAIPASSIGNED event

Public Members

esp_netif_t ***esp_netif**

Pointer to the associated netif handle

esp_ip4_addr_t **ip**

IP address which was assigned to the station

uint8_t **mac**[6]

MAC address of the connected client

struct **bridgeif_config**

LwIP bridge configuration

Public Members

uint16_t **max_fdb_dyn_entries**

maximum number of entries in dynamic forwarding database

uint16_t **max_fdb_sta_entries**

maximum number of entries in static forwarding database

uint8_t **max_ports**

maximum number of ports the bridge can consist of

struct **esp_netif_inherent_config**

ESP-netif inherent config parameters.

Public Members

esp_netif_flags_t **flags**

flags that define esp-netif behavior

uint8_t **mac**[6]

initial mac address for this interface

const *esp_netif_ip_info_t* ***ip_info**

initial ip address for this interface

uint32_t **get_ip_event**

event id to be raised when interface gets an IP

uint32_t **lost_ip_event**

event id to be raised when interface loses its IP

const char ***if_key**

string identifier of the interface

const char ***if_desc**

textual description of the interface

int **route_prio**

numeric priority of this interface to become a default routing if (if other netifs are up). A higher value of route_prio indicates a higher priority

bridgeif_config_t ***bridge_info**

LwIP bridge configuration

struct **esp_netif_driver_base_s**

ESP-netif driver base handle.

Public Members

esp_err_t (**post_attach**)(*esp_netif_t* *netif, *esp_netif_io_driver_handle* h)

post attach function pointer

esp_netif_t ***netif**

netif handle

struct **esp_netif_driver_ifconfig**

Specific IO driver configuration.

Public Members

esp_netif_iodriver_handle **handle**

io-driver handle

esp_err_t (***transmit**)(void *h, void *buffer, size_t len)

transmit function pointer

esp_err_t (***transmit_wrap**)(void *h, void *buffer, size_t len, void *netstack_buffer)

transmit wrap function pointer

void (***driver_free_rx_buffer**)(void *h, void *buffer)

free rx buffer function pointer

struct **esp_netif_config**

Generic esp_netif configuration.

Public Members

const *esp_netif_inherent_config_t* ***base**

base config

const *esp_netif_driver_ifconfig_t* ***driver**

driver config

const *esp_netif_netstack_config_t* ***stack**

stack config

struct **esp_netif_pair_mac_ip_t**

DHCP client's addr info (pair of MAC and IP address)

Public Members

uint8_t **mac**[6]

Clients MAC address

esp_ip4_addr_t **ip**

Clients IP address

Macros

ESP_ERR_ESP_NETIF_BASE

Definition of ESP-NETIF based errors.

ESP_NETIF_BR_DROP

ESP_NETIF_BR_FDW_CPU

Type Definitions

typedef struct esp_netif_obj **esp_netif_t**

typedef enum *esp_netif_flags* **esp_netif_flags_t**

typedef enum *esp_netif_ip_event_type* **esp_netif_ip_event_type_t**

typedef struct *bridgeif_config* **bridgeif_config_t**

LwIP bridge configuration

typedef struct *esp_netif_inherent_config* **esp_netif_inherent_config_t**

ESP-netif inherent config parameters.

typedef struct *esp_netif_config* **esp_netif_config_t**

typedef void ***esp_netif_iodriver_handle**

IO driver handle type.

typedef struct *esp_netif_driver_base_s* **esp_netif_driver_base_t**

ESP-netif driver base handle.

typedef struct *esp_netif_driver_ifconfig* **esp_netif_driver_ifconfig_t**

typedef struct *esp_netif_netstack_config* **esp_netif_netstack_config_t**

Specific L3 network stack configuration.

typedef *esp_err_t* (***esp_netif_receive_t**)(*esp_netif_t* *esp_netif, void *buffer, size_t len, void *eb)

ESP-NETIF Receive function type.

Enumerations

enum **esp_netif_dns_type_t**

Type of DNS server.

Values:

enumerator **ESP_NETIF_DNS_MAIN**

DNS main server address

enumerator **ESP_NETIF_DNS_BACKUP**

DNS backup server address (Wi-Fi STA and Ethernet only)

enumerator **ESP_NETIF_DNS_FALLBACK**

DNS fallback server address (Wi-Fi STA and Ethernet only)

enumerator **ESP_NETIF_DNS_MAX**

enum **esp_netif_dhcp_status_t**

Status of DHCP client or DHCP server.

Values:

enumerator **ESP_NETIF_DHCP_INIT**

DHCP client/server is in initial state (not yet started)

enumerator **ESP_NETIF_DHCP_STARTED**

DHCP client/server has been started

enumerator **ESP_NETIF_DHCP_STOPPED**

DHCP client/server has been stopped

enumerator **ESP_NETIF_DHCP_STATUS_MAX**

enum **esp_netif_dhcp_option_mode_t**

Mode for DHCP client or DHCP server option functions.

Values:

enumerator **ESP_NETIF_OP_START**

enumerator **ESP_NETIF_OP_SET**

Set option

enumerator **ESP_NETIF_OP_GET**

Get option

enumerator **ESP_NETIF_OP_MAX**

enum **esp_netif_dhcp_option_id_t**

Supported options for DHCP client or DHCP server.

Values:

enumerator **ESP_NETIF_SUBNET_MASK**

Network mask

enumerator **ESP_NETIF_DOMAIN_NAME_SERVER**

Domain name server

enumerator **ESP_NETIF_ROUTER_SOLICITATION_ADDRESS**

Solicitation router address

enumerator **ESP_NETIF_REQUESTED_IP_ADDRESS**

Request specific IP address

enumerator **ESP_NETIF_IP_ADDRESS_LEASE_TIME**

Request IP address lease time

enumerator **ESP_NETIF_IP_REQUEST_RETRY_TIME**

Request IP address retry counter

enumerator **ESP_NETIF_VENDOR_CLASS_IDENTIFIER**

Vendor Class Identifier of a DHCP client

enumerator **ESP_NETIF_VENDOR_SPECIFIC_INFO**

Vendor Specific Information of a DHCP server

enum **ip_event_t**

IP event declarations

Values:

enumerator **IP_EVENT_STA_GOT_IP**

station got IP from connected AP

enumerator **IP_EVENT_STA_LOST_IP**

station lost IP and the IP is reset to 0

enumerator **IP_EVENT_AP_STAIPASSIGNED**

soft-AP assign an IP to a connected station

enumerator **IP_EVENT_GOT_IP6**

station or ap or ethernet interface v6IP addr is preferred

enumerator **IP_EVENT_ETH_GOT_IP**

ethernet got IP from connected AP

enumerator **IP_EVENT_ETH_LOST_IP**

ethernet lost IP and the IP is reset to 0

enumerator **IP_EVENT_PPP_GOT_IP**

PPP interface got IP

enumerator **IP_EVENT_PPP_LOST_IP**

PPP interface lost IP

enum **esp_netif_flags**

Values:

enumerator **ESP_NETIF_DHCP_CLIENT**

enumerator **ESP_NETIF_DHCP_SERVER**

enumerator **ESP_NETIF_FLAG_AUTOUP**

enumerator **ESP_NETIF_FLAG_GARP**

enumerator **ESP_NETIF_FLAG_EVENT_IP_MODIFIED**

enumerator **ESP_NETIF_FLAG_IS_PPP**

enumerator **ESP_NETIF_FLAG_IS_BRIDGE**

enumerator **ESP_NETIF_FLAG_MLDV6_REPORT**

enum **esp_netif_ip_event_type**

Values:

enumerator **ESP_NETIF_IP_EVENT_GOT_IP**

enumerator **ESP_NETIF_IP_EVENT_LOST_IP**

Functions

`esp_err_t esp_vfs_l2tap_intf_register` (`l2tap_vfs_config_t *config`)

Add L2 TAP virtual filesystem driver.

This function must be called prior usage of ESP-NETIF L2 TAP Interface

参数 config -- L2 TAP virtual filesystem driver configuration. Default base path `/dev/net/tap` is used when this parameter is NULL.

返回 `esp_err_t`

- ESP_OK on success

`esp_err_t esp_vfs_l2tap_intf_unregister` (`const char *base_path`)

Removes L2 TAP virtual filesystem driver.

参数 base_path -- Base path to the L2 TAP virtual filesystem driver. Default path `/dev/net/tap` is used when this parameter is NULL.

返回 `esp_err_t`

- ESP_OK on success

`esp_err_t esp_vfs_l2tap_eth_filter` (`l2tap_iodriver_handle driver_handle`, `void *buff`, `size_t *size`)

Filters received Ethernet L2 frames into L2 TAP infrastructure.

参数

- **driver_handle** -- handle of driver at which the frame was received
- **buff** -- received L2 frame
- **size** -- input length of the L2 frame which is set to 0 when frame is filtered into L2 TAP

返回 `esp_err_t`

- ESP_OK is always returned

Structures

struct `l2tap_vfs_config_t`

L2Tap VFS config parameters.

Public Members

const char ***base_path**

vfs base path

2.4.4 IP 网络层协议

ESP-NETIF 自定义 I/O 驱动程序

本节概述了如何配置具有 ESP-NETIF 连接功能的新 I/O 驱动程序。

通常情况下，I/O 驱动程序须注册为 ESP-NETIF 驱动程序。因此，它依赖于 ESP-NETIF 组件，并负责提供数据路径函数、后附回调函数，并在多数情况下用于设置默认事件处理程序，根据驱动程序的生命周期转换来定义网络接口操作。

数据包 Input/Output 根据 *ESP-NETIF 架构* 章节提供的图表可以看出，须定义以下三个数据路径函数 API 以连接 ESP-NETIF：

- `esp_netif_transmit()`
- `esp_netif_free_rx_buffer()`
- `esp_netif_receive()`

前两个函数可以传输和释放 RX 缓冲区，用作回调。它们由 ESP-NETIF（及其底层 TCP/IP 堆栈）调用，并由 I/O 驱动实现。

另一方面，接收函数由 I/O 驱动程序调用，因此驱动的代码只需在接收到新数据时调用 `esp_netif_receive()` 函数。

后附回调 网络接口初始化的最后一步是调用以下 API，将 ESP-NETIF 实例附加到 I/O 驱动程序上：

```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_t
↳ driver_handle);
```

假设 `esp_netif_iodriver_handle` 是指向驱动程序对象的指针，该对象是从 `struct esp_netif_driver_base_s` 衍生的结构体，那么 I/O 驱动结构体的第一个成员必须是此基础结构，并指向：

- 后附函数回调
- 相关的 ESP-NETIF 实例

因此，I/O 驱动程序须创建以下结构体的实例：

```
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;           /*!< 保留基本结构体作为 esp_netif_
↳驱动 */
    driver_impl_t *h;                       /*!< 驱动实现 */
} my_netif_driver_t;
```

此实例中包含 `my_netif_driver_t::base.post_attach` 的真实值和实际的驱动处理程序 `my_netif_driver_t::h`。

从初始化代码调用 `esp_netif_attach()` 时，将执行 I/O 驱动程序代码的后附回调，以在 ESP-NETIF 和 I/O 驱动程序实例之间相互注册回调。通常，后附回调中也会启动驱动程序。以下为一个简单的后附回调示例：

```
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

默认处理程序 I/O 驱动程序通常还会根据 I/O 驱动程序的状态转换，为相关网络接口的生命周期行为提供默认定义，例如 `driver start` -> `network start` 等。

以下是此类默认处理程序的一个示例：

```
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_
↳netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_
↳EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_
↳EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

网络堆栈连接 用于传输和释放 RX 缓冲区的数据路径函数（在 I/O 驱动中定义）由 ESP-NETIF 的 TCP/IP 堆栈连接层调用。

注意，ESP-IDF 为最常见的网络接口（如 Wi-Fi station 或以太网）提供了几种网络堆栈配置。这些配置定义在 `esp_netif/include/esp_netif_defaults.h` 中，能够满足大多数网络驱动程序的需求。在少数情况下，一些专家用户可能希望自定义基于 lwIP 的接口层，这需要额外设置 lwIP 依赖。

以下参考 API 概述了这些网络堆栈和 ESP-NETIF 的交互：

Header File

- `components/esp_netif/include/esp_netif_net_stack.h`
- This header file can be included with:

```
#include "esp_netif_net_stack.h"
```

- This header file is a part of the API provided by the `esp_netif` component. To declare that your component depends on `esp_netif`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_netif
```

or

```
PRIV_REQUIRES esp_netif
```

Functions

`esp_netif_t` *`esp_netif_get_handle_from_netif_impl` (void *dev)

Returns esp-netif handle.

参数 `dev` -- [in] opaque ptr to network interface of specific TCP/IP stack

返回 handle to related esp-netif instance

void *`esp_netif_get_netif_impl` (`esp_netif_t` *esp_netif)

Returns network stack specific implementation handle.

参数 `esp_netif` -- [in] Handle to esp-netif instance

返回 handle to related network stack netif handle

`esp_err_t` `esp_netif_set_link_speed` (`esp_netif_t` *esp_netif, uint32_t speed)

Set link-speed for the specified network interface.

参数

- `esp_netif` -- [in] Handle to esp-netif instance
- `speed` -- [in] Link speed in bit/s

返回 ESP_OK on success

`esp_err_t` `esp_netif_transmit` (`esp_netif_t` *esp_netif, void *data, size_t len)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

参数

- `esp_netif` -- [in] Handle to esp-netif instance
- `data` -- [in] Data to be transmitted
- `len` -- [in] Length of the data frame

返回 ESP_OK on success, an error passed from the I/O driver otherwise

`esp_err_t` `esp_netif_transmit_wrap` (`esp_netif_t` *esp_netif, void *data, size_t len, void *netstack_buf)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

参数

- `esp_netif` -- [in] Handle to esp-netif instance
- `data` -- [in] Data to be transmitted
- `len` -- [in] Length of the data frame
- `netstack_buf` -- [in] net stack buffer

返回 ESP_OK on success, an error passed from the I/O driver otherwise

void `esp_netif_free_rx_buffer` (void *esp_netif, void *buffer)

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

参数

- `esp_netif` -- [in] Handle to esp-netif instance
- `buffer` -- [in] Rx buffer pointer

TCP/IP 套接字 API 的示例代码存放在 ESP-IDF 示例项目的 `protocols/sockets` 目录下。

2.4.5 应用层协议

应用层网络协议（IP 网络层协议之上）的相关文档存放在 `应用层协议` 目录下。

2.5 外设 API

This warning was automatically inserted due to the source file being in the `add_warnings_pages` list.

2.5.1 模数转换器 (ADC) 单次转换模式驱动

简介

模数转换器集成于芯片，支持测量特定模拟 IO 管脚的模拟信号。

ESP32-P4 有两个 ADC 单元，可以在以下场景使用：

- 生成 ADC 单次转换结果
- 生成连续 ADC 转换结果

本指南介绍了 ADC 单次转换模式。

功能概述

下文将分节概述安装和运行 ADC 的基本步骤：

- **资源分配** - 介绍获取 ADC 句柄所需设置的参数，以及如何在 ADC 完成工作后回收资源。
- **配置 ADC 单元实例** - 介绍配置 ADC 单元所需设置的参数，用于获取 ADC 转换的原始结果。
- **读取转换结果** - 介绍如何获取 ADC 转换的原始结果。
- **硬件限制** - 介绍与 ADC 相关的硬件限制。
- **电源管理** - 介绍电源管理的相关内容。
- **IRAM 安全** - 介绍在禁用 cache 时，如何读取 ADC 转换的原始结果。
- **线程安全** - 介绍由驱动程序认证为线程安全的 API。
- **Kconfig 选项** - 介绍支持的 Kconfig 选项，不同选项对驱动程序的操作会产生不同影响。

资源分配 ADC 单次转换模式驱动基于 ESP32-P4 SAR ADC 模块实现，不同的 ESP 芯片可能拥有不同数量的独立 ADC。对于单次转换模式驱动而言，ADC 实例以 `adc_oneshot_unit_handle_t` 表示。

请设置所需的初始配置结构体 `adc_oneshot_unit_init_cfg_t` 安装 ADC 实例，具体如下：

- `adc_oneshot_unit_init_cfg_t::unit_id` 选择 ADC。请参阅 [技术规格书](#)，了解对应 ADC 的专用模拟 IO 管脚。
- `adc_oneshot_unit_init_cfg_t::clk_src` 选择 ADC 的时钟源。设置为 0 时，驱动程序将使用默认时钟源，详情请参阅 `adc_oneshot_clk_src_t`。
- `adc_oneshot_unit_init_cfg_t::ulp_mode` 设置是否支持 ADC 在 ULP 模式下工作。

完成 ADC 初始配置后，使用已设置的初始配置结构体 `adc_oneshot_unit_init_cfg_t` 调用 `adc_oneshot_new_unit()`。如果分配成功，该函数将返回 ADC 单元实例句柄。

该函数可能因参数无效、内存不足等原因返回错误代码。比如，当要分配的 ADC 实例已经注册时，该函数会返回 `ESP_ERR_NOT_FOUND` 错误。可用 ADC 数量可通过 `SOC_ADC_PERIPH_NUM` 查看。

如果不再需要先前创建的 ADC 单元实例，请调用 `adc_oneshot_del_unit()` 回收该实例，相关的硬件和软件资源也会回收。

在普通单次转换模式下创建 ADC 单元实例句柄

```
adc_oneshot_unit_handle_t adc1_handle;
adc_oneshot_unit_init_cfg_t init_config1 = {
    .unit_id = ADC_UNIT_1,
    .ulp_mode = ADC_ULP_MODE_DISABLE,
};
ESP_ERROR_CHECK(adc_oneshot_new_unit(&init_config1, &adc1_handle));
```

回收 ADC 单元实例

```
ESP_ERROR_CHECK(adc_oneshot_del_unit(adc1_handle));
```

配置 ADC 单元实例 创建 ADC 单元实例后，请设置 `adc_oneshot_chan_cfg_t` 配置 ADC IO 以测量模拟信号，具体如下：

- `adc_oneshot_chan_cfg_t::atten`，ADC 衰减。请参阅 [技术参考手册](#) > 片上传感器与模拟信号处理。
- `adc_oneshot_chan_cfg_t::bitwidth`，原始转换结果的位宽。

备注： ADC IO 及其对应的 ADC 通道编号，请参阅 [技术规格书](#)。

此外，可以使用 `adc_continuous_io_to_channel()` 和 `adc_continuous_channel_to_io()` 了解 ADC 通道和 ADC IO。

为使以上设置生效，请使用上述配置结构体调用 `adc_oneshot_config_channel()`，并指定要配置的 ADC 通道。函数 `adc_oneshot_config_channel()` 支持多次调用，以配置不同的 ADC 通道。驱动程序将在内部保存每个通道的配置。

配置两个 ADC 通道

```
adc_oneshot_chan_cfg_t config = {
    .bitwidth = ADC_BITWIDTH_DEFAULT,
    .atten = ADC_ATTEN_DB_12,
};
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, EXAMPLE_ADC1_CHAN0, &
↪config));
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, EXAMPLE_ADC1_CHAN1, &
↪config));
```

读取转换结果 完成上述配置后，ADC 即可测量来自配置好的 ADC 通道的模拟信号。调用 `adc_oneshot_read()` 可以获取 ADC 通道的原始转换结果。

- `adc_oneshot_read()` 可安全使用。ADC 由其他驱动程序/外设共享，请参阅 [硬件限制](#)。函数 `adc_oneshot_read()` 使用互斥锁，避免与其他函数同时使用硬件，因此该函数不应在 ISR 上下文中使用。当 ADC 由其他驱动程序/外设占用时，该函数可能出错，并返回 `ESP_ERR_TIMEOUT` 错误。此时，ADC 原始结果无效。

该函数可能因参数无效而调用失败。

通过该函数获取的 ADC 转换结果为原始数据。可以使用以下公式，根据 ADC 原始结果计算电压：

$$V_{out} = D_{out} * V_{max} / D_{max} \quad (1)$$

其中：

Vout	数字输出结果，代表电压。
Dout	ADC 原始数字读取结果。
Vmax	可测量的最大模拟输入电压，与 ADC 衰减相关，请参考 技术参考手册 > 片上传感器与模拟信号处理。
Dmax	输出 ADC 原始数字读取结果的最大值，即 $2^{\text{位宽}}$ ，位宽即之前配置的 <code>adc_digi_pattern_config_t::bit_width</code> 。

若需进一步校准，将 ADC 原始结果转换为以 mV 为单位的电压数据，请参考校准文档 [模数转换器 \(ADC\) 校准驱动程序](#)。

读取原始结果

```
ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN0, &adc_raw[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN0,
↪ adc_raw[0][0]);

ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN1, &adc_raw[0][1]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN1,
↪ adc_raw[0][1]);
```

硬件限制

- 随机数生成器 (RNG) 以 ADC 为输入源。使用 ADC 单次转换模式驱动从 RNG 生成随机数时，随机性会减弱。
- 一个 ADC 单元每次只能在一种操作模式下运行，可以是连续模式或单次模式。`adc_oneshot_start()` 提供了保护措施。

电源管理 启用电源管理，即启用 `CONFIG_PM_ENABLE` 时，系统在空闲状态下可能会调整系统时钟频率。然而，ADC 单次转换模式驱动以轮询例程运行，`adc_oneshot_read()` 会不断检查 CPU 是否完成读取，直到函数返回。在此期间，ADC 单次转换模式驱动程序所在的任务不会受阻塞。因此，在读取时时钟频率保持稳定。

IRAM 安全 flash 写入/擦除、OTA 等原因都可能导致 cache 禁用，此时，默认不应运行任何 ADC 单次转换模式驱动 API。如果在禁用 cache 时执行了 ADC 单次转换模式驱动 API，可能会出现类似 `Illegal Instruction` 或 `Load/Store Prohibited` 的错误。

线程安全

- `adc_oneshot_new_unit()`
- `adc_oneshot_config_channel()`
- `adc_oneshot_read()`

上述函数均为线程安全，使用时，可以直接从不同的 RTOS 任务中调用以上函数，无需额外锁保护。

- `adc_oneshot_del_unit()` 非线程安全。此外，与上文中线程安全的函数一起调用该函数时，可能导致线程安全函数的调用出错。

Kconfig 选项

- `CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM` 决定了放置 ADC 快速读取函数的位置，即 IRAM 或 flash 中，详情请参阅 [IRAM 安全](#)。

应用示例

- ADC 单次转换模式示例：[peripherals/adc/oneshot_read](#)。

API 参考

Header File

- `components/hal/include/hal/adc_types.h`
- This header file can be included with:

```
#include "hal/adc_types.h"
```

Structures

struct `adc_digi_pattern_config_t`
ADC digital controller pattern configuration.

Public Members

uint8_t `atten`
Attenuation of this ADC channel.

uint8_t `channel`
ADC channel.

uint8_t `unit`
ADC unit.

uint8_t `bit_width`
ADC output bit width.

struct `adc_digi_output_data_t`
ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

Public Members

uint32_t `data`
ADC real output data info. Resolution: 12 bit.

uint32_t `reserved12`
Reserved12.

uint32_t **channel**

ADC channel index info. If (channel < ADC_CHANNEL_MAX), The data is valid. If (channel > ADC_CHANNEL_MAX), The data is invalid.

uint32_t **unit**

ADC unit index info. 0: ADC1; 1: ADC2.

uint32_t **reserved17_31**

Reserved17.

struct *adc_digi_output_data_t*::[anonymous]::[anonymous] **type2**

When the configured output format is 12bit.

uint32_t **val**

Raw data value

Type Definitions

typedef *soc_periph_adc_digi_clk_src_t* **adc_oneshot_clk_src_t**

Clock source type of oneshot mode which uses digital controller.

typedef *soc_periph_adc_digi_clk_src_t* **adc_continuous_clk_src_t**

Clock source type of continuous mode which uses digital controller.

Enumerations

enum **adc_unit_t**

ADC unit.

Values:

enumerator **ADC_UNIT_1**

SAR ADC 1.

enumerator **ADC_UNIT_2**

SAR ADC 2.

enum **adc_channel_t**

ADC channels.

Values:

enumerator **ADC_CHANNEL_0**

ADC channel.

enumerator **ADC_CHANNEL_1**

ADC channel.

enumerator **ADC_CHANNEL_2**

ADC channel.

enumerator **ADC_CHANNEL_3**

ADC channel.

enumerator **ADC_CHANNEL_4**

ADC channel.

enumerator **ADC_CHANNEL_5**

ADC channel.

enumerator **ADC_CHANNEL_6**

ADC channel.

enumerator **ADC_CHANNEL_7**

ADC channel.

enumerator **ADC_CHANNEL_8**

ADC channel.

enumerator **ADC_CHANNEL_9**

ADC channel.

enum **adc_atten_t**

ADC attenuation parameter. Different parameters determine the range of the ADC.

Values:

enumerator **ADC_ATTEN_DB_0**

No input attenuation, ADC can measure up to approx.

enumerator **ADC_ATTEN_DB_2_5**

The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB.

enumerator **ADC_ATTEN_DB_6**

The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB.

enumerator **ADC_ATTEN_DB_12**

The input voltage of ADC will be attenuated extending the range of measurement by about 12 dB.

enumerator **ADC_ATTEN_DB_11**

This is deprecated, it behaves the same as `ADC_ATTEN_DB_12`

enum **adc_bitwidth_t**

Values:

enumerator **ADC_BITWIDTH_DEFAULT**

Default ADC output bits, max supported width will be selected.

enumerator **ADC_BITWIDTH_9**

ADC output width is 9Bit.

enumerator **ADC_BITWIDTH_10**

ADC output width is 10Bit.

enumerator **ADC_BITWIDTH_11**

ADC output width is 11Bit.

enumerator **ADC_BITWIDTH_12**

ADC output width is 12Bit.

enumerator **ADC_BITWIDTH_13**

ADC output width is 13Bit.

enum **adc_ulp_mode_t**

Values:

enumerator **ADC_ULP_MODE_DISABLE**

ADC ULP mode is disabled.

enumerator **ADC_ULP_MODE_FSM**

ADC is controlled by ULP FSM.

enumerator **ADC_ULP_MODE_RISCV**

ADC is controlled by ULP RISCV.

enum **adc_digi_convert_mode_t**

ADC digital controller (DMA mode) work mode.

Values:

enumerator **ADC_CONV_SINGLE_UNIT_1**

Only use ADC1 for conversion.

enumerator **ADC_CONV_SINGLE_UNIT_2**

Only use ADC2 for conversion.

enumerator **ADC_CONV_BOTH_UNIT**

Use Both ADC1 and ADC2 for conversion simultaneously.

enumerator **ADC_CONV_ALTER_UNIT**

Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2

enum **adc_digi_output_format_t**

ADC digital controller (DMA mode) output data format option.

Values:

enumerator **ADC_DIGI_OUTPUT_FORMAT_TYPE1**

See `adc_digi_output_data_t.type1`

enumerator **ADC_DIGI_OUTPUT_FORMAT_TYPE2**

See [adc_digi_output_data_t.type2](#)

enum **adc_digi_iir_filter_t**

ADC IIR Filter ID.

Values:

enumerator **ADC_DIGI_IIR_FILTER_0**

Filter 0.

enumerator **ADC_DIGI_IIR_FILTER_1**

Filter 1.

enum **adc_digi_iir_filter_coeff_t**

IIR Filter Coefficient.

Values:

enumerator **ADC_DIGI_IIR_FILTER_COEFF_2**

The filter coefficient is 2.

enumerator **ADC_DIGI_IIR_FILTER_COEFF_4**

The filter coefficient is 4.

enumerator **ADC_DIGI_IIR_FILTER_COEFF_8**

The filter coefficient is 8.

enumerator **ADC_DIGI_IIR_FILTER_COEFF_16**

The filter coefficient is 16.

enumerator **ADC_DIGI_IIR_FILTER_COEFF_64**

The filter coefficient is 64.

enum **adc_monitor_id_t**

ADC monitor (continuous mode) ID.

Values:

enumerator **ADC_MONITOR_0**

The monitor index 0.

enumerator **ADC_MONITOR_1**

The monitor index 1.

enum **adc_monitor_mode_t**

Monitor config/event mode type.

Values:

enumerator **ADC_MONITOR_MODE_HIGH**

ADC raw_result > threshold value, monitor interrupt will be generated.

enumerator **ADC_MONITOR_MODE_LOW**

ADC raw_result < threshold value, monitor interrupt will be generated.

Header File

- `components/esp_adc/include/esp_adc/adc_oneshot.h`
- This header file can be included with:

```
#include "esp_adc/adc_oneshot.h"
```

- This header file is a part of the API provided by the `esp_adc` component. To declare that your component depends on `esp_adc`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_adc
```

or

```
PRIV_REQUIRES esp_adc
```

Functions

`esp_err_t adc_oneshot_new_unit` (const `adc_oneshot_unit_init_cfg_t` *init_config, `adc_oneshot_unit_handle_t` *ret_unit)

Create a handle to a specific ADC unit.

备注: This API is thread-safe. For more details, see ADC programming guide

参数

- **init_config** -- [in] Driver initial configurations
- **ret_unit** -- [out] ADC unit handle

返回

- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid arguments
- `ESP_ERR_NO_MEM`: No memory
- `ESP_ERR_NOT_FOUND`: The ADC peripheral to be claimed is already in use
- `ESP_FAIL`: Clock source isn't initialised correctly

`esp_err_t adc_oneshot_config_channel` (`adc_oneshot_unit_handle_t` handle, `adc_channel_t` channel, const `adc_oneshot_chan_cfg_t` *config)

Set ADC oneshot mode required configurations.

备注: This API is thread-safe. For more details, see ADC programming guide

参数

- **handle** -- [in] ADC handle
- **channel** -- [in] ADC channel to be configured
- **config** -- [in] ADC configurations

返回

- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid arguments

`esp_err_t adc_oneshot_read` (`adc_oneshot_unit_handle_t` handle, `adc_channel_t` chan, int *out_raw)

Get one ADC conversion raw result.

备注: This API is thread-safe. For more details, see ADC programming guide

备注: This API should NOT be called in an ISR context

参数

- **handle** -- **[in]** ADC handle
- **chan** -- **[in]** ADC channel
- **out_raw** -- **[out]** ADC conversion raw result

返回

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_TIMEOUT: Timeout, the ADC result is invalid

esp_err_t **adc_oneshot_del_unit** (*adc_oneshot_unit_handle_t* handle)

Delete the ADC unit handle.

备注: This API is thread-safe. For more details, see ADC programming guide

参数 **handle** -- **[in]** ADC handle

返回

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_NOT_FOUND: The ADC peripheral to be disclaimed isn't in use

esp_err_t **adc_oneshot_io_to_channel** (int io_num, *adc_unit_t* *const unit_id, *adc_channel_t* *const channel)

Get ADC channel from the given GPIO number.

参数

- **io_num** -- **[in]** GPIO number
- **unit_id** -- **[out]** ADC unit
- **channel** -- **[out]** ADC channel

返回

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_NOT_FOUND: The IO is not a valid ADC pad

esp_err_t **adc_oneshot_channel_to_io** (*adc_unit_t* unit_id, *adc_channel_t* channel, int *const io_num)

Get GPIO number from the given ADC channel.

参数

- **unit_id** -- **[in]** ADC unit
- **channel** -- **[in]** ADC channel
- **io_num** -- **[out]** GPIO number
- -- ESP_OK: On success
- -- ESP_ERR_INVALID_ARG: Invalid argument

esp_err_t **adc_oneshot_get_calibrated_result** (*adc_oneshot_unit_handle_t* handle, *adc_cali_handle_t* cali_handle, *adc_channel_t* chan, int *cali_result)

Convenience function to get ADC calibrated result.

This is an all-in-one function which does:

- oneshot read ADC raw result

- calibrate the raw result and convert it into calibrated result (in mV)

参数

- **handle** -- [in] ADC oneshot handle, you should call `adc_oneshot_new_unit()` to get this handle
- **cali_handle** -- [in] ADC calibration handle, you should call `adc_cali_create_scheme_x()` in `adc_cali_scheme.h` to create a handle
- **chan** -- [in] ADC channel
- **cali_result** -- [out] Calibrated ADC result (in mV)

返回

- ESP_OK Other return errors from `adc_oneshot_read()` and `adc_cali_raw_to_voltage()`

Structures

struct **adc_oneshot_unit_init_cfg_t**

ADC oneshot driver initial configurations.

Public Members

adc_unit_t **unit_id**

ADC unit.

adc_oneshot_clk_src_t **clk_src**

Clock source.

adc_ulp_mode_t **ulp_mode**

ADC controlled by ULP, see `adc_ulp_mode_t`

struct **adc_oneshot_chan_cfg_t**

ADC channel configurations.

Public Members

adc_atten_t **atten**

ADC attenuation.

adc_bitwidth_t **bitwidth**

ADC conversion result bits.

Type Definitions

typedef struct `adc_oneshot_unit_ctx_t` ***adc_oneshot_unit_handle_t**

Type of ADC unit handle for oneshot mode.

This warning was automatically inserted due to the source file being in the `add_warnings_pages` list.

2.5.2 模数转换器 (ADC) 连续转换模式驱动

简介

ESP32-P4 芯片集成了模数转换器 (ADC)，支持测量特定模拟 IO 管脚的模拟信号。此外，ADC 还支持直接内存访问 (DMA) 功能，高效获取 ADC 转换结果。

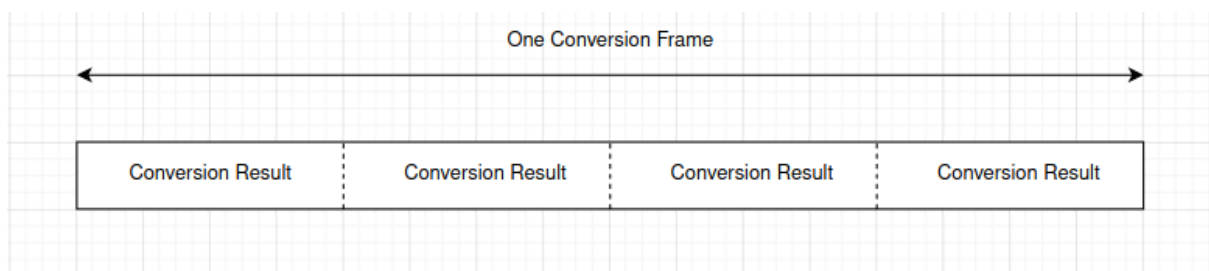

ESP32-P4 具有两个 ADC 单元，可应用于以下场景：

- 生成单次 ADC 转换结果
- 生成连续 ADC 转换结果

本指南介绍了 ADC 连续转换模式。

ADC 连续转换模式驱动概念 ADC 连续转换模式驱动由多个转换帧组成。

- **转换帧**：一个转换帧包含多个转换结果。转换帧大小以字节为单位，在 `adc_continuous_new_handle()` 中配置。
- **转换结果**：一个转换结果包含多个字节，即 `SOC_ADC_DIGI_RESULT_BYTES`。转换结果的数据结构由 `adc_digi_output_data_t` 定义，包括 ADC 单元、ADC 通道以及原始数据。

功能概述

下文将分节概述安装 ADC 连续转换模式驱动，并从一组 ADC 通道连续读取 ADC 转换结果的基本步骤：

- **资源分配**：介绍初始化 ADC 连续转换模式驱动所需设置的参数，以及如何将驱动去初始化。
- **配置 ADC**：介绍如何将 ADC 配置为在连续转换模式下工作。
- **ADC 控制**：介绍 ADC 控制函数。
- **注册事件回调**：介绍如何将特定用户代码链接到 ADC 连续转换模式事件回调函数。
- **读取转换结果**：介绍如何获取 ADC 转换结果。
- **硬件限制**：介绍与 ADC 相关的硬件限制。
- **电源管理**：介绍电源管理的相关内容。
- **IRAM 安全**：介绍与 IRAM 安全相关的函数。
- **线程安全**：介绍由驱动程序认证为线程安全的 API。

资源分配 ADC 连续转换模式驱动基于 ESP32-P4 SAR ADC 模块实现，不同的 ESP 目标芯片可能拥有不同数量的独立 ADC。

请按照以下步骤设置配置结构体 `adc_continuous_handle_cfg_t`，创建 ADC 连续转换模式驱动的句柄：

- `adc_continuous_handle_cfg_t::max_store_buf_size`：以字节为单位设置最大缓冲池的大小，驱动程序将 ADC 转换结果保存到该缓冲池中。缓冲池已满时，新的转换将丢失。
- `adc_continuous_handle_cfg_t::conv_frame_size`：以字节为单位设置 ADC 转换帧大小。
- `adc_continuous_handle_cfg_t::flags`：设置可以改变驱动程序行为的标志。
 - `flush_pool`：缓冲池满时自动清空缓冲池。

完成以上 ADC 配置后，使用已设置的配置结构体 `adc_continuous_handle_cfg_t` 调用 `adc_continuous_new_handle()`。该函数可能将在特定情况下返回错误值，如无效参数、内存不足等。

函数返回 `ESP_ERR_NOT_FOUND` 时，表明 GDMA 空闲通道不足。

如果不再使用 ADC 连续转换模式驱动，请调用 `adc_continuous_deinit()` 将驱动去初始化。

初始化 ADC 连续转换模式驱动

```
adc_continuous_handle_cfg_t adc_config = {
    .max_store_buf_size = 1024,
    .conv_frame_size = 100,
};
ESP_ERROR_CHECK(adc_continuous_new_handle(&adc_config));
```

回收 ADC 单元

```
ESP_ERROR_CHECK(adc_continuous_deinit());
```

配置 ADC 初始化 ADC 连续转换模式驱动后，设置 `adc_continuous_config_t` 配置 ADC IO，测量模拟信号：

- `adc_continuous_config_t::pattern_num`: 要使用的 ADC 通道数量。
- `adc_continuous_config_t::adc_pattern`: 每个要使用的 ADC 通道的配置列表，请参阅下文描述。
- `adc_continuous_config_t::sample_freq_hz`: 期望的 ADC 采样频率，单位为 Hz。
- `adc_continuous_config_t::conv_mode`: 连续转换模式。
- `adc_continuous_config_t::format`: 转换模式结果的输出格式。

按照以下步骤设置 `adc_digi_pattern_config_t`：

- `adc_digi_pattern_config_t::atten`: ADC 衰减。请参阅 [技术参考手册](#) 中的片上传感器与模拟信号处理章节。
- `adc_digi_pattern_config_t::channel`: IO 对应的 ADC 通道号，请参阅下文注意事项。
- `adc_digi_pattern_config_t::unit`: IO 所属的 ADC 单元。
- `adc_digi_pattern_config_t::bit_width`: 原始转换结果的位宽。

备注：对于 IO 对应的 ADC 通道号，请参阅 [技术参考手册](#) 获取 ADC IO 管脚的详细信息。另外，可以使用 `adc_continuous_io_to_channel()` 和 `adc_continuous_channel_to_io()` 获取 ADC 通道和 ADC IO 的对应关系。

为使这些设置生效，请使用上述配置结构体，调用 `adc_continuous_config()`。此 API 可能由于 `ESP_ERR_INVALID_ARG` 等原因返回错误。当它返回 `ESP_ERR_INVALID_STATE` 时，意味着 ADC 连续转换模式驱动已经启动，此时不应调用此 API。

请参考 ADC 连续转换模式示例 [peripherals/adc/continuous_read](#)，查看相应配置代码。

ADC 控制

启动和停止 调用 `adc_continuous_start()`，将使 ADC 开始从配置好的 ADC 通道测量模拟信号，并生成转换结果。

相反，调用 `adc_continuous_stop()` 则会停止 ADC 转换。

```
ESP_ERROR_CHECK(adc_continuous_stop());
```

注册事件回调 调用 `adc_continuous_register_event_callbacks()`，可以将自己的函数链接到驱动程序的 ISR 中。通过 `adc_continuous_evt_cbs_t` 可查看所有支持的事件回调。

- `adc_continuous_evt_cbs_t::on_conv_done`: 当一个转换帧完成时，触发此事件。
- `adc_continuous_evt_cbs_t::on_pool_ovf`: 当内部缓冲池已满时，触发此事件，新的转换结果将丢失。

由于上述回调函数在 ISR 中调用，请确保回调函数适合在 ISR 上下文中运行，且这些回调不应涉及阻塞逻辑。回调函数的原型在 `adc_continuous_callback_t` 中声明。

在调用 `adc_continuous_register_event_callbacks()` 时，还可以通过参数 `user_data` 注册自己的上下文，该用户数据将直接传递给回调函数。

此回调函数可能由于 `ESP_ERR_INVALID_ARG` 等原因返回错误。启用 `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` 时，如果回调函数失败并报错，可能是因为回调函数不在内部 RAM 中，请查看错误日志了解详情。此外，如果回调函数出现 `ESP_ERR_INVALID_STATE` 错误，表明 ADC 连续转换模式驱动已经启动，此时不应添加回调。

转换完成事件 当驱动程序完成一次转换后，会触发 `adc_continuous_evt_cbs_t::on_conv_done` 事件，并填充事件数据。事件数据包含一个指向转换帧缓冲区的指针，以及转换帧缓冲区大小。要了解事件数据结构，请参阅 `adc_continuous_evt_data_t`。

备注：注意，数据缓冲区 `adc_continuous_evt_data_t::conv_frame_buffer` 由驱动程序本身维护，请勿释放此内存。

备注：启用 Kconfig 选项 `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` 时，注册的回调函数以及回调函数中调用的函数应放置在 IRAM 中，涉及的变量也应放置在内部 RAM 中。

缓冲池溢出事件 ADC 连续转换模式驱动使用内部缓冲池保存转换结果，缓冲池满时将发生缓冲池溢出事件。此时，驱动程序不会继续填充事件数据。缓冲池溢出通常是因为调用 `adc_continuous_read()` 从池中读取数据的速度远低于 ADC 转换的速度。

读取转换结果 调用 `adc_continuous_start()` 启动 ADC 连续转换，调用 `adc_continuous_read()` 可以获取 ADC 通道的转换结果。注意提供缓冲区，获取原始结果。

函数 `adc_continuous_read()` 每次都会尝试以期望长度读取转换结果。

- 调用 `adc_continuous_read()` 可以请求读取指定长度的转换结果。但有时实际可用的转换结果可能少于请求长度，此时，函数仍会将数据从内部池移动到你提供的缓冲区中。因此，请查看 `out_length` 的值，了解实际移动到缓冲区中的转换结果数量。
- 如果内部池中生成转换结果，函数将会阻塞一段时间，即 `timeout_ms`，直到转换结果生成。如果始终没有转换结果生成，函数将返回 `ESP_ERR_TIMEOUT`。
- 如果 ADC 连续转换生成的结果填满了内部池，新产生的结果将丢失。下次调用 `adc_continuous_read()` 时，将返回 `ESP_ERR_INVALID_STATE`，提示此情况发生。

此 API 提供了一个读取所有 ADC 连续转换结果的机会。

从上述函数读取的 ADC 转换结果为原始数据。要根据 ADC 原始结果计算电压，可以使用以下公式：

$$V_{out} = D_{out} * V_{max} / D_{max} \quad (1)$$

其中：

Vout	数据输出结果，代表电压。
Dout	ADC 原始数据读取结果。
Vmax	可测量的最大模拟输入电压，与 ADC 衰减相关，请参考 技术参考手册 中的片上传感器与模拟信号处理章节。
Dmax	输出 ADC 原始数据读取结果的最大值，即 2^N 位宽，位宽即之前配置的 <code>adc_digi_pattern_config_t::bit_width</code> 。

若需进一步校准，将 ADC 原始结果转换为以 mV 为单位的电压数据，请参考 [模数转换器 \(ADC\) 校准驱动程序](#)。

硬件限制

- 一个 ADC 单元一次只能运行一种操作模式，即连续模式或单次模式。`adc_continuous_start()` 提供了保护措施。
- 随机数生成器 (RNG) 以 ADC 为输入源。使用 ADC 连续转换模式驱动从 RNG 生成随机数时，随机性会减弱。

电源管理 启用电源管理，即启用 `CONFIG_PM_ENABLE` 时，系统在空闲状态下，可能会调整 APB 时钟频率，这可能会改变 ADC 连续转换的行为。

然而，通过获取类型为 `ESP_PM_APB_FREQ_MAX` 的电源管理锁，ADC 连续转换模式驱动可以阻止这种改变。调用 `adc_continuous_start()` 启动连续转换后即可获取该锁。同样，调用 `adc_continuous_stop()` 停止转换后将释放该锁。因此，必须确保 `adc_continuous_start()` 和 `adc_continuous_stop()` 成对出现，否则电源管理将失效。

IRAM 安全 ADC 连续转换模式驱动的所有 API 均非 IRAM 安全。禁用 cache 时，不应运行这类 API。启用 Kconfig 选项 `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` 可确保驱动的内部 ISR 处理程序为 IRAM 安全，此时即使禁用 cache，驱动仍然会将转换结果保存到其内部缓冲池中。

线程安全 ADC 连续转换模式驱动的 API 不一定线程安全，但驱动程序提供了共享硬件互斥，详情请参阅 [硬件限制](#)。

应用示例

- ADC 连续转换模式示例：[peripherals/adc/continuous_read](#)。

API 参考

Header File

- `components/esp_adc/include/esp_adc/adc_continuous.h`
- This header file can be included with:

```
#include "esp_adc/adc_continuous.h"
```

- This header file is a part of the API provided by the `esp_adc` component. To declare that your component depends on `esp_adc`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_adc
```

or

```
PRIV_REQUIRES esp_adc
```

Functions

`esp_err_t adc_continuous_new_handle` (const `adc_continuous_handle_cfg_t` *hdl_config, `adc_continuous_handle_t` *ret_handle)

Initialize ADC continuous driver and get a handle to it.

参数

- **hdl_config** -- [in] Pointer to ADC initialization config. Refer to `adc_continuous_handle_cfg_t`.
- **ret_handle** -- [out] ADC continuous mode driver handle

返回

- `ESP_ERR_INVALID_ARG` If the combination of arguments is invalid.
- `ESP_ERR_NOT_FOUND` No free interrupt found with the specified flags
- `ESP_ERR_NO_MEM` If out of memory

- ESP_OK On success

esp_err_t **adc_continuous_config** (*adc_continuous_handle_t* handle, const *adc_continuous_config_t* *config)

Set ADC continuous mode required configurations.

参数

- **handle** -- **[in]** ADC continuous mode driver handle
- **config** -- **[in]** Refer to *adc_digi_config_t*.

返回

- ESP_ERR_INVALID_STATE: Driver state is invalid, you shouldn't call this API at this moment
- ESP_ERR_INVALID_ARG: If the combination of arguments is invalid.
- ESP_OK: On success

esp_err_t **adc_continuous_register_event_callbacks** (*adc_continuous_handle_t* handle, const *adc_continuous_evt_cbs_t* *cbs, void *user_data)

Register callbacks.

备注: User can deregister a previously registered callback by calling this function and setting the to-be-deregistered callback member in the *cbs* structure to NULL.

备注: When CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables (including *user_data*) should be in internal RAM as well.

备注: You should only call this API when the ADC continuous mode driver isn't started. Check return value to know this.

参数

- **handle** -- **[in]** ADC continuous mode driver handle
- **cbs** -- **[in]** Group of callback functions
- **user_data** -- **[in]** User data, which will be delivered to the callback functions directly

返回

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_INVALID_STATE: Driver state is invalid, you shouldn't call this API at this moment

esp_err_t **adc_continuous_start** (*adc_continuous_handle_t* handle)

Start the ADC under continuous mode. After this, the hardware starts working.

参数 **handle** -- **[in]** ADC continuous mode driver handle

返回

- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

esp_err_t **adc_continuous_read** (*adc_continuous_handle_t* handle, uint8_t *buf, uint32_t length_max, uint32_t *out_length, uint32_t timeout_ms)

Read bytes from ADC under continuous mode.

参数

- **handle** -- **[in]** ADC continuous mode driver handle

- **buf** -- **[out]** Conversion result buffer to read from ADC. Suggest convert to `adc_digi_output_data_t` for ADC Conversion Results. See the subsection Driver Backgrounds in this header file to learn about this concept.
- **length_max** -- **[in]** Expected length of the Conversion Results read from the ADC, in bytes.
- **out_length** -- **[out]** Real length of the Conversion Results read from the ADC via this API, in bytes.
- **timeout_ms** -- **[in]** Time to wait for data via this API, in millisecond.

返回

- `ESP_ERR_INVALID_STATE` Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- `ESP_ERR_TIMEOUT` Operation timed out
- `ESP_OK` On success

`esp_err_t adc_continuous_stop(adc_continuous_handle_t handle)`

Stop the ADC. After this, the hardware stops working.

参数 **handle** -- **[in]** ADC continuous mode driver handle

返回

- `ESP_ERR_INVALID_STATE` Driver state is invalid.
- `ESP_OK` On success

`esp_err_t adc_continuous_deinit(adc_continuous_handle_t handle)`

Deinitialize the ADC continuous driver.

参数 **handle** -- **[in]** ADC continuous mode driver handle

返回

- `ESP_ERR_INVALID_STATE` Driver state is invalid.
- `ESP_OK` On success

`esp_err_t adc_continuous_flush_pool(adc_continuous_handle_t handle)`

Flush the driver internal pool.

备注: This API is not supposed to be called in an ISR context

参数 **handle** -- **[in]** ADC continuous mode driver handle

返回

- `ESP_ERR_INVALID_STATE` Driver state is invalid, you should call this API when it's in init state
- `ESP_ERR_INVALID_ARG`: Invalid arguments
- `ESP_OK` On success

`esp_err_t adc_continuous_io_to_channel(int io_num, adc_unit_t *const unit_id, adc_channel_t *const channel)`

Get ADC channel from the given GPIO number.

参数

- **io_num** -- **[in]** GPIO number
- **unit_id** -- **[out]** ADC unit
- **channel** -- **[out]** ADC channel

返回

- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_NOT_FOUND`: The IO is not a valid ADC pad

`esp_err_t adc_continuous_channel_to_io(adc_unit_t unit_id, adc_channel_t channel, int *const io_num)`

Get GPIO number from the given ADC channel.

参数

- **unit_id** -- [in] ADC unit
- **channel** -- [in] ADC channel
- **io_num** -- [out] GPIO number
- -- ESP_OK: On success
- -- ESP_ERR_INVALID_ARG: Invalid argument

Structures

struct **adc_continuous_handle_cfg_t**

ADC continuous mode driver initial configurations.

Public Members

uint32_t **max_store_buf_size**

Max length of the conversion results that driver can store, in bytes.

uint32_t **conv_frame_size**

Conversion frame size, in bytes. This should be in multiples of SOC_ADC_DIGI_DATA_BYTES_PER_CONV.

uint32_t **flush_pool**

Flush the internal pool when the pool is full.

struct *adc_continuous_handle_cfg_t*::[anonymous] **flags**

Driver flags.

struct **adc_continuous_config_t**

ADC continuous mode driver configurations.

Public Members

uint32_t **pattern_num**

Number of ADC channels that will be used.

adc_digi_pattern_config_t ***adc_pattern**

List of configs for each ADC channel that will be used.

uint32_t **sample_freq_hz**

The expected ADC sampling frequency in Hz. Please refer to *soc/soc_caps.h* to know available sampling frequency range

adc_digi_convert_mode_t **conv_mode**

ADC DMA conversion mode, see *adc_digi_convert_mode_t*.

adc_digi_output_format_t **format**

ADC DMA conversion output format, see *adc_digi_output_format_t*.

struct **adc_continuous_evt_data_t**

Event data structure.

备注: The `conv_frame_buffer` is maintained by the driver itself, so never free this piece of memory.

Public Members

uint8_t ***conv_frame_buffer**

Pointer to conversion result buffer for one conversion frame.

uint32_t **size**

Conversion frame size.

struct **adc_continuous_evt_cbs_t**

Group of ADC continuous mode callbacks.

备注: These callbacks are all running in an ISR environment.

备注: When `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables should be in internal RAM as well.

Public Members

[*adc_continuous_callback_t*](#) **on_conv_done**

Event callback, invoked when one conversion frame is done. See the subsection `Driver Backgrounds` in this header file to learn about the `conversion` frame concept.

[*adc_continuous_callback_t*](#) **on_pool_ovf**

Event callback, invoked when the internal pool is full.

Macros

ADC_MAX_DELAY

ADC read max timeout value, it may make the `adc_continuous_read` block forever if the OS supports.

Type Definitions

typedef struct `adc_continuous_ctx_t` ***adc_continuous_handle_t**

Type of `adc` continuous mode driver handle.

typedef bool (***adc_continuous_callback_t**)([*adc_continuous_handle_t*](#) handle, const [*adc_continuous_evt_data_t*](#) *edata, void *user_data)

Prototype of `ADC` continuous mode event callback.

Param handle [in] `ADC` continuous mode driver handle

Param edata [in] Pointer to `ADC` continuous mode event data

Param `user_data [in]` User registered context, registered when in `adc_continuous_register_event_callbacks()`
Return Whether a high priority task is woken up by this function

2.5.3 模数转换器 (ADC) 校准驱动程序

简介

在 ESP32-P4 中，模数转换器 (ADC) 比较输入的模拟电压和参考电压，以确定每一位数字输出结果。ESP32-P4 设计的 ADC 参考电压为 1100 mV。然而，不同芯片的真实参考电压可能会略有变化，范围在 1000 mV 到 1200 mV 之间。本文介绍了 ADC 校准驱动程序，可以降低参考电压不同带来的影响，获取更准确的输出结果。

功能概述

下文将分节概述安装和使用 ADC 校准驱动程序的基本步骤：

- **创建校准方案** - 介绍如何创建和删除校准方案句柄。
- **结果转换** - 介绍如何将原始 ADC 结果转换为校准后的结果。
- **线程安全** - 列出由驱动程序认证为线程安全的 API。
- **减少噪声** - 介绍一种常见的降低噪声的方法。

创建校准方案 ADC 校准驱动程序会提供 ADC 校准方案。对于驱动程序来说，每个 ADC 校准方案对应一个 ADC 校准句柄 `adc_cali_handle_t`。

使用 `adc_cali_check_scheme()` 可以查看芯片支持的校准方案。若已了解芯片支持的校准方案，可以跳过该步骤，直接调用对应函数创建校准方案句柄。

使用自定义 ADC 校准方案时，可以选择调整函数 `adc_cali_check_scheme()`，或直接跳过该步骤，调用自定义函数创建校准方案句柄。

备注: 要使用自定义校准方案，可以通过提供创建函数，创建自己的校准方案句柄。请参阅 `components/esp_adc/interface/adc_cali_interface.h` 中的函数表 `adc_cali_scheme_t`，了解 ESP ADC 校准接口。

结果转换 对驱动程序进行完上述配置和初始化工作后，可以调用 `adc_cali_raw_to_voltage()`，将原始 ADC 结果转换为校准结果，校准结果以 mV 为单位。该函数可能因参数无效而调用失败。如果函数返回 `ESP_ERR_INVALID_STATE`，说明校准方案尚未创建。因此你需要创建一个校准方案句柄，通过 `adc_cali_check_scheme()` 可以了解当前芯片支持的校准方案；你也可以提供自定义校准方案，创建对应的校准方案句柄。

获取电压

```
ESP_ERROR_CHECK(adc_cali_raw_to_voltage(adc_cali_handle, adc_raw[0][0], &
↳voltage[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Cali Voltage: %d mV", ADC_UNIT_1 + 1, EXAMPLE_
↳ADC1_CHAN0, voltage[0][0]);
```

线程安全 驱动程序会确保工厂函数 `esp_adc_cali_new_scheme()` 的线程安全，使用时，可以直接从不同的 RTOS 任务中调用此类函数，无需额外锁保护。

其他以 `adc_cali_handle_t` 作为第一个位置参数的函数均非线程安全，在没有设置互斥锁保护的的任务中，应避免从多个任务中调用这类函数。

减少噪声 ESP32-P4 ADC 对噪声敏感，可能导致 ADC 读数出现较大偏差。根据不同使用场景，要减少噪声影响，你可能需要将旁路电容（如 100 nF 陶瓷电容）连接到 ADC 使用的输入管脚。此外，也可以通过多次采样，进一步减轻噪声的影响。

PRIV_REQUIRES esp_adc
```

Functions

`esp_err_t adc_cali_check_scheme(adc_cali_scheme_ver_t *scheme_mask)`

Check the supported ADC calibration scheme.

参数 `scheme_mask` -- [out] Supported ADC calibration scheme(s)

返回

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_NOT_SUPPORTED: No supported calibration scheme

`esp_err_t adc_cali_raw_to_voltage(adc_cali_handle_t handle, int raw, int *voltage)`

Convert ADC raw data to calibrated voltage.

参数

- **handle** -- [in] ADC calibration handle
- **raw** -- [in] ADC raw data
- **voltage** -- [out] Calibrated ADC voltage (in mV)

返回

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_INVALID_STATE: Invalid state, scheme didn't registered

Type Definitions

```
typedef struct adc_cali_scheme_t *adc_cali_handle_t
    ADC calibration handle.
```

Enumerations

```
enum adc_cali_scheme_ver_t
```

ADC calibration scheme.

Values:

```
enumerator ADC_CALI_SCHEME_VER_LINE_FITTING
```

Line fitting scheme.

```
enumerator ADC_CALI_SCHEME_VER_CURVE_FITTING
```

Curve fitting scheme.

```
PRIV_REQUIRES esp_adc
```

2.5.4 Analog Comparator

Introduction

Analog Comparator is a peripheral that can be used to compare a source signal with the internal reference voltage or an external reference signal.

It is a cost effective way to replace an amplifier comparator in some scenarios. But unlike the continuous comparing of the amplifier comparator, ESP Analog Comparator is driven by a source clock, which decides the sampling frequency.

Analog Comparator on ESP32-P4 has 2 unit(s), the channels in the unit(s) are:

UNIT0

- Source Channel: GPIO52
- External Reference Channel: GPIO51
- Internal Reference Channel: Range 0% ~ 70% of the VDD, the step is 10% of the VDD

UNIT1

- Source Channel: GPIO54
- External Reference Channel: GPIO53
- Internal Reference Channel: Range 0% ~ 70% of the VDD, the step is 10% of the VDD

Functional Overview

The following sections of this document cover the typical steps to install and operate an Analog Comparator unit:

- *Resource Allocation* - covers which parameters should be set up to get a unit handle and how to recycle the resources when it finishes working.
- *Further Configurations* - covers the other configurations that might need to be specific and what they are used for.
- *Enable and Disable Unit* - covers how to enable and disable the unit.
- *Power Management* - describes how different source clock selections can affect power consumption.
- *IRAM Safe* - lists which functions are supposed to work even when the cache is disabled.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.
- *ETM Events* -

Resource Allocation An Analog Comparator unit channel is represented by `ana_cmpr_handle_t`. Each unit can support either an internal or an external reference.

To allocate the resource of the Analog Comparator unit, `ana_cmpr_new_unit()` need to be called to get the handle of the unit. Configurations `ana_cmpr_config_t` need to be specified while allocating the unit:

- `ana_cmpr_config_t::unit` selects the Analog Comparator unit.
- `ana_cmpr_config_t::clk_src` selects the source clock for Analog Comparator, it can affect the sampling frequency. Note that the clock source of the Analog Comparator comes from the iomux, it is shared with GPIO extension peripherals like SDM (Sigma-Delta Modulation) and Glitch Filter. The configuration will fail if you specify different clock sources for multiple GPIO extension peripherals. The default clock sources of these peripherals are same, typically, we select `soc_periph_ana_cmpr_clk_src_t::ANA_CMPR_CLK_SRC_DEFAULT` as the clock source.
- `ana_cmpr_config_t::ref_src` selects the reference source from internal voltage or external signal.
- `ana_cmpr_config_t::cross_type` selects which kind of cross type can trigger the interrupt.

The function `ana_cmpr_new_unit()` can fail due to various errors such as insufficient memory, invalid arguments, etc. If a previously created Analog Comparator unit is no longer required, you should recycle it by calling `ana_cmpr_del_unit()`. It allows the underlying HW channel to be used for other purposes. Before deleting an Analog Comparator unit handle, you should disable it by `ana_cmpr_unit_disable()` in advance, or make sure it has not been enabled yet by `ana_cmpr_unit_enable()`.

```
#include "driver/ana_cmpr.h"

ana_cmpr_handle_t cmpr = NULL;
ana_cmpr_config_t config = {
    .unit = 0,
    .clk_src = ANA_CMPR_CLK_SRC_DEFAULT,
    .ref_src = ANA_CMPR_REF_SRC_INTERNAL,
    .cross_type = ANA_CMPR_CROSS_ANY,
};
ESP_ERROR_CHECK(ana_cmpr_new_unit(&config, &cmpr));
// ...
ESP_ERROR_CHECK(ana_cmpr_del_unit(cmpr));
```

Further Configurations

- `ana_cmpr_set_intl_reference()` - Specify the internal reference voltage when `ana_cmpr_ref_source_t::ANA_CMPR_REF_SRC_INTERNAL` is selected as reference source.

It requires `ana_cmpr_internal_ref_config_t::ref_volt` to specify the voltage. The voltage related to the VDD power supply, which can only support a certain fixed percentage of VDD. Currently on ESP32-P4, the internal reference voltage can range from 0 ~ 70% VDD with a step of 10%.

```
#include "driver/ana_cmpr.h"

ana_cmpr_internal_ref_config_t ref_cfg = {
    .ref_volt = ANA_CMPR_REF_VOLT_50_PCT_VDD,
};
ESP_ERROR_CHECK(ana_cmpr_set_internal_reference(cmpr, &ref_cfg));
```

- [ana_cmpr_set_debounce\(\)](#) - Set the debounce configuration.

It requires [ana_cmpr_debounce_config_t::wait_us](#) to set the interrupt waiting time. The interrupt is disabled temporarily for [ana_cmpr_debounce_config_t::wait_us](#) micro seconds, so that the frequent triggering can be avoid while the source signal crossing the reference signal. That is, the waiting time is supposed to be inverse ratio to the relative frequency between the source and reference. If the waiting time is set too short, it can not bypass the jitter totally, but if too long, the next crossing interrupt might be missed.

```
#include "driver/ana_cmpr.h"

ana_cmpr_debounce_config_t dbc_cfg = {
    .wait_us = 1,
};
ESP_ERROR_CHECK(ana_cmpr_set_debounce(cmpr, &dbc_cfg));
```

- [ana_cmpr_set_cross_type\(\)](#) - Set the source signal cross type.

The initial cross type is set int [ana_cmpr_new_unit\(\)](#), this function can update the cross type, even in ISR context.

```
#include "driver/ana_cmpr.h"

ESP_ERROR_CHECK(ana_cmpr_set_cross_type(cmpr, ANA_CMPR_CROSS_POS));
```

- [ana_cmpr_register_event_callbacks\(\)](#) - Register the callbacks.

Currently it supports [ana_cmpr_event_callbacks_t::on_cross](#), it will be called when the crossing event (specified by [ana_cmpr_config_t::cross_type](#)) occurs.

```
#include "driver/ana_cmpr.h"

static bool IRAM_ATTR example_ana_cmpr_on_cross_callback(ana_cmpr_handle_t cmpr,
                                                       const ana_cmpr_cross_event_
↳data_t *edata,
                                                       void *user_ctx)
{
    // ...
    return false;
}

ana_cmpr_event_callbacks_t cbs = {
    .on_cross = example_ana_cmpr_on_cross_callback,
};
ESP_ERROR_CHECK(ana_cmpr_register_event_callbacks(cmpr, &cbs, NULL));
```

备注: When [CONFIG_ANA_CMPR_ISR_IRAM_SAFE](#) is enabled, you should guarantee the callback context and involved data to be in internal RAM by add the attribute `IRAM_ATTR`. (See more in [IRAM Safe](#))

Enable and Disable Unit

- [ana_cmpr_enable\(\)](#) - Enable the Analog Comparator unit.
- [ana_cmpr_disable\(\)](#) - Disable the Analog Comparator unit.

After the Analog Comparator unit is enabled and the crossing event interrupt is enabled, a power management lock will be acquired if the power management is enabled (see [Power Management](#)). Under the **enable** state, only

`ana_cmpr_set_intl_reference()` and `ana_cmpr_set_debounce()` can be called, other functions can only be called after the unit is disabled.

Calling `ana_cmpr_disable()` does the opposite.

Power Management When power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the resolution of the Analog Comparator.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_NO_LIGHT_SLEEP`. Whenever the driver creates a Analog Comparator unit instance that has selected the clock source like `ANA_CMPR_CLK_SRC_DEFAULT` or `ANA_CMPR_CLK_SRC_XTAL` as its clock source, the driver guarantees that the power management lock is acquired when enable the channel by `ana_cmpr_enable()`. Likewise, the driver releases the lock when `ana_cmpr_disable()` is called for that channel.

IRAM Safe By default, the Analog Comparator interrupt will be deferred when the Cache is disabled for reasons like programming/erasing Flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_ANA_CMPR_ISR_IRAM_SAFE` that:

1. Enables the interrupt being serviced even when cache is disabled
2. Places all functions that used by the ISR into IRAM¹
3. Places driver object into DRAM (in case it is allocated on PSRAM)

This allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

There is a Kconfig option `CONFIG_ANA_CMPR_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are listed as follows:

- `ana_cmpr_set_internal_reference()`
- `ana_cmpr_set_debounce()`
- `ana_cmpr_set_cross_type()`

Thread Safety The factory function `ana_cmpr_new_unit()` is guaranteed to be thread safe by the driver, which means, user can call it from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `ana_cmpr_set_internal_reference()`
- `ana_cmpr_set_debounce()`
- `ana_cmpr_set_cross_type()`

Other functions that take the `ana_cmpr_handle_t` as the first positional parameter, are not treated as thread safe. Which means the user should avoid calling them from multiple tasks.

Kconfig Options

- `CONFIG_ANA_CMPR_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see *IRAM Safe* for more information.
- `CONFIG_ANA_CMPR_CTRL_FUNC_IN_IRAM` controls where to place the Analog Comparator control functions (IRAM or Flash), see *IRAM Safe* for more information.
- `CONFIG_ANA_CMPR_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enabling this option increases the firmware binary size.

¹ `ana_cmpr_event_callbacks_t::on_cross` callback and the functions invoked by itself should also be placed in IRAM, you need to take care of them by themselves.

ETM Events To create an analog comparator cross event, you need to include `driver/ana_cmpr_etm.h` additionally, and allocate the event by `ana_cmpr_new_etm_event()`. You can refer to *ETM* for how to connect an event to a task.

Application Example

- [peripherals/analog_comparator](#) shows the basic usage of the analog comparator, and other potential usages like hysteresis comparator and SPWM generator.

Functions

`esp_err_t ana_cmpr_new_unit` (const `ana_cmpr_config_t` *config, `ana_cmpr_handle_t` *ret_cmpr)

Allocating a new analog comparator unit handle.

参数

- **config** -- [in] The config of the analog comparator unit
- **ret_cmpr** -- [out] The returned analog comparator unit handle

返回

- `ESP_OK` Allocate analog comparator unit handle success
- `ESP_ERR_NO_MEM` No memory for the analog comparator structure
- `ESP_ERR_INVALID_ARG` NULL pointer of the parameters or wrong unit number
- `ESP_ERR_INVALID_STATE` The unit has been allocated or the clock source has been occupied

`esp_err_t ana_cmpr_del_unit` (`ana_cmpr_handle_t` cmpr)

Delete the analog comparator unit handle.

参数 **cmpr** -- [in] The handle of analog comparator unit

返回

- `ESP_OK` Delete analog comparator unit handle success
- `ESP_ERR_INVALID_ARG` NULL pointer of the parameters or wrong unit number
- `ESP_ERR_INVALID_STATE` The analog comparator is not disabled yet

`esp_err_t ana_cmpr_set_internal_reference` (`ana_cmpr_handle_t` cmpr, const `ana_cmpr_internal_ref_config_t` *ref_cfg)

Set internal reference configuration.

备注: This function only need to be called when `ana_cmpr_config_t::ref_src` is `ANA_CMPR_REF_SRC_INTERNAL`.

备注: This function is allowed to run within ISR context including intr callbacks

备注: This function will be placed into IRAM if `CONFIG_ANA_CMPR_CTRL_FUNC_IN_IRAM` is on, so that it's allowed to be executed when Cache is disabled

参数

- **cmpr** -- **[in]** The handle of analog comparator unit
- **ref_cfg** -- **[in]** Internal reference configuration

返回

- `ESP_OK` Set denounce configuration success
- `ESP_ERR_INVALID_ARG` NULL pointer of the parameters
- `ESP_ERR_INVALID_STATE` The reference source is not `ANA_CMPR_REF_SRC_INTERNAL`

esp_err_t **ana_cmpr_set_debounce** (*ana_cmpr_handle_t* cmpr, const *ana_cmpr_debounce_config_t* *dbc_cfg)

Set debounce configuration to the analog comparator.

备注: This function is allowed to run within ISR context including intr callbacks

备注: This function will be placed into IRAM if `CONFIG_ANA_CMPR_CTRL_FUNC_IN_IRAM` is on, so that it's allowed to be executed when Cache is disabled

参数

- **cmpr** -- **[in]** The handle of analog comparator unit
- **dbc_cfg** -- **[in]** Debounce configuration

返回

- `ESP_OK` Set denounce configuration success
- `ESP_ERR_INVALID_ARG` NULL pointer of the parameters

esp_err_t **ana_cmpr_set_cross_type** (*ana_cmpr_handle_t* cmpr, *ana_cmpr_cross_type_t* cross_type)

Set the source signal cross type.

备注: The initial cross type is configured in `ana_cmpr_new_unit`, this function can update the cross type

备注: This function is allowed to run within ISR context including intr callbacks

备注: This function will be placed into IRAM if `CONFIG_ANA_CMPR_CTRL_FUNC_IN_IRAM` is on, so that it's allowed to be executed when Cache is disabled

参数

- **cmpr** -- **[in]** The handle of analog comparator unit
- **cross_type** -- **[in]** The source signal cross type that can trigger the interrupt

返回

- `ESP_OK` Set denounce configuration success
- `ESP_ERR_INVALID_ARG` NULL pointer of the parameters

esp_err_t **ana_cmpr_register_event_callbacks** (*ana_cmpr_handle_t* cmpr, const *ana_cmpr_event_callbacks_t* *cbs, void *user_data)

Register analog comparator interrupt event callbacks.

备注: This function can only be called before enabling the unit

参数

- **cmpr** -- **[in]** The handle of analog comparator unit
- **cbs** -- **[in]** Group of callback functions
- **user_data** -- **[in]** The user data that will be passed to callback functions directly

返回

- **ESP_OK** Register callbacks success
- **ESP_ERR_INVALID_ARG** NULL pointer of the parameters
- **ESP_ERR_INVALID_STATE** The analog comparator has been enabled

esp_err_t **ana_cmpr_enable** (*ana_cmpr_handle_t* cmpr)

Enable the analog comparator unit.

参数 **cmpr** -- **[in]** The handle of analog comparator unit

返回

- **ESP_OK** Enable analog comparator unit success
- **ESP_ERR_INVALID_ARG** NULL pointer of the parameters
- **ESP_ERR_INVALID_STATE** The analog comparator has been enabled

esp_err_t **ana_cmpr_disable** (*ana_cmpr_handle_t* cmpr)

Disable the analog comparator unit.

参数 **cmpr** -- **[in]** The handle of analog comparator unit

返回

- **ESP_OK** Disable analog comparator unit success
- **ESP_ERR_INVALID_ARG** NULL pointer of the parameters
- **ESP_ERR_INVALID_STATE** The analog comparator has disabled already

esp_err_t **ana_cmpr_get_gpio** (*ana_cmpr_unit_t* unit, *ana_cmpr_channel_type_t* chan_type, int *gpio_num)

Get the specific GPIO number of the analog comparator unit.

参数

- **unit** -- **[in]** The handle of analog comparator unit
- **chan_type** -- **[in]** The channel type of analog comparator, like source channel or reference channel
- **gpio_num** -- **[out]** The output GPIO number of this channel

返回

- **ESP_OK** Get GPIO success
- **ESP_ERR_INVALID_ARG** NULL pointer of the parameters or wrong unit number or wrong channel type

Structures

struct **ana_cmpr_config_t**

Analog comparator unit configuration.

Public Members

ana_cmpr_unit_t **unit**

Analog comparator unit

***ana_cmpr_clk_src_t* clk_src**

The clock source of the analog comparator, which decide the resolution of the comparator

***ana_cmpr_ref_source_t* ref_src**

Reference signal source of the comparator, select using ANA_CMPR_REF_SRC_INTERNAL or ANA_CMPR_REF_SRC_EXTERNAL. For internal reference, the reference voltage should be set to `internal_ref_volt`, for external reference, the reference signal should be connect to ANA_CMPRx_EXT_REF_GPIO

***ana_cmpr_cross_type_t* cross_type**

The crossing types that can trigger interrupt

int intr_priority

The interrupt priority, range 0~7, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3) otherwise the larger the higher, 7 is NMI

uint32_t io_loop_back

Enable this field when the other signals that output on the comparison pins are supposed to be fed back. Normally used for debug/test scenario

struct *ana_cmpr_config_t*::[anonymous] flags

Analog comparator driver flags

struct *ana_cmpr_internal_ref_config_t*

Analog comparator internal reference configuration.

Public Members***ana_cmpr_ref_voltage_t* ref_volt**

The internal reference voltage. It can be specified to a certain fixed percentage of the VDD power supply, currently supports 0%~70% VDD with a step 10%

struct *ana_cmpr_debounce_config_t*

Analog comparator debounce filter configuration.

Public Members**uint32_t wait_us**

The wait time of re-enabling the interrupt after the last triggering, it is used to avoid the spurious triggering while the source signal crossing the reference signal. The value should regarding how fast the source signal changes, e.g., a rapid signal requires a small wait time, otherwise the next crosses may be missed. (Unit: micro second)

struct *ana_cmpr_event_callbacks_t*

Group of Analog Comparator callbacks.

备注: The callbacks are all running under ISR environment

备注: When CONFIG_ANA_CMPR_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

`ana_cmpr_cross_cb_t on_cross`

The callback function on cross interrupt

Header File

- `components/esp_driver_ana_cmpr/include/driver/ana_cmpr_types.h`
- This header file can be included with:

```
#include "driver/ana_cmpr_types.h"
```

- This header file is a part of the API provided by the `esp_driver_ana_cmpr` component. To declare that your component depends on `esp_driver_ana_cmpr`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_ana_cmpr
```

or

```
PRIV_REQUIRES esp_driver_ana_cmpr
```

Structures

struct `ana_cmpr_cross_event_data_t`

Analog comparator cross event data.

Public Members

`ana_cmpr_cross_type_t cross_type`

The cross type of the target signal to the reference signal. Will either be ANA_CMPR_CROSS_POS or ANA_CMPR_CROSS_NEG Always be ANA_CMPR_CROSS_ANY if target does not support independent interrupt (like ESP32H2)

Macros

`ANA_CMPR_UNIT_0`

Deprecated:

Analog comparator unit 0

Type Definitions

typedef int `ana_cmpr_unit_t`

Analog comparator unit.

typedef struct `ana_cmpr_t *ana_cmpr_handle_t`

Analog comparator unit handle.

typedef *soc_periph_ana_cmpr_clk_src_t* **ana_cmpr_clk_src_t**

Analog comparator clock source.

typedef bool (***ana_cmpr_cross_cb_t**)(*ana_cmpr_handle_t* cmpr, const *ana_cmpr_cross_event_data_t* *edata, void *user_ctx)

Prototype of Analog comparator event callback.

Param cmpr [in] Analog Comparator handle, created from `ana_cmpr_new_unit()`

Param edata [in] Point to Analog Comparator event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function. (Currently not use)

Param user_ctx [in] User registered context, passed from `ana_cmpr_register_event_callbacks()`

Return Whether a high priority task has been waken up by this callback function

Enumerations

enum **ana_cmpr_ref_source_t**

Analog comparator reference source.

Values:

enumerator **ANA_CMPR_REF_SRC_INTERNAL**

Analog Comparator internal reference source, related to VDD

enumerator **ANA_CMPR_REF_SRC_EXTERNAL**

Analog Comparator external reference source, from `ANA_CMPR0_EXT_REF_GPIO`

enum **ana_cmpr_channel_type_t**

Analog comparator channel type.

Values:

enumerator **ANA_CMPR_SOURCE_CHAN**

Analog Comparator source channel, which is used to input the signal that to be compared

enumerator **ANA_CMPR_EXT_REF_CHAN**

Analog Comparator external reference channel, which is used as the reference signal

enum **ana_cmpr_cross_type_t**

Analog comparator interrupt type.

Values:

enumerator **ANA_CMPR_CROSS_DISABLE**

Disable the cross event interrupt

enumerator **ANA_CMPR_CROSS_POS**

Positive cross can trigger event interrupt

enumerator **ANA_CMPR_CROSS_NEG**

Negative cross can trigger event interrupt

enumerator **ANA_CMPR_CROSS_ANY**
Any cross can trigger event interrupt

enum **ana_cmpr_ref_voltage_t**
Analog comparator internal reference voltage.

Values:

enumerator **ANA_CMPR_REF_VOLT_0_PCT_VDD**
Internal reference voltage equals to 0% VDD

enumerator **ANA_CMPR_REF_VOLT_10_PCT_VDD**
Internal reference voltage equals to 10% VDD

enumerator **ANA_CMPR_REF_VOLT_20_PCT_VDD**
Internal reference voltage equals to 20% VDD

enumerator **ANA_CMPR_REF_VOLT_30_PCT_VDD**
Internal reference voltage equals to 30% VDD

enumerator **ANA_CMPR_REF_VOLT_40_PCT_VDD**
Internal reference voltage equals to 40% VDD

enumerator **ANA_CMPR_REF_VOLT_50_PCT_VDD**
Internal reference voltage equals to 50% VDD

enumerator **ANA_CMPR_REF_VOLT_60_PCT_VDD**
Internal reference voltage equals to 60% VDD

enumerator **ANA_CMPR_REF_VOLT_70_PCT_VDD**
Internal reference voltage equals to 70% VDD

2.5.5 时钟树

ESP32-P4 的时钟子系统用于从一系列根时钟中提取并分配系统/模块时钟。时钟树驱动程序负责维护系统时钟的基本功能，并管理模块时钟间的复杂关系。

本文档首先介绍了根时钟和模块时钟，随后介绍了可供用户调用的时钟树 API，调用这些 API，可以监测模块时钟的运行状态。

简介

本节列出了 ESP32-P4 支持的根时钟和模块时钟的定义，这些定义通常用于驱动程序配置，有助于为外设选择合适的时钟源。

根时钟 根时钟会产生可靠的时钟信号，经各种门、复用器、分频器或倍频器传递，这些时钟信号最终成为 CPU 内核、Wi-Fi、蓝牙、RTC 及外设等功能模块的时钟源。

ESP32-P4 的根时钟列在 `soc_root_clk_t` 中：

- 内部 17.5 MHz RC 振荡器 (RC_FAST)
此 RC 振荡器可产生约 17.5 MHz 的时钟信号输出，标识为 RC_FAST_CLK。
在运行时，通过校准，可以计算 RC_FAST_CLK 的实际频率。
- 外部 40 MHz 晶振 (XTAL)
- 内部 136 kHz RC 振荡器 (RC_SLOW)
此 RC 振荡器产生约 136 kHz 的时钟信号输出，标识为 RC_SLOW_CLK。在运行时，通过校准，可以计算该时钟信号的实际频率。
- 外部 32 kHz 晶振 - 可选 (XTAL32K)
XTAL32K_CLK 的时钟源是连接到 XTAL_32K_P 和 XTAL_32K_N 管脚的 32 kHz 晶振。
通过校准，可以计算 XTAL32K_CLK 的实际频率。
- 内部 32 kHz RC 振荡器 (RC32K)
在运行时，通过校准，可以计算该时钟信号的实际频率。

与晶振产生的信号相比，从 RC 振荡器电路产生的信号通常精度较低，且容易受环境影响。因此，ESP32-P4 为 RTC_SLOW_CLK 提供了几种时钟源选项，可以根据对系统时间精度和对功耗的要求选择。更多详情，请参阅[RTC 定时器时钟源](#)。

模块时钟 ESP32-P4 的可用模块时钟在 `soc_module_clk_t` 中列出，每个模块时钟都有其唯一 ID。查阅文档中的枚举值，即可获取各模块时钟的详细信息。

使用 API

时钟树驱动程序提供了一个一体化接口，可以获取模块时钟的频率，即 `esp_clk_tree_src_get_freq_hz()`。通过该函数，你可以在任何时刻，通过提供时钟名称 `soc_module_clk_t` 和指定返回频率值的精度级别 `esp_clk_tree_src_freq_precision_t`，获取时钟频率。

API 参考

Header File

- `components/soc/esp32p4/include/soc/clk_tree_defs.h`
- This header file can be included with:

```
#include "soc/clk_tree_defs.h"
```

Macros

SOC_CLK_RC_FAST_FREQ_APPROX

Approximate RC_FAST_CLK frequency in Hz

SOC_CLK_RC_SLOW_FREQ_APPROX

Approximate RC_SLOW_CLK frequency in Hz

SOC_CLK_RC32K_FREQ_APPROX

Approximate RC32K_CLK frequency in Hz

SOC_CLK_XTAL32K_FREQ_APPROX

Approximate XTAL32K_CLK frequency in Hz

SOC_GPTIMER_CLKS

Array initializer for all supported clock sources of GPTimer.

The following code can be used to iterate all possible clocks:

```
soc_periph_gptimer_clk_src_t gptimer_clks[] = (soc_periph_gptimer_clk_src_t)SOC_GPTIMER_CLKS;
for (size_t i = 0; i < sizeof(gptimer_clks) / sizeof(gptimer_clks[0]); i++) {
    soc_periph_gptimer_clk_src_t clk = gptimer_clks[i];
    // Test GPTimer with the clock `clk`
}
```

SOC_RMT_CLKS

Array initializer for all supported clock sources of RMT.

SOC_UART_CLKS

Array initializer for all supported clock sources of UART.

SOC_LP_UART_CLKS

Array initializer for all supported clock sources of LP_UART.

SOC_MCPWM_TIMER_CLKS

Array initializer for all supported clock sources of MCPWM Timer.

SOC_MCPWM_CAPTURE_CLKS

Array initializer for all supported clock sources of MCPWM Capture Timer.

SOC_MCPWM_CARRIER_CLKS

Array initializer for all supported clock sources of MCPWM Carrier.

SOC_I2S_CLKS

Array initializer for all supported clock sources of I2S.

SOC_LP_I2S_CLKS

Array initializer for all supported clock sources of LP I2S.

SOC_LCD_CLKS

Array initializer for all supported clock sources of LCD.

SOC_CAM_CLKS

Array initializer for all supported clock sources of CAM.

SOC_MIPI_CSI_PHY_CLKS

Array initializer for all supported clock sources of MIPI CSI PHY interface.

SOC_MIPI_DSI_DPI_CLKS

Array initializer for all supported clock sources of MIPI DSI DPI interface.

SOC_MIPI_DSI_PHY_CLKS

Array initializer for all supported clock sources of MIPI DSI PHY interface.

SOC_I2C_CLKS

Array initializer for all supported clock sources of I2C.

SOC_LP_I2C_CLKS

Array initializer for all supported clock sources of LP_I2C.

SOC_SPI_CLKS

Array initializer for all supported clock sources of SPI.

SOC_PSRAM_CLKS

Array initializer for all supported clock sources of PSRAM.

SOC_FLASH_CLKS

Array initializer for all supported clock sources of FLASH.

SOC_ISP_CLKS

Array initializer for all supported clock sources of ISP.

SOC_SDM_CLKS

Array initializer for all supported clock sources of SDM.

SOC_GLITCH_FILTER_CLKS

Array initializer for all supported clock sources of Glitch Filter.

SOC_ANA_CMPR_CLKS

Array initializer for all supported clock sources of Analog Comparator.

SOC_TWAI_CLKS

Array initializer for all supported clock sources of TWAI.

SOC_ADC_DIGI_CLKS

Array initializer for all supported clock sources of ADC digital controller.

SOC_ADC_RTC_CLKS

Array initializer for all supported clock sources of ADC RTC controller.

SOC_MWDT_CLKS

Array initializer for all supported clock sources of MWDT.

SOC_LEDC_CLKS

Array initializer for all supported clock sources of LEDC.

SOC_PARLIO_CLKS

Array initializer for all supported clock sources of PARLIO.

SOC_SDMMC_CLKS

Array initializer for all supported clock sources of SDMMC.

SOC_TEMP_SENSOR_CLKS

Array initializer for all supported clock sources of Temperature Sensor.

Enumerationsenum **soc_root_clk_t**

Root clock.

*Values:*enumerator **SOC_ROOT_CLK_INT_RC_FAST**

Internal 17.5MHz RC oscillator

enumerator **SOC_ROOT_CLK_INT_RC_SLOW**

Internal 136kHz RC oscillator

enumerator **SOC_ROOT_CLK_EXT_XTAL**

External 40MHz crystal

enumerator **SOC_ROOT_CLK_EXT_XTAL32K**

External 32kHz crystal

enumerator **SOC_ROOT_CLK_INT_RC32K**

Internal 32kHz RC oscillator

enumerator **SOC_ROOT_CLK_EXT_OSC_SLOW**

External slow clock signal at pin1

enum **soc_cpu_clk_src_t**

CPU_CLK mux inputs, which are the supported clock sources for the CPU_CLK.

备注: Enum values are matched with the register field values on purpose

*Values:*enumerator **SOC_CPU_CLK_SRC_XTAL**

Select XTAL_CLK as CPU_CLK source

enumerator **SOC_CPU_CLK_SRC_CPLL**

Select CPLL_CLK as CPU_CLK source (CPLL_CLK is the output of 40MHz crystal oscillator frequency multiplier, can be 320/360/400MHz)

enumerator **SOC_CPU_CLK_SRC_PLL**

Alias name for SOC_CPU_CLK_SRC_CPLL

enumerator **SOC_CPU_CLK_SRC_RC_FAST**

Select RC_FAST_CLK as CPU_CLK source

enumerator **SOC_CPU_CLK_SRC_INVALID**

Invalid CPU_CLK source

enum **soc_rtc_slow_clk_src_t**

RTC_SLOW_CLK mux inputs, which are the supported clock sources for the RTC_SLOW_CLK.

备注: Enum values are matched with the register field values on purpose

Values:

enumerator **SOC_RTC_SLOW_CLK_SRC_RC_SLOW**
Select RC_SLOW_CLK as RTC_SLOW_CLK source

enumerator **SOC_RTC_SLOW_CLK_SRC_XTAL32K**
Select XTAL32K_CLK as RTC_SLOW_CLK source

enumerator **SOC_RTC_SLOW_CLK_SRC_RC32K**
Select RC32K_CLK as RTC_SLOW_CLK source

enumerator **SOC_RTC_SLOW_CLK_SRC_INVALID**
Invalid RTC_SLOW_CLK source

enum **soc_rtc_fast_clk_src_t**
RTC_FAST_CLK mux inputs, which are the supported clock sources for the RTC_FAST_CLK.

备注: Enum values are matched with the register field values on purpose

Values:

enumerator **SOC_RTC_FAST_CLK_SRC_RC_FAST**
Select RC_FAST_CLK as RTC_FAST_CLK source

enumerator **SOC_RTC_FAST_CLK_SRC_XTAL**
Select XTAL_CLK as RTC_FAST_CLK source

enumerator **SOC_RTC_FAST_CLK_SRC_XTAL_DIV**
Alias name for SOC_RTC_FAST_CLK_SRC_XTAL

enumerator **SOC_RTC_FAST_CLK_SRC_LP_PLL**
Select LP_PLL_CLK as RTC_FAST_CLK source (LP_PLL_CLK is a 8MHz clock sourced from RC32K or XTAL32K)

enumerator **SOC_RTC_FAST_CLK_SRC_INVALID**
Invalid RTC_FAST_CLK source

enum **soc_lp_pll_clk_src_t**
LP_PLL_CLK mux inputs, which are the supported clock sources for the LP_PLL_CLK.

备注: Enum values are matched with the register field values on purpose

Values:

enumerator **SOC_LP_PLL_CLK_SRC_RC32K**
Select RC32K_CLK as LP_PLL_CLK source

enumerator **SOC_LP_PLL_CLK_SRC_XTAL32K**

Select XTAL32K_CLK as LP_PLL_CLK source

enumerator **SOC_LP_PLL_CLK_SRC_INVALID**

Invalid LP_PLL_CLK source

enum **soc_xtal_freq_t**

Possible main XTAL frequency options on the target.

备注: Enum values equal to the frequency value in MHz

备注: Not all frequency values listed here are supported in IDF. Please check SOC_XTAL_SUPPORT_XXX in soc_caps.h for the supported ones.

Values:

enumerator **SOC_XTAL_FREQ_40M**

40MHz XTAL

enum **soc_module_clk_t**

Supported clock sources for modules (CPU, peripherals, RTC, etc.)

备注: enum starts from 1, to save 0 for special purpose

Values:

enumerator **SOC_MOD_CLK_CPU**

CPU_CLK can be sourced from XTAL, CPLL, or RC_FAST by configuring soc_cpu_clk_src_t

enumerator **SOC_MOD_CLK_RTC_FAST**

RTC_FAST_CLK can be sourced from XTAL, RC_FAST, or LP_PLL by configuring soc_rtc_fast_clk_src_t

enumerator **SOC_MOD_CLK_RTC_SLOW**

RTC_SLOW_CLK can be sourced from RC_SLOW, XTAL32K, or RC32K by configuring soc_rtc_slow_clk_src_t

enumerator **SOC_MOD_CLK_PLL_F20M**

PLL_F20M_CLK is derived from SPLL (clock gating + "fixed" divider of 24), it has a fixed frequency of 20MHz

enumerator **SOC_MOD_CLK_PLL_F25M**

PLL_F25M_CLK is derived from MPLL (clock gating + configurable divider), it will have a frequency of 25MHz

enumerator **SOC_MOD_CLK_PLL_F80M**

PLL_F80M_CLK is derived from SPLL (clock gating + "fixed" divider of 6), it has a fixed frequency of 80MHz

enumerator **SOC_MOD_CLK_PLL_F160M**

PLL_F160M_CLK is derived from SPLL (clock gating + "fixed" divider of 3), it has a fixed frequency of 160MHz

enumerator **SOC_MOD_CLK_PLL_F240M**

PLL_F240M_CLK is derived from SPLL (clock gating + "fixed" divider of 2), it has a fixed frequency of 240MHz

enumerator **SOC_MOD_CLK_CPLL**

CPLL is from 40MHz XTAL oscillator frequency multipliers

enumerator **SOC_MOD_CLK_SPLL**

SPLL is from 40MHz XTAL oscillator frequency multipliers, it has a "fixed" frequency of 480MHz

enumerator **SOC_MOD_CLK_MPLL**

MPLL is from 40MHz XTAL oscillator frequency multipliers

enumerator **SOC_MOD_CLK_XTAL32K**

XTAL32K_CLK comes from the external 32kHz crystal, passing a clock gating to the peripherals

enumerator **SOC_MOD_CLK_RC_FAST**

RC_FAST_CLK comes from the internal 20MHz rc oscillator, passing a clock gating to the peripherals

enumerator **SOC_MOD_CLK_XTAL**

XTAL_CLK comes from the external 40MHz crystal

enumerator **SOC_MOD_CLK_APLL**

Audio PLL is sourced from PLL, and its frequency is configurable through APLL configuration registers

enumerator **SOC_MOD_CLK_XTAL_D2**

XTAL_D2_CLK comes from the external 40MHz crystal, passing a div of 2 to the LP peripherals

enumerator **SOC_MOD_CLK_LP_PLL**

LP_PLL is from 32kHz XTAL oscillator frequency multipliers, it has a fixed frequency of 8MHz

enumerator **SOC_MOD_CLK_LP_DYN_FAST**

LP_DYN_FAST can be derived from RTC_SLOW_CLK or RTC_FAST_CLK depending on the chip's power mode: in active mode, select RTC_FAST_CLK as the clock source; in light/deep sleep mode, select RTC_SLOW_CLK as the clock source

enumerator **SOC_MOD_CLK_LP_PERI**

LP_PERI_CLK is derived from LP_DYN_FAST (configurable divider)

enumerator **SOC_MOD_CLK_INVALID**

Indication of the end of the available module clock sources

enum **soc_periph_sys timer_clk_src_t**

Type of SYSTIMER clock source.

Values:

enumerator **SYSTIMER_CLK_SRC_XTAL**

SYSTIMER source clock is XTAL

enumerator **SYSTIMER_CLK_SRC_RC_FAST**

SYSTIMER source clock is RC_FAST

enumerator **SYSTIMER_CLK_SRC_DEFAULT**

SYSTIMER source clock default choice is XTAL

enum **soc_periph_gptimer_clk_src_t**

Type of GPTimer clock source.

Values:

enumerator **GPTIMER_CLK_SRC_PLL_F80M**

Select PLL_F80M as the source clock

enumerator **GPTIMER_CLK_SRC_RC_FAST**

Select RC_FAST as the source clock

enumerator **GPTIMER_CLK_SRC_XTAL**

Select XTAL as the source clock

enumerator **GPTIMER_CLK_SRC_DEFAULT**

Select PLL_F80M as the default choice

enum **soc_periph_tg_clk_src_legacy_t**

Type of Timer Group clock source, reserved for the legacy timer group driver.

Values:

enumerator **TIMER_SRC_CLK_PLL_F80M**

Timer group clock source is PLL_F80M

enumerator **TIMER_SRC_CLK_XTAL**

Timer group clock source is XTAL

enumerator **TIMER_SRC_CLK_DEFAULT**

Timer group clock source default choice is PLL_F80M

enum **soc_periph_rmt_clk_src_t**

Type of RMT clock source.

Values:

enumerator **RMT_CLK_SRC_PLL_F80M**

Select PLL_F80M as the source clock

enumerator **RMT_CLK_SRC_RC_FAST**

Select RC_FAST as the source clock

enumerator **RMT_CLK_SRC_XTAL**
Select XTAL as the source clock

enumerator **RMT_CLK_SRC_DEFAULT**
Select PLL_F80M as the default choice

enum **soc_periph_rmt_clk_src_legacy_t**
Type of RMT clock source, reserved for the legacy RMT driver.

Values:

enumerator **RMT_BASECLK_PLL_F80M**
RMT source clock is PLL_F80M

enumerator **RMT_BASECLK_XTAL**
RMT source clock is XTAL

enumerator **RMT_BASECLK_DEFAULT**
RMT source clock default choice is PLL_F80M

enum **soc_periph_uart_clk_src_legacy_t**
Type of UART clock source, reserved for the legacy UART driver.

Values:

enumerator **UART_SCLK_PLL_F80M**
UART source clock is PLL_F80M

enumerator **UART_SCLK_RTC**
UART source clock is RC_FAST

enumerator **UART_SCLK_XTAL**
UART source clock is XTAL

enumerator **UART_SCLK_DEFAULT**
UART source clock default choice is PLL_F80M

enum **soc_periph_lp_uart_clk_src_t**
Type of LP_UART clock source.

Values:

enumerator **LP_UART_SCLK_LP_FAST**
LP_UART source clock is LP(RTC)_FAST

enumerator **LP_UART_SCLK_XTAL_D2**
LP_UART source clock is XTAL_D2

enumerator **LP_UART_SCLK_DEFAULT**
LP_UART source clock default choice is LP(RTC)_FAST

enum **soc_periph_mcpwm_timer_clk_src_t**

Type of MCPWM timer clock source.

Values:

enumerator **MCPWM_TIMER_CLK_SRC_PLL160M**

Select PLL_F160M as the source clock

enumerator **MCPWM_TIMER_CLK_SRC_XTAL**

Select XTAL as the source clock

enumerator **MCPWM_TIMER_CLK_SRC_DEFAULT**

Select PLL_F160M as the default choice

enum **soc_periph_mcpwm_capture_clk_src_t**

Type of MCPWM capture clock source.

Values:

enumerator **MCPWM_CAPTURE_CLK_SRC_PLL160M**

Select PLL_F160M as the source clock

enumerator **MCPWM_CAPTURE_CLK_SRC_XTAL**

Select XTAL as the source clock

enumerator **MCPWM_CAPTURE_CLK_SRC_DEFAULT**

Select PLL_F160M as the default choice

enum **soc_periph_mcpwm_carrier_clk_src_t**

Type of MCPWM carrier clock source.

Values:

enumerator **MCPWM_CARRIER_CLK_SRC_PLL160M**

Select PLL_F160M as the source clock

enumerator **MCPWM_CARRIER_CLK_SRC_XTAL**

Select XTAL as the source clock

enumerator **MCPWM_CARRIER_CLK_SRC_DEFAULT**

Select PLL_F160M as the default choice

enum **soc_periph_i2s_clk_src_t**

I2S clock source enum.

Values:

enumerator **I2S_CLK_SRC_DEFAULT**

Select XTAL as the default source clock

enumerator **I2S_CLK_SRC_XTAL**

Select XTAL as the source clock

enumerator **I2S_CLK_SRC_APLL**
Select APLL as the source clock

enumerator **I2S_CLK_SRC_EXTERNAL**
Select external clock as source clock

enum **soc_periph_lp_i2s_clk_src_t**
LP I2S clock source enum.

Values:

enumerator **LP_I2S_CLK_SRC_DEFAULT**
Select LP_PERI as the default source clock

enumerator **LP_I2S_CLK_SRC_LP_PERI**
Select LP_PERI as the source clock

enumerator **LP_I2S_CLK_SRC_XTAL_D2**
LP_I2S source clock is XTAL_D2

enum **soc_periph_lcd_clk_src_t**
Type of LCD clock source.

Values:

enumerator **LCD_CLK_SRC_PLL160M**
Select PLL_F160M as the source clock

enumerator **LCD_CLK_SRC_XTAL**
Select XTAL as the source clock

enumerator **LCD_CLK_SRC_APLL**
Select APLL as the source clock

enumerator **LCD_CLK_SRC_DEFAULT**
Select PLL_F160M as the default choice

enum **soc_periph_cam_clk_src_t**
Type of CAM clock source.

Values:

enumerator **CAM_CLK_SRC_PLL160M**
Select PLL_F160M as the source clock

enumerator **CAM_CLK_SRC_XTAL**
Select XTAL as the source clock

enumerator **CAM_CLK_SRC_APLL**
Select APLL as the source clock

enumerator **CAM_CLK_SRC_DEFAULT**

Select PLL_F160M as the default choice

enum **soc_periph_mipi_csi_phy_clk_src_t**

Type of MIPI CSI PHY clock source.

Values:

enumerator **MIPI_CSI_PHY_CLK_SRC_RC_FAST**

Select RC_FAST as MIPI CSI PHY source clock

enumerator **MIPI_CSI_PHY_CLK_SRC_PLL_F25M**

Select PLL_F25M as MIPI CSI PHY source clock

enumerator **MIPI_CSI_PHY_CLK_SRC_PLL_F20M**

Select PLL_F20M as MIPI CSI PHY source clock

enumerator **MIPI_CSI_PHY_CLK_SRC_DEFAULT**

Select PLL_F20M as default clock

enum **soc_periph_mipi_dsi_dpi_clk_src_t**

Type of MIPI DSI DPI clock source.

Values:

enumerator **MIPI_DSI_DPI_CLK_SRC_XTAL**

Select XTAL as MIPI DSI DPI source clock

enumerator **MIPI_DSI_DPI_CLK_SRC_PLL_F160M**

Select PLL_F160M as MIPI DSI DPI source clock

enumerator **MIPI_DSI_DPI_CLK_SRC_PLL_F240M**

Select PLL_F240M as MIPI DSI DPI source clock

enumerator **MIPI_DSI_DPI_CLK_SRC_DEFAULT**

Select PLL_F240M as default clock

enum **soc_periph_mipi_dsi_phy_clk_src_t**

Type of MIPI DSI PHY clock source.

Values:

enumerator **MIPI_DSI_PHY_CLK_SRC_RC_FAST**

Select RC_FAST as MIPI DSI PHY source clock

enumerator **MIPI_DSI_PHY_CLK_SRC_PLL_F25M**

Select PLL_F25M as MIPI DSI PHY source clock

enumerator **MIPI_DSI_PHY_CLK_SRC_PLL_F20M**

Select PLL_F20M as MIPI DSI PHY source clock

enumerator **MIPI_DSI_PHY_CLK_SRC_DEFAULT**

Select PLL_F20M as default clock

enum **soc_periph_i2c_clk_src_t**

Type of I2C clock source.

Values:

enumerator **I2C_CLK_SRC_XTAL**

Select XTAL as the source clock

enumerator **I2C_CLK_SRC_RC_FAST**

Select RC_FAST as the source clock

enumerator **I2C_CLK_SRC_DEFAULT**

Select XTAL as the default source clock

enum **soc_periph_lp_i2c_clk_src_t**

Type of LP_I2C clock source.

Values:

enumerator **LP_I2C_SCLK_LP_FAST**

LP_I2C source clock is RTC_FAST

enumerator **LP_I2C_SCLK_XTAL_D2**

LP_I2C source clock is XTAL_D2

enumerator **LP_I2C_SCLK_DEFAULT**

LP_I2C source clock default choice is RTC_FAST

enum **soc_periph_spi_clk_src_t**

Type of SPI clock source.

Values:

enumerator **SPI_CLK_SRC_XTAL**

Select XTAL as SPI source clock

enumerator **SPI_CLK_SRC_RC_FAST**

Select RC_FAST_20M as SPI source clock

enumerator **SPI_CLK_SRC_SPLL**

Select SPLL as SPI source clock

enumerator **SPI_CLK_SRC_DEFAULT**

Select SPLL as SPI source clock

enum **soc_periph_psram_clk_src_t**

Type of PSRAM clock source.

Values:

enumerator **PSRAM_CLK_SRC_DEFAULT**

Select SOC_MOD_CLK_SPLL as PSRAM source clock

enumerator **PSRAM_CLK_SRC_XTAL**

Select SOC_MOD_CLK_XTAL as PSRAM source clock

enumerator **PSRAM_CLK_SRC_CPLL**

Select SOC_MOD_CLK_CPLL as PSRAM source clock

enumerator **PSRAM_CLK_SRC_SPLL**

Select SOC_MOD_CLK_SPLL as PSRAM source clock

enumerator **PSRAM_CLK_SRC_MPLL**

Select SOC_MOD_CLK_MPLL as PSRAM source clock

enum **soc_periph_flash_clk_src_t**

Type of FLASH clock source.

Values:

enumerator **FLASH_CLK_SRC_DEFAULT**

Select SOC_MOD_CLK_SPLL as FLASH source clock

enumerator **FLASH_CLK_SRC_XTAL**

Select SOC_MOD_CLK_XTAL as FLASH source clock

enumerator **FLASH_CLK_SRC_CPLL**

Select SOC_MOD_CLK_CPLL as FLASH source clock

enumerator **FLASH_CLK_SRC_SPLL**

Select SOC_MOD_CLK_SPLL as FLASH source clock

enum **soc_periph_isp_clk_src_t**

Type of ISP clock source.

Values:

enumerator **ISP_CLK_SRC_DEFAULT**

Select SOC_MOD_CLK_PLL_F160M as ISP source clock

enumerator **ISP_CLK_SRC_XTAL**

Select SOC_MOD_CLK_XTAL as ISP source clock

enumerator **ISP_CLK_SRC_PLL160**

Select SOC_MOD_CLK_PLL_F160M as ISP source clock

enumerator **ISP_CLK_SRC_PLL240**

Select SOC_MOD_CLK_PLL_F240M as ISP source clock

enum **soc_periph_sdm_clk_src_t**

Sigma Delta Modulator clock source.

Values:

enumerator **SDM_CLK_SRC_XTAL**

Select XTAL clock as the source clock

enumerator **SDM_CLK_SRC_PLL_F80M**

Select PLL_F80M clock as the source clock

enumerator **SDM_CLK_SRC_DEFAULT**

Select PLL_F80M clock as the default clock choice

enum **soc_periph_glitch_filter_clk_src_t**

Glitch filter clock source.

Values:

enumerator **GLITCH_FILTER_CLK_SRC_XTAL**

Select XTAL clock as the source clock

enumerator **GLITCH_FILTER_CLK_SRC_PLL_F80M**

Select PLL_F80M clock as the source clock

enumerator **GLITCH_FILTER_CLK_SRC_DEFAULT**

Select PLL_F80M clock as the default clock choice

enum **soc_periph_ana_cmpr_clk_src_t**

Analog Comparator clock source.

Values:

enumerator **ANA_CMPR_CLK_SRC_XTAL**

Select XTAL clock as the source clock

enumerator **ANA_CMPR_CLK_SRC_PLL_F80M**

Select PLL_F80M clock as the source clock

enumerator **ANA_CMPR_CLK_SRC_DEFAULT**

Select PLL_F80M as the default clock choice

enum **soc_periph_twai_clk_src_t**

TWAI clock source.

Values:

enumerator **TWAI_CLK_SRC_XTAL**

Select XTAL as the source clock

enumerator **TWAI_CLK_SRC_RC_FAST**

Select RC_FAST as the source clock

enumerator **TWAI_CLK_SRC_DEFAULT**

Select XTAL as the default clock choice

enum **soc_periph_adc_digi_clk_src_t**

ADC digital controller clock source.

Values:

enumerator **ADC_DIGI_CLK_SRC_XTAL**

Select XTAL as the source clock

enumerator **ADC_DIGI_CLK_SRC_RC_FAST**

Select RC_FAST as the source clock

enumerator **ADC_DIGI_CLK_SRC_PLL_F80M**

Select PLL_F80M as the source clock

enumerator **ADC_DIGI_CLK_SRC_DEFAULT**

Select PLL_F80M as the default clock choice

enum **soc_periph_adc_rtc_clk_src_t**

ADC RTC controller clock source.

Values:

enumerator **ADC_RTC_CLK_SRC_RC_FAST**

Select RC_FAST as the source clock

enumerator **ADC_RTC_CLK_SRC_DEFAULT**

Select RC_FAST as the default clock choice

enum **soc_periph_mwdt_clk_src_t**

MWDT clock source.

Values:

enumerator **MWDT_CLK_SRC_XTAL**

Select XTAL as the source clock

enumerator **MWDT_CLK_SRC_PLL_F80M**

Select PLL fixed 80 MHz as the source clock

enumerator **MWDT_CLK_SRC_RC_FAST**

Select RTC fast as the source clock

enumerator **MWDT_CLK_SRC_DEFAULT**

Select XTAL 40 MHz as the default clock choice

enum **soc_periph_ledc_clk_src_legacy_t**

Type of LEDC clock source, reserved for the legacy LEDC driver.

Values:

enumerator **LEDC_AUTO_CLK**

LEDC source clock will be automatically selected based on the giving resolution and duty parameter when init the timer

enumerator **LEDC_USE_XTAL_CLK**

Select XTAL as the source clock

enumerator **LEDC_USE_PLL_DIV_CLK**

Select PLL_F80M clock as the source clock

enumerator **LEDC_USE_RC_FAST_CLK**

Select RC_FAST as the source clock

enum **soc_periph_parlio_clk_src_t**

PARLIO clock source.

Values:

enumerator **PARLIO_CLK_SRC_XTAL**

Select XTAL as the source clock

enumerator **PARLIO_CLK_SRC_RC_FAST**

Select RC_FAST as the source clock

enumerator **PARLIO_CLK_SRC_PLL_F160M**

Select PLL_F160M as the source clock

enumerator **PARLIO_CLK_SRC_EXTERNAL**

Select EXTERNAL clock as the source clock

enumerator **PARLIO_CLK_SRC_DEFAULT**

Select PLL_F160M as the default clock choice

enum **soc_periph_sdmmc_clk_src_t**

Type of SDMMC clock source.

Values:

enumerator **SDMMC_CLK_SRC_DEFAULT**

Select PLL_160M as the default choice

enumerator **SDMMC_CLK_SRC_PLL160M**

Select PLL_160M as the source clock

enum **soc_periph_temperature_sensor_clk_src_t**

Type of Temp Sensor clock source.

Values:

enumerator **TEMPERATURE_SENSOR_CLK_SRC_LP_PERI**

Select LP_PERI as the source clock

enumerator **TEMPERATURE_SENSOR_CLK_SRC_DEFAULT**

Select LP_PERI as the default choice

enum **soc_clkout_sig_id_t**

Values:

enumerator **CLKOUT_SIG_MPLL**

MPLL is from 40MHz XTAL oscillator frequency multipliers

enumerator **CLKOUT_SIG_SPLL**

SPLL is from 40MHz XTAL oscillator frequency multipliers, it has a "fixed" frequency of 480MHz

enumerator **CLKOUT_SIG_CPLL**

CPLL_CLK is the output of 40MHz crystal oscillator frequency multiplier, can be 320/360/400MHz

enumerator **CLKOUT_SIG_XTAL**

External 40MHz crystal

enumerator **CLKOUT_SIG_RC_FAST**

Internal 17.5MHz RC oscillator

enumerator **CLKOUT_SIG_RC_SLOW**

Internal 136kHz RC oscillator

enumerator **CLKOUT_SIG_RC_32K**

Internal 32kHz RC oscillator

enumerator **CLKOUT_SIG_XTAL32K**

External 32kHz crystal clock

enumerator **CLKOUT_SIG_I2S0**

I2S0 clock, depends on the i2s driver configuration

enumerator **CLKOUT_SIG_I2S1**

I2S1 clock, depends on the i2s driver configuration

enumerator **CLKOUT_SIG_I2S2**

I2S2 clock, depends on the i2s driver configuration

enumerator **CLKOUT_SIG_CPU**

CPU clock

enumerator **CLKOUT_SIG_MEM**

MEM clock

enumerator **CLKOUT_SIG_SYS**

SYS clock

enumerator **CLKOUT_SIG_APB**

APB clock

enumerator **CLKOUT_SIG_PLL_F80M**

From PLL, usually be 80MHz

enumerator **CLKOUT_SIG_INVALID**

Header File

- `components/esp_hw_support/include/esp_clk_tree.h`
- This header file can be included with:

```
#include "esp_clk_tree.h"
```

Functions

`esp_err_t esp_clk_tree_src_get_freq_hz` (`soc_module_clk_t` clk_src, `esp_clk_tree_src_freq_precision_t` precision, `uint32_t` *freq_value)

Get frequency of module clock source.

参数

- **clk_src** -- **[in]** Clock source available to modules, in `soc_module_clk_t`
- **precision** -- **[in]** Degree of precision, one of `esp_clk_tree_src_freq_precision_t` values. This arg only applies to the clock sources that their frequencies can vary: `SOC_MOD_CLK_RTC_FAST`, `SOC_MOD_CLK_RTC_SLOW`, `SOC_MOD_CLK_RC_FAST`, `SOC_MOD_CLK_RC_FAST_D256`, `SOC_MOD_CLK_XTAL32K`. For other clock sources, this field is ignored.
- **freq_value** -- **[out]** Frequency of the clock source, in Hz

返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Calibration failed

Enumerations

enum `esp_clk_tree_src_freq_precision_t`

Degree of precision of frequency value to be returned by `esp_clk_tree_src_get_freq_hz()`

Values:

enumerator **ESP_CLK_TREE_SRC_FREQ_PRECISION_CACHED**

enumerator **ESP_CLK_TREE_SRC_FREQ_PRECISION_APPROX**

enumerator **ESP_CLK_TREE_SRC_FREQ_PRECISION_EXACT**

enumerator **ESP_CLK_TREE_SRC_FREQ_PRECISION_INVALID**

2.5.6 事件任务矩阵 (ETM)

简介

如果外设 X 需要向外设 Y 发起事件通知，一般只能通过 CPU 中断实现。在此过程中，CPU 会代表外设 X，给外设 Y 发送通知。然而，在对时间敏感的应用程序中，CPU 中断引发的延迟不容忽视。

通过引入事件任务矩阵 (ETM) 模块，部分外设可以直接通过预先设置的连接关系，将事件通知发送给其他外设，无需 CPU 中断介入。由此，外设实现精确、低延迟同步，并减轻 CPU 负担。

图 4: ETM 通道概述

ETM 模块具有多个通道，这些通道支持用户根据需要进行配置，连接特定事件与任务。激活某一事件时，ETM 将自动触发相应任务。

支持 ETM 功能的外设向 ETM 提供其事件和任务的连接关系。ETM 通道可以连接任意事件和任务，事件和任务甚至可以来自于同一个外设。然而，对于一个 ETM 通道，一次只能将一个事件与一个任务连接（即 1 对 1 关系）。如果要使用不同事件触发同一任务，则需申请多条 ETM 通道。

使用 ETM 通常可实现以下功能：

- 当定时器报警事件发生时，翻转 GPIO 电平
- 当在 GPIO 上监测到脉冲边沿时，启动 ADC 转换

功能概述

下文将分节概述 ETM 的功能，并介绍配置和使用 ETM 模块的基本步骤：

- [ETM 通道分配](#) - 介绍如何安装和卸载 ETM 通道。
- [ETM 事件](#) - 介绍如何分配新的 ETM 事件句柄，以及如何从不同外设获取现有句柄。
- [ETM 任务](#) - 介绍如何分配新的 ETM 任务句柄，以及如何从不同外设获取现有句柄。
- [ETM 通道控制](#) - 介绍常见的 ETM 通道控制函数。
- [线程安全](#) - 列出了驱动程序中始终线程安全的 API。
- [Kconfig 选项](#) - 列出了 ETM 支持的 Kconfig 选项，这些选项对驱动程序的行为会产生不同影响。

ETM 通道分配 在 ESP32-P4 中，存在许多相同的 ETM 通道¹，各通道在软件中由 `esp_etm_channel_handle_t` 表示。可用硬件资源汇集在资源池内，由 ETM 核心驱动程序管理，无需手动管理通道的分配和释放。ETM 核心驱动程序会在调用 `esp_etm_new_channel()` 时自动分配通道，在调用 `esp_etm_del_channel()` 时删除通道。分配通道的要求通过 `esp_etm_channel_config_t` 配置。

在删除 ETM 通道前，请调用 `esp_etm_channel_disable()` 禁用要删除的通道，或确保该通道尚未由 `esp_etm_channel_enable()` 启用，再继续删除操作。

¹ 不同 ESP 芯片系列的 ETM 通道数量可能不同。要了解更多详情，请参阅 [ESP32-P4 技术参考手册 > 事件任务矩阵 \(ETM\) \[PDF\]](#)。驱动程序对通道申请数量不做限制，但当硬件资源用尽时，驱动程序将返回错误。因此，每次进行通道分配（即调用 `esp_etm_new_channel()`）时，请注意检查返回值。

ETM 事件 ETM 事件对其事件源进行了抽象，屏蔽了具体事件源的细节，并在软件中表示为 `esp_etm_event_handle_t`，使应用程序可以更便捷地处理不同类型的事件。ETM 事件可以由各种外设产生，因此获取事件句柄的方法因外设而异。当不再需要某个事件时，请调用 `esp_etm_channel_connect()`，并传递一个 NULL 事件句柄，断开与事件的连接，随后调用 `esp_etm_del_event()`，释放事件资源。

GPIO 事件 GPIO 边沿事件是最常见的事件类型，任何 GPIO 管脚均可触发这类事件。要创建 GPIO 事件句柄，请调用 `gpio_new_etm_event()`，并使用 `gpio_etm_event_config_t` 提供的配置信息：

- `gpio_etm_event_config_t::edge` 或 `gpio_etm_event_config_t::edges` 决定触发事件的边沿类型，支持的边沿类型已在 `gpio_etm_event_edge_t` 中列出。

接下来，请调用 `gpio_etm_event_bind_gpio()` 函数，连接 GPIO ETM 事件句柄与 GPIO 管脚。注意，要设置 GPIO 管脚，只能使用由 `gpio_new_etm_event()` 函数创建的 ETM 事件句柄。对于其他类型的 ETM 事件，调用此函数，将返回 `ESP_ERR_INVALID_ARG` 错误。该函数也无法完成 GPIO 的初始化，在使用 GPIO ETM 事件之前，仍需调用 `gpio_config()` 函数，设置 GPIO 管脚的属性，如方向、高/低电平模式等。

其他外设事件

- 调用 `esp_systick_new_etm_alarm_event()` 可以从 RTOS SysTick 获取 ETM 事件句柄，每个 CPU 核心可以获取一个事件句柄。
- 要了解如何从 `esp_timer` 获取 ETM 事件句柄，请参阅 [ESP 定时器](#)。
- 要了解如何从 GPTimer 获取 ETM 事件句柄，请参阅 [通用定时器](#)。
- 要了解如何从 `async memcopy` 获取 ETM 事件句柄，请参阅 [异步内存复制](#)。
- 要了解如何从 MCPWM 中获取 ETM 事件句柄，请参阅 [电机控制脉宽调制器 \(MCPWM\)](#)。
- 要了解如何从模拟比较器获取 ETM 事件句柄，请参阅 [Analog Comparator](#)。

ETM 任务 ETM 任务对其操作进行了抽象，在软件中表示为 `esp_etm_task_handle_t`，使任务得以用同一方式管理和表示。ETM 任务可以分配给不同外设，因此获取任务句柄的方式因外设而异。当不再需要某个任务时，请调用 `esp_etm_channel_connect()`，并传递一个 NULL 事件句柄，断开与任务的连接，随后调用 `esp_etm_del_event()`，释放任务资源。

GPIO 任务 GPIO 任务是最常见的任务类型。一个 GPIO 可以采取一个或多个 GPIO 操作，而一个 GPIO 任务也可以同时管理多个 GPIO 管脚。当 ETM 通道激活任务时，任务可以同时设置管理的所有 GPIO 引脚，使其设置/清除/切换状态。要创建 GPIO 任务句柄，请调用 `gpio_new_etm_task()`，并使用 `gpio_etm_task_config_t` 提供的配置信息：

- `gpio_etm_task_config_t::action` 或 `gpio_etm_task_config_t::actions` 决定 ETM 任务将采取的 GPIO 操作，支持的操作类型在 `gpio_etm_task_action_t` 中列出。如果一个 GPIO 需要采取多个 GPIO 操作，这些操作任务的创建必须通过配置 `gpio_etm_task_config_t::actions` 的数组并在一次 `gpio_new_etm_task()` 调用中一并完成。

接下来，需要连接 GPIO ETM 任务句柄与 GPIO 管脚。为此，请调用 `gpio_etm_task_add_gpio()` 函数。如果需要任务句柄管理更多的 GPIO 管脚，可以重复调用以上函数，注意，要设置 GPIO 管脚，只能使用由 `gpio_new_etm_task()` 函数创建的 ETM 任务句柄。对于其他类型的 ETM 任务，调用此函数，将返回 `ESP_ERR_INVALID_ARG` 错误。该函数也无法完成 GPIO 的初始化，在使用 GPIO ETM 任务之前，仍需调用 `gpio_config()` 函数，设置 GPIO 管脚的属性，如方向、高/低电平模式等。

要删除 GPIO ETM 任务，请调用 `esp_etm_del_task()`。在此之前，请确保已经调用过 `gpio_etm_task_rm_gpio()`，删除了所有先前添加的 GPIO 管脚。

其他外设任务

- 要了解如何从 GPTimer 获取 ETM 任务句柄，请参阅 [通用定时器](#)。

ETM 通道控制

映射事件与任务 在调用 `esp_etm_channel_connect()` 将它们连接到同一个 ETM 通道之前，ETM 事件与 ETM 任务之间没有任何映射关系。注意，使用 NULL 任务/事件句柄调用该函数时，会将通道与任何任务或事件解除映射。此函数可以在通道启用之前或之后调用，但在运行时调用此函数更改映射关系存在一定风险，因为此时通道可能正处于周期的中间阶段，新的映射可能无法立即生效。

启用及禁用通道 调用 `esp_etm_channel_enable()` 启用 ETM 通道，调用 `esp_etm_channel_disable()` 禁用 ETM 通道。

ETM 通道分析 要检查是否为 ETM 通道设置了正确的事件和任务，可以调用 `esp_etm_dump()`，输出所有工作中的 ETM 通道及其关联的事件和任务。输出格式如下：

```
=====ETM Dump Start=====
channel 0: event 48 ==> task 17
channel 1: event 48 ==> task 90
channel 2: event 48 ==> task 94
=====ETM Dump End=====
```

以上输出信息打印的数字 ID 在 `soc/soc_etm_source.h` 文件中定义。

线程安全 ETM 驱动程序会确保工厂函数 `esp_etm_new_channel()` 和 `gpio_new_etm_task()` 的线程安全。使用时，可以直接从不同的 RTOS 任务中调用此类函数，无需额外锁保护。

在 ISR 环境中，不支持运行任何函数。

其他以 `esp_etm_channel_handle_t`、`esp_etm_task_handle_t` 和 `esp_etm_event_handle_t` 作为首个位置参数的函数，则非线程安全，应避免从不同任务中调用此类函数。

Kconfig 选项

- `CONFIG_ETM_ENABLE_DEBUG_LOG` 用于启用调试日志输出，启用此选项将增加固件的二进制文件大小。

API 参考

Header File

- `components/esp_hw_support/include/esp_etm.h`
- This header file can be included with:

```
#include "esp_etm.h"
```

Functions

`esp_err_t esp_etm_new_channel` (const `esp_etm_channel_config_t` *config, `esp_etm_channel_handle_t` *ret_chan)

Allocate an ETM channel.

备注： The channel can later be freed by `esp_etm_del_channel`

参数

- **config** -- [in] ETM channel configuration
- **ret_chan** -- [out] Returned ETM channel handle

返回

- ESP_OK: Allocate ETM channel successfully
- ESP_ERR_INVALID_ARG: Allocate ETM channel failed because of invalid argument
- ESP_ERR_NO_MEM: Allocate ETM channel failed because of out of memory
- ESP_ERR_NOT_FOUND: Allocate ETM channel failed because all channels are used up and no more free one
- ESP_FAIL: Allocate ETM channel failed because of other reasons

esp_err_t **esp_etm_del_channel** (*esp_etm_channel_handle_t* chan)

Delete an ETM channel.

参数 **chan** -- **[in]** ETM channel handle that created by `esp_etm_new_channel`
返回

- ESP_OK: Delete ETM channel successfully
- ESP_ERR_INVALID_ARG: Delete ETM channel failed because of invalid argument
- ESP_FAIL: Delete ETM channel failed because of other reasons

esp_err_t **esp_etm_channel_enable** (*esp_etm_channel_handle_t* chan)

Enable ETM channel.

备注: This function will transit the channel state from init to enable.

参数 **chan** -- **[in]** ETM channel handle that created by `esp_etm_new_channel`
返回

- ESP_OK: Enable ETM channel successfully
- ESP_ERR_INVALID_ARG: Enable ETM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable ETM channel failed because the channel has been enabled already
- ESP_FAIL: Enable ETM channel failed because of other reasons

esp_err_t **esp_etm_channel_disable** (*esp_etm_channel_handle_t* chan)

Disable ETM channel.

备注: This function will transit the channel state from enable to init.

参数 **chan** -- **[in]** ETM channel handle that created by `esp_etm_new_channel`
返回

- ESP_OK: Disable ETM channel successfully
- ESP_ERR_INVALID_ARG: Disable ETM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable ETM channel failed because the channel is not enabled yet
- ESP_FAIL: Disable ETM channel failed because of other reasons

esp_err_t **esp_etm_channel_connect** (*esp_etm_channel_handle_t* chan, *esp_etm_event_handle_t* event, *esp_etm_task_handle_t* task)

Connect an ETM event to an ETM task via a previously allocated ETM channel.

备注: Setting the ETM event/task handle to NULL means to disconnect the channel from any event/task

参数

- **chan** -- **[in]** ETM channel handle that created by `esp_etm_new_channel`
- **event** -- **[in]** ETM event handle obtained from a driver/peripheral, e.g. `xxx_new_etm_event`
- **task** -- **[in]** ETM task handle obtained from a driver/peripheral, e.g. `xxx_new_etm_task`

返回

- ESP_OK: Connect ETM event and task to the channel successfully
- ESP_ERR_INVALID_ARG: Connect ETM event and task to the channel failed because of invalid argument
- ESP_FAIL: Connect ETM event and task to the channel failed because of other reasons

esp_err_t **esp_etm_del_event** (*esp_etm_event_handle_t* event)

Delete ETM event.

备注: Although the ETM event comes from various peripherals, we provide the same user API to delete the event handle seamlessly.

参数 event -- **[in]** ETM event handle obtained from a driver/peripheral, e.g. `xxx_new_etm_event`

返回

- ESP_OK: Delete ETM event successfully
- ESP_ERR_INVALID_ARG: Delete ETM event failed because of invalid argument
- ESP_FAIL: Delete ETM event failed because of other reasons

esp_err_t **esp_etm_del_task** (*esp_etm_task_handle_t* task)

Delete ETM task.

备注: Although the ETM task comes from various peripherals, we provide the same user API to delete the task handle seamlessly.

参数 task -- **[in]** ETM task handle obtained from a driver/peripheral, e.g. `xxx_new_etm_task`

返回

- ESP_OK: Delete ETM task successfully
- ESP_ERR_INVALID_ARG: Delete ETM task failed because of invalid argument
- ESP_FAIL: Delete ETM task failed because of other reasons

esp_err_t **esp_etm_dump** (FILE *out_stream)

Dump ETM channel usages to the given IO stream.

参数 out_stream -- **[in]** IO stream (e.g. stdout)

返回

- ESP_OK: Dump ETM channel usages successfully
- ESP_ERR_INVALID_ARG: Dump ETM channel usages failed because of invalid argument
- ESP_FAIL: Dump ETM channel usages failed because of other reasons

Structures

struct **esp_etm_channel_config_t**

ETM channel configuration.

Type Definitions

typedef struct esp_etm_channel_t ***esp_etm_channel_handle_t**

ETM channel handle.

typedef struct esp_etm_event_t ***esp_etm_event_handle_t**

ETM event handle.

typedef struct esp_etm_task_t ***esp_etm_task_handle_t**

ETM task handle.

Header File

- [components/esp_driver_gpio/include/driver/gpio_etm.h](#)
- This header file can be included with:

```
#include "driver/gpio_etm.h"
```

- This header file is a part of the API provided by the `esp_driver_gpio` component. To declare that your component depends on `esp_driver_gpio`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_gpio
```

or

```
PRIV_REQUIRES esp_driver_gpio
```

Functions

esp_err_t **gpio_new_etm_event** (const *gpio_etm_event_config_t* *config, *esp_etm_event_handle_t* *ret_event, ...)

Create an ETM event object for the GPIO peripheral.

备注: The created ETM event object can be deleted later by calling `esp_etm_del_event`

备注: The newly created ETM event object is not bind to any GPIO, you need to call `gpio_etm_event_bind_gpio` to bind the wanted GPIO

备注: Every success call to this function will acquire a free GPIO ETM event channel

参数

- **config** -- [in] GPIO ETM event configuration
- **ret_event** -- [out] Returned ETM event handle
- ... -- [out] Other returned ETM event handles if any (the order of the returned event handles is aligned with the array order in field `edges` in `gpio_etm_event_config_t`)

返回

- `ESP_OK`: Create ETM event successfully
- `ESP_ERR_INVALID_ARG`: Create ETM event failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create ETM event failed because of out of memory
- `ESP_ERR_NOT_FOUND`: Create ETM event failed because all events are used up and no more free one
- `ESP_FAIL`: Create ETM event failed because of other reasons

esp_err_t **gpio_etm_event_bind_gpio** (*esp_etm_event_handle_t* event, int gpio_num)

Bind the GPIO with the ETM event.

备注: Calling this function multiple times with different GPIO number can override the previous setting immediately.

备注: Only GPIO ETM object can call this function

参数

- **event** -- **[in]** ETM event handle that created by `gpio_new_etm_event`
- **gpio_num** -- **[in]** GPIO number that can trigger the ETM event

返回

- `ESP_OK`: Set the GPIO for ETM event successfully
- `ESP_ERR_INVALID_ARG`: Set the GPIO for ETM event failed because of invalid argument, e.g. GPIO is not input capable, ETM event is not of GPIO type
- `ESP_FAIL`: Set the GPIO for ETM event failed because of other reasons

`esp_err_t gpio_new_etm_task` (const `gpio_etm_task_config_t` *config, `esp_etm_task_handle_t` *ret_task, ...)

Create an ETM task object for the GPIO peripheral.

备注: The created ETM task object can be deleted later by calling `esp_etm_del_task`

备注: The GPIO ETM task works like a container, a newly created ETM task object doesn't have GPIO members to be managed. You need to call `gpio_etm_task_add_gpio` to put one or more GPIOs to the container.

备注: Every success call to this function will acquire a free GPIO ETM task channel

参数

- **config** -- **[in]** GPIO ETM task configuration
- **ret_task** -- **[out]** Returned ETM task handle
- ... -- **[out]** Other returned ETM task handles if any (the order of the returned task handles is aligned with the array order in field `actions` in `gpio_etm_task_config_t`)

返回

- `ESP_OK`: Create ETM task successfully
- `ESP_ERR_INVALID_ARG`: Create ETM task failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create ETM task failed because of out of memory
- `ESP_ERR_NOT_FOUND`: Create ETM task failed because all tasks are used up and no more free one
- `ESP_FAIL`: Create ETM task failed because of other reasons

`esp_err_t gpio_etm_task_add_gpio` (`esp_etm_task_handle_t` task, int gpio_num)

Add GPIO to the ETM task.

备注: You can call this function multiple times to add more GPIOs

备注: Only GPIO ETM object can call this function

参数

- **task** -- **[in]** ETM task handle that created by `gpio_new_etm_task`

- **gpio_num** -- [in] GPIO number that can be controlled by the ETM task
- 返回
- ESP_OK: Add GPIO to the ETM task successfully
 - ESP_ERR_INVALID_ARG: Add GPIO to the ETM task failed because of invalid argument, e.g. GPIO is not output capable, ETM task is not of GPIO type
 - ESP_ERR_INVALID_STATE: Add GPIO to the ETM task failed because the GPIO is used by other ETM task already
 - ESP_FAIL: Add GPIO to the ETM task failed because of other reasons

esp_err_t **gpio_etm_task_rm_gpio** (*esp_etm_task_handle_t* task, int gpio_num)

Remove the GPIO from the ETM task.

备注: Before deleting the ETM task, you need to remove all the GPIOs from the ETM task by this function

备注: Only GPIO ETM object can call this function

参数

- **task** -- [in] ETM task handle that created by `gpio_new_etm_task`
- **gpio_num** -- [in] GPIO number that to be remove from the ETM task

返回

- ESP_OK: Remove the GPIO from the ETM task successfully
- ESP_ERR_INVALID_ARG: Remove the GPIO from the ETM task failed because of invalid argument
- ESP_ERR_INVALID_STATE: Remove the GPIO from the ETM task failed because the GPIO is not controlled by this ETM task
- ESP_FAIL: Remove the GPIO from the ETM task failed because of other reasons

Structures

struct **gpio_etm_event_config_t**

GPIO ETM event configuration.

If more than one kind of ETM edge event want to be triggered on the same GPIO pin, you can configure them together. It helps to save GPIO ETM event channel resources for other GPIOs.

Public Members

gpio_etm_event_edge_t **edge**

Which kind of edge can trigger the ETM event module

gpio_etm_event_edge_t **edges**[GPIO_ETM_EVENT_EDGE_TYPES]

Array of kinds of edges to trigger the ETM event module on the same GPIO

struct **gpio_etm_task_config_t**

GPIO ETM task configuration.

If multiple actions wants to be added to the same GPIO pin, you have to configure all the GPIO ETM tasks together.

Public Members

gpio_etm_task_action_t action

Action to take by the ETM task module

gpio_etm_task_action_t actions[GPIO_ETM_TASK_ACTION_TYPES]

Array of actions to take by the ETM task module on the same GPIO

Macros**GPIO_ETM_EVENT_EDGE_TYPES**

GPIO ETM edge events are POS/NEG/ANY

GPIO_ETM_TASK_ACTION_TYPES

GPIO ETM action tasks are SET/CLEAR/TOGGLE

Enumerationsenum **gpio_etm_event_edge_t**

GPIO edges that can be used as ETM event.

Values:

enumerator **GPIO_ETM_EVENT_EDGE_POS**

A rising edge on the GPIO will generate an ETM event signal

enumerator **GPIO_ETM_EVENT_EDGE_NEG**

A falling edge on the GPIO will generate an ETM event signal

enumerator **GPIO_ETM_EVENT_EDGE_ANY**

Any edge on the GPIO can generate an ETM event signal

enum **gpio_etm_task_action_t**

GPIO actions that can be taken by the ETM task.

Values:

enumerator **GPIO_ETM_TASK_ACTION_SET**

Set the GPIO level to high

enumerator **GPIO_ETM_TASK_ACTION_CLR**

Clear the GPIO level to low

enumerator **GPIO_ETM_TASK_ACTION_TOG**

Toggle the GPIO level

Header File

- [components/esp_system/include/esp_systick_etm.h](#)
- This header file can be included with:

```
#include "esp_systick_etm.h"
```

Functions

`esp_err_t esp_systick_new_etm_alarm_event` (int core_id, `esp_etm_event_handle_t` *out_event)

Get the ETM event handle of systick hardware's alarm/heartbeat event.

备注: The created ETM event object can be deleted later by calling `esp_etm_del_event`

参数

- **core_id** -- [in] CPU core ID
- **out_event** -- [out] Returned ETM event handle

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

2.5.7 GPIO & RTC GPIO**GPIO 汇总**

ESP32-P4 芯片具有 55 个物理 GPIO 管脚 (GPIO0 ~ GPIO54)。每个管脚都可用作一个通用 IO，或连接一个内部的外设信号。通过 GPIO 交换矩阵和 IO MUX，可配置外设模块的输入信号来源于任何的 IO 管脚，并且外设模块的输出信号也可连接到任意 IO 管脚。这些模块共同组成了芯片的 IO 控制。更多详细信息，请参阅 *ESP32-P4 技术参考手册 > IO MUX 和 GPIO 矩阵 (GPIO、IO_MUX)* [PDF]。

下表提供了各管脚的详细信息，部分 GPIO 具有特殊的使用限制，具体可参考表中的注释列。

GPIO	模拟功能	LP GPIO	注释
GPIO0		LP_GPIO0	
GPIO1		LP_GPIO1	
GPIO2	TOUCH0	LP_GPIO2

GPIO53	ADC1_CH12, ANA_CMPR_CH1 外 部参考电压		
GPIO54	ADC1_CH13, ANA_CMPR_CH1 同 相输入		

备注:

- Strapping 管脚: GPIO34, GPIO35、GPIO36、GPIO37 和 GPIO38 是 Strapping 管脚。更多信息请参考 [ESP32-P4 技术规格书](#)。
- USB-JTAG: GPIO24 和 GPIO25 默认用于 USB-JTAG。如果将它们配置为普通 GPIO，驱动程序将禁用 USB-JTAG 功能。

- 处于 Deep-sleep 模式时
- 超低功耗协处理器 (*ULP-LP-Core*) 运行时
- 使用 ADC/DAC 等模拟功能时
- 使用低功耗外设时，例如: LP_UART，LP_I2C 等

获取 IO 管脚实时配置状态

GPIO 驱动提供了一个函数 `gpio_dump_io_configuration()` 用来输出指定管脚的实时配置状态，包括上下拉、输入输出使能、管脚映射等。例如，以下命令可用于输出 GPIO4，GPIO8 与 GPIO26 的配置状态：

```
gpio_dump_io_configuration(stdout, (1ULL << 4) | (1ULL << 18) | (1ULL << 26));
```

其输出信息如下：

```
=====IO DUMP Start=====
IO[4] -
  Pullup: 1, Pulldown: 0, DriveCap: 2
  InputEn: 1, OutputEn: 0, OpenDrain: 0
  FuncSel: 1 (GPIO)
  GPIO Matrix SigIn ID: (simple GPIO input)
  SleepSelEn: 1

IO[18] -
  Pullup: 0, Pulldown: 0, DriveCap: 2
  InputEn: 0, OutputEn: 1, OpenDrain: 0
  FuncSel: 1 (GPIO)
  GPIO Matrix SigOut ID: 256 (simple GPIO output)
  SleepSelEn: 1

IO[26] **RESERVED** -
  Pullup: 1, Pulldown: 0, DriveCap: 2
  InputEn: 1, OutputEn: 0, OpenDrain: 0
  FuncSel: 0 (IOMUX)
  SleepSelEn: 1

=====IO DUMP End=====
```

如果你想要查看所有管脚的配置状态，可以使用命令

```
gpio_dump_all_io_configuration(stdout, SOC_GPIO_VALID_GPIO_MASK);
```

如果 IO 管脚通过 GPIO 交换矩阵连接到内部外设信号，输出信息打印中的外设信号 ID 定义可以在 `soc/esp32p4/include/soc/gpio_sig_map.h` 头文件中查看。`**RESERVED**` 字样则表示此 IO 用于连接 SPI flash 或 PSRAM，强烈建议不要重新配置这些管脚用于其他功能。

请不要依赖技术参考手册中记录的 GPIO 默认配置状态，因为特殊用途的 GPIO 可能会在 `app_main` 之前被引导程序或应用程序启动阶段的代码更改。

配置 USB PHY 管脚为普通 GPIO 管脚

要将 USB PHY 管脚配置为普通 GPIO 管脚，可使用函数 `gpio_config()`，请参考以下代码片段来进行配置。

```
gpio_config_t usb_phy_conf = {
    .pin_bit_mask = (1ULL << USB_PHY_DP_PIN) | (1ULL << USB_PHY_DM_PIN),
    .mode = GPIO_MODE_INPUT_OUTPUT,
    .pull_up_en = 0,
    .pull_down_en = 0,
    .intr_type = GPIO_INTR_DISABLE,
};
gpio_config(&usb_phy_conf);
```

GPIO 毛刺过滤器

ESP32-P4 内置硬件的过滤器可以过滤掉 GPIO 输入端口上的毛刺信号，在一定程度上避免错误触发中断或者是错把噪声当成有效的外设信号。

每个 GPIO 都可以使用独立的毛刺过滤器，该过滤器可以将那些脉冲宽度窄于 2 个采样时钟的信号剔除掉，该宽度无法配置。GPIO 对输入信号的采样时钟通常是 IO_MUX 的时钟源。在驱动中，此类过滤器称为管脚毛刺过滤器。可以调用 `gpio_new_pin_glitch_filter()` 函数创建一个过滤器句柄。过滤器的相关配置保存在 `gpio_pin_glitch_filter_config_t` 结构体中。

- `gpio_pin_glitch_filter_config_t::gpio_num` 设置启用毛刺过滤器的 GPIO 编号。

ESP32-P4 提供了 8 个灵活的毛刺过滤器，被过滤信号的脉冲宽度可以由软件进行配置。此类过滤器则称为灵活毛刺过滤器。每个过滤器都可以应用于任意 GPIO 输入，然而，将多个过滤器应用于同一 GPIO 上效果并不会叠加。可以调用 `gpio_new_flex_glitch_filter()` 函数来创建一个过滤器句柄。过滤器的相关配置保存在 `gpio_flex_glitch_filter_config_t` 结构体中。

- `gpio_flex_glitch_filter_config_t::gpio_num` 设置启用毛刺过滤器的 GPIO 编号。
- `gpio_flex_glitch_filter_config_t::window_width_ns` 和 `gpio_flex_glitch_filter_config_t::window_thres_ns` 是毛刺过滤器的关键参数。在 `gpio_flex_glitch_filter_config_t::window_width_ns` 时间内，任何脉冲信号，如果它的宽度小于 `gpio_flex_glitch_filter_config_t::window_thres_ns`，那么该脉冲信号就会被滤除掉。`gpio_flex_glitch_filter_config_t::window_thres_ns` 的值不能大于 `gpio_flex_glitch_filter_config_t::window_width_ns`。

请注意，管脚毛刺过滤器和灵活毛刺过滤器是各自独立的，支持为同一 GPIO 同时启用这两种过滤器。

毛刺过滤器默认关闭，可调用 `gpio_glitch_filter_enable()` 使能过滤器。如需回收这个过滤器，可以调用 `gpio_del_glitch_filter()` 函数。在回收句柄前，请确保过滤器处于关闭状态，否则需调用 `gpio_glitch_filter_disable()`。

GPIO 迟滞过滤器

ESP32-P4 支持输入引脚的硬件迟滞，这可以减少由于输入电压在逻辑 0、1 临界值附近时采样不稳定造成的 GPIO 中断误触，尤其是当输入逻辑电平转换较慢，电平建立时间较长时。

每个引脚可以独立启用迟滞功能。默认情况下，它处于关闭状态。你可以通过配置 `gpio_config_t::hys_ctrl_mode` 来选择启用与否。迟滞控制模式会和其余 GPIO 配置一起在 `gpio_config()` 中生效。

应用示例

- GPIO 输出和输入中断示例：[peripherals/gpio/generic_gpio](#)。

- This header file can be included with:

```
#include "driver/gpio.h"
```

- This header file is a part of the API provided by the `esp_driver_gpio` component. To declare that your component depends on `esp_driver_gpio`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_gpio
```

or

```
PRIV_REQUIRES esp_driver_gpio
```

Functions**esp_err_t gpio_config** (const *gpio_config_t* *pGPIOConfig)

GPIO common configuration.

Configure GPIO's Mode, pull-up, PullDown, IntrType

参数 pGPIOConfig -- Pointer to GPIO configure struct**返回**

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t gpio_reset_pin (*gpio_num_t* gpio_num)

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

备注: This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

参数 gpio_num -- GPIO number.**返回** Always return ESP_OK.**esp_err_t gpio_set_intr_type** (*gpio_num_t* gpio_num, *gpio_int_type_t* intr_type)

GPIO set interrupt trigger type.

参数

- **gpio_num** -- GPIO number. If you want to set the trigger type of e.g. of GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **intr_type** -- Interrupt type, select from *gpio_int_type_t*

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t gpio_intr_enable (*gpio_num_t* gpio_num)

Enable GPIO module interrupt signal.

备注: ESP32: Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to the comments of `adc1_get_raw`. Please refer to Section 3.11 of [ESP32 ECO and Workarounds for Bugs](#) for the description of this issue.

参数 gpio_num -- GPIO number. If you want to enable an interrupt on e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);**返回**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t gpio_intr_disable (*gpio_num_t* gpio_num)

Disable GPIO module interrupt signal.

备注: This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

参数 gpio_num -- GPIO number. If you want to disable the interrupt of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);**返回**

- ESP_OK success

- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_set_level** (gpio_num_t gpio_num, uint32_t level)

GPIO set output level.

备注: This function is allowed to be executed when Cache is disabled within ISR context, by enabling CONFIG_GPIO_CTRL_FUNC_IN_IRAM

参数

- **gpio_num** -- GPIO number. If you want to set the output level of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **level** -- Output level. 0: low ; 1: high

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO number error

int **gpio_get_level** (gpio_num_t gpio_num)

GPIO get input level.

警告: If the pad is not configured for input (or input and output) the returned value is always 0.

参数 **gpio_num** -- GPIO number. If you want to get the logic level of e.g. pin GPIO16, gpio_num should be GPIO_NUM_16 (16);

返回

- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

esp_err_t **gpio_set_direction** (gpio_num_t gpio_num, *gpio_mode_t* mode)

GPIO set direction.

Configure GPIO direction,such as output_only,input_only,output_and_input

参数

- **gpio_num** -- Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **mode** -- GPIO direction

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

esp_err_t **gpio_set_pull_mode** (gpio_num_t gpio_num, *gpio_pull_mode_t* pull)

Configure GPIO pull-up/pull-down resistors.

备注: ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

参数

- **gpio_num** -- GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **pull** -- GPIO pull up/down mode.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

esp_err_t **gpio_wakeup_enable** (gpio_num_t gpio_num, *gpio_int_type_t* intr_type)

Enable GPIO wake-up function.

参数

- **gpio_num** -- GPIO number.
- **intr_type** -- GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_wakeup_disable** (gpio_num_t gpio_num)

Disable GPIO wake-up function.

参数 **gpio_num** -- GPIO number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_isr_register** (void (*fn)(void*), void *arg, int intr_alloc_flags, *gpio_isr_handle_t* *handle)

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative `gpio_install_isr_service()` and `gpio_isr_handler_add()` API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the *interrupt allocation functions*.

参数

- **fn** -- Interrupt handler function.
- **arg** -- Parameter for handler function
- **intr_alloc_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See `esp_intr_alloc.h` for more info.
- **handle** -- Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

返回

- ESP_OK Success ;
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags

esp_err_t **gpio_pullup_en** (gpio_num_t gpio_num)

Enable pull-up on GPIO.

参数 **gpio_num** -- GPIO number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_pullup_dis** (gpio_num_t gpio_num)

Disable pull-up on GPIO.

参数 **gpio_num** -- GPIO number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_pulldown_en** (gpio_num_t gpio_num)

Enable pull-down on GPIO.

参数 **gpio_num** -- GPIO number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_pullup_dis** (gpio_num_t gpio_num)

Disable pull-up on GPIO.

参数 **gpio_num** -- GPIO number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_install_isr_service** (int intr_alloc_flags)

Install the GPIO driver's ETS_GPIO_INTR_SOURCE ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with `gpio_isr_register()` - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the `gpio_isr_handler_add()` function.

参数 **intr_alloc_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See `esp_intr_alloc.h` for more info.

返回

- ESP_OK Success
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_INVALID_ARG GPIO error

void **gpio_uninstall_isr_service** (void)

Uninstall the driver's GPIO ISR service, freeing related resources.

esp_err_t **gpio_isr_handler_add** (gpio_num_t gpio_num, *gpio_isr_t* isr_handler, void *args)

Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver's GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as "ISR stack size" in `menuconfig`). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

参数

- **gpio_num** -- GPIO number
- **isr_handler** -- ISR handler function for the corresponding GPIO number.
- **args** -- parameter for ISR handler.

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_isr_handler_remove** (gpio_num_t gpio_num)

Remove ISR handler for the corresponding GPIO pin.

参数 **gpio_num** -- GPIO number

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_set_drive_capability** (gpio_num_t gpio_num, *gpio_drive_cap_t* strength)

Set GPIO pad drive capability.

参数

- **gpio_num** -- GPIO number, only support output GPIOs
- **strength** -- Drive capability of the pad

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_get_drive_capability** (gpio_num_t gpio_num, *gpio_drive_cap_t* *strength)

Get GPIO pad drive capability.

参数

- **gpio_num** -- GPIO number, only support output GPIOs
- **strength** -- Pointer to accept drive capability of the pad

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_hold_en** (gpio_num_t gpio_num)

Enable gpio pad hold function.

When a GPIO is set to hold, its state is latched at that moment and will not change when the internal signal or the IO MUX/GPIO configuration is modified (including input enable, output enable, output value, function, and drive strength values). This function can be used to retain the state of GPIOs when the power domain of where GPIO/IOMUX belongs to becomes off. For example, chip or system is reset (e.g. watchdog time-out, deep-sleep events are triggered), or peripheral power-down in light-sleep.

This function works in both input and output modes, and only applicable to output-capable GPIOs. If this function is enabled: in output mode: the output level of the GPIO will be locked and can not be changed. in input mode: the input read value can still reflect the changes of the input signal.

However, on ESP32/S2/C3/S3/C2, this function cannot be used to hold the state of a digital GPIO during Deep-sleep. Even if this function is enabled, the digital GPIO will be reset to its default state when the chip wakes up from Deep-sleep. If you want to hold the state of a digital GPIO during Deep-sleep, please call `gpio_deep_sleep_hold_en`.

Power down or call `gpio_hold_dis` will disable this function.

参数 **gpio_num** -- GPIO number, only support output-capable GPIOs

返回

- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

esp_err_t **gpio_hold_dis** (gpio_num_t gpio_num)

Disable gpio pad hold function.

When the chip is woken up from peripheral power-down sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don't want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level(because gpio18 is input mode by default). If you don't want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

参数 **gpio_num** -- GPIO number, only support output-capable GPIOs

返回

- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

void **gpio_iomux_in** (uint32_t gpio_num, uint32_t signal_idx)

SOC_GPIO_SUPPORT_HOLD_SINGLE_IO_IN_DSLP.

Set pad input to a peripheral signal through the IOMUX.

参数

- **gpio_num** -- GPIO number of the pad.
- **signal_idx** -- Peripheral signal id to input. One of the *_IN_IDX signals in `soc/gpio_sig_map.h`.

void **gpio_iomux_out** (uint8_t gpio_num, int func, bool out_en_inv)

Set peripheral output to an GPIO pad through the IOMUX.

参数

- **gpio_num** -- gpio_num GPIO number of the pad.
- **func** -- The function number of the peripheral pin to output pin. One of the FUNC_X_* of specified pin (X) in soc/io_mux_reg.h.
- **out_en_inv** -- True if the output enable needs to be inverted, otherwise False.

esp_err_t **gpio_force_hold_all** (void)

Force hold all digital and rtc gpio pads.

GPIO force hold, no matter the chip in active mode or sleep modes.

This function will immediately cause all pads to latch the current values of input enable, output enable, output value, function, and drive strength values.

警告:

- This function will hold flash and UART pins as well. Therefore, this function, and all code run afterwards (till calling `gpio_force_unhold_all` to disable this feature), **MUST** be placed in internal RAM as holding the flash pins will halt SPI flash operation, and holding the UART pins will halt any UART logging.
- The hold state of all pads will be cancelled during ROM boot, so it is not recommended to use this API to hold the pads state during deepsleep and reset.

esp_err_t **gpio_force_unhold_all** (void)

Unhold all digital and rtc gpio pads.

备注: The global hold signal and the hold signal of each IO act on the PAD through 'or' logic, so if a pad has already been configured to hold by `gpio_hold_en`, this API can't release its hold state.

esp_err_t **gpio_sleep_sel_en** (gpio_num_t gpio_num)

Enable SLP_SEL to change GPIO status automantically in lightsleep.

参数 **gpio_num** -- GPIO number of the pad.

返回

- ESP_OK Success

esp_err_t **gpio_sleep_sel_dis** (gpio_num_t gpio_num)

Disable SLP_SEL to change GPIO status automantically in lightsleep.

参数 **gpio_num** -- GPIO number of the pad.

返回

- ESP_OK Success

esp_err_t **gpio_sleep_set_direction** (gpio_num_t gpio_num, *gpio_mode_t* mode)

GPIO set direction at sleep.

Configure GPIO direction,such as output_only,input_only,output_and_input

参数

- **gpio_num** -- Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **mode** -- GPIO direction

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

esp_err_t **gpio_sleep_set_pull_mode** (gpio_num_t gpio_num, *gpio_pull_mode_t* pull)

Configure GPIO pull-up/pull-down resistors at sleep.

备注: ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

参数

- **gpio_num** -- GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **pull** -- GPIO pull up/down mode.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

esp_err_t **gpio_deep_sleep_wakeup_enable** (gpio_num_t gpio_num, *gpio_intr_type_t* intr_type)

Enable GPIO deep-sleep wake-up function.

备注: Called by the SDK. User shouldn't call this directly in the APP.

参数

- **gpio_num** -- GPIO number.
- **intr_type** -- GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_deep_sleep_wakeup_disable** (gpio_num_t gpio_num)

Disable GPIO deep-sleep wake-up function.

参数 **gpio_num** -- GPIO number

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_dump_io_configuration** (FILE *out_stream, uint64_t io_bit_mask)

Dump IO configuration information to console.

参数

- **out_stream** -- IO stream (e.g. stdout)
- **io_bit_mask** -- IO pin bit mask, each bit maps to an IO

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Structures

struct **gpio_config_t**

Configuration parameters of GPIO pad for gpio_config function.

Public Members

`uint64_t pin_bit_mask`

Enumerations

enum **gpio_port_t**

Values:

enumerator **GPIO_PORT_0**

enumerator **GPIO_PORT_MAX**

enum **gpio_int_type_t**

Values:

enumerator **GPIO_INTR_DISABLE**

Disable GPIO interrupt

enumerator **GPIO_INTR_POSEDGE**

GPIO interrupt type : rising edge

enumerator **GPIO_INTR_NEGEDGE**

GPIO interrupt type : falling edge

enumerator **GPIO_INTR_ANYEDGE**

GPIO interrupt type : both rising and falling edge

enumerator **GPIO_INTR_LOW_LEVEL**

GPIO interrupt type : input low level trigger

enumerator **GPIO_INTR_HIGH_LEVEL**

GPIO interrupt type : input high level trigger

enumerator **GPIO_INTR_MAX**

enum **gpio_mode_t**

Values:

enumerator **GPIO_MODE_DISABLE**

GPIO mode : disable input and output

enumerator **GPIO_MODE_INPUT**

GPIO mode : input only

enumerator **GPIO_MODE_OUTPUT**

GPIO mode : output only mode

enumerator **GPIO_MODE_OUTPUT_OD**

GPIO mode : output only with open-drain mode

enumerator **GPIO_MODE_INPUT_OUTPUT_OD**

GPIO mode : output and input with open-drain mode

enumerator **GPIO_MODE_INPUT_OUTPUT**

GPIO mode : output and input mode

enum **gpio_pullup_t**

Values:

enumerator **GPIO_PULLUP_DISABLE**

Disable GPIO pull-up resistor

enumerator **GPIO_PULLUP_ENABLE**

Enable GPIO pull-up resistor

enum **gpiopulldown_t**

Values:

enumerator **GPIO_PULLDOWN_DISABLE**

Disable GPIO pull-down resistor

enumerator **GPIO_PULLDOWN_ENABLE**

Enable GPIO pull-down resistor

enum **gpio_pull_mode_t**

Values:

enumerator **GPIO_PULLUP_ONLY**

Pad pull up

enumerator **GPIO_PULLDOWN_ONLY**

Pad pull down

enumerator **GPIO_PULLUP_PULLDOWN**

Pad pull up + pull down

enumerator **GPIO_FLOATING**

Pad floating

enum **gpio_drive_cap_t**

Values:

enumerator **GPIO_DRIVE_CAP_0**

Pad drive capability: weak

enumerator **GPIO_DRIVE_CAP_1**

Pad drive capability: stronger

enumerator **GPIO_DRIVE_CAP_2**

Pad drive capability: medium

enumerator **GPIO_DRIVE_CAP_DEFAULT**

Pad drive capability: medium

enumerator **GPIO_DRIVE_CAP_3**

Pad drive capability: strongest

enumerator **GPIO_DRIVE_CAP_MAX**

enum **gpio_hys_ctrl_mode_t**

Available option for configuring hysteresis feature of GPIOs.

Values:

enumerator **GPIO_HYS_SOFT_DISABLE**

Pad input hysteresis disable by software

enumerator **GPIO_HYS_SOFT_ENABLE**

Pad input hysteresis enable by software

API 参考 - RTC GPIO

Header File

- [components/esp_driver_gpio/include/driver/rtc_io.h](#)
- This header file can be included with:

```
#include "driver/rtc_io.h"
```

- This header file is a part of the API provided by the `esp_driver_gpio` component. To declare that your component depends on `esp_driver_gpio`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_gpio
```

or

PRIV_REQUIRES esp_driver_gpio

Functions

bool **rtc_gpio_is_valid_gpio** (gpio_num_t gpio_num)

Determine if the specified GPIO is a valid RTC GPIO.

参数 **gpio_num** -- GPIO number

返回 true if GPIO is valid for RTC GPIO use. false otherwise.

int **rtc_io_number_get** (gpio_num_t gpio_num)

Get RTC IO index number by gpio number.

参数 **gpio_num** -- GPIO number

返回 ≥ 0 : Index of rtcio. -1 : The gpio is not rtcio.

esp_err_t **rtc_gpio_init** (gpio_num_t gpio_num)

Init a GPIO as RTC GPIO.

This function must be called when initializing a pad for an analog function.

参数 **gpio_num** -- GPIO number (e.g. GPIO_NUM_12)

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t **rtc_gpio_deinit** (gpio_num_t gpio_num)

Init a GPIO as digital GPIO.

参数 **gpio_num** -- GPIO number (e.g. GPIO_NUM_12)

返回

- ESP_OK success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

uint32_t **rtc_gpio_get_level** (gpio_num_t gpio_num)

Get the RTC IO input level.

参数 **gpio_num** -- GPIO number (e.g. GPIO_NUM_12)

返回

- 1 High level
- 0 Low level
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t **rtc_gpio_set_level** (gpio_num_t gpio_num, uint32_t level)

Set the RTC IO output level.

参数

- **gpio_num** -- GPIO number (e.g. GPIO_NUM_12)
- **level** -- output level

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t **rtc_gpio_set_direction** (gpio_num_t gpio_num, *rtc_gpio_mode_t* mode)

RTC GPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

参数

- **gpio_num** -- GPIO number (e.g. GPIO_NUM_12)
- **mode** -- GPIO direction

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t **rtc_gpio_set_direction_in_sleep** (gpio_num_t gpio_num, *rtc_gpio_mode_t* mode)

RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 supports INPUT_ONLY mode. The rest targets support INPUT_ONLY, OUTPUT_ONLY, INPUT_OUTPUT mode.

参数

- **gpio_num** -- GPIO number (e.g. GPIO_NUM_12)
- **mode** -- GPIO direction

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t **rtc_gpio_pullup_en** (gpio_num_t gpio_num)

RTC GPIO pullup enable.

This function only works for RTC IOs. In general, call `gpio_pullup_en`, which will work both for normal GPIOs and RTC IOs.

参数 **gpio_num** -- GPIO number (e.g. GPIO_NUM_12)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t **rtc_gpio_pulldown_en** (gpio_num_t gpio_num)

RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call `gpio_pulldown_en`, which will work both for normal GPIOs and RTC IOs.

参数 **gpio_num** -- GPIO number (e.g. GPIO_NUM_12)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t **rtc_gpio_pullup_dis** (gpio_num_t gpio_num)

RTC GPIO pullup disable.

This function only works for RTC IOs. In general, call `gpio_pullup_dis`, which will work both for normal GPIOs and RTC IOs.

参数 **gpio_num** -- GPIO number (e.g. GPIO_NUM_12)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t **rtc_gpio_pulldown_dis** (gpio_num_t gpio_num)

RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call `gpio_pulldown_dis`, which will work both for normal GPIOs and RTC IOs.

参数 **gpio_num** -- GPIO number (e.g. GPIO_NUM_12)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t **rtc_gpio_set_drive_capability** (gpio_num_t gpio_num, *gpio_drive_cap_t* strength)

Set RTC GPIO pad drive capability.

参数

- **gpio_num** -- GPIO number, only support output GPIOs
- **strength** -- Drive capability of the pad

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **rtc_gpio_get_drive_capability** (gpio_num_t gpio_num, *gpio_drive_cap_t* *strength)

Get RTC GPIO pad drive capability.

参数

- **gpio_num** -- GPIO number, only support output GPIOs
- **strength** -- Pointer to accept drive capability of the pad

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **rtc_gpio_iomux_func_sel** (gpio_num_t gpio_num, int func)

Select a RTC IOMUX function for the RTC IO.

参数

- **gpio_num** -- GPIO number
- **func** -- Function to assign to the pin

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **rtc_gpio_hold_en** (gpio_num_t gpio_num)

Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

参数 **gpio_num** -- GPIO number (e.g. GPIO_NUM_12)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t **rtc_gpio_hold_dis** (gpio_num_t gpio_num)

Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC_IO peripheral.

参数 **gpio_num** -- GPIO number (e.g. GPIO_NUM_12)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t **rtc_gpio_force_hold_en_all** (void)

Enable force hold signal for all RTC IOs.

Each RTC pad has a "force hold" input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

esp_err_t **rtc_gpio_force_hold_dis_all** (void)

Disable force hold signal for all RTC IOs.

esp_err_t **rtc_gpio_wakeup_enable** (gpio_num_t gpio_num, *gpio_intr_type_t* intr_type)

Enable wakeup from sleep mode using specific GPIO.

参数

- **gpio_num** -- GPIO number
- **intr_type** -- Wakeup on high level (GPIO_INTR_HIGH_LEVEL) or low level (GPIO_INTR_LOW_LEVEL)

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if `gpio_num` is not an RTC IO, or `intr_type` is not one of GPIO_INTR_HIGH_LEVEL, GPIO_INTR_LOW_LEVEL.

esp_err_t **rtc_gpio_wakeup_disable** (gpio_num_t gpio_num)

Disable wakeup from sleep mode using specific GPIO.

参数 `gpio_num` -- GPIO number

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if `gpio_num` is not an RTC IO

Macros

RTC_GPIO_IS_VALID_GPIO (gpio_num)

Header File

PRIV_REQUIRES esp_driver_gpio
```

Functions

esp_err_t **lp_gpio_connect_in_signal** (gpio_num_t gpio_num, uint32_t signal_idx, bool inv)

Connect a RTC(LP) GPIO input with a peripheral signal, which tagged as input attribute.

备注: There's no limitation on the number of signals that a RTC(LP) GPIO can connect with

参数

- `gpio_num` -- GPIO number, especially, `LP_GPIO_MATRIX_CONST_ZERO_INPUT` means connect logic 0 to signal `LP_GPIO_MATRIX_CONST_ONE_INPUT` means connect logic 1 to signal
- `signal_idx` -- LP peripheral signal index (tagged as input attribute)
- `inv` -- Whether the RTC(LP) GPIO input to be inverted or not

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **lp_gpio_connect_out_signal** (gpio_num_t gpio_num, uint32_t signal_idx, bool out_inv, bool out_en_inv)

Connect a peripheral signal which tagged as output attribute with a RTC(LP) GPIO.

备注: There's no limitation on the number of RTC(LP) GPIOs that a signal can connect with

参数

- `gpio_num` -- GPIO number

- **signal_idx** -- LP peripheral signal index (tagged as input attribute), especially, SIG_LP_GPIO_OUT_IDX means disconnect RTC(LP) GPIO and other peripherals. Only the RTC GPIO driver can control the output level
- **out_inv** -- Whether to signal to be inverted or not
- **out_en_inv** -- Whether the output enable control is inverted or not

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Header File

- [components/hal/include/hal/rtc_io_types.h](#)
- This header file can be included with:

```
#include "hal/rtc_io_types.h"
```

Enumerations

enum **rtc_gpio_mode_t**

RTCIO output/input mode type.

Values:

enumerator **RTC_GPIO_MODE_INPUT_ONLY**

Pad input

enumerator **RTC_GPIO_MODE_OUTPUT_ONLY**

Pad output

enumerator **RTC_GPIO_MODE_INPUT_OUTPUT**

Pad input + output

enumerator **RTC_GPIO_MODE_DISABLED**

Pad (output + input) disable

enumerator **RTC_GPIO_MODE_OUTPUT_OD**

Pad open-drain output

enumerator **RTC_GPIO_MODE_INPUT_OUTPUT_OD**

Pad input + open-drain output

or

PRIV_REQUIRES esp_driver_gpio

Functions

esp_err_t **gpio_new_pin_glitch_filter** (const *gpio_pin_glitch_filter_config_t* *config, *gpio_glitch_filter_handle_t* *ret_filter)

Create a pin glitch filter.

备注: Pin glitch filter parameters are fixed, pulses shorter than two sample clocks (IO-MUX's source clock) will be filtered out. It's independent with "flex" glitch filter. See also `gpio_new_flex_glitch_filter`.

备注: The created filter handle can later be deleted by `gpio_del_glitch_filter`.

参数

- **config** -- **[in]** Glitch filter configuration
- **ret_filter** -- **[out]** Returned glitch filter handle

返回

- ESP_OK: Create a pin glitch filter successfully
- ESP_ERR_INVALID_ARG: Create a pin glitch filter failed because of invalid arguments (e.g. wrong GPIO number)
- ESP_ERR_NO_MEM: Create a pin glitch filter failed because of out of memory
- ESP_FAIL: Create a pin glitch filter failed because of other error

esp_err_t **gpio_new_flex_glitch_filter** (const *gpio_flex_glitch_filter_config_t* *config, *gpio_glitch_filter_handle_t* *ret_filter)

Allocate a flex glitch filter.

备注: "flex" means the filter parameters (window, threshold) are adjustable. It's independent with pin glitch filter. See also `gpio_new_pin_glitch_filter`.

备注: The created filter handle can later be deleted by `gpio_del_glitch_filter`.

参数

- **config** -- **[in]** Glitch filter configuration
- **ret_filter** -- **[out]** Returned glitch filter handle

返回

- ESP_OK: Allocate a flex glitch filter successfully
- ESP_ERR_INVALID_ARG: Allocate a flex glitch filter failed because of invalid arguments (e.g. wrong GPIO number, filter parameters out of range)
- ESP_ERR_NO_MEM: Allocate a flex glitch filter failed because of out of memory
- ESP_ERR_NOT_FOUND: Allocate a flex glitch filter failed because the underlying hardware resources are used up
- ESP_FAIL: Allocate a flex glitch filter failed because of other error

esp_err_t **gpio_del_glitch_filter** (*gpio_glitch_filter_handle_t* filter)

Delete a glitch filter.

参数 **filter** -- **[in]** Glitch filter handle returned from `gpio_new_flex_glitch_filter` or `gpio_new_pin_glitch_filter`

返回

- ESP_OK: Delete glitch filter successfully
- ESP_ERR_INVALID_ARG: Delete glitch filter failed because of invalid arguments

- `ESP_ERR_INVALID_STATE`: Delete glitch filter failed because the glitch filter is still in working
- `ESP_FAIL`: Delete glitch filter failed because of other error

esp_err_t **gpio_glitch_filter_enable** (*gpio_glitch_filter_handle_t* filter)

Enable a glitch filter.

参数 filter -- [in] Glitch filter handle returned from `gpio_new_flex_glitch_filter` or `gpio_new_pin_glitch_filter`

返回

- `ESP_OK`: Enable glitch filter successfully
- `ESP_ERR_INVALID_ARG`: Enable glitch filter failed because of invalid arguments
- `ESP_ERR_INVALID_STATE`: Enable glitch filter failed because the glitch filter is already enabled
- `ESP_FAIL`: Enable glitch filter failed because of other error

esp_err_t **gpio_glitch_filter_disable** (*gpio_glitch_filter_handle_t* filter)

Disable a glitch filter.

参数 filter -- [in] Glitch filter handle returned from `gpio_new_flex_glitch_filter` or `gpio_new_pin_glitch_filter`

返回

- `ESP_OK`: Disable glitch filter successfully
- `ESP_ERR_INVALID_ARG`: Disable glitch filter failed because of invalid arguments
- `ESP_ERR_INVALID_STATE`: Disable glitch filter failed because the glitch filter is not enabled yet
- `ESP_FAIL`: Disable glitch filter failed because of other error

Structures

struct **gpio_pin_glitch_filter_config_t**

Configuration of GPIO pin glitch filter.

Public Members

glitch_filter_clock_source_t **clk_src**

Clock source for the glitch filter

gpio_num_t **gpio_num**

GPIO number

struct **gpio_flex_glitch_filter_config_t**

Configuration of GPIO flex glitch filter.

Public Members

glitch_filter_clock_source_t **clk_src**

Clock source for the glitch filter

gpio_num_t **gpio_num**

GPIO number

uint32_t **window_width_ns**

Sample window width (in ns)

uint32_t **window_thres_ns**

Sample window threshold (in ns), during the `window_width_ns` sample window, any pulse whose width < `window_thres_ns` will be discarded.

Type Definitions

```
typedef struct gpio_glitch_filter_t *gpio_glitch_filter_handle_t
```

Typedef of GPIO glitch filter handle.

2.5.8 通用定时器

简介

通用定时器是 ESP32-P4 定时器组外设的驱动程序。ESP32-P4 硬件定时器分辨率高，具有灵活的报警功能。定时器内部计数器达到特定目标数值的行为被称为定时器报警。定时器报警时将调用用户注册的不同定时器回调函数。

通用定时器通常在以下场景中使用：

- 如同挂钟一般自由运行，随时随地获取高分辨率时间戳；
- 生成周期性警报，定期触发事件；
- 生成一次性警报，在目标时间内响应。

功能概述

下文介绍了配置和操作定时器的常规步骤：

- **资源分配** - 获取定时器句柄应设置的参数，以及如何在通用定时器完成工作时回收资源。
- **设置和获取计数值** - 如何强制定时器从起点开始计数，以及如何随时获取计数值。
- **设置警报动作** - 启动警报事件应设置的参数。
- **注册事件回调函数** - 如何将用户的特定代码挂载到警报事件回调函数。
- **使能和禁用定时器** - 如何使能和禁用定时器。
- **启动和停止定时器** - 通过不同报警行为启动定时器的典型使用场景。
- **ETM 事件与任务** - 定时器提供了哪些事件和任务可以连接到 ETM 通道上。
- **电源管理** - 选择不同的时钟源将会如何影响功耗。
- **IRAM 安全** - 在 cache 禁用的情况下，如何更好地让定时器处理中断事务以及实现 IO 控制功能。
- **线程安全** - 驱动程序保证哪些 API 线程安全。
- **Kconfig 选项** - 支持的 Kconfig 选项，这些选项会对驱动程序行为产生不同影响。

资源分配 不同的 ESP 芯片可能有不同数量的独立定时器组，每组内也可能有若干个独立定时器。¹

通用定时器实例由 `gptimer_handle_t` 表示。可用硬件资源汇集在资源池内，由后台驱动程序管理，无需考虑硬件所属的定时器以及定时器组。

要安装一个定时器实例，需要提前提供配置结构体 `gptimer_config_t`：

- `gptimer_config_t::clk_src` 选择定时器的时钟源。`gptimer_clock_source_t` 中列出多个可用时钟，仅可选择其中一个时钟。了解不同时钟源对功耗的影响，请查看章节 [电源管理](#)。
- `gptimer_config_t::direction` 设置定时器的计数方向，`gptimer_count_direction_t` 中列出多个支持的方向，仅可选择其中一个方向。
- `gptimer_config_t::resolution_hz` 设置内部计数器的分辨率。计数器每滴答一次相当于 **1 / resolution_hz** 秒。

¹ 不同 ESP 芯片系列的通用定时器实例数量可能不同。了解详细信息，请参考《ESP32-P4 技术参考手册》> 章节 [定时器组 \(TIMG\) \[PDF\]](#)。驱动程序对通道申请数量不做限制，但当硬件资源用尽时，驱动程序将返回错误。在分配资源时，请务必检查返回值（例如 `gptimer_new_timer()`）。

- `gptimer_config::intr_priority` 设置中断的优先级。如果设置为 0，则会分配一个默认优先级的中断，否则会使用指定的优先级。
- 选用 `gptimer_config_t::intr_shared` 设置是否将定时器中断源标记为共享源。了解共享中断的优缺点，请参考 [Interrupt Handling](#)。

完成上述结构配置之后，可以将结构传递给 `gptimer_new_timer()`，用以实例化定时器实例并返回定时器句柄。

该函数可能由于内存不足、参数无效等错误而失败。具体来说，当没有更多的空闲定时器（即所有硬件资源已用完）时，将返回 `ESP_ERR_NOT_FOUND`。可用定时器总数由 `SOC_TIMER_GROUP_TOTAL_TIMERS` 表示，不同的 ESP 芯片该数值不同。

如已不再需要之前创建的通用定时器实例，应通过调用 `gptimer_del_timer()` 回收定时器，以便底层硬件定时器用于其他目的。在删除通用定时器句柄之前，请通过 `gptimer_disable()` 禁用定时器，或者通过 `gptimer_enable()` 确认定时器尚未使能。

创建分辨率为 1 MHz 的通用定时器句柄

```
gptimer_handle_t gptimer = NULL;
gptimer_config_t timer_config = {
    .clk_src = GPTIMER_CLK_SRC_DEFAULT,
    .direction = GPTIMER_COUNT_UP,
    .resolution_hz = 1 * 1000 * 1000, // 1MHz, 1 tick = 1us
};
ESP_ERROR_CHECK(gptimer_new_timer(&timer_config, &gptimer));
```

设置和获取计数值 创建通用定时器时，内部计数器将默认重置为零。计数值可以通过 `gptimer_set_raw_count()` 异步更新。最大计数值取决于硬件定时器的位宽，这也会在 SOC 宏 `SOC_TIMER_GROUP_COUNTER_BIT_WIDTH` 中有所反映。当更新活动定时器的原始计数值时，定时器将立即从新值开始计数。

计数值可以随时通过 `gptimer_get_raw_count()` 获取。

设置警报动作 对于大多数通用定时器使用场景而言，应在启动定时器之前设置警报动作，但不包括简单的挂钟场景，该场景仅需自由运行的定时器。设置警报动作，需要根据如何使用警报事件来配置 `gptimer_alarm_config_t` 的不同参数：

- `gptimer_alarm_config_t::alarm_count` 设置触发警报事件的目标计数值。设置警报值时还需考虑计数方向。尤其是当 `gptimer_alarm_config_t::auto_reload_on_alarm` 为 `true` 时，`gptimer_alarm_config_t::alarm_count` 和 `gptimer_alarm_config_t::reload_count` 不能设置为相同的值，因为警报值和重载值相同时没有意义。
- `gptimer_alarm_config_t::reload_count` 代表警报事件发生时要重载的计数值。此配置仅在 `gptimer_alarm_config_t::auto_reload_on_alarm` 设置为 `true` 时生效。
- `gptimer_alarm_config_t::auto_reload_on_alarm` 标志设置是否使能自动重载功能。如果使能，硬件定时器将在警报事件发生时立即将 `gptimer_alarm_config_t::reload_count` 的值重载到计数器中。

要使警报配置生效，需要调用 `gptimer_set_alarm_action()`。特别是当 `gptimer_alarm_config_t` 设置为 `NULL` 时，报警功能将被禁用。

备注：如果警报值已设置且定时器超过该值，则会立即触发警报。

注册事件回调函数 定时器启动后，可动态产生特定事件（如“警报事件”）。如需在事件发生时调用某些函数，请通过 `gptimer_register_event_callbacks()` 将函数挂载到中断服务例程 (ISR)。 `gptimer_event_callbacks_t` 中列出了所有支持的事件回调函数：

- `gptimer_event_callbacks_t::on_alarm` 设置警报事件的回调函数。由于此函数在 ISR 上下文中调用，必须确保该函数不会试图阻塞（例如，确保仅从函数内调用具有 ISR 后缀的 FreeRTOS API）。函数原型在 `gptimer_alarm_cb_t` 中有所声明。

也可以通过参数 `user_data`，将自己的上下文保存到 `gptimer_register_event_callbacks()` 中。用户数据将直接传递给回调函数。

此功能将为定时器延迟安装中断服务，但不使能中断服务。所以，请在 `gptimer_enable()` 之前调用这一函数，否则将返回 `ESP_ERR_INVALID_STATE` 错误。了解详细信息，请查看章节 [使能和禁用定时器](#)。

使能和禁用定时器 在对定时器进行 IO 控制之前，需要先调用 `gptimer_enable()` 使能定时器。此函数功能如下：

- 此函数将把定时器驱动程序的状态从 **init** 切换为 **enable**。
- 如果 `gptimer_register_event_callbacks()` 已经延迟安装中断服务，此函数将使能中断服务。
- 如果选择了特定的时钟源（例如 APB 时钟），此函数将获取适当的电源管理锁。了解更多信息，请查看章节 [电源管理](#)。

调用 `gptimer_disable()` 会进行相反的操作，即将定时器驱动程序恢复到 **init** 状态，禁用中断服务并释放电源管理锁。

启动和停止定时器 启动和停止是定时器的基本 IO 操作。调用 `gptimer_start()` 可以使内部计数器开始工作，而 `gptimer_stop()` 可以使计数器停止工作。下文说明了如何在存在或不存在警报事件的情况下启动定时器。

调用 `gptimer_start()` 将使驱动程序状态从 **enable** 转换为 **run**，反之亦然。注意确保 `start` 和 `stop` 函数成对使用，否则，函数可能返回 `ESP_ERR_INVALID_STATE`。

将定时器作为挂钟启动

```
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
// Retrieve the timestamp at anytime
uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));
```

触发周期性事件

```
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↳event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    // Don't introduce complex logics in callbacks
    // Suggest dealing with event data in the main loop, instead of in this_
↳callback
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}
```

(下页继续)

```

gptimer_alarm_config_t alarm_config = {
    .reload_count = 0, // counter will reload with 0 on alarm event
    .alarm_count = 1000000, // period = 1s @resolution 1MHz
    .flags.auto_reload_on_alarm = true, // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

```

触发一次性事件

```

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↪event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1 * 1000 * 1000, // alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

```

警报值动态更新 通过更改 `gptimer_alarm_event_data_t::alarm_value`, 可以在 ISR 程序回调中动态更新警报值。警报值将在回调函数返回后更新。

```

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↪event_data_t *edata, void *user_ctx)

```

(下页继续)

```

{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_data;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // reconfigure alarm value
    gptimer_alarm_config_t alarm_config = {
        .alarm_count = edata->alarm_value + 1000000, // alarm in next 1s
    };
    gptimer_set_alarm_action(timer, &alarm_config);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1000000, // initial alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer, &alarm_config));

```

ETM 事件与任务 定时器可以产生多种事件，这些事件可以连接到 *ETM* 模块。*gptimer_etm_event_type_t* 中列出了定时器能够产生的事件类型。用户可以通过调用 *gptimer_new_etm_event()* 来获得相应事件的 ETM event 句柄。同样地，定时器还公开了一些可被其他事件触发然后自动执行的任务。*gptimer_etm_task_type_t* 中列出了定时器能够支持的任务类型。用户可以通过调用 *gptimer_new_etm_task()* 来获得相应任务的 ETM task 句柄。

关于如何将定时器事件和任务连接到 ETM 通道中，请参阅 *ETM* 文档。

电源管理 有些电源管理的策略会在某些时刻关闭时钟源，或者改变时钟源的频率，以求降低功耗。比如在启用 DFS 后，APB 时钟源会降低频率。如果浅睡眠 (Light-sleep) 模式也被开启，PLL 和 XTAL 时钟都会被默认关闭，从而导致 GPTimer 的计时不准确。

驱动程序会根据具体的时钟源选择，通过创建不同的电源锁来避免上述情况的发生。驱动会在 *gptimer_enable()* 函数中增加电源锁的引用计数，并在 *gptimer_disable()* 函数中减少电源锁的引用计数，从而保证了在 *gptimer_enable()* 和 *gptimer_disable()* 之间，GPTimer 的时钟源始终处于稳定工作的状态。

IRAM 安全 默认情况下，当 cache 因写入或擦除 flash 等原因而被禁用时，通用定时器的中断服务将会延迟，造成警报中断无法及时执行。在实时应用程序中通常需要避免这一情况发生。

调用 Kconfig 选项 *CONFIG_GPTIMER_ISR_IRAM_SAFE* 可实现如下功能：

- 即使禁用 cache 也可使能正在运行的中断
- 将 ISR 使用的所有函数放入 IRAM²
- 将驱动程序对象放入 DRAM（以防意外映射到 PSRAM）

这将允许中断在 cache 禁用时运行，但会增加 IRAM 使用量。

² *gptimer_event_callbacks_t::on_alarm* 回调函数和这一函数调用的函数也需放在 IRAM 中，请自行处理。

调用另一 Kconfig 选项 `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` 也可将常用的 IO 控制功能放入 IRAM，以便这些函数在 cache 禁用时也能执行。常用的 IO 控制功能如下：

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

线程安全 驱动提供的所有 API 都是线程安全的。使用时，可以直接从不同的 RTOS 任务中调用此类函数，无需额外锁保护。以下这些函数还支持在中断上下文中运行。

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_get_captured_count()`
- `gptimer_set_alarm_action()`

Kconfig 选项

- `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` 控制着定时器控制函数的存放位置（IRAM 或 flash）。
- `CONFIG_GPTIMER_ISR_HANDLER_IN_IRAM` 控制着定时器中断处理函数的存放位置（IRAM 或 flash）。
- `CONFIG_GPTIMER_ISR_IRAM_SAFE` 控制着中断处理函数是否需要在 cache 关闭的时候被屏蔽掉。更多信息，请参阅 [IRAM 安全](#)。
- `CONFIG_GPTIMER_ENABLE_DEBUG_LOG` 用于启用调试日志输出。启用这一选项将增加固件二进制文件大小。

应用示例

- 示例 [peripherals/timer_group/gptimer](#) 中列出了通用定时器的典型用例。
- 示例 [peripherals/timer_group/gptimer_capture_hc_sr04](#) 展示了如何在 ETM 模块的帮助下，用定时器捕获外部事件的时间戳。

or

```
PRIV_REQUIRES esp_driver_gptimer
```

Functions

esp_err_t **gptimer_new_timer** (const *gptimer_config_t* *config, *gptimer_handle_t* *ret_timer)

Create a new General Purpose Timer, and return the handle.

备注: The newly created timer is put in the "init" state.

参数

- **config** -- **[in]** GPTimer configuration
- **ret_timer** -- **[out]** Returned timer handle

返回

- ESP_OK: Create GPTimer successfully
- ESP_ERR_INVALID_ARG: Create GPTimer failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPTimer failed because out of memory
- ESP_ERR_NOT_FOUND: Create GPTimer failed because all hardware timers are used up and no more free one
- ESP_FAIL: Create GPTimer failed because of other error

esp_err_t **gptimer_del_timer** (*gptimer_handle_t* timer)

Delete the GPTimer handle.

备注: A timer must be in the "init" state before it can be deleted.

参数 **timer** -- **[in]** Timer handle created by `gptimer_new_timer`

返回

- ESP_OK: Delete GPTimer successfully
- ESP_ERR_INVALID_ARG: Delete GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete GPTimer failed because the timer is not in init state
- ESP_FAIL: Delete GPTimer failed because of other error

esp_err_t **gptimer_set_raw_count** (*gptimer_handle_t* timer, uint64_t value)

Set GPTimer raw count value.

备注: When updating the raw count of an active timer, the timer will immediately start counting from the new value.

备注: This function is allowed to run within ISR context

备注: If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

参数

- **timer** -- **[in]** Timer handle created by `gptimer_new_timer`
- **value** -- **[in]** Count value to be set

返回

- ESP_OK: Set GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Set GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Set GPTimer raw count value failed because of other error

esp_err_t **gptimer_get_raw_count** (*gptimer_handle_t* timer, uint64_t *value)

Get GPTimer raw count value.

备注: This function will trigger a software capture event and then return the captured count value.

备注: With the raw count value and the resolution returned from `gptimer_get_resolution`, you can convert the count value into seconds.

备注: This function is allowed to run within ISR context

备注: If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

参数

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **value** -- [out] Returned GPTimer count value

返回

- `ESP_OK`: Get GPTimer raw count value successfully
- `ESP_ERR_INVALID_ARG`: Get GPTimer raw count value failed because of invalid argument
- `ESP_FAIL`: Get GPTimer raw count value failed because of other error

esp_err_t **gptimer_get_resolution** (*gptimer_handle_t* timer, uint32_t *out_resolution)

Return the real resolution of the timer.

备注: usually the timer resolution is same as what you configured in the `gptimer_config_t::resolution_hz`, but some unstable clock source (e.g. `RC_FAST`) will do a calibration, the real resolution can be different from the configured one.

参数

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **out_resolution** -- [out] Returned timer resolution, in Hz

返回

- `ESP_OK`: Get GPTimer resolution successfully
- `ESP_ERR_INVALID_ARG`: Get GPTimer resolution failed because of invalid argument
- `ESP_FAIL`: Get GPTimer resolution failed because of other error

esp_err_t **gptimer_get_captured_count** (*gptimer_handle_t* timer, uint64_t *value)

Get GPTimer captured count value.

备注: The capture action can be issued either by ETM event or by software (see also `gptimer_get_raw_count`).

备注: This function is allowed to run within ISR context

备注: If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

参数

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **value** -- [out] Returned captured count value

返回

- `ESP_OK`: Get GPTimer captured count value successfully
- `ESP_ERR_INVALID_ARG`: Get GPTimer captured count value failed because of invalid argument
- `ESP_FAIL`: Get GPTimer captured count value failed because of other error

`esp_err_t gptimer_register_event_callbacks` (`gptimer_handle_t` timer, const `gptimer_event_callbacks_t` *cbs, void *user_data)

Set callbacks for GPTimer.

备注: User registered callbacks are expected to be runnable within ISR context

备注: The first call to this function needs to be before the call to `gptimer_enable`

备注: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

参数

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **cbs** -- [in] Group of callback functions
- **user_data** -- [in] User data, which will be passed to callback functions directly

返回

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set event callbacks failed because the timer is not in init state
- `ESP_FAIL`: Set event callbacks failed because of other error

`esp_err_t gptimer_set_alarm_action` (`gptimer_handle_t` timer, const `gptimer_alarm_config_t` *config)

Set alarm event actions for GPTimer.

备注: This function is allowed to run within ISR context, so you can update new alarm action immediately in any ISR callback.

备注: If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled. In this case, please also ensure the `gptimer_alarm_config_t` instance is placed in the static data section instead of in the read-only data section. e.g.: `static gptimer_alarm_config_t alarm_config = { ... };`

参数

- **timer** -- [in] Timer handle created by `gptimer_new_timer`

- **config** -- **[in]** Alarm configuration, especially, set config to NULL means disabling the alarm function

返回

- ESP_OK: Set alarm action for GPTimer successfully
- ESP_ERR_INVALID_ARG: Set alarm action for GPTimer failed because of invalid argument
- ESP_FAIL: Set alarm action for GPTimer failed because of other error

esp_err_t **gptimer_enable** (*gptimer_handle_t* timer)

Enable GPTimer.

备注: This function will transit the timer state from "init" to "enable".

备注: This function will enable the interrupt service, if it's lazy installed in `gptimer_register_event_callbacks`.

备注: This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the `gptimer_config_t`, while `CONFIG_PM_ENABLE` is enabled.

备注: Enable a timer doesn't mean to start it. See also `gptimer_start` for how to make the timer start counting.

参数 **timer** -- **[in]** Timer handle created by `gptimer_new_timer`

返回

- ESP_OK: Enable GPTimer successfully
- ESP_ERR_INVALID_ARG: Enable GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable GPTimer failed because the timer is already enabled
- ESP_FAIL: Enable GPTimer failed because of other error

esp_err_t **gptimer_disable** (*gptimer_handle_t* timer)

Disable GPTimer.

备注: This function will transit the timer state from "enable" to "init".

备注: This function will disable the interrupt service if it's installed.

备注: This function will release the PM lock if it's acquired in the `gptimer_enable`.

备注: Disable a timer doesn't mean to stop it. See also `gptimer_stop` for how to make the timer stop counting.

参数 **timer** -- **[in]** Timer handle created by `gptimer_new_timer`

返回

- ESP_OK: Disable GPTimer successfully
- ESP_ERR_INVALID_ARG: Disable GPTimer failed because of invalid argument

- ESP_ERR_INVALID_STATE: Disable GPTimer failed because the timer is not enabled yet
- ESP_FAIL: Disable GPTimer failed because of other error

esp_err_t **gptimer_start** (*gptimer_handle_t* timer)

Start GPTimer (internal counter starts counting)

备注: This function will transit the timer state from "enable" to "run".

备注: This function is allowed to run within ISR context

备注: If CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

参数 *timer* -- [in] Timer handle created by `gptimer_new_timer`

返回

- ESP_OK: Start GPTimer successfully
- ESP_ERR_INVALID_ARG: Start GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start GPTimer failed because the timer is not enabled or is already in running
- ESP_FAIL: Start GPTimer failed because of other error

esp_err_t **gptimer_stop** (*gptimer_handle_t* timer)

Stop GPTimer (internal counter stops counting)

备注: This function will transit the timer state from "run" to "enable".

备注: This function is allowed to run within ISR context

备注: If CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

参数 *timer* -- [in] Timer handle created by `gptimer_new_timer`

返回

- ESP_OK: Stop GPTimer successfully
- ESP_ERR_INVALID_ARG: Stop GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Stop GPTimer failed because the timer is not in running.
- ESP_FAIL: Stop GPTimer failed because of other error

Structures

struct **gptimer_config_t**

General Purpose Timer configuration.

Public Members

gptimer_clock_source_t **clk_src**

GPTimer clock source

gptimer_count_direction_t **direction**

Count direction

uint32_t **resolution_hz**

Counter resolution (working frequency) in Hz, hence, the step size of each count tick equals to (1 / resolution_hz) seconds

int **intr_priority**

GPTimer interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t **intr_shared**

Set true, the timer interrupt number can be shared with other peripherals

uint32_t **backup_before_sleep**

If set, the driver will backup/restore the GPTimer registers before/after entering/exist sleep mode. By this approach, the system can power off GPTimer's power domain. This can save power, but at the expense of more RAM being consumed

struct *gptimer_config_t*::[anonymous] **flags**

GPTimer config flags

struct **gptimer_event_callbacks_t**

Group of supported GPTimer callbacks.

备注: The callbacks are all running under ISR environment

备注: When CONFIG_GPTIMER_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

Public Members

gptimer_alarm_cb_t **on_alarm**

Timer alarm callback

struct **gptimer_alarm_config_t**

General Purpose Timer alarm configuration.

Public Members

uint64_t **alarm_count**

Alarm target count value

uint64_t **reload_count**

Alarm reload count value, effect only when `auto_reload_on_alarm` is set to true

uint32_t **auto_reload_on_alarm**

Reload the count value by hardware, immediately at the alarm event

struct *gptimer_alarm_config_t*::[anonymous] **flags**

Alarm config flags

Header File

- `components/esp_driver_gptimer/include/driver/gptimer_etm.h`
- This header file can be included with:

```

Functions

esp_err_t **gptimer_new_etm_event** (*gptimer_handle_t* timer, const *gptimer_etm_event_config_t* *config, *esp_etm_event_handle_t* *out_event)

Get the ETM event for GPTimer.

备注: The created ETM event object can be deleted later by calling `esp_etm_del_event`

参数

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **config** -- [in] GPTimer ETM event configuration
- **out_event** -- [out] Returned ETM event handle

返回

- ESP_OK: Get ETM event successfully
- ESP_ERR_INVALID_ARG: Get ETM event failed because of invalid argument
- ESP_FAIL: Get ETM event failed because of other error

esp_err_t **gptimer_new_etm_task** (*gptimer_handle_t* timer, const *gptimer_etm_task_config_t* *config, *esp_etm_task_handle_t* *out_task)

Get the ETM task for GPTimer.

备注: The created ETM task object can be deleted later by calling `esp_etm_del_task`

参数

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **config** -- [in] GPTimer ETM task configuration
- **out_task** -- [out] Returned ETM task handle

返回

- ESP_OK: Get ETM task successfully

- ESP_ERR_INVALID_ARG: Get ETM task failed because of invalid argument
- ESP_FAIL: Get ETM task failed because of other error

Structures

struct **gptimer_etm_event_config_t**
GPTimer ETM event configuration.

Public Members

gptimer_etm_event_type_t **event_type**
GPTimer ETM event type

struct **gptimer_etm_task_config_t**
GPTimer ETM task configuration.

Public Members

gptimer_etm_task_type_t **task_type**
GPTimer ETM task type

```
REQUIRES esp_driver_gptimer
```

or

```
PRIV_REQUIRES esp_driver_gptimer
```

Structures

struct **gptimer_alarm_event_data_t**
GPTimer alarm event data.

Public Members

uint64_t **count_value**
Current count value

uint64_t **alarm_value**
Current alarm value

Type Definitions

typedef struct gptimer_t **gptimer_handle_t**

Type of General Purpose Timer handle.

typedef bool (***gptimer_alarm_cb_t**)(*gptimer_handle_t* timer, const *gptimer_alarm_event_data_t* *edata, void *user_ctx)

Timer alarm callback prototype.

Param timer [in] Timer handle created by `gptimer_new_timer`

Param edata [in] Alarm event data, fed by driver

Param user_ctx [in] User data, passed from `gptimer_register_event_callbacks`

Return Whether a high priority task has been waken up by this function

Header File

- [components/hal/include/hal/timer_types.h](#)
- This header file can be included with:

```
#include "hal/timer_types.h"
```

Type Definitions

typedef *soc_periph_gptimer_clk_src_t* **gptimer_clock_source_t**

GPTimer clock source.

备注: User should select the clock source based on the power and resolution requirement

Enumerations

enum **gptimer_count_direction_t**

GPTimer count direction.

Values:

enumerator **GPTIMER_COUNT_DOWN**

Decrease count value

enumerator **GPTIMER_COUNT_UP**

Increase count value

enum **gptimer_etm_task_type_t**

GPTimer specific tasks that supported by the ETM module.

Values:

enumerator **GPTIMER_ETM_TASK_START_COUNT**

Start the counter

enumerator **GPTIMER_ETM_TASK_STOP_COUNT**

Stop the counter

enumerator **GPTIMER_ETM_TASK_EN_ALARM**

Enable the alarm

enumerator **GPTIMER_ETM_TASK_RELOAD**

Reload preset value into counter

enumerator **GPTIMER_ETM_TASK_CAPTURE**

Capture current count value into specific register

enumerator **GPTIMER_ETM_TASK_MAX**

Maximum number of tasks

enum **gptimer_etm_event_type_t**

GPTimer specific events that supported by the ETM module.

Values:

enumerator **GPTIMER_ETM_EVENT_ALARM_MATCH**

Count value matches the alarm target value

enumerator **GPTIMER_ETM_EVENT_MAX**

Maximum number of events

2.5.9 专用 GPIO

概述

专用 GPIO 专为 CPU 与 GPIO 矩阵和 IO MUX 交互而设计。任何配置为“专用”的 GPIO 都可以通过 CPU 指令直接访问，从而轻松提高 GPIO 翻转速度，方便用户以 bit-banging 的方式模拟串行/并行接口。通过 CPU 指令的方式控制 GPIO 的软件开销非常小，因此能够胜任一些特殊场合，比如通过示波器观测“GPIO 翻转信号”来间接测量某些性能指标。

创建/销毁 GPIO 捆绑包

GPIO 捆绑包是一组 GPIO，该组 GPIO 可以在一个 CPU 周期内同时操作。一个包能够包含 GPIO 的最大数量受每个 CPU 的限制。另外，GPIO 捆绑包与派生它的 CPU 有很强的相关性。**注意，任何对 GPIO 捆绑包操作的任务都必须运行在 GPIO 捆绑包所属的 CPU 内核。**同理，只有那些安装在同一个 CPU 内核上的 ISR 才允许对该 GPIO 捆绑包进行操作。

备注：专用 GPIO 更像是 CPU 外设，因此与 CPU 内核关系密切。强烈建议在 pin-to-core 任务中安装和操作 GPIO 捆绑包。例如，如果 GPIOA 连接到了 CPU0，而专用的 GPIO 指令却是从 CPU1 发出的，那么就无法控制 GPIOA。

安装 GPIO 捆绑包需要调用 `dedic_gpio_new_bundle()` 来分配软件资源并将专用通道连接到用户选择的 GPIO。GPIO 捆绑包的配置在 `dedic_gpio_bundle_config_t` 结构体中：

- `gpio_array`: 包含 GPIO 编号的数组。
- `array_size`: `gpio_array` 的元素个数。
- `flags`: 用于控制 GPIO 捆绑包行为的标志。
 - `in_en` 和 `out_en` 用于选择是否开启输入输出功能（这两个功能可以同时开启）。
 - `in_invert` 和 `out_invert` 用于选择是否反转 GPIO 信号。

以下代码展示了如何安装只有输出功能的 GPIO 捆绑包：

```

// 配置 GPIO
const int bundleA_gpios[] = {0, 1};
gpio_config_t io_conf = {
    .mode = GPIO_MODE_OUTPUT,
};
for (int i = 0; i < sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]); i++) {
    io_conf.pin_bit_mask = 1ULL << bundleA_gpios[i];
    gpio_config(&io_conf);
}
// 创建 bundleA, 仅输出
dedic_gpio_bundle_handle_t bundleA = NULL;
dedic_gpio_bundle_config_t bundleA_config = {
    .gpio_array = bundleA_gpios,
    .array_size = sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]),
    .flags = {
        .out_en = 1,
    },
};
ESP_ERROR_CHECK(dedic_gpio_new_bundle(&bundleA_config, &bundleA));

```

如需卸载 GPIO 捆绑包，可调用 `dedic_gpio_del_bundle()`。

备注： `dedic_gpio_new_bundle()` 不包含任何 GPIO pad 配置（例如上拉/下拉、驱动能力、输出/输入使能）。因此，在安装专用 GPIO 捆绑包之前，必须使用 GPIO 驱动程序 API（如 `gpio_config()`）单独配置 GPIO。更多关于 GPIO 驱动的信息，请参考 [GPIO API 参考](#)。

GPIO 捆绑包操作

操作	函数
以掩码的方式指定 GPIO 捆绑包的输出	<code>dedic_gpio_bundle_write()</code>
读取 GPIO 捆绑包实际输出的电平值	<code>dedic_gpio_bundle_read_out()</code>
读取 GPIO 捆绑包中输入的电平值	<code>dedic_gpio_bundle_read_in()</code>

备注： 由于函数调用的开销和内部涉及的位操作，使用上述函数可能无法获得较高的 GPIO 翻转速度。用户可以尝试通过编写汇编代码操作 GPIO 来减少开销，但应自行注意线程安全。

通过编写汇编代码操作 GPIO

高阶用户可以通过编写汇编代码或调用 CPU 低层 API 来操作 GPIO。常见步骤为：

1. 分配一个 GPIO 捆绑包：`dedic_gpio_new_bundle()`
2. 查询该包占用的掩码：`dedic_gpio_get_out_mask()` 和/或 `dedic_gpio_get_in_mask()`
3. 调用 CPU LL apis（如 `cpu_ll_write_dedic_gpio_mask`）或使用该掩码编写汇编代码
4. 切换 IO 的最快捷方式是使用专用的“设置/清除”指令：

有关支持的专用 GPIO 指令的详细信息，请参考 [ESP32-P4 技术参考手册 > ESP-RISC-V CPU \[PDF\]](#)。

一些专用的 CPU 指令也包含在 `hal/dedic_gpio_cpu_ll.h` 中，作为辅助内联函数。

备注： 由于自定义指令在不同目标上可能会有不同的格式，在应用程序中编写汇编代码可能会让代码难以在不同的芯片架构之间移植。

应用示例

- 通过汇编代码使用专用的 CPU 指令来操作 GPIO 以模拟 UART/I2C/SPI 协议 (Bit Banging) [peripherals/dedicated_gpio](#).

API 参考

Header File

- [components/esp_driver_gpio/include/driver/dedic_gpio.h](#)
- This header file can be included with:

```
#include "driver/dedic_gpio.h"
```

- This header file is a part of the API provided by the `esp_driver_gpio` component. To declare that your component depends on `esp_driver_gpio`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_gpio
```

or

```
PRIV_REQUIRES esp_driver_gpio
```

Functions

`esp_err_t dedic_gpio_get_out_mask` (`dedic_gpio_bundle_handle_t` bundle, `uint32_t *mask`)

Get allocated channel mask.

备注: Each bundle should have at least one mask (in or/and out), based on bundle configuration.

备注: With the returned mask, user can directly invoke LL function like "dedic_gpio_cpu_ll_write_mask" or write assembly code with dedicated GPIO instructions, to get better performance on GPIO manipulation.

参数

- **bundle** -- **[in]** Handle of GPIO bundle that returned from "dedic_gpio_new_bundle"
- **mask** -- **[out]** Returned mask value for on specific direction (in or out)

返回

- ESP_OK: Get channel mask successfully
- ESP_ERR_INVALID_ARG: Get channel mask failed because of invalid argument
- ESP_FAIL: Get channel mask failed because of other error

`esp_err_t dedic_gpio_get_in_mask` (`dedic_gpio_bundle_handle_t` bundle, `uint32_t *mask`)

`esp_err_t dedic_gpio_get_out_offset` (`dedic_gpio_bundle_handle_t` bundle, `uint32_t *offset`)

Get the channel offset of the GPIO bundle.

A GPIO bundle maps the GPIOs of a particular direction to a consecutive set of channels within a particular GPIO bank of a particular CPU. This function returns the offset to the bundle's first channel of a particular direction within the bank.

参数

- **bundle** -- **[in]** Handle of GPIO bundle that returned from "dedic_gpio_new_bundle"
- **offset** -- **[out]** Offset value to the first channel of a specific direction (in or out)

返回

- ESP_OK: Get channel offset successfully
- ESP_ERR_INVALID_ARG: Get channel offset failed because of invalid argument

- ESP_FAIL: Get channel offset failed because of other error

esp_err_t **dedic_gpio_get_in_offset** (*dedic_gpio_bundle_handle_t* bundle, uint32_t *offset)

esp_err_t **dedic_gpio_new_bundle** (const *dedic_gpio_bundle_config_t* *config, *dedic_gpio_bundle_handle_t* *ret_bundle)

Create GPIO bundle and return the handle.

备注: One has to enable at least input or output mode in "config" parameter.

参数

- **config** -- [in] Configuration of GPIO bundle
- **ret_bundle** -- [out] Returned handle of the new created GPIO bundle

返回

- ESP_OK: Create GPIO bundle successfully
- ESP_ERR_INVALID_ARG: Create GPIO bundle failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPIO bundle failed because of no capable memory
- ESP_ERR_NOT_FOUND: Create GPIO bundle failed because of no enough continuous dedicated channels
- ESP_FAIL: Create GPIO bundle failed because of other error

esp_err_t **dedic_gpio_del_bundle** (*dedic_gpio_bundle_handle_t* bundle)

Destroy GPIO bundle.

参数 **bundle** -- [in] Handle of GPIO bundle that returned from "dedic_gpio_new_bundle"

返回

- ESP_OK: Destroy GPIO bundle successfully
- ESP_ERR_INVALID_ARG: Destroy GPIO bundle failed because of invalid argument
- ESP_FAIL: Destroy GPIO bundle failed because of other error

void **dedic_gpio_bundle_write** (*dedic_gpio_bundle_handle_t* bundle, uint32_t mask, uint32_t value)

Write value to GPIO bundle.

备注: The mask is seen from the view of GPIO bundle. For example, bundleA contains [GPIO10, GPIO12, GPIO17], to set GPIO17 individually, the mask should be 0x04.

备注: For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

参数

- **bundle** -- [in] Handle of GPIO bundle that returned from "dedic_gpio_new_bundle"
- **mask** -- [in] Mask of the GPIOs to be written in the given bundle
- **value** -- [in] Value to write to given GPIO bundle, low bit represents low member in the bundle

uint32_t **dedic_gpio_bundle_read_out** (*dedic_gpio_bundle_handle_t* bundle)

Read the value that output from the given GPIO bundle.

备注: For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

参数 **bundle** -- [in] Handle of GPIO bundle that returned from "dedic_gpio_new_bundle"

返回 Value that output from the GPIO bundle, low bit represents low member in the bundle

uint32_t **dedic_gpio_bundle_read_in** (*dedic_gpio_bundle_handle_t* bundle)

Read the value that input to the given GPIO bundle.

备注: For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

参数 **bundle** -- [in] Handle of GPIO bundle that returned from "dedic_gpio_new_bundle"
返回 Value that input to the GPIO bundle, low bit represents low member in the bundle

Structures

struct **dedic_gpio_bundle_config_t**

Type of Dedicated GPIO bundle configuration.

Public Members

const int ***gpio_array**

Array of GPIO numbers, gpio_array[0] ~ gpio_array[size-1] <=> low_dedic_channel_num ~ high_dedic_channel_num

size_t **array_size**

Number of GPIOs in gpio_array

unsigned int **in_en**

Enable input

unsigned int **in_invert**

Invert input signal

unsigned int **out_en**

Enable output

unsigned int **out_invert**

Invert output signal

struct *dedic_gpio_bundle_config_t*::[anonymous] **flags**

Flags to control specific behaviour of GPIO bundle

Type Definitions

typedef struct *dedic_gpio_bundle_t* ***dedic_gpio_bundle_handle_t**

Type of Dedicated GPIO bundle.

2.5.10 哈希消息认证码 (HMAC)

哈希消息认证码 (HMAC) 是一种安全的身份认证技术，支持使用预共享的密钥验证消息的真实性和完整性。利用烧录在 eFuse 块中的密钥，HMAC 可以为生成 SHA256-HMAC 提供硬件加速。

更多有关应用操作流程，及 HMAC 计算过程的详细信息，请参阅 [ESP32-P4 技术参考手册 > HMAC 加速器 \(HMAC\) \[PDF\]](#)。

通用应用方案

现有 A、B 双方，他们都需要验证对方发送消息的真实性和完整性。那么在开始发送消息前，双方应通过安全通道交换密钥。

要验证来自 A 的信息，B 可遵循以下步骤：

- A 计算要发送的消息的 HMAC。
- A 将消息及消息的 HMAC 一并发送给 B。
- B 自行计算所接收消息的 HMAC。
- B 检查接收到的 HMAC 是否与计算得出的 HMAC 匹配。

若两个 HMAC 匹配，消息为真。

但 HMAC 本身还可以应用于更多场景，如支持 HMAC 的挑战-应答协议，或作为更多安全模块（详见下文）的密钥输入等。

ESP32-P4 上的 HMAC

在 ESP32-P4 HMAC 模块的 eFuse 中会烧录一个密钥，可将该 eFuse 密钥设置为禁止所有外部资源访问，避免密钥泄露。

此外，在 ESP32-P4 上的 HMAC 有以下三种应用场景：

1. HMAC 支持软件使用
2. HMAC 用作数字签名 (DS) 的密钥
3. HMAC 用于启用软禁用的 JTAG 接口

第一种应用场景称为 **上行模式**，后两种应用场景称为 **下行模式**。

HMAC 的 eFuse 密钥 在 ESP32-P4 中，有六个物理 eFuse 块可用作 HMAC 的密钥，分别是块 4 到块 9。在 API 中，枚举类型 `hmac_key_id_t` 将这些块映射为 `HMAC_KEY0 ~ HMAC_KEY5`。

每个密钥都有相应的 eFuse 参数 **密钥功能 (key purpose)**，决定密钥应用于 HMAC 的哪种应用场景。

密钥功能	应用场景
8	HMAC 支持软件使用
7	HMAC 用作数字签名 (DS) 的密钥
6	HMAC 启用软禁用的 JTAG 接口
5	HMAC 既用作数字签名 (DS) 的密钥，又用于启用 JTAG 接口

这样一来，可以确保密钥用于原定场景。

要计算 HMAC，软件必须同时提供包含密钥的密钥块 ID，以及 **密钥功能**（详情请参阅 [ESP32-P4 技术参考手册 > eFuse 控制器 \(eFuse\) \[PDF\]](#)）。

在进行 HMAC 密钥计算前，HMAC 会验证软件所提供密钥块的功能。在软件所提供 ID 的对应密钥块中，eFuse 存储了密钥块的功能。只有当软件所提供密钥块的功能与 eFuse 中存储的密钥块功能匹配，才会继续进行计算。

HMAC 支持软件使用 密钥功能值：8

在此情况下，HMAC 支持软件使用，如验证消息真实性等。

API `esp_hmac_calculate()` 用于计算 HMAC。输入参数包括消息、消息长度以及包含密钥的 eFuse 密钥块 ID，且该密钥块的 eFuse 密钥功能设置为上行模式。

HMAC 用作数字签名 (DS) 的密钥 密钥功能值：7、5

HMAC 可用作密钥派生函数，解码数字签名模块使用的私钥参数。在此情况下，硬件使用标准信息进行处理。在 HMAC 部分只需提供 eFuse 密钥块和功能；而在数字签名模块则还需要一些额外参数。

无论是密钥还是实际的 HMAC，都不会暴露在 HMAC 和数字签名模块之外。对 HMAC 的计算，以及将其传递给数字签名模块的过程，均在内部进行。

详情请参阅 [ESP32-P4 技术参考手册 > 数字签名 \(DS\) \[PDF\]](#)。

HMAC 启用 JTAG 接口 密钥功能值：6、5

HMAC 的第三种应用场景是将其作为密钥，启用软禁用的 JTAG 接口。

重新启用 JTAG 接口的步骤如下：

第一步：设置

1. 生成一个 256 位的 HMAC 密钥，用于重新启用 JTAG。
2. 将步骤 1 获得的密钥写入 eFuse 块，且 eFuse 块的密钥功能参数应为 HMAC_DOWN_ALL (5) 或 HMAC_DOWN_JTAG (6)。为此，可以使用固件中的 `esp_efuse_write_key()` 函数，或使用主机上的 `espefuse.py` 完成操作。
3. 使用 `esp_efuse_set_read_protect()` 将 eFuse 密钥块配置为读保护，防止软件读取写入到 eFuse 密钥块中的 HMAC 密钥值。
4. 在烧录到 ESP32-P4 上时，将特定的位或位组设置为 `soft JTAG disable`。这样可以永久禁用 JTAG 接口，除非软件提供正确的密钥值进行验证。

备注： API `esp_efuse_write_field_cnt(ESP_EFUSE_SOFT_DIS_JTAG, ESP_EFUSE_SOFT_DIS_JTAG[0]->bit_count)` 支持在 ESP32-P4 上烧录 `soft JTAG disable` 位。

备注： 置位 `DIS_PAD_JTAG` eFuse 时，JTAG 处于永久禁用状态，`SOFT_DIS_JTAG` 功能将失效。

启用 JTAG

1. 以 eFuse 中的密钥和 32 个 0x00 字节为输入，经过 HMAC-SHA256 函数处理，得到的函数输出结果即重新启用 JTAG 的密钥。
2. 从固件调用 `esp_hmac_jtag_enable()` 函数时，传递上一步获取的密钥值。
3. 要在固件中重新禁用 JTAG，可以重置系统，或调用 `esp_hmac_jtag_disable()`。

关于如何暂时禁用以及重新启用 JTAG 的完整示例，请参考 [security/hmac_soft_jtag](#)。

更多有关详情，请参阅 [ESP32-P4 技术参考手册 > HMAC 加速器 \(HMAC\) \[PDF\]](#)。

应用示例

以下为针对特定应用场景的实例代码，可用于设置 eFuse 密钥，并将其用于计算支持软件使用的 HMAC。

`esp_efuse_write_key` 可以设置 eFuse 中的物理密钥块 4，并设置其功能。`ESP_EFUSE_KEY_PURPOSE_HMAC_UP` (8) 表明，该密钥仅适用于生成支持软件使用的 HMAC。

```
#include "esp_efuse.h"

const uint8_t key_data[32] = { ... };

esp_err_t status = esp_efuse_write_key(EFUSE_BLK_KEY4,
    ESP_EFUSE_KEY_PURPOSE_HMAC_UP,
    key_data, sizeof(key_data));

if (status == ESP_OK) {
```

(下页继续)

```

    // 密钥写入成功
} else {
    // 密钥写入失败, 可能已写入过
}

```

接下来可以使用已存储的密钥来计算 HMAC, 供软件使用。

```

#include "esp_hmac.h"

uint8_t hmac[32];

const char *message = "Hello, HMAC!";
const size_t msg_len = 12;

esp_err_t result = esp_hmac_calculate(HMAC_KEY4, message, msg_len, hmac);

if (result == ESP_OK) {
    // HMAC 已写入 hmac 数组
} else {
    // 计算 HMAC 失败
}

```

API 参考

Header File

- [components/esp_hw_support/include/esp_hmac.h](#)
- This header file can be included with:

```
#include "esp_hmac.h"
```

Functions

esp_err_t esp_hmac_calculate (*hmac_key_id_t* key_id, const void *message, size_t message_len, uint8_t *hmac)

Calculate the HMAC of a given message.

Calculate the HMAC *hmac* of a given message *message* with length *message_len*. SHA256 is used for the calculation.

备注: Uses the HMAC peripheral in "upstream" mode.

参数

- **key_id** -- Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to the HMAC upstream purpose value.
- **message** -- the message for which to calculate the HMAC
- **message_len** -- message length return ESP_ERR_INVALID_STATE if unsuccessful
- **hmac** -- [out] the hmac result; the buffer behind the provided pointer must be a writeable buffer of 32 bytes

返回

- ESP_OK, if the calculation was successful,
- ESP_ERR_INVALID_ARG if message or hmac is a nullptr or if key_id out of range
- ESP_FAIL, if the hmac calculation failed

esp_err_t **esp_hmac_jtag_enable** (*hmac_key_id_t* key_id, const uint8_t *token)

Use HMAC peripheral in Downstream mode to re-enable the JTAG, if it is not permanently disabled by HW. In downstream mode, HMAC calculations performed by peripheral are used internally and not provided back to user.

备注: Return value of the API does not indicate the JTAG status.

参数

- **key_id** -- Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to HMAC downstream purpose.
- **token** -- Pre calculated HMAC value of the 32-byte 0x00 using SHA-256 and the known private HMAC key. The key is already programmed to a eFuse key block. The key block number is provided as the first parameter to this function.

返回

- ESP_OK, if the key_purpose of the key_id matches to HMAC downstream mode, The API returns success even if calculated HMAC does not match with the provided token. However, The JTAG will be re-enabled only if the calculated HMAC value matches with provided token, otherwise JTAG will remain disabled.
- ESP_FAIL, if the key_purpose of the key_id is not set to HMAC downstream purpose or JTAG is permanently disabled by EFUSE_HARD_DIS_JTAG eFuse parameter.
- ESP_ERR_INVALID_ARG, invalid input arguments

esp_err_t **esp_hmac_jtag_disable** (void)

Disable the JTAG which might be enabled using the HMAC downstream mode. This function just clears the result generated by calling esp_hmac_jtag_enable() API.

返回

- ESP_OK return ESP_OK after writing the HMAC_SET_INVALIDATE_JTAG_REG with value 1.

Enumerations

enum **hmac_key_id_t**

The possible efuse keys for the HMAC peripheral

Values:

enumerator **HMAC_KEY0**

enumerator **HMAC_KEY2**

enumerator **HMAC_KEY3**

enumerator **HMAC_KEY4**

enumerator **HMAC_KEY5**

enumerator **HMAC_KEY_MAX**

2.5.11 数字签名 (DS)

数字签名 (DS) 模块利用 RSA 硬件加速器为信息签名。HMAC 作为密钥派生函数，使用 eFuse 作为输入密钥，输出一组加密参数。随后，数字签名模块利用这组预加密的参数，计算出签名。以上过程均在硬件中完成，因此在计算签名时，软件无法获取 RSA 参数的解密密钥，也无法获取 HMAC 密钥派生函数的输入密钥。

签名计算所涉及的硬件信息以及所用寄存器的有关信息，请参阅 [ESP32-P4 技术参考手册 > 数字签名 \(DS\) \[PDF\]](#)。

私钥参数

RSA 签名的私钥参数存储在 flash 中。为防止发生未经授权的访问，这些参数都进行了 AES 加密。此时，HMAC 模块被作为密钥派生函数，用于计算 AES 加密了的私钥参数。同时，HMAC 模块本身使用的来自 eFuse 密钥块的密钥也具有读取保护，可以防止发生未经授权的访问。

调用签名计算时，软件只需指定使用的 eFuse 密钥、相应的 eFuse 密钥用途、加密的 RSA 参数位置以及待签名的数据或信息。

密钥生成

在使用 DS 外设前，需首先创建并存储 HMAC 密钥和 RSA 私钥，此步骤可在 ESP32-P4 上通过软件完成，也可在主机上进行。在 ESP-IDF 中，可以使用 `esp_efuse_write_block()` 设置 HMAC 密钥，并使用 `esp_hmac_calculate()` 对 RSA 私钥参数进行加密。

计算并组装私钥参数的详细信息，请参阅 [ESP32-P4 技术参考手册 > 数字签名 \(DS\) \[PDF\]](#)。

在 ESP-IDF 中进行数字签名计算

在 ESP-IDF 中进行数字签名计算的工作流程，以及所用寄存器的有关信息，请参阅 [ESP32-P4 技术参考手册 > 数字签名 \(DS\) \[PDF\]](#)。

要进行数字签名计算，需要准备以下三个参数：

1. 用作 HMAC 密钥的 eFuse 密钥块 ID
2. 加密私钥参数的位置
3. 待签名的数据或信息

由于签名计算需要一些时间，ESP-IDF 提供了两种可用的 API。第一种是 `esp_ds_sign()`，调用此 API 后，程序会在计算完成前保持阻塞状态。如果在计算过程中，软件需要执行其他操作，则可以调用 `esp_ds_start_sign()`，用另一种方式启动签名计算，然后周期性地调用 `esp_ds_is_busy()`，检查计算是否已完成。一旦计算完成，即可调用 `esp_ds_finish_sign()` 来获取签名结果。

API `esp_ds_sign()` 和 `esp_ds_start_sign()` 会借助 DS 外设计算明文 RSA 签名。RSA 签名需要转换成合适的格式，以供进一步使用。例如，MbedTLS SSL 栈支持 PKCS#1 格式，使用 API `esp_ds_rsa_sign()` 可以直接获得 PKCS#1 v1.5 格式的签名，该 API 内部调用了 `esp_ds_start_sign()` 函数，并将签名转换成 PKCS#1 v1.5 格式。

备注：此处只是最基本的 DS 构造块，其消息必须是固定长度。为在任意消息上创建签名，通常会将实际消息的哈希值作为输入，并将其填充到所需长度。乐鑫计划在未来提供一个 API 来实现这个功能。

TLS 连接所需的 DS 外设配置

在 ESP32-P4 芯片上使用 TLS 连接之前，必须先配置 DS 外设，具体步骤如下：

- 1) 随机生成一个 256 位的值，作为初始化向量 (IV)。

- 2) 随机生成一个 256 位的值，作为 HMAC_KEY。
- 3) 使用客户端私钥 (RAS) 和上述步骤生成的参数，计算加密的私钥参数。
- 4) 将 256 位的 HMAC_KEY 烧录到 eFuse 中，只支持 DS 外设读取。

更多细节，请参阅 [ESP32-P4 技术参考手册 > 数字签名 \(DS\) \[PDF\]](#)。

如果要以开发为目的配置 DS 外设，可以使用 [esp-secure-cert-tool](#)。

配置完 DS 外设后获取的加密私钥参数需要保存在 flash 中并传递给 DS 外设，DS 外设将使用这些参数完成数字签名。随后，应用程序需要从 flash 中读取 DS 数据，这可以通过 [esp_secure_cert_mgr](#) 组件提供的 API 完成。更多细节，请参阅 [component/README](#)。

在 `esp_tls` 仓库内部，*ESP-TLS* 负责完成初始化 DS 外设、执行数字签名的过程。更多细节，请参阅 [ESP-TLS 的数字签名](#)。

如 *ESP-TLS* 文档所述，应用程序只需将加密私钥参数作为 `ds_data` 传递给 `esp_tls` 上下文，`esp_tls` 仓库内部就会执行所有必要操作，以初始化 DS 外设，并执行数字签名。

使用 DS 外设进行 SSL 双向认证

示例 [protocols/mqtt/ssl_ds](#) 展示了如何使用 DS 外设进行 SSL 双向认证。在示例中，使用了 `mqtt_client`（通过 *ESP-MQTT* 实现），通过 SSL 传输连接到代理服务器 `test.mosquitto.org`，并进行 SSL 双向认证。SSL 部分在内部使用 *ESP-TLS* 完成。更多细节，请参阅 [protocols/mqtt/ssl_ds/README.md](#)。

- This header file can be included with:

```
#include "esp_ds.h"
```

Functions

`esp_err_t esp_ds_sign` (const void *message, const `esp_ds_data_t` *data, `hmac_key_id_t` key_id, void *signature)

Sign the message with a hardware key from specific key slot. The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows: $Z = XY \text{ mod } M$ where, Z is the signature, X is the input message, Y and M are the RSA private key parameters.

This function is a wrapper around `esp_ds_finish_sign()` and `esp_ds_start_sign()`, so do not use them in parallel. It blocks until the signing is finished and then returns the signature.

备注: Please see note section of `esp_ds_start_sign()` for more details about the input parameters.

参数

- **message** -- the message to be signed; its length should be $(data->rsa_length + 1) * 4$ bytes, and those bytes must be in little endian format. It is your responsibility to apply your hash function and padding before calling this function, if required. (e.g. `message = padding(hash(inputMsg))`)
- **data** -- the encrypted signing key data (AES encrypted RSA key + IV)
- **key_id** -- the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **signature** -- the destination of the signature, should be $(data->rsa_length + 1) * 4$ bytes long

返回

- ESP_OK if successful, the signature was written to the parameter `signature`.

- `ESP_ERR_INVALID_ARG` if one of the parameters is `NULL` or `data->rsa_length` is too long or 0
- `ESP_ERR_HW_CRYPTODS_HMAC_FAIL` if there was an HMAC failure during retrieval of the decryption key
- `ESP_ERR_NO_MEM` if there hasn't been enough memory to allocate the context object
- `ESP_ERR_HW_CRYPTODS_INVALID_KEY` if there's a problem with passing the HMAC key to the DS component
- `ESP_ERR_HW_CRYPTODS_INVALID_DIGEST` if the message digest didn't match; the signature is invalid.
- `ESP_ERR_HW_CRYPTODS_INVALID_PADDING` if the message padding is incorrect, the signature can be read though since the message digest matches.

`esp_err_t esp_ds_start_sign` (const void *message, const `esp_ds_data_t` *data, `hmac_key_id_t` key_id, `esp_ds_context_t` **esp_ds_ctx)

Start the signing process.

This function yields a context object which needs to be passed to `esp_ds_finish_sign()` to finish the signing process. The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows: $Z = XY \text{ mod } M$ where, Z is the signature, X is the input message, Y and M are the RSA private key parameters.

备注: This function locks the HMAC, SHA, AES and RSA components, so the user has to ensure to call `esp_ds_finish_sign()` in a timely manner. The numbers Y , M , R_b which are a part of `esp_ds_data_t` should be provided in little endian format and should be of length equal to the RSA private key bit length. The message length in bits should also be equal to the RSA private key bit length. No padding is applied to the message automatically, Please ensure the message is appropriate padded before calling the API.

参数

- **message** -- the message to be signed; its length should be $(\text{data->rsa_length} + 1) * 4$ bytes, and those bytes must be in little endian format. It is your responsibility to apply your hash function and padding before calling this function, if required. (e.g. `message = padding(hash(inputMsg))`)
- **data** -- the encrypted signing key data (AES encrypted RSA key + IV)
- **key_id** -- the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **esp_ds_ctx** -- the context object which is needed for finishing the signing process later

返回

- `ESP_OK` if successful, the ds operation was started now and has to be finished with `esp_ds_finish_sign()`
- `ESP_ERR_INVALID_ARG` if one of the parameters is `NULL` or `data->rsa_length` is too long or 0
- `ESP_ERR_HW_CRYPTODS_HMAC_FAIL` if there was an HMAC failure during retrieval of the decryption key
- `ESP_ERR_NO_MEM` if there hasn't been enough memory to allocate the context object
- `ESP_ERR_HW_CRYPTODS_INVALID_KEY` if there's a problem with passing the HMAC key to the DS component

bool `esp_ds_is_busy` (void)

Return true if the DS peripheral is busy, otherwise false.

备注: Only valid if `esp_ds_start_sign()` was called before.

`esp_err_t esp_ds_finish_sign` (void *signature, `esp_ds_context_t` *esp_ds_ctx)

Finish the signing process.

参数

- **signature** -- the destination of the signature, should be $(data \rightarrow rsa_length + 1) * 4$ bytes long, the resultant signature bytes shall be written in little endian format.
- **esp_ds_ctx** -- the context object retrieved by `esp_ds_start_sign()`

返回

- ESP_OK if successful, the ds operation has been finished and the result is written to signature.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL
- ESP_ERR_HW_CRYPTODS_INVALID_DIGEST if the message digest didn't match; the signature is invalid. This means that the encrypted RSA key parameters are invalid, indicating that they may have been tampered with or indicating a flash error, etc.
- ESP_ERR_HW_CRYPTODS_INVALID_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches (see TRM for more details).

`esp_err_t esp_ds_encrypt_params(esp_ds_data_t *data, const void *iv, const esp_ds_p_data_t *p_data, const void *key)`

Encrypt the private key parameters.

The encryption is a prerequisite step before any signature operation can be done. It is not strictly necessary to use this encryption function, the encryption could also happen on an external device.

备注: The numbers Y, M, Rb which are a part of `esp_ds_data_t` should be provided in little endian format and should be of length equal to the RSA private key bit length. The message length in bits should also be equal to the RSA private key bit length. No padding is applied to the message automatically, Please ensure the message is appropriate padded before calling the API.

参数

- **data** -- Output buffer to store encrypted data, suitable for later use generating signatures.
- **iv** -- Pointer to 16 byte IV buffer, will be copied into 'data'. Should be randomly generated bytes each time.
- **p_data** -- Pointer to input plaintext key data. The expectation is this data will be deleted after this process is done and 'data' is stored.
- **key** -- Pointer to 32 bytes of key data. Type determined by `key_type` parameter. The expectation is the corresponding HMAC key will be stored to efuse and then permanently erased.

返回

- ESP_OK if successful, the ds operation has been finished and the result is written to signature.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or `p_data->rsa_length` is too long

Structures

struct **esp_digital_signature_data**

Encrypted private key data. Recommended to store in flash in this format.

备注: This struct has to match to one from the ROM code! This documentation is mostly taken from there.

Public Members

`esp_digital_signature_length_t rsa_length`

RSA LENGTH register parameters (number of words in RSA key & operands, minus one).

This value must match the length field encrypted and stored in 'c', or invalid results will be returned. (The DS peripheral will always use the value in 'c', not this value, so an attacker can't alter the DS peripheral results this way, it will just truncate or extend the message and the resulting signature in software.)

备注: In IDF, the enum type length is the same as of type unsigned, so they can be used interchangeably. See the ROM code for the original declaration of struct `ets_ds_data_t`.

uint32_t **iv**[ESP_DS_IV_BIT_LEN / 32]

IV value used to encrypt 'c'

uint8_t **c**[ESP_DS_C_LEN]

Encrypted Digital Signature parameters. Result of AES-CBC encryption of plaintext values. Includes an encrypted message digest.

struct **esp_ds_p_data_t**

Plaintext parameters used by Digital Signature.

This is only used for encrypting the RSA parameters by calling `esp_ds_encrypt_params()`. Afterwards, the result can be stored in flash or in other persistent memory. The encryption is a prerequisite step before any signature operation can be done.

备注: Y, M, Rb, & M_Prime must all be in little endian format.

Public Members

uint32_t **Y**[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]

RSA exponent.

uint32_t **M**[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]

RSA modulus.

uint32_t **Rb**[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]

RSA r inverse operand.

uint32_t **M_prime**

RSA M prime operand.

uint32_t **length**

RSA length in words (32 bit)

Macros

ESP_DS_IV_BIT_LEN

ESP_DS_IV_LEN

ESP_DS_SIGNATURE_MAX_BIT_LEN

`ESP_DS_SIGNATURE_MD_BIT_LEN`

`ESP_DS_SIGNATURE_M_PRIME_BIT_LEN`

`ESP_DS_SIGNATURE_L_BIT_LEN`

`ESP_DS_SIGNATURE_PADDING_BIT_LEN`

`ESP_DS_C_LEN`

Type Definitions

typedef struct esp_ds_context **esp_ds_context_t**

typedef struct *esp_digital_signature_data* **esp_ds_data_t**

Encrypted private key data. Recommended to store in flash in this format.

备注: This struct has to match to one from the ROM code! This documentation is mostly taken from there.

Enumerations

enum **esp_digital_signature_length_t**

Values:

enumerator **ESP_DS_RSA_1024**

enumerator **ESP_DS_RSA_2048**

enumerator **ESP_DS_RSA_3072**

enumerator **ESP_DS_RSA_4096**

2.5.12 Inter-Integrated Circuit (I2C)

Introduction

I2C is a serial, synchronous, multi-device, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. I2C uses two bidirectional open-drain lines: serial data line (SDA) and serial clock line (SCL), pulled up by resistors.

ESP32-P4 has 2 I2C controller (also called port), responsible for handling communication on the I2C bus. A single I2C controller can be a master or a slave.

Additionally, the ESP32-P4 chip has 1 low-power (LP) I2C controller. It is the cut-down version of regular I2C. Usually, the LP I2C controller only support basic I2C functionality with a much smaller RAM size, and does not support slave mode. For a full list of difference between HP I2C and LP I2C, please refer to the *ESP32-P4 Technical Reference Manual > I2C Controller (I2C) > Features* [PDF].

You can use LP I2C peripheral when HP I2C is not sufficient for users' usage. But please note again the LP I2C does not support all HP I2C functions. Please read docs before you use it.

Typically, an I2C slave device has a 7-bit address or 10-bit address. ESP32-P4 supports both I2C Standard-mode (Sm) and Fast-mode (Fm) which can go up to 100KHz and 400KHz respectively.

警告: The clock frequency of SCL in master mode should not be larger than 400 KHz

备注: The frequency of SCL is influenced by both the pull-up resistor and the wire capacitance. Therefore, users are strongly recommended to choose appropriate pull-up resistors to make the frequency accurate. The recommended value for pull-up resistors usually ranges from 1K Ohms to 10K Ohms.

Keep in mind that the higher the frequency, the smaller the pull-up resistor should be (but not less than 1 KOhms). Indeed, large resistors will decline the current, which will increase the clock switching time and reduce the frequency. We usually recommend a range of 2 KOhms to 5 KOhms, but users may also need to make some adjustments depending on their current draw requirements.

I2C Clock Configuration

- `i2c_clock_source_t::I2C_CLK_SRC_DEFAULT`: Default I2C source clock.
- `i2c_clock_source_t::I2C_CLK_SRC_XTAL`: External crystal for I2C clock source.
- `i2c_clock_source_t::I2C_CLK_RC_FAST`: Internal 20MHz rc oscillator for I2C clock source.

I2C File Structure

图 5: I2C file structure

Public headers that need to be included in the I2C application

- `i2c.h`: The header file of legacy I2C APIs (for apps using legacy driver).

- `i2c_master.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with master mode).
- `i2c_slave.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with slave mode).

备注: The legacy driver can't coexist with the new driver. Include `i2c.h` to use the legacy driver or the other two headers to use the new driver. Please keep in mind that the legacy driver is now deprecated and will be removed in future.

Public headers that have been included in the headers above

- `i2c_types_legacy.h`: The legacy public types that only used in the legacy driver.
- `i2c_types.h`: The header file that provides public types.

Functional Overview

The I2C driver offers following services:

- *Resource Allocation* - covers how to allocate I2C bus with properly set of configurations. It also covers how to recycle the resources when they finished working.
- *I2C Master Controller* - covers behavior of I2C master controller. Introduce data transmit, data receive, and data transmit and receive.
- *I2C Slave Controller* - covers behavior of I2C slave controller. Involve data transmit and data receive.
- *Power Management* - describes how different source clock will affect power consumption.
- *IRAM Safe* - describes tips on how to make the I2C interrupt work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can bring different effects to the driver.

Resource Allocation Both I2C master bus and I2C slave bus, when supported, are represented by `i2c_bus_handle_t` in the driver. The available ports are managed in a resource pool that allocates a free port on request.

Install I2C master bus and device The I2C master is designed based on bus-device model. So `i2c_master_bus_config_t` and `i2c_device_config_t` are required separately to allocate the I2C master bus instance and I2C device instance.

I2C master bus requires the configuration that specified by `i2c_master_bus_config_t`:

- `i2c_master_bus_config_t::i2c_port` sets the I2C port used by the controller.
- `i2c_master_bus_config_t::sda_io_num` sets the GPIO number for the serial data bus (SDA).
- `i2c_master_bus_config_t::scl_io_num` sets the GPIO number for the serial clock bus (SCL).
- `i2c_master_bus_config_t::clk_source` selects the source clock for I2C bus. The available clocks are listed in `i2c_clock_source_t`. For the effect on power consumption of different clock source, please refer to *Power Management* section.
- `i2c_master_bus_config_t::glitch_ignore_cnt` sets the glitch period of master bus, if the glitch period on the line is less than this value, it can be filtered out, typically value is 7.
- `i2c_master_bus_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use a interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the priority indicated by `i2c_master_bus_config_t::intr_priority`. Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)).
- `i2c_master_bus_config_t::trans_queue_depth` Depth of internal transfer queue. Only valid in asynchronous transaction.
- `i2c_master_bus_config_t::enable_internal_pullup` Enable internal pullups. Note: This is not strong enough to pullup buses under high-speed frequency. A suitable external pullup is recommended.

If the configurations in `i2c_master_bus_config_t` is specified, users can call `i2c_new_master_bus()` to allocate and initialize an I2C master bus. This function will return an I2C bus handle if it runs correctly. Specifically, when there are no more I2C port available, this function will return `ESP_ERR_NOT_FOUND` error.

图 6: I2C master bus-device module

I2C master device requires the configuration that specified by `i2c_device_config_t`:

- `i2c_device_config_t::dev_addr_length` configure the address bit length of the slave device. User can choose from enumerator `I2C_ADDR_BIT_LEN_7` or `I2C_ADDR_BIT_LEN_10` (if supported).
- `i2c_device_config_t::device_address` I2C device raw address. Please parse the device address to this member directly. For example, the device address is 0x28, then parse 0x28 to `i2c_device_config_t::device_address`, don't carry a write/read bit.
- `i2c_device_config_t::scl_speed_hz` set the scl line frequency of this device.
- `i2c_device_config_t::scl_wait_us`. SCL await time (in us). Usually this value should not be very small because slave stretch will happen in pretty long time. (It's possible even stretch for 12ms). Set 0 means use default reg value.

Once the `i2c_device_config_t` structure is populated with mandatory parameters, users can call `i2c_master_bus_add_device()` to allocate an I2C device instance and mounted to the master bus then. This function will return an I2C device handle if it runs correctly. Specifically, when the I2C bus is not initialized properly, calling this function will result in a `ESP_ERR_INVALID_ARG` error.

```
#include "driver/i2c_master.h"

i2c_master_bus_config_t i2c_mst_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
    .flags.enable_internal_pullup = true,
};

i2c_master_bus_handle_t bus_handle;
ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};
```

(下页继续)

```
i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));
```

Install I2C master bus with LP I2C Peripheral Install I2C master bus with LP I2C peripheral is almost as same as how HP I2C peripheral is installed. However, there are still some difference user should take focus on including IOs, clock sources, i2c port number, etc. Following code will show you how to install I2C master bus with LP_I2C.

```
#include "driver/i2c_master.h"

i2c_master_bus_config_t i2c_mst_config = {
    .clk_source = LP_I2C_SCLK_DEFAULT, // clock source for LP i2c, might_
    ↪different from HP I2C
    .i2c_port = LP_I2C_NUM_0, // Assign to LP I2C port
    .scl_io_num = 7, // SCL IO number. Please refer to_
    ↪technical reference manual
    .sda_io_num = 6, // SDA IO number. Please refer to_
    ↪technical reference manual
    .glitch_ignore_cnt = 7,
    .flags.enable_internal_pullup = true,
};

i2c_master_bus_handle_t bus_handle;
ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));
```

Uninstall I2C master bus and device If a previously installed I2C bus or device is no longer needed, it's recommended to recycle the resource by calling `i2c_master_bus_rm_device()` or `i2c_del_master_bus()`, so that to release the underlying hardware.

Install I2C slave device I2C slave requires the configuration that specified by `i2c_slave_config_t`:

- `i2c_slave_config_t::i2c_port` sets the I2C port used by the controller.
- `i2c_slave_config_t::sda_io_num` sets the GPIO number for serial data bus (SDA).
- `i2c_slave_config_t::scl_io_num` sets the GPIO number for serial clock bus (SCL).
- `i2c_slave_config_t::clk_source` selects the source clock for I2C bus. The available clocks are listed in `i2c_clock_source_t`. For the effect on power consumption of different clock source, please refer to [Power Management](#) section.
- `i2c_slave_config_t::send_buf_depth` sets the sending buffer length.
- `i2c_slave_config_t::slave_addr` sets the slave address
- `i2c_master_bus_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use a interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the priority indicated by `i2c_master_bus_config_t::intr_priority` Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `i2c_del_master_bus()` is called.
- `i2c_slave_config_t::addr_bit_len` sets true if you need the slave to have a 10-bit address.
- `i2c_slave_config_t::access_ram_en` Set true to enable the non-fifo mode. Thus the I2C data fifo can be used as RAM, and double addressing will be synchronised opened.

- `i2c_slave_config_t::slave_unmatch_en` Set true to enable the slave unmatch interrupt. If master send command address cannot match the slave address, and unmatch interrupt will be triggered.

Once the `i2c_slave_config_t` structure is populated with mandatory parameters, users can call `i2c_new_slave_device()` to allocate and initialize an I2C master bus. This function will return an I2C bus handle if it runs correctly. Specifically, when there are no more I2C port available, this function will return `ESP_ERR_NOT_FOUND` error.

```
i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7,
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .send_buf_depth = 256,
    .scl_io_num = I2C_SLAVE_SCL_IO,
    .sda_io_num = I2C_SLAVE_SDA_IO,
    .slave_addr = 0x58,
};

i2c_slave_dev_handle_t slave_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &slave_handle));
```

Uninstall I2C slave device If a previously installed I2C bus is no longer needed, it's recommended to recycle the resource by calling `i2c_del_slave_device()`, so that to release the underlying hardware.

I2C Master Controller After installing the i2c master driver by `i2c_new_master_bus()`, ESP32-P4 is ready to communicate with other I2C devices. I2C APIs allow the standard transactions. Like the wave as follows:

I2C Master Write After installing I2C master bus successfully, you can simply call `i2c_master_transmit()` to write data to the slave device. The principle of this function can be explained by following chart.

In order to organize the process, the driver uses a command link, that should be populated with a sequence of commands and then passed to I2C controller for execution.

图 7: I2C master write to slave

Simple example for writing data to slave:

```
#define DATA_LENGTH 100
i2c_master_bus_config_t i2c_mst_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = I2C_PORT_NUM_0,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
```

(下页继续)

```

        .glitch_ignore_cnt = 7,
};
i2c_master_bus_handle_t bus_handle;

ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));

ESP_ERROR_CHECK(i2c_master_transmit(dev_handle, data_wr, DATA_LENGTH, -1));

```

I2C Master Read After installing I2C master bus successfully, you can simply call `i2c_master_receive()` to read data from the slave device. The principle of this function can be explained by following chart.

图 8: I2C master read from slave

Simple example for reading data from slave:

```

#define DATA_LENGTH 100
i2c_master_bus_config_t i2c_mst_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = I2C_PORT_NUM_0,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
};
i2c_master_bus_handle_t bus_handle;

ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));

i2c_master_receive(dev_handle, data_rd, DATA_LENGTH, -1);

```

I2C Master Write and Read Some I2C device needs write configurations before reading data from it, therefore, an interface called `i2c_master_transmit_receive()` can help. The principle of this function can be explained by following chart.

Simple example for writing and reading from slave:

图 9: I2C master write to slave and read from slave

```
i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(I2C_PORT_NUM_0, &dev_cfg, &dev_handle));
uint8_t buf[20] = {0x20};
uint8_t buffer[2];
ESP_ERROR_CHECK(i2c_master_transmit_receive(dev_handle, buf, sizeof(buf), buffer, 2, -1));
```

I2C Master Probe I2C driver can use `i2c_master_probe()` to detect whether the specific device has been connected on I2C bus. If this function return `ESP_OK`, that means the device has been detected.

重要: Pull-ups must be connected to the SCL and SDA pins when this function is called. If you get `ESP_ERR_TIMEOUT` while `xfer_timeout_ms` was parsed correctly, you should check the pull-up resistors. If you do not have proper resistors nearby, setting `flags.enable_internal_pullup` as true is also acceptable.

图 10: I2C master probe

Simple example for probing an I2C device:

```
i2c_master_bus_config_t i2c_mst_config_1 = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
    .flags.enable_internal_pullup = true,
};

i2c_master_bus_handle_t bus_handle;

ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config_1, &bus_handle));
ESP_ERROR_CHECK(i2c_master_probe(bus_handle, 0x22, -1));
ESP_ERROR_CHECK(i2c_del_master_bus(bus_handle));
```

I2C Slave Controller After installing the i2c slave driver by `i2c_new_slave_device()`, ESP32-P4 is ready to communicate with other I2C master as a slave.

I2C Slave Write The send buffer of the I2C slave is used as a FIFO to store the data to be sent. The data will queue up until the master requests them. You can call `i2c_slave_transmit()` to transfer data.

Simple example for writing data to FIFO:

```

uint8_t *data_wr = (uint8_t *) malloc(DATA_LENGTH);

i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7,    // 7-bit address
    .clk_source = I2C_CLK_SRC_DEFAULT,    // set the clock source
    .i2c_port = 0,                        // set I2C port number
    .send_buf_depth = 256,                // set tx buffer length
    .scl_io_num = 2,                      // SCL gpio number
    .sda_io_num = 1,                      // SDA gpio number
    .slave_addr = 0x58,                   // slave address
};

i2c_bus_handle_t i2c_bus_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &i2c_bus_handle));
for (int i = 0; i < DATA_LENGTH; i++) {
    data_wr[i] = i;
}

ESP_ERROR_CHECK(i2c_slave_transmit(i2c_bus_handle, data_wr, DATA_LENGTH, 10000));

```

I2C Slave Read Whenever the master writes data to the slave, the slave will automatically store data in the receive buffer. This allows the slave application to call the function `i2c_slave_receive()` as its own discretion. As `i2c_slave_receive()` is designed as a non-blocking interface. So the user needs to register callback `i2c_slave_register_event_callbacks()` to know when the receive has finished.

```

static IRAM_ATTR bool i2c_slave_rx_done_callback(i2c_slave_dev_handle_t channel,
↳const i2c_slave_rx_done_event_data_t *edata, void *user_data)
{
    BaseType_t high_task_wakeup = pdFALSE;
    QueueHandle_t receive_queue = (QueueHandle_t)user_data;
    xQueueSendFromISR(receive_queue, edata, &high_task_wakeup);
    return high_task_wakeup == pdTRUE;
}

uint8_t *data_rd = (uint8_t *) malloc(DATA_LENGTH);
uint32_t size_rd = 0;

i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7,
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .send_buf_depth = 256,
    .scl_io_num = I2C_SLAVE_SCL_IO,
    .sda_io_num = I2C_SLAVE_SDA_IO,
    .slave_addr = 0x58,
};

i2c_slave_dev_handle_t slave_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &slave_handle));

s_receive_queue = xQueueCreate(1, sizeof(i2c_slave_rx_done_event_data_t));
i2c_slave_event_callbacks_t cbs = {
    .on_recv_done = i2c_slave_rx_done_callback,
};
ESP_ERROR_CHECK(i2c_slave_register_event_callbacks(slave_handle, &cbs, s_receive_
↳queue));

i2c_slave_rx_done_event_data_t rx_data;
ESP_ERROR_CHECK(i2c_slave_receive(slave_handle, data_rd, DATA_LENGTH));
xQueueReceive(s_receive_queue, &rx_data, pdMS_TO_TICKS(10000));
// Receive done.

```

Put Data In I2C Slave RAM I2C slave fifo mentioned above can be used as RAM, which means user can access the RAM directly via address fields. For example, writing data to the 3rd ram block with following graph. Before using this, please note that `i2c_slave_config_t::access_ram_en` needs to be set to true.

图 11: Put data in I2C slave RAM

```
uint8_t data_rd[DATA_LENGTH_RAM] = {0};

i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7,
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .send_buf_depth = 256,
    .scl_io_num = I2C_SLAVE_SCL_IO,
    .sda_io_num = I2C_SLAVE_SDA_IO,
    .slave_addr = 0x58,
    .flags.access_ram_en = true,
};

// Master write to slave.

i2c_slave_dev_handle_t slave_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &slave_handle));
ESP_ERROR_CHECK(i2c_slave_read_ram(slave_handle, 0x5, data_rd, DATA_LENGTH_RAM));
ESP_ERROR_CHECK(i2c_del_slave_device(slave_handle));
```

Get Data From I2C Slave RAM Data can be stored in the RAM with a specific offset by the slave controller, and the master can read this data directly via the RAM address. For example, if the data is stored in 3rd ram block, master can read this data by following graph. Before using this, please note that `i2c_slave_config_t::access_ram_en` needs to be set to true.

图 12: Get data from I2C slave RAM

```
uint8_t data_wr[DATA_LENGTH_RAM] = {0};

i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7,
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .send_buf_depth = 256,
    .scl_io_num = I2C_SLAVE_SCL_IO,
    .sda_io_num = I2C_SLAVE_SDA_IO,
    .slave_addr = 0x58,
    .flags.access_ram_en = true,
};

i2c_slave_dev_handle_t slave_handle;
```

(下页继续)

```
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &slave_handle));
ESP_ERROR_CHECK(i2c_slave_write_ram(slave_handle, 0x2, data_wr, DATA_LENGTH_RAM));
ESP_ERROR_CHECK(i2c_del_slave_device(slave_handle));
```

Register Event Callbacks

I2C master callbacks When an I2C master bus triggers an interrupt, a specific event will be generated and notify the CPU. If you have some functions that need to be called when those events occurred, you can hook your functions to the ISR (Interrupt Service Routine) by calling `i2c_master_register_event_callbacks()`. Since the registered callback functions are called in the interrupt context, user should ensure the callback function doesn't attempt to block (e.g. by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The callback functions are required to return a boolean value, to tell the ISR whether a high priority task is woke up by it.

I2C master event callbacks are listed in the `i2c_master_event_callbacks_t`.

Although I2C is a synchronous communication protocol, we also support asynchronous behavior by registering above callback. In this way, I2C APIs will be non-blocking interface. But note that on the same bus, only one device can adopt asynchronous operation.

重要: I2C master asynchronous transaction is still an experimental feature. (The issue is when asynchronous transaction is very large, it will cause memory problem.)

- `i2c_master_event_callbacks_t::on_rcv_done` sets a callback function for master "transaction-done" event. The function prototype is declared in `i2c_master_callback_t`.

I2C slave callbacks When an I2C slave bus triggers an interrupt, a specific event will be generated and notify the CPU. If you have some function that needs to be called when those events occurred, you can hook your function to the ISR (Interrupt Service Routine) by calling `i2c_slave_register_event_callbacks()`. Since the registered callback functions are called in the interrupt context, user should ensure the callback function doesn't attempt to block (e.g. by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The callback function has a boolean return value, to tell the caller whether a high priority task is woke up by it.

I2C slave event callbacks are listed in the `i2c_slave_event_callbacks_t`.

- `i2c_slave_event_callbacks_t::on_rcv_done` sets a callback function for "receive-done" event. The function prototype is declared in `i2c_slave_received_callback_t`.

Power Management If the controller clock source is selected to `I2C_CLK_SRC_XTAL`, then the driver won't install power management lock for it, which is more suitable for a low power application as long as the source clock can still provide sufficient resolution.

IRAM Safe By default, the I2C interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the event callback functions will not get executed in time, which is not expected in a real-time application.

There's a Kconfig option `CONFIG_I2C_ISR_IRAM_SAFE` that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM
3. Place driver object into DRAM (in case it's mapped to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

Thread Safety The factory function `i2c_new_master_bus()` and `i2c_new_slave_device()` are guaranteed to be thread safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other public I2C APIs are not thread safe. which means the user should avoid calling them from multiple tasks, if user strongly needs to call them in multiple tasks, please add extra lock.

Kconfig Options

- `CONFIG_I2C_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see also `IRAM Safe` for more information.
- `CONFIG_I2C_ENABLE_DEBUG_LOG` is used to enable the debug log at the cost of increased firmware binary size.

REQUIRES esp_driver_i2c
```

or

```
PRIV_REQUIRES esp_driver_i2c
```

Functions

`esp_err_t i2c_new_master_bus` (const `i2c_master_bus_config_t` *bus_config, `i2c_master_bus_handle_t` *ret_bus_handle)

Allocate an I2C master bus.

参数

- **bus_config** -- [in] I2C master bus configuration.
- **ret_bus_handle** -- [out] I2C bus handle

返回

- `ESP_OK`: I2C master bus initialized successfully.
- `ESP_ERR_INVALID_ARG`: I2C bus initialization failed because of invalid argument.
- `ESP_ERR_NO_MEM`: Create I2C bus failed because of out of memory.
- `ESP_ERR_NOT_FOUND`: No more free bus.

`esp_err_t i2c_master_bus_add_device` (`i2c_master_bus_handle_t` bus_handle, const `i2c_device_config_t` *dev_config, `i2c_master_dev_handle_t` *ret_handle)

Add I2C master BUS device.

参数

- **bus_handle** -- [in] I2C bus handle.
- **dev_config** -- [in] device config.
- **ret_handle** -- [out] device handle.

返回

- `ESP_OK`: Create I2C master device successfully.
- `ESP_ERR_INVALID_ARG`: I2C bus initialization failed because of invalid argument.
- `ESP_ERR_NO_MEM`: Create I2C bus failed because of out of memory.

`esp_err_t i2c_del_master_bus` (`i2c_master_bus_handle_t` bus_handle)

Deinitialize the I2C master bus and delete the handle.

参数 **bus_handle** -- [in] I2C bus handle.

返回

- ESP_OK: Delete I2C bus success, otherwise, failed.
- Otherwise: Some module delete failed.

esp_err_t **i2c_master_bus_rm_device** (*i2c_master_dev_handle_t* handle)

I2C master bus delete device.

参数 **handle** -- i2c device handle

返回

- ESP_OK: If device is successfully deleted.

esp_err_t **i2c_master_transmit** (*i2c_master_dev_handle_t* i2c_dev, const uint8_t *write_buffer, size_t write_size, int xfer_timeout_ms)

Perform a write transaction on the I2C bus. The transaction will be undergoing until it finishes or it reaches the timeout provided.

备注: If a callback was registered with `i2c_master_register_event_callbacks`, the transaction will be asynchronous, and thus, this function will return directly, without blocking. You will get finish information from callback. Besides, data buffer should always be completely prepared when callback is registered, otherwise, the data will get corrupt.

参数

- **i2c_dev** -- [in] I2C master device handle that created by `i2c_master_bus_add_device`.
- **write_buffer** -- [in] Data bytes to send on the I2C bus.
- **write_size** -- [in] Size, in bytes, of the write buffer.
- **xfer_timeout_ms** -- [in] Wait timeout, in ms. Note: -1 means wait forever.

返回

- ESP_OK: I2C master transmit success
- ESP_ERR_INVALID_ARG: I2C master transmit parameter invalid.
- ESP_ERR_TIMEOUT: Operation timeout (larger than `xfer_timeout_ms`) because the bus is busy or hardware crash.

esp_err_t **i2c_master_transmit_receive** (*i2c_master_dev_handle_t* i2c_dev, const uint8_t *write_buffer, size_t write_size, uint8_t *read_buffer, size_t read_size, int xfer_timeout_ms)

Perform a write-read transaction on the I2C bus. The transaction will be undergoing until it finishes or it reaches the timeout provided.

备注: If a callback was registered with `i2c_master_register_event_callbacks`, the transaction will be asynchronous, and thus, this function will return directly, without blocking. You will get finish information from callback. Besides, data buffer should always be completely prepared when callback is registered, otherwise, the data will get corrupt.

参数

- **i2c_dev** -- [in] I2C master device handle that created by `i2c_master_bus_add_device`.
- **write_buffer** -- [in] Data bytes to send on the I2C bus.
- **write_size** -- [in] Size, in bytes, of the write buffer.
- **read_buffer** -- [out] Data bytes received from i2c bus.
- **read_size** -- [in] Size, in bytes, of the read buffer.
- **xfer_timeout_ms** -- [in] Wait timeout, in ms. Note: -1 means wait forever.

返回

- ESP_OK: I2C master transmit-receive success
- ESP_ERR_INVALID_ARG: I2C master transmit parameter invalid.

- `ESP_ERR_TIMEOUT`: Operation timeout (larger than `xfer_timeout_ms`) because the bus is busy or hardware crash.

`esp_err_t i2c_master_receive` (`i2c_master_dev_handle_t` i2c_dev, `uint8_t *`read_buffer, `size_t` read_size, `int` xfer_timeout_ms)

Perform a read transaction on the I2C bus. The transaction will be undergoing until it finishes or it reaches the timeout provided.

备注: If a callback was registered with `i2c_master_register_event_callbacks`, the transaction will be asynchronous, and thus, this function will return directly, without blocking. You will get finish information from callback. Besides, data buffer should always be completely prepared when callback is registered, otherwise, the data will get corrupt.

参数

- `i2c_dev` -- **[in]** I2C master device handle that created by `i2c_master_bus_add_device`.
- `read_buffer` -- **[out]** Data bytes received from i2c bus.
- `read_size` -- **[in]** Size, in bytes, of the read buffer.
- `xfer_timeout_ms` -- **[in]** Wait timeout, in ms. Note: -1 means wait forever.

返回

- `ESP_OK`: I2C master receive success
- `ESP_ERR_INVALID_ARG`: I2C master receive parameter invalid.
- `ESP_ERR_TIMEOUT`: Operation timeout (larger than `xfer_timeout_ms`) because the bus is busy or hardware crash.

`esp_err_t i2c_master_probe` (`i2c_master_bus_handle_t` bus_handle, `uint16_t` address, `int` xfer_timeout_ms)

Probe I2C address, if address is correct and ACK is received, this function will return `ESP_OK`.

Attention Pull-ups must be connected to the SCL and SDA pins when this function is called. If you get `ESP_ERR_TIMEOUT` while `xfer_timeout_ms` was parsed correctly, you should check the pull-up resistors. If you do not have proper resistors nearby, `flags.enable_internal_pullup` is also acceptable.

备注: The principle of this function is to send device address with a write command. If the device on your I2C bus, there would be an ACK signal and function returns `ESP_OK`. If the device is not on your I2C bus, there would be a NACK signal and function returns `ESP_ERR_NOT_FOUND`. `ESP_ERR_TIMEOUT` is not an expected failure, which indicated that the i2c probe not works properly, usually caused by pull-up resistors not be connected properly. Suggestion check data on SDA/SCL line to see whether there is ACK/NACK signal is on line when i2c probe function fails.

备注: There are lots of I2C devices all over the world, we assume that not all I2C device support the behavior like `device_address+nack/ack`. So, if the on line data is strange and no ack/nack got respond. Please check the device datasheet.

参数

- `bus_handle` -- **[in]** I2C master device handle that created by `i2c_master_bus_add_device`.
- `address` -- **[in]** I2C device address that you want to probe.
- `xfer_timeout_ms` -- **[in]** Wait timeout, in ms. Note: -1 means wait forever (Not recommended in this function).

返回

- `ESP_OK`: I2C device probe successfully

- `ESP_ERR_NOT_FOUND`: I2C probe failed, doesn't find the device with specific address you gave.
- `ESP_ERR_TIMEOUT`: Operation timeout (larger than `xfer_timeout_ms`) because the bus is busy or hardware crash.

`esp_err_t i2c_master_register_event_callbacks` (*`i2c_master_dev_handle_t`* i2c_dev, const *`i2c_master_event_callbacks_t`* *cbs, void *user_data)

Register I2C transaction callbacks for a master device.

备注: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

备注: When `CONFIG_I2C_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

备注: If the callback is used for helping asynchronous transaction. On the same bus, only one device can be used for performing asynchronous operation.

参数

- **`i2c_dev`** -- **[in]** I2C master device handle that created by `i2c_master_bus_add_device`.
- **`cbs`** -- **[in]** Group of callback functions
- **`user_data`** -- **[in]** User data, which will be passed to callback functions directly

返回

- `ESP_OK`: Set I2C transaction callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set I2C transaction callbacks failed because of invalid argument
- `ESP_FAIL`: Set I2C transaction callbacks failed because of other error

`esp_err_t i2c_master_bus_reset` (*`i2c_master_bus_handle_t`* bus_handle)

Reset the I2C master bus.

参数 `bus_handle` -- I2C bus handle.

返回

- `ESP_OK`: Reset succeed.
- `ESP_ERR_INVALID_ARG`: I2C master bus handle is not initialized.
- Otherwise: Reset failed.

`esp_err_t i2c_master_bus_wait_all_done` (*`i2c_master_bus_handle_t`* bus_handle, int timeout_ms)

Wait for all pending I2C transactions done.

参数

- **`bus_handle`** -- **[in]** I2C bus handle
- **`timeout_ms`** -- **[in]** Wait timeout, in ms. Specially, -1 means to wait forever.

返回

- `ESP_OK`: Flush transactions successfully
- `ESP_ERR_INVALID_ARG`: Flush transactions failed because of invalid argument
- `ESP_ERR_TIMEOUT`: Flush transactions failed because of timeout
- `ESP_FAIL`: Flush transactions failed because of other error

Structures

struct **i2c_master_bus_config_t**

I2C master bus specific configurations.

Public Members

i2c_port_num_t **i2c_port**

I2C port number, -1 for auto selecting, (not include LP I2C instance)

gpio_num_t **sda_io_num**

GPIO number of I2C SDA signal, pulled-up internally

gpio_num_t **scl_io_num**

GPIO number of I2C SCL signal, pulled-up internally

i2c_clock_source_t **clk_source**

Clock source of I2C master bus

lp_i2c_clock_source_t **lp_source_clk**

LP_UART source clock selection

uint8_t **glitch_ignore_cnt**

If the glitch period on the line is less than this value, it can be filtered out, typically value is 7 (unit: I2C module clock cycle)

int **intr_priority**

I2C interrupt priority, if set to 0, driver will select the default priority (1,2,3).

size_t **trans_queue_depth**

Depth of internal transfer queue, increase this value can support more transfers pending in the background, only valid in asynchronous transaction. (Typically max_device_num * per_transaction)

uint32_t **enable_internal_pullup**

Enable internal pullups. Note: This is not strong enough to pullup buses under high-speed frequency. Recommend proper external pull-up if possible

struct *i2c_master_bus_config_t*::[anonymous] **flags**

I2C master config flags

struct **i2c_device_config_t**

I2C device configuration.

Public Members

i2c_addr_bit_len_t **dev_addr_length**

Select the address length of the slave device.

uint16_t **device_address**

I2C device raw address. (The 7/10 bit address without read/write bit)

uint32_t **scl_speed_hz**

I2C SCL line frequency.

uint32_t **scl_wait_us**

Timeout value. (unit: us). Please note this value should not be so small that it can handle stretch/disturbance properly. If 0 is set, that means use the default reg value

uint32_t **disable_ack_check**

Disable ACK check. If this is set false, that means ack check is enabled, the transaction will be stopped and API returns error when nack is detected.

struct *i2c_device_config_t*::[anonymous] **flags**

I2C device config flags

struct **i2c_master_event_callbacks_t**

Group of I2C master callbacks, can be used to get status during transaction or doing other small things. But take care potential concurrency issues.

备注: The callbacks are all running under ISR context

备注: When CONFIG_I2C_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

i2c_master_callback_t **on_trans_done**

I2C master transaction finish callback

Header File

```
REQUIRES esp_driver_i2c
```

or

```
PRIV_REQUIRES esp_driver_i2c
```

Functions

esp_err_t **i2c_new_slave_device** (const *i2c_slave_config_t* *slave_config, *i2c_slave_dev_handle_t* *ret_handle)

Initialize an I2C slave device.

参数

- **slave_config** -- [in] I2C slave device configurations

- **ret_handle** -- [out] Return a generic I2C device handle

返回

- ESP_OK: I2C slave device initialized successfully
- ESP_ERR_INVALID_ARG: I2C device initialization failed because of invalid argument.
- ESP_ERR_NO_MEM: Create I2C device failed because of out of memory.

esp_err_t **i2c_del_slave_device** (*i2c_slave_dev_handle_t* i2c_slave)

Deinitialize the I2C slave device.

参数 **i2c_slave** -- [in] I2C slave device handle that created by `i2c_new_slave_device`.

返回

- ESP_OK: Delete I2C device successfully.
- ESP_ERR_INVALID_ARG: I2C device initialization failed because of invalid argument.

esp_err_t **i2c_slave_receive** (*i2c_slave_dev_handle_t* i2c_slave, uint8_t *data, size_t buffer_size)

Read bytes from I2C internal buffer. Start a job to receive I2C data.

备注: This function is non-blocking, it initiates a new receive job and then returns. User should check the received data from the `on_recv_done` callback that registered by `i2c_slave_register_event_callbacks()`.

参数

- **i2c_slave** -- [in] I2C slave device handle that created by `i2c_new_slave_device`.
- **data** -- [out] Buffer to store data from I2C fifo. Should be valid until `on_recv_done` is triggered.
- **buffer_size** -- [in] Buffer size of data that provided by users.

返回

- ESP_OK: I2C slave receive success.
- ESP_ERR_INVALID_ARG: I2C slave receive parameter invalid.
- ESP_ERR_NOT_SUPPORTED: This function should be work in fifo mode, but I2C_SLAVE_NONFIFO mode is configured

esp_err_t **i2c_slave_transmit** (*i2c_slave_dev_handle_t* i2c_slave, const uint8_t *data, int size, int xfer_timeout_ms)

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer's data.

备注: If you connect this slave device to some master device, the data transaction direction is from slave device to master device.

参数

- **i2c_slave** -- [in] I2C slave device handle that created by `i2c_new_slave_device`.
- **data** -- [in] Buffer to write to slave fifo, can pickup by master. Can be freed after this function returns. Equal or larger than `size`.
- **size** -- [in] In bytes, of `data` buffer.
- **xfer_timeout_ms** -- [in] Wait timeout, in ms. Note: -1 means wait forever.

返回

- ESP_OK: I2C slave transmit success.
- ESP_ERR_INVALID_ARG: I2C slave transmit parameter invalid.
- ESP_ERR_TIMEOUT: Operation timeout(larger than `xfer_timeout_ms`) because the device is busy or hardware crash.
- ESP_ERR_NOT_SUPPORTED: This function should be work in fifo mode, but I2C_SLAVE_NONFIFO mode is configured

esp_err_t **i2c_slave_register_event_callbacks** (*i2c_slave_dev_handle_t* i2c_slave, const *i2c_slave_event_callbacks_t* *cbs, void *user_data)

Set I2C slave event callbacks for I2C slave channel.

备注: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

备注: When `CONFIG_I2C_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

参数

- **i2c_slave** -- **[in]** I2C slave device handle that created by `i2c_new_slave_device`.
- **cbs** -- **[in]** Group of callback functions
- **user_data** -- **[in]** User data, which will be passed to callback functions directly

返回

- `ESP_OK`: Set I2C transaction callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set I2C transaction callbacks failed because of invalid argument
- `ESP_FAIL`: Set I2C transaction callbacks failed because of other error

esp_err_t **i2c_slave_read_ram** (*i2c_slave_dev_handle_t* i2c_slave, uint8_t ram_address, uint8_t *data, size_t receive_size)

Read bytes from I2C internal ram. This can be only used when `access_ram_en` in configuration structure set to true.

参数

- **i2c_slave** -- **[in]** I2C slave device handle that created by `i2c_new_slave_device`.
- **ram_address** -- **[in]** The offset of RAM (Cannot larger than I2C RAM memory)
- **data** -- **[out]** Buffer to store data read from I2C ram.
- **receive_size** -- **[in]** Received size from RAM.

返回

- `ESP_OK`: I2C slave transmit success.
- `ESP_ERR_INVALID_ARG`: I2C slave transmit parameter invalid.
- `ESP_ERR_NOT_SUPPORTED`: This function should be work in non-fifo mode, but `I2C_SLAVE_FIFO` mode is configured

esp_err_t **i2c_slave_write_ram** (*i2c_slave_dev_handle_t* i2c_slave, uint8_t ram_address, const uint8_t *data, size_t size)

Write bytes to I2C internal ram. This can be only used when `access_ram_en` in configuration structure set to true.

参数

- **i2c_slave** -- **[in]** I2C slave device handle that created by `i2c_new_slave_device`.
- **ram_address** -- **[in]** The offset of RAM (Cannot larger than I2C RAM memory)
- **data** -- **[in]** Buffer to fill.
- **size** -- **[in]** Received size from RAM.

返回

- `ESP_OK`: I2C slave transmit success.
- `ESP_ERR_INVALID_ARG`: I2C slave transmit parameter invalid.
- `ESP_ERR_INVALID_SIZE`: Write size is larger than
- `ESP_ERR_NOT_SUPPORTED`: This function should be work in non-fifo mode, but `I2C_SLAVE_FIFO` mode is configured

Structures

struct **i2c_slave_config_t**

I2C slave specific configurations.

Public Members

i2c_port_num_t **i2c_port**

I2C port number, -1 for auto selecting

gpio_num_t **sda_io_num**

SDA IO number used by I2C bus

gpio_num_t **scl_io_num**

SCL IO number used by I2C bus

i2c_clock_source_t **clk_source**

Clock source of I2C bus.

uint32_t **send_buf_depth**

Depth of internal transfer ringbuffer, increase this value can support more transfers pending in the background

uint16_t **slave_addr**

I2C slave address

i2c_addr_bit_len_t **addr_bit_len**

I2C slave address in bit length

int **intr_priority**

I2C interrupt priority, if set to 0, driver will select the default priority (1,2,3).

uint32_t **broadcast_en**

I2C slave enable broadcast

uint32_t **access_ram_en**

Can get access to I2C RAM directly

uint32_t **slave_unmatch_en**

Can trigger unmatch interrupt when slave address does not match what master sends

struct *i2c_slave_config_t*::[anonymous] **flags**

I2C slave config flags

struct **i2c_slave_event_callbacks_t**

Group of I2C slave callbacks (e.g. get i2c slave stretch cause). But take care of potential concurrency issues.

备注: The callbacks are all running under ISR context

备注: When CONFIG_I2C_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

i2c_slave_received_callback_t on_recv_done

I2C slave receive done callback

Header File

- `components/esp_driver_i2c/include/driver/i2c_types.h`
- This header file can be included with:

```
#include "driver/i2c_types.h"
```

- This header file is a part of the API provided by the `esp_driver_i2c` component. To declare that your component depends on `esp_driver_i2c`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_i2c
```

or

```
PRIV_REQUIRES esp_driver_i2c
```

Structures

struct `i2c_master_event_data_t`

Data type used in I2C event callback.

Public Members

i2c_master_event_t event

The I2C hardware event that I2C callback is called.

struct `i2c_slave_rx_done_event_data_t`

Event structure used in I2C slave.

Public Members

`uint8_t *buffer`

Pointer for buffer received in callback.

Type Definitions

typedef int `i2c_port_num_t`

I2C port number.

typedef struct `i2c_master_bus_t *i2c_master_bus_handle_t`

Type of I2C master bus handle.

```
typedef struct i2c_master_dev_t *i2c_master_dev_handle_t
```

Type of I2C master bus device handle.

```
typedef struct i2c_slave_dev_t *i2c_slave_dev_handle_t
```

Type of I2C slave device handle.

```
typedef bool (*i2c_master_callback_t)(i2c_master_dev_handle_t i2c_dev, const i2c_master_event_data_t *evt_data, void *arg)
```

An callback for I2C transaction.

Param i2c_dev [in] Handle for I2C device.

Param evt_data [out] I2C capture event data, fed by driver

Param arg [in] User data, set in `i2c_master_register_event_callbacks()`

Return Whether a high priority task has been waken up by this function

```
typedef bool (*i2c_slave_received_callback_t)(i2c_slave_dev_handle_t i2c_slave, const i2c_slave_rx_done_event_data_t *evt_data, void *arg)
```

Callback signature for I2C slave.

Param i2c_slave [in] Handle for I2C slave.

Param evt_data [out] I2C capture event data, fed by driver

Param arg [in] User data, set in `i2c_slave_register_event_callbacks()`

Return Whether a high priority task has been waken up by this function

Enumerations

```
enum i2c_master_status_t
```

Enumeration for I2C fsm status.

Values:

enumerator **I2C_STATUS_READ**

read status for current master command

enumerator **I2C_STATUS_WRITE**

write status for current master command

enumerator **I2C_STATUS_START**

Start status for current master command

enumerator **I2C_STATUS_STOP**

stop status for current master command

enumerator **I2C_STATUS_IDLE**

idle status for current master command

enumerator **I2C_STATUS_ACK_ERROR**

ack error status for current master command

enumerator **I2C_STATUS_DONE**

I2C command done

enumerator **I2C_STATUS_TIMEOUT**

I2C bus status error, and operation timeout

enum **i2c_master_event_t**

Enumeration for I2C event.

Values:

enumerator **I2C_EVENT_ALIVE**

i2c bus in alive status.

enumerator **I2C_EVENT_DONE**

i2c bus transaction done

enumerator **I2C_EVENT_NACK**

i2c bus nack

enumerator **I2C_EVENT_TIMEOUT**

i2c bus timeout

Header File

- [components/hal/include/hal/i2c_types.h](#)
- This header file can be included with:

```
#include "hal/i2c_types.h"
```

Structures

struct **i2c_hal_clk_config_t**

Data structure for calculating I2C bus timing.

Public Members

uint16_t **clkm_div**

I2C core clock divider

uint16_t **scl_low**

I2C scl low period

uint16_t **scl_high**

I2C scl high period

uint16_t **scl_wait_high**

I2C scl wait_high period

uint16_t **sda_hold**

I2C scl low period

uint16_t **sda_sample**
I2C sda sample time

uint16_t **setup**
I2C start and stop condition setup period

uint16_t **hold**
I2C start and stop condition hold period

uint16_t **tout**
I2C bus timeout period

Type Definitions

typedef *soc_periph_i2c_clk_src_t* **i2c_clock_source_t**
I2C group clock source.

typedef *soc_periph_lp_i2c_clk_src_t* **lp_i2c_clock_source_t**
LP_UART source clock.

Enumerations

enum **i2c_port_t**
I2C port number, can be I2C_NUM_0 ~ (I2C_NUM_MAX-1).

Values:

enumerator **I2C_NUM_0**
I2C port 0

enumerator **I2C_NUM_1**
I2C port 1

enumerator **LP_I2C_NUM_0**

enumerator **I2C_NUM_MAX**
I2C port max

enum **i2c_addr_bit_len_t**
Enumeration for I2C device address bit length.

Values:

enumerator **I2C_ADDR_BIT_LEN_7**
i2c address bit length 7

enumerator **I2C_ADDR_BIT_LEN_10**
i2c address bit length 10

enum **i2c_mode_t**
Values:

enumerator **I2C_MODE_SLAVE**

I2C slave mode

enumerator **I2C_MODE_MASTER**

I2C master mode

enumerator **I2C_MODE_MAX**

enum **i2c_rw_t**

Values:

enumerator **I2C_MASTER_WRITE**

I2C write data

enumerator **I2C_MASTER_READ**

I2C read data

enum **i2c_trans_mode_t**

Values:

enumerator **I2C_DATA_MODE_MSB_FIRST**

I2C data msb first

enumerator **I2C_DATA_MODE_LSB_FIRST**

I2C data lsb first

enumerator **I2C_DATA_MODE_MAX**

enum **i2c_addr_mode_t**

Values:

enumerator **I2C_ADDR_BIT_7**

I2C 7bit address for slave mode

enumerator **I2C_ADDR_BIT_10**

I2C 10bit address for slave mode

enumerator **I2C_ADDR_BIT_MAX**

enum **i2c_ack_type_t**

Values:

enumerator **I2C_MASTER_ACK**

I2C ack for each byte read

enumerator **I2C_MASTER_NACK**

I2C nack for each byte read

enumerator **I2C_MASTER_LAST_NACK**

I2C nack for the last byte

enumerator **I2C_MASTER_ACK_MAX**

enum **i2c_slave_stretch_cause_t**

Enum for I2C slave stretch causes.

Values:

enumerator **I2C_SLAVE_STRETCH_CAUSE_ADDRESS_MATCH**

Stretching SCL low when the slave is read by the master and the address just matched

enumerator **I2C_SLAVE_STRETCH_CAUSE_TX_EMPTY**

Stretching SCL low when TX FIFO is empty in slave mode

enumerator **I2C_SLAVE_STRETCH_CAUSE_RX_FULL**

Stretching SCL low when RX FIFO is full in slave mode

enumerator **I2C_SLAVE_STRETCH_CAUSE_SENDING_ACK**

Stretching SCL low when slave sending ACK

2.5.13 I2S

简介

I2S (Inter-IC Sound, 集成电路内置音频总线) 是一种同步串行通信协议, 通常用于在两个数字音频设备之间传输音频数据。

ESP32-P4 包含 1 个 I2S 外设。通过配置这些外设, 可以借助 I2S 驱动来输入和输出采样数据。

标准或 TDM 通信模式下的 I2S 总线包含以下几条线路:

- **MCLK**: 主时钟线。该信号线可选, 具体取决于从机, 主要用于向 I2S 从机提供参考时钟。
- **BCLK**: 位时钟线。用于数据线的位时钟。
- **WS**: 字 (声道) 选择线。通常用于识别声道 (除 PDM 模式外)。
- **DIN/DOUT**: 串行数据输入/输出线。如果 DIN 和 DOUT 被配置到相同的 GPIO, 数据将在内部回环。

PDM 通信模式下的 I2S 总线包含以下几条线路:

- **CLK**: PDM 时钟线。
- **DIN/DOUT**: 串行数据输入/输出线。

每个 I2S 控制器都具备以下功能, 可由 I2S 驱动进行配置:

- 可用作系统主机或从机
- 可用作发射器或接收器
- DMA 控制器支持流数据采样, CPU 无需单独复制每个采样数据

每个控制器都有独立的 RX 和 TX 通道, 连接到不同 GPIO 管脚, 能够在不同的时钟和声道配置下工作。注意, 尽管在一个控制器上 TX 通道和 RX 通道的内部 MCLK 相互独立, 但输出的 MCLK 信号只能连接到一个通道。如果需要两个互相独立的 MCLK 输出, 必须将其分配到不同的 I2S 控制器上。

I2S 文件结构

图 13: I2S 文件结构

需要包含在 I2S 应用中的公共头文件如下所示:

- `i2s.h`: 提供原有 I2S API (用于使用原有驱动的应用)。
- `i2s_std.h`: 提供标准通信模式的 API (用于使用标准模式的新驱动程序的应用)。
- `i2s_pdm.h`: 提供 PDM 通信模式的 API (用于使用 PDM 模式的新驱动程序的应用)。
- `i2s_tdm.h`: 提供 TDM 通信模式的 API (用于使用 TDM 模式的新驱动的应用)。

备注: 原有驱动与新驱动无法共存。包含 `i2s.h` 以使用原有驱动, 或包含其他三个头文件以使用新驱动。原有驱动未来可能会被删除。

已包含在上述头文件中的公共头文件如下所示:

- `i2s_types_legacy.h`: 提供只在原有驱动中使用的原有公共类型。
- `i2s_types.h`: 提供公共类型。
- `i2s_common.h`: 提供所有通信模式通用的 API。

I2S 时钟

时钟源

- `i2s_clock_src_t::I2S_CLK_SRC_DEFAULT`: 默认 PLL 时钟。
- `i2s_clock_src_t::I2S_CLK_SRC_PLL_160M`: 160 MHz PLL 时钟。

时钟术语

- **采样率:** 单声道每秒采样数据数量。
- **SCLK:** 源时钟频率, 即时钟源的频率。
- **MCLK:** 主时钟频率, BCLK 由其产生。MCLK 信号通常作为参考时钟, 用于同步 I2S 主机和从机之间的 BCLK 和 WS。
- **BCLK:** 位时钟频率, 一个 BCLK 时钟周期代表数据管脚上的一个数据位。通过 `i2s_std_slot_config_t::slot_bit_width` 配置的通道位宽即为一个声道中的 BCLK 时钟周期数量, 因此一个声道中可以有 8/16/24/32 个 BCLK 时钟周期。

- **LRCK / WS**: 左/右时钟或字选择时钟。在非 PDM 模式下，其频率等于采样率。

备注: 通常, MCLK 应该同时是采样率和 BCLK 的倍数。字段 `i2s_std_clk_config_t::mclk_multiple` 表示 MCLK 相对于采样率的倍数。在大多数情况下, 将其设置为 `I2S_MCLK_MULTIPLE_256` 即可。但如果 `slot_bit_width` 被设置为 `I2S_SLOT_BIT_WIDTH_24BIT`, 为了保证 MCLK 是 BCLK 的整数倍, 应该将 `i2s_std_clk_config_t::mclk_multiple` 设置为能被 3 整除的倍数, 如 `I2S_MCLK_MULTIPLE_384`, 否则 WS 会不精准。

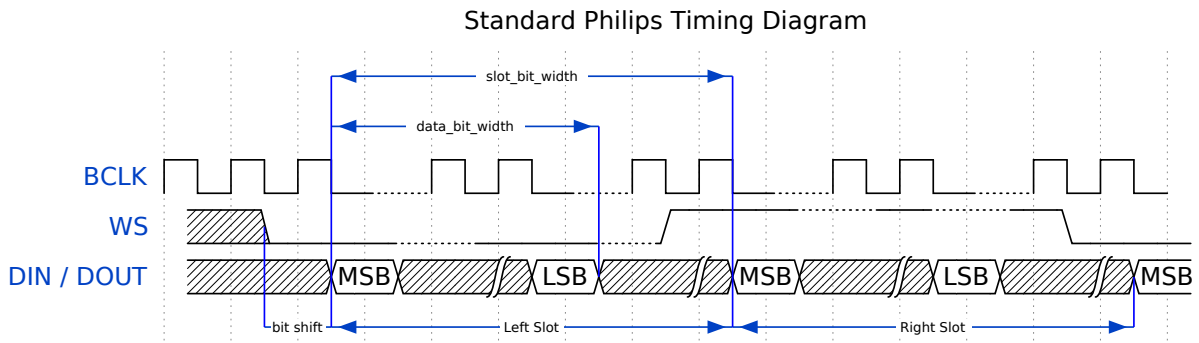

I2S 通信模式

模式概览

芯片	I2S 标准	PDM TX	PDM RX	TDM	ADC/DAC	LCD/摄像头
ESP32	I2S 0/1	I2S 0	I2S 0	无	I2S 0	I2S 0
ESP32-S2	I2S 0	无	无	无	无	I2S 0
ESP32-C3	I2S 0	I2S 0	无	I2S 0	无	无
ESP32-C6	I2S 0	I2S 0	无	I2S 0	无	无
ESP32-S3	I2S 0/1	I2S 0	I2S 0	I2S 0/1	无	无
ESP32-H2	I2S 0	I2S 0	无	I2S 0	无	无
ESP32-P4	I2S 0~2	I2S 0	I2S 0	I2S 0~2	无	无

标准模式 标准模式中有且仅有左右两个声道, 驱动中将声道称为 slot。这些声道可以支持 8/16/24/32 位宽的采样数据, 声道的通信格式主要包括以下几种:

- **Philips 格式**: 数据信号与 WS 信号相比有一个位的位移。WS 信号的占空比为 50%。

- **MSB 格式**: 与 Philips 格式基本相同, 但其数据没有位移。

- **PCM 帧同步**: 数据有一个位的位移, 同时 WS 信号变成脉冲, 持续一个 BCLK 周期。

PDM 模式 (TX) 在 PDM (Pulse-density Modulation, 脉冲密度调制) 模式下, TX 通道可以将 PCM 数据转换为 PDM 格式, 该格式始终有左右两个声道。PDM TX 只在 I2S0 中受支持, 且只支持 16 位宽的采样数据。PDM TX 至少需要一个 CLK 管脚用于时钟信号, 一个 DOOUT 管脚用于数据信号 (即下图中的 WS 和 SD 信号。BCK 信号为内部位采样时钟, 在 PDM 设备之间不需要)。PDM 模式允许用户配置上采样参数 `i2s_pdm_tx_clk_config_t::up_sample_fp` 和 `i2s_pdm_tx_clk_config_t::up_sample_fs`, 上采样率可以通过公式
$$\text{up_sample_rate} = \text{i2s_pdm_tx_clk_config_t::up_sample_fp} / \text{i2s_pdm_tx_clk_config_t::up_sample_fs}$$
 来计算。在 PDM TX 中有以下两种上采样模式:

- **固定时钟频率模式:** 在这种模式下, 上采样率将根据采样率的变化而变化。设置 $f_p = 960$, $f_s = \text{sample_rate} / 100$, 则 CLK 管脚上的时钟频率 (F_{pdm}) 将固定为 $128 * 48 \text{ KHz} = 6.144 \text{ MHz}$ 。注意此频率不等于采样率 (F_{pcm})。
- **固定上采样率模式:** 在这种模式下, 上采样率固定为 2。设置 $f_p = 960$, $f_s = 480$, 则 CLK 管脚上的时钟频率 (F_{pdm}) 将为 $128 * \text{sample_rate}$ 。

PDM 模式 (RX) 在 PDM (Pulse-density Modulation, 脉冲密度调制) 模式下, RX 通道可以接收 PDM 格式的数据并将数据转换成 PCM 格式。PDM RX 只在 I2S0 中受支持, 且只支持 16 位宽的采样数据。PDM RX 至少需要一个 CLK 管脚用于时钟信号, 一个 DIN 管脚用于数据信号。此模式允许用户配置下采样参数 `i2s_pdm_rx_clk_config_t::dn_sample_mode`。在 PDM RX 中有以下两种下采样模式:

- `i2s_pdm_dsr_t::I2S_PDM_DSR_8S`: 在这种模式下, WS 管脚的时钟频率 (F_{pdm}) 将为 $\text{sample_rate} (F_{\text{pcm}}) * 64$ 。
- `i2s_pdm_dsr_t::I2S_PDM_DSR_16S`: 在这种模式下, WS 管脚的时钟频率 (F_{pdm}) 将为 $\text{sample_rate} (F_{\text{pcm}}) * 128$ 。

TDM 模式 TDM (Time Division Multiplexing, 时分多路复用) 模式最多支持 16 个声道, 可通过 `i2s_tdm_slot_config_t::slot_mask` 启用通道。

该模式下无论启用多少声道, 都支持任意数据位宽, 也即一个帧中最多可以有 $32 \text{ 位宽} * 16 \text{ 个声道} = 512 \text{ 位}$ 的数据。

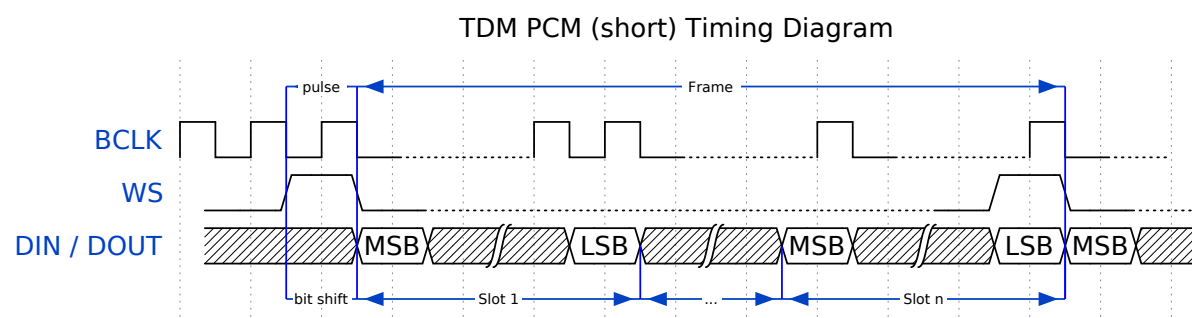

- **Philips 格式:** 数据信号与 WS 信号相比有一个位的位移。无论一帧中包含多少个声道, WS 信号的占空比将始终保持为 50%。

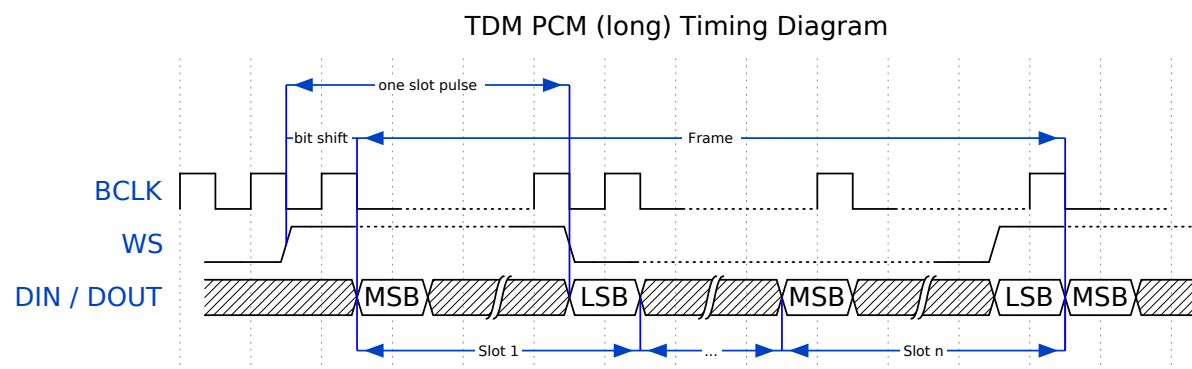

- **MSB 格式:** 与 Philips 格式基本相同，但数据没有位移。

- **PCM 短帧同步:** 数据有一个位的位移，同时 WS 信号变为脉冲，每帧持续一个 BCLK 周期。

- **PCM 长帧同步:** 数据有一个位的位移，同时 WS 信号将在每一帧持续一个声道的宽度。例如，如果启用了四个声道，那么 WS 的占空比将是 25%，如果启用了五个声道，则为 20%。

功能概览

I2S 驱动提供以下服务：

资源管理 I2S 驱动中的资源可分为三个级别：

- 平台级资源：当前芯片中所有 I2S 控制器的资源。
- 控制器级资源：一个 I2S 控制器的资源。
- 通道级资源：一个 I2S 控制器 TX 或 RX 通道的资源。

公开的 API 都是通道级别的 API，通道句柄 `i2s_chan_handle_t` 可以帮助用户管理特定通道下的资源，而无需考虑其他两个级别的资源。高级别资源为私有资源，由驱动自动管理。用户可以调用 `i2s_new_channel()` 来分配通道句柄，或调用 `i2s_del_channel()` 来删除该句柄。

电源管理 电源管理启用（即开启 `CONFIG_PM_ENABLE`）时，系统将在进入 Light-sleep 前调整或停止 I2S 时钟源，这可能会影响 I2S 信号，从而导致传输或接收的数据无效。

I2S 驱动可以获取电源管理锁，从而防止系统设置更改或时钟源被禁用。时钟源为 APB 时，锁的类型将被设置为 `esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX`。时钟源为 APLL（若支持）时，锁的类型将被设置为 `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`。用户通过 I2S 读写时（即调用 `i2s_channel_read()` 或 `i2s_channel_write()`），驱动程序将获取电源管理锁，并在读写完成后释放锁。

有限状态机 I2S 通道有三种状态，分别为 registered（已注册）、ready（准备就绪）和 running（运行中），它们的关系如下图所示：

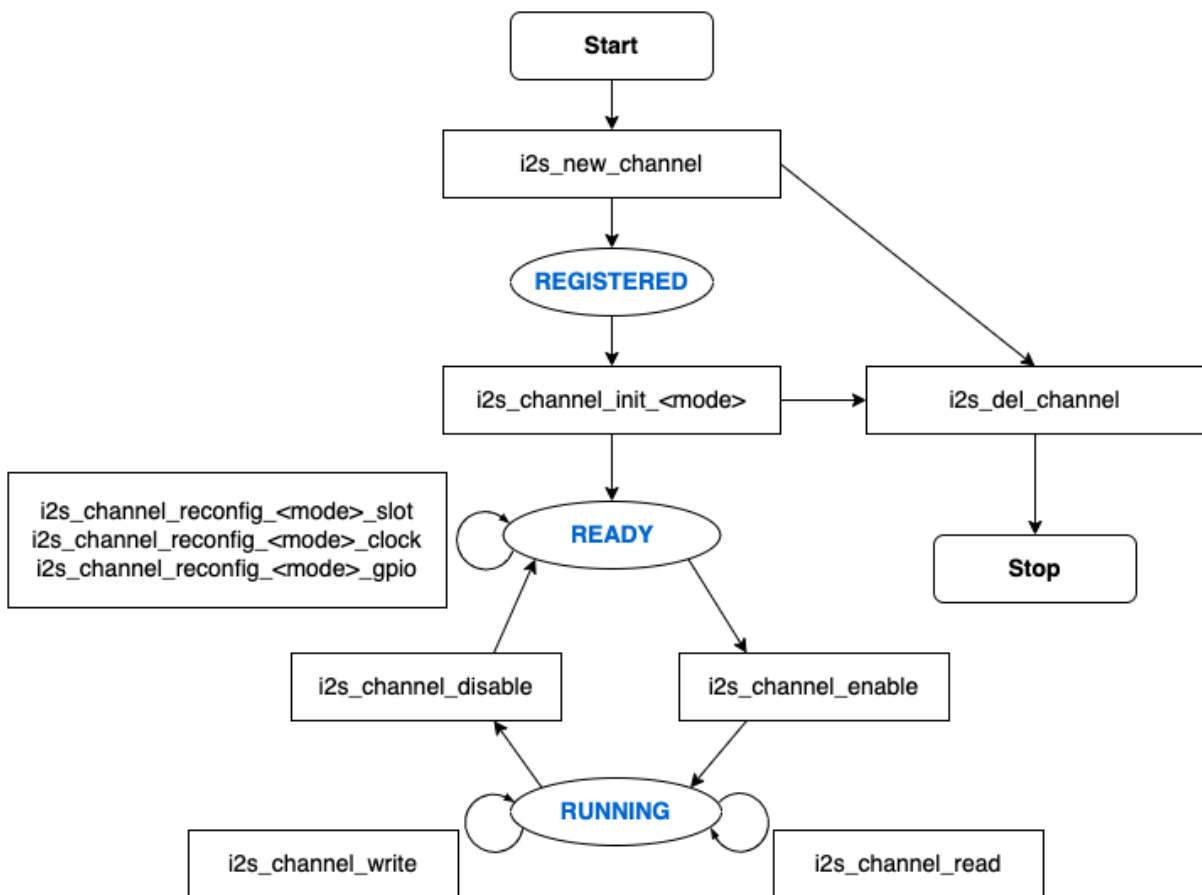

图 14: I2S 有限状态机

图中的 `<mode>` 可用相应的 I2S 通信模式来代替，如 `std` 代表标准的双声道模式。更多关于通信模式的信息，请参考 [I2S 通信模式](#) 小节。

数据传输 I2S 的数据传输（包括数据发送和接收）由 DMA 实现。在传输数据之前，请调用 `i2s_channel_enable()` 来启用特定的通道。发送或接收的数据达到 DMA 缓冲区的大小时，将触发 `I2S_OUT_EOF` 或 `I2S_IN_SUC_EOF` 中断。注意，DMA 缓冲区的大小不等于 `i2s_chan_config_t::dma_frame_num`，这里的一帧是指一个 WS 周期内的所有采样数据。因此，`dma_buffer_size = dma_frame_num * slot_num * slot_bit_width / 8`。传输数据时，可以调用 `i2s_channel_write()` 来输入数据，并把数据从源缓冲区复制到 DMA TX 缓冲区等待传输完成。此过程将重复进行，直到发送的字节数达到配置的大小。接收数据时，用户可以调用函

数 `i2s_channel_read()` 来等待接收包含 DMA 缓冲区地址的消息队列，从而将数据从 DMA RX 缓冲区复制到目标缓冲区。

`i2s_channel_write()` 和 `i2s_channel_read()` 都是阻塞函数，在源缓冲区的数据发送完毕前，或是整个目标缓冲区都被加载数据占用时，它们会一直保持等待状态。在等待时间达到最大阻塞时间时，返回 `ESP_ERR_TIMEOUT` 错误。要实现异步发送或接收数据，可以通过 `i2s_channel_register_event_callback()` 注册回调，随即便可在回调函数中直接访问 DMA 缓冲区，无需通过这两个阻塞函数来发送或接收数据。但请注意，该回调是一个中断回调，不要在该回调中添加复杂的逻辑、进行浮点运算或调用不可重入函数。

配置 用户可以通过调用相应函数（即 `i2s_channel_init_std_mode()`、`i2s_channel_init_pdm_rx_mode()`、`i2s_channel_init_pdm_tx_mode()` 或 `i2s_channel_init_tdm_mode()`）将通道初始化为特定模式。如果初始化后需要更新配置，必须先调用 `i2s_channel_disable()` 以确保通道已经停止运行，然后再调用相应的 `'reconfig'` 函数，例如 `i2s_channel_reconfig_std_slot()`、`i2s_channel_reconfig_std_clock()` 和 `i2s_channel_reconfig_std_gpio()`。

IRAM 安全 默认情况下，由于写入或擦除 flash 等原因导致 cache 被禁用时，I2S 中断将产生延迟，无法及时执行 EOF 中断。

在实时应用中，可通过启用 Kconfig 选项 `CONFIG_I2S_ISR_IRAM_SAFE` 来避免此种情况发生，启用后：

1. 即使在 cache 被禁用的情况下，中断仍可继续运行。
2. 驱动程序将存放在 DRAM 中（以防其意外映射到 PSRAM 中）。

启用该选项可以保证 cache 禁用时的中断运行，但会相应增加 IRAM 占用。

线程安全 驱动程序可保证所有公开的 I2S API 的线程安全，使用时，可以直接从不同的 RTOS 任务中调用此类 API，无需额外锁保护。注意，I2S 驱动使用 mutex 锁来保证线程安全，因此不允许在 ISR 中使用这些 API。

Kconfig 选项

- `CONFIG_I2S_ISR_IRAM_SAFE` 控制默认 ISR 处理程序能否在禁用 cache 的情况下工作。更多信息可参考 **IRAM 安全**。
- `CONFIG_I2S_SUPPRESS_DEPRECATED_WARN` 控制是否在使用原有 I2S 驱动时关闭警告信息。
- `CONFIG_I2S_ENABLE_DEBUG_LOG` 用于启用调试日志输出。启用该选项将增加固件的二进制文件大小。

应用实例

I2S 驱动例程请参考 `peripherals/i2s` 目录。以下为每种模式的简单用法：

标准 TX/RX 模式的应用 不同声道的通信格式可通过以下标准模式的辅助宏来生成。如上所述，在标准模式下有三种格式，辅助宏分别为：

- `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`
- `I2S_STD_PCM_SLOT_DEFAULT_CONFIG`
- `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`

时钟配置的辅助宏为：

- `I2S_STD_CLK_DEFAULT_CONFIG`。

请参考 **标准模式** 了解 STD API 的相关信息。更多细节请参考 `esp_driver_i2s/include/driver/i2s_std.h`。

STD TX 模式 以 16 位数据位宽为例，如果 `uint16_t` 写缓冲区中的数据如下所示：

数据 0	数据 1	数据 2	数据 3	数据 4	数据 5	数据 6	数据 7	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

下表展示了在不同 `i2s_std_slot_config_t::slot_mode` 和 `i2s_std_slot_config_t::slot_mask` 设置下线路上的真实数据。

数据位宽	声道模式	声道掩码	WS 低电平	WS 高电平	WS 低电平	WS 高电平	WS 低电平	WS 高电平	WS 低电平	WS 高电平
16 位	单声道	左	0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004	0x0000
		右	0x0000	0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004
		左右	0x0001	0x0001	0x0002	0x0002	0x0003	0x0003	0x0004	0x0004
	立体声	左	0x0001	0x0000	0x0003	0x0000	0x0005	0x0000	0x0007	0x0000
		右	0x0000	0x0002	0x0000	0x0004	0x0000	0x0006	0x0000	0x0008
		左右	0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008

备注： 数据位宽为 8 位和 32 位时，缓冲区的类型最好为 `uint8_t` 和 `uint32_t`。但需注意，数据位宽为 24 位时，数据缓冲区应该以 3 字节对齐，即每 3 个字节代表一个 24 位数据，另外，`i2s_chan_config_t::dma_frame_num`、`i2s_std_clk_config_t::mclk_multiple` 和写缓冲区的大小应该为 3 的倍数，否则线路上的数据或采样率可能会不准确。

```
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
/* 通过辅助宏获取默认的通道配置
 * 这个辅助宏在 'i2s_common.h' 中定义，由所有 I2S 通信模式共享
 * 它可以帮助指定 I2S 角色和端口 ID */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↪MASTER);
/* 分配新的 TX 通道并获取该通道的句柄 */
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* 进行配置，可以通过宏生成声道配置和时钟配置
 * 这两个辅助宏在 'i2s_std.h' 中定义，只能用于 STD 模式
 * 它们可以帮助初始化或更新声道和时钟配置 */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_
↪MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* 初始化通道 */
i2s_channel_init_std_mode(tx_handle, &std_cfg);
```

(下页继续)

(续上页)

```

/* 在写入数据之前,先启用 TX 通道 */
i2s_channel_enable(tx_handle);
i2s_channel_write(tx_handle, src_buf, bytes_to_write, bytes_written, ticks_to_
↪wait);

/* 如果需要更新声道或时钟配置
 * 需要在更新前先禁用通道 */
// i2s_channel_disable(tx_handle);
// std_cfg.slot_cfg.slot_mode = I2S_SLOT_MODE_MONO; // 默认为立体声
// i2s_channel_reconfig_std_slot(tx_handle, &std_cfg.slot_cfg);
// std_cfg.clk_cfg.sample_rate_hz = 96000;
// i2s_channel_reconfig_std_clock(tx_handle, &std_cfg.clk_cfg);

/* 删除通道之前必须先禁用通道 */
i2s_channel_disable(tx_handle);
/* 如果不再需要句柄,删除该句柄以释放通道资源 */
i2s_del_channel(tx_handle);

```

STD RX 模式 例如,当数据位宽为 16 时,如线路上的数据如下所示:

WS 低电 平	WS 高电 平	WS 低电 平	WS 高电 平	WS 低电 平	WS 高电 平	WS 低电 平	WS 高电 平	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

不同 `i2s_std_slot_config_t::slot_mode` 和 `i2s_std_slot_config_t::slot_mask` 配置下缓冲区中收到的数据如下所示。

数据位 宽	声道模 式	声道掩 码	数据 0	数据 1	数据 2	数据 3	数据 4	数据 5	数据 6	数据 7
16 位	单声道	左	0x0001	0x0003	0x0005	0x0007	0x0009	0x000b	0x000d	0x000f
		右	0x0002	0x0004	0x0006	0x0008	0x000a	0x000c	0x000e	0x0010
	立体声	任意	0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008

备注: 8 位、24 位和 32 位与 16 位的情况类似,接收缓冲区的数据位宽与线路上的数据位宽相等。此外需注意,数据位宽为 24 位时, `i2s_chan_config_t::dma_frame_num`、`i2s_std_clk_config_t::mclk_multiple` 和接收缓冲区的大小应该为 3 的倍数,否则线路上的数据或采样率可能会不准确。

```

#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t rx_handle;
/* 通过辅助宏获取默认的配置
 * 这个辅助宏在 'i2s_common.h' 中定义,由所有 I2S 通信模式共享
 * 它可以帮助指定 I2S 角色和端口 ID */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↪MASTER);
/* 分配新的 TX 通道并获取该通道的句柄 */
i2s_new_channel(&chan_cfg, NULL, &rx_handle);

/* 进行配置,可以通过宏生成声道配置和时钟配置
 * 这两个辅助宏在 'i2s_std.h' 中定义,只能用于 STD 模式
 * 它们可以帮助初始化或更新声道和时钟配置 */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),

```

(下页继续)

```

        .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_
↪MODE_STEREO),
        .gpio_cfg = {
            .mclk = I2S_GPIO_UNUSED,
            .bclk = GPIO_NUM_4,
            .ws = GPIO_NUM_5,
            .dout = I2S_GPIO_UNUSED,
            .din = GPIO_NUM_19,
            .invert_flags = {
                .mclk_inv = false,
                .bclk_inv = false,
                .ws_inv = false,
            },
        },
    },
};
/* 初始化通道 */
i2s_channel_init_std_mode(rx_handle, &std_cfg);

/* 在读取数据之前, 先启动 RX 通道 */
i2s_channel_enable(rx_handle);
i2s_channel_read(rx_handle, desc_buf, bytes_to_read, bytes_read, ticks_to_wait);

/* 删除通道之前必须先禁用通道 */
i2s_channel_disable(rx_handle);
/* 如果不再需要句柄, 删除该句柄以释放通道资源 */
i2s_del_channel(rx_handle);

```

PDM TX 模式的应用 针对 TX 通道的 PDM 模式，声道配置的辅助宏为：

- `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

时钟配置的辅助宏为：

- `I2S_PDM_TX_CLK_DEFAULT_CONFIG`

PDM TX API 的相关信息，可参考 [PDM 模式](#)。更多细节请参阅 `esp_driver_i2s/include/driver/i2s_pdm.h`。

PDM 数据位宽固定为 16 位。如果 `int16_t` 写缓冲区中的数据如下：

数据 0	数据 1	数据 2	数据 3	数据 4	数据 5	数据 6	数据 7	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

下表展示了不同 `i2s_pdm_tx_slot_config_t::slot_mode` 和 `i2s_pdm_tx_slot_config_t::slot_mask` 设置下线路上的真实数据。为方便理解，已将线路上的数据格式由 PDM 转为 PCM。

线路模式	声道模式	线路	左	右	左	右	左	右	左	右
单线 Codec	单声道	dout	0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004	0x0000
	立体声	dout	0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008
单线 DAC	单声道	dout	0x0001	0x0001	0x0002	0x0002	0x0003	0x0003	0x0004	0x0004
双线 DAC	单声道	dout	0x0002	0x0002	0x0004	0x0004	0x0006	0x0006	0x0008	0x0008
		dout2	0x0000	0x0000	0x0000	0x0000	0x0000	0x0000	0x0000	0x0000
	立体声	dout	0x0002	0x0002	0x0004	0x0004	0x0006	0x0006	0x0008	0x0008
		dout2	0x0001	0x0001	0x0003	0x0003	0x0005	0x0005	0x0007	0x0007

备注： PDM TX 模式有三种线路模式，分别为 `I2S_PDM_TX_ONE_LINE_CODECC`、`I2S_PDM_TX_ONE_LINE_DAC` 和 `I2S_PDM_TX_TWO_LINE_DAC`。单线 Codec 用于需要时钟信

号的 PDM 编解码器，PDM 编解码器可以通过时钟电平来区分左右声道。另外两种模式可通过低通滤波器直接驱动功率放大器，而无需时钟信号，所以有两条线路来区分左右声道。此外，对于单线 Codec 的单声道模式，可以通过在 GPIO 配置中设置时钟反转标志，强制将声道改变为右声道。

```
#include "driver/i2s_pdm.h"
#include "driver/gpio.h"

/* 分配 I2S TX 通道 */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_
↪MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* 初始化通道为 PDM TX 模式 */
i2s_pdm_tx_config_t pdm_tx_cfg = {
    .clk_cfg = I2S_PDM_TX_CLK_DEFAULT_CONFIG(36000),
    .slot_cfg = I2S_PDM_TX_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_
↪MODE_MONO),
    .gpio_cfg = {
        .clk = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .invert_flags = {
            .clk_inv = false,
        },
    },
};
i2s_channel_init_pdm_tx_mode(tx_handle, &pdm_tx_cfg);

...
```

PDM RX 模式的应用 针对 RX 通道的 PDM 模式，声道配置的辅助宏为：

- `I2S_PDM_RX_SLOT_DEFAULT_CONFIG`

时钟配置的辅助宏为：

- `I2S_PDM_RX_CLK_DEFAULT_CONFIG`

PDM RX API 的相关信息，可参考 [PDM 模式](#)。更多细节请参阅 `esp_driver_i2s/include/driver/i2s_pdm.h`。

PDM 数据位宽固定为 16 位。如果线路上的数据如下所示。为方便理解，已将线路上的数据格式由 PDM 转为 PCM。

左	右	左	右	左	右	左	右	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

下表展示了不同 `i2s_pdm_rx_slot_config_t::slot_mode` 和 `i2s_pdm_rx_slot_config_t::slot_mask` 设置下 `int16_t` 缓冲区接收的数据。

```
#include "driver/i2s_pdm.h"
#include "driver/gpio.h"

i2s_chan_handle_t rx_handle;

/* 分配 I2S RX 通道 */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_
↪MASTER);
i2s_new_channel(&chan_cfg, NULL, &rx_handle);

/* 初始化通道为 PDM RX 模式 */
i2s_pdm_rx_config_t pdm_rx_cfg = {
```

(下页继续)

```

        .clk_cfg = I2S_PDM_RX_CLK_DEFAULT_CONFIG(36000),
        .slot_cfg = I2S_PDM_RX_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_
↪MODE_MONO),
        .gpio_cfg = {
            .clk = GPIO_NUM_5,
            .din = GPIO_NUM_19,
            .invert_flags = {
                .clk_inv = false,
            },
        },
    },
};
i2s_channel_init_pdm_rx_mode(rx_handle, &pdm_rx_cfg);
...

```

TDM TX/RX 模式的应用 可以通过以下 TDM 模式的辅助宏生成不同的声道通信格式。如上所述，TDM 模式有四种格式，它们的辅助宏分别为：

- [I2S_TDM_PHILIPS_SLOT_DEFAULT_CONFIG](#)
- [I2S_TDM_MSB_SLOT_DEFAULT_CONFIG](#)
- [I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG](#)
- [I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG](#)

时钟配置的辅助宏为：

- [I2S_TDM_CLK_DEFAULT_CONFIG](#)

有关 TDM API 的信息，请参阅 [TDM 模式](#)。更多细节请参阅 [esp_driver_i2s/include/driver/i2s_tdm.h](#)。

备注：在为从机配置时钟时，由于硬件限制，请注意 `i2s_tdm_clk_config_t::bclk_div` 不应小于 8，增加此字段的值可以减少从机发送数据的延迟。使用高采样率时，数据可能会延迟一个 BCLK 周期以上，这将导致数据错位。可以通过缓慢增加 `i2s_tdm_clk_config_t::bclk_div` 的值来进行校正。

由于 `i2s_tdm_clk_config_t::bclk_div` 是 MCLK 基于 BCLK 的除数，增加该值也可以提高 MCLK 频率。因此，如果 MCLK 频率太高，将会无法从源时钟分频，此时时钟计算可能会失败，也就是说 `i2s_tdm_clk_config_t::bclk_div` 不是越大越好。

TDM TX 模式

```

#include "driver/i2s_tdm.h"
#include "driver/gpio.h"

/* 分配 I2S TX 通道 */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↪MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* 初始化通道为 TDM 模式 */
i2s_tdm_config_t tdm_cfg = {
    .clk_cfg = I2S_TDM_CLK_DEFAULT_CONFIG(44100),
    .slot_cfg = I2S_TDM_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_
↪MODE_STEREO,
        I2S_TDM_SLOT0 | I2S_TDM_SLOT1 | I2S_TDM_SLOT2 | I2S_TDM_SLOT3),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
    },
};

```

(下页继续)

```

        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_tdm_mode(tx_handle, &tdm_cfg);
...

```

TDM RX 模式

```

#include "driver/i2s_tdm.h"
#include "driver/gpio.h"

/* 将通道模式设置为 TDM */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_CONFIG(I2S_ROLE_MASTER, I2S_COMM_MODE_TDM,
↪ &i2s_pin);
i2s_new_channel(&chan_cfg, NULL, &rx_handle);

/* 初始化通道为 TDM 模式 */
i2s_tdm_config_t tdm_cfg = {
    .clk_cfg = I2S_TDM_CLK_DEFAULT_CONFIG(44100),
    .slot_cfg = I2S_TDM_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_
↪MODE_STEREO,
        I2S_TDM_SLOT0 | I2S_TDM_SLOT1 | I2S_TDM_SLOT2 | I2S_TDM_SLOT3),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = I2S_GPIO_UNUSED,
        .din = GPIO_NUM_18,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_tdm_mode(rx_handle, &tdm_cfg);
...

```

全双工 全双工模式可以在 I2S 端口中同时注册 TX 和 RX 通道，同时通道共享 BCLK 和 WS 信号。目前，STD 和 TDM 通信模式支持以下方式的全双工通信，但不支持 PDM 全双工模式，因为 PDM 模式下 TX 和 RX 通道的时钟不同。

请注意，一个句柄只能代表一个通道，因此仍然需要对 TX 和 RX 通道逐个进行声道和时钟配置。

以下示例展示了如何分配两个全双工通道：

```

#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;

/* 分配两个 I2S 通道 */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↪MASTER);

```

(下页继续)

(续上页)

```

/* 同时分配给 TX 和 RX 通道，使其进入全双工模式。 */
i2s_new_channel(&chan_cfg, &tx_handle, &rx_handle);

/* 配置两个通道，因为在全双工模式下，TX 和 RX 通道必须相同。 */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(32000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_
↳SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_std_mode(tx_handle, &std_cfg);
i2s_channel_init_std_mode(rx_handle, &std_cfg);

i2s_channel_enable(tx_handle);
i2s_channel_enable(rx_handle);

...

```

单工模式 在单工模式下分配通道，应该为每个通道调用 `i2s_new_channel()`。ESP32-P4 上，TX/RX 通道的时钟和 GPIO 管脚相互独立，因此可以配置为不同的模式和时钟，并且能够在单工模式下共存于同一个 I2S 端口中。对于 PDM 模式，用户可以通过在同一个 I2S 端口上注册 PDM TX 单工和 PDM RX 单工来实现 PDM 双工。但在这种情况下，PDM TX/RX 可能会使用不同的时钟，因此在配置 GPIO 管脚和时钟时需多加注意。

以下为单工模式的示例。请注意，如果 TX 和 RX 通道来自同一个控制器，则 TX 和 RX 通道的内部 MCLK 信号虽然是分开的，但输出的 MCLK 信号只能绑定到其中一个通道。如果两个通道都初始化了 MCLK，则该信号会绑定到后初始化的通道。

```

#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_
↳MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);
i2s_std_config_t std_tx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_
↳SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = GPIO_NUM_0,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,

```

(下页继续)

```

        .ws_inv = false,
    },
},
};
/* 初始化通道 */
i2s_channel_init_std_mode(tx_handle, &std_tx_cfg);
i2s_channel_enable(tx_handle);

/* 如果没有找到其他可用的 I2S 设备, RX 通道将被注册在另一个 I2S 上
 * 并返回 ESP_ERR_NOT_FOUND */
i2s_new_channel(&chan_cfg, NULL, &rx_handle); // RX 和 TX 通道都将注册在 I2S0_
↪上, 但配置可以不同
i2s_std_config_t std_rx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(16000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_
↪MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_6,
        .ws = GPIO_NUM_7,
        .dout = I2S_GPIO_UNUSED,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
},
};
i2s_channel_init_std_mode(rx_handle, &std_rx_cfg);
i2s_channel_enable(rx_handle);

```

应用注意事项

防止数据丢失 对于需要高频采样率的应用, 数据的巨大吞吐量可能会导致数据丢失。用户可以通过注册 ISR 回调函数来接收事件队列中的数据丢失事件:

```

static IRAM_ATTR bool i2s_rx_queue_overflow_callback(i2s_chan_handle_t_
↪handle, i2s_event_data_t *event, void *user_ctx)
{
    // 处理 RX 队列溢出事件 ...
    return false;
}

i2s_event_callbacks_t cbs = {
    .on_recv = NULL,
    .on_recv_q_ovf = i2s_rx_queue_overflow_callback,
    .on_sent = NULL,
    .on_send_q_ovf = NULL,
};
TEST_ESP_OK(i2s_channel_register_event_callback(rx_handle, &cbs, NULL));

```

请按照以下步骤操作, 以防止数据丢失:

1. 确定中断间隔。通常来说, 当发生数据丢失时, 为减少中断次数, 中断间隔应该越久越好。因此, 在保证 DMA 缓冲区大小不超过最大值 4092 的前提下, 应使 dma_frame_num 尽可能大。具体转换关系如下:

```

interrupt_interval(unit: sec) = dma_frame_num / sample_rate
dma_buffer_size = dma_frame_num * slot_num * data_bit_width / 8 <= 4092

```

2. 确定 `dma_desc_num` 的值。`dma_desc_num` 由 `i2s_channel_read` 轮询周期的最大时间决定，所有接收到的数据都应该存储在两个 `i2s_channel_read` 之间。这个周期可以通过计时器或输出 GPIO 信号来计算。具体转换关系如下：

```
dma_desc_num > polling_cycle / interrupt_interval
```

3. 确定接收缓冲区大小。在 `i2s_channel_read` 中提供的接收缓冲区应当能够容纳所有 DMA 缓冲区中的数据，这意味着它应该大于所有 DMA 缓冲区的总大小：

```
recv_buffer_size > dma_desc_num * dma_buffer_size
```

例如，如果某个 I2S 应用的已知值包括：

```
sample_rate = 144000 Hz
data_bit_width = 32 bits
slot_num = 2
polling_cycle = 10 ms
```

那么可以按照以下公式计算出参数 `dma_frame_num`、`dma_desc_num` 和 `recv_buf_size`：

```
dma_frame_num * slot_num * data_bit_width / 8 = dma_buffer_size <= 4092
dma_frame_num <= 511
interrupt_interval = dma_frame_num / sample_rate = 511 / 144000 = 0.003549 s = 3.
↳ 549 ms
dma_desc_num > polling_cycle / interrupt_interval = cell(10 / 3.549) = cell(2.818)
↳ = 3
recv_buffer_size > dma_desc_num * dma_buffer_size = 3 * 4092 = 12276 bytes
```

Functions

[esp_err_t i2s_channel_init_std_mode](#) (*i2s_chan_handle_t* handle, const *i2s_std_config_t* *std_cfg)

Initialize I2S channel to standard mode.

备注： Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

参数

- **handle** -- [in] I2S channel handler

- **std_cfg** -- **[in]** Configurations for standard mode, including clock, slot and GPIO The clock configuration can be generated by the helper macro `I2S_STD_CLK_DEFAULT_CONFIG` The slot configuration can be generated by the helper macro `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_STD_PCM_SLOT_DEFAULT_CONFIG` or `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`

返回

- `ESP_OK` Initialize successfully
- `ESP_ERR_NO_MEM` No memory for storing the channel information
- `ESP_ERR_INVALID_ARG` NULL pointer or invalid configuration
- `ESP_ERR_INVALID_STATE` This channel is not registered

esp_err_t `i2s_channel_reconfig_std_clock` (*i2s_chan_handle_t* handle, const *i2s_std_clk_config_t* *clk_cfg)

Reconfigure the I2S clock for standard mode.

备注: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

备注: The input channel handle has to be initialized to standard mode, i.e., `i2s_channel_init_std_mode` has been called before reconfiguring

参数

- **handle** -- **[in]** I2S channel handler
- **clk_cfg** -- **[in]** Standard mode clock configuration, can be generated by `I2S_STD_CLK_DEFAULT_CONFIG`

返回

- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not standard mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

esp_err_t `i2s_channel_reconfig_std_slot` (*i2s_chan_handle_t* handle, const *i2s_std_slot_config_t* *slot_cfg)

Reconfigure the I2S slot for standard mode.

备注: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

备注: The input channel handle has to be initialized to standard mode, i.e., `i2s_channel_init_std_mode` has been called before reconfiguring

参数

- **handle** -- **[in]** I2S channel handler
- **slot_cfg** -- **[in]** Standard mode slot configuration, can be generated by `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_STD_PCM_SLOT_DEFAULT_CONFIG` and `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`.

返回

- `ESP_OK` Set clock successfully
- `ESP_ERR_NO_MEM` No memory for DMA buffer
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not standard mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

`esp_err_t i2s_channel_reconfig_std_gpio` (`i2s_chan_handle_t` handle, const `i2s_std_gpio_config_t` *gpio_cfg)

Reconfigure the I2S GPIO for standard mode.

备注: Only allowed to be called when the channel state is `READY`, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

备注: The input channel handle has to be initialized to standard mode, i.e., `i2s_channel_init_std_mode` has been called before reconfiguring

参数

- **handle** -- [in] I2S channel handler
- **gpio_cfg** -- [in] Standard mode GPIO configuration, specified by user

返回

- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not standard mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

Structures

struct `i2s_std_slot_config_t`

I2S slot configuration for standard mode.

Public Members

`i2s_data_bit_width_t data_bit_width`

I2S sample data bit width (valid data bits per sample)

`i2s_slot_bit_width_t slot_bit_width`

I2S slot bit width (total bits per slot)

`i2s_slot_mode_t slot_mode`

Set mono or stereo mode with `I2S_SLOT_MODE_MONO` or `I2S_SLOT_MODE_STEREO` In TX direction, mono means the written buffer contains only one slot data and stereo means the written buffer contains both left and right data

`i2s_std_slot_mask_t slot_mask`

Select the left, right or both slot

uint32_t `ws_width`

WS signal width (i.e. the number of BCLK ticks that WS signal is high)

bool `ws_pol`

WS signal polarity, set true to enable high lever first

bool `bit_shift`

Set to enable bit shift in Philips mode

bool **left_align**
Set to enable left alignment

bool **big_endian**
Set to enable big endian

bool **bit_order_lsb**
Set to enable lsb first

struct **i2s_std_clk_config_t**
I2S clock configuration for standard mode.

Public Members

uint32_t **sample_rate_hz**
I2S sample rate

i2s_clock_src_t **clk_src**
Choose clock source, see `soc_periph_i2s_clk_src_t` for the supported clock sources. selected `I2S_CLK_SRC_EXTERNAL` (if supports) to enable the external source clock input via MCLK pin,

uint32_t **ext_clk_freq_hz**
External clock source frequency in Hz, only take effect when `clk_src = I2S_CLK_SRC_EXTERNAL`, otherwise this field will be ignored, Please make sure the frequency input is equal or greater than BCLK, i.e. `sample_rate_hz * slot_bits * 2`

i2s_mclk_multiple_t **mclk_multiple**
The multiple of MCLK to the sample rate Default is 256 in the helper macro, it can satisfy most of cases, but please set this field a multiple of 3 (like 384) when using 24-bit data width, otherwise the sample rate might be inaccurate

struct **i2s_std_gpio_config_t**
I2S standard mode GPIO pins configuration.

Public Members

gpio_num_t **mclk**
MCK pin, output by default, input if the clock source is selected to `I2S_CLK_SRC_EXTERNAL`

gpio_num_t **bclk**
BCK pin, input in slave role, output in master role

gpio_num_t **ws**
WS pin, input in slave role, output in master role

gpio_num_t **dout**
DATA pin, output

`gpio_num_t din`

DATA pin, input

`uint32_t mclk_inv`

Set 1 to invert the MCLK input/output

`uint32_t bclk_inv`

Set 1 to invert the BCLK input/output

`uint32_t ws_inv`

Set 1 to invert the WS input/output

struct `i2s_std_gpio_config_t`::[anonymous] `invert_flags`

GPIO pin invert flags

struct `i2s_std_config_t`

I2S standard mode major configuration that including clock/slot/GPIO configuration.

Public Members

`i2s_std_clk_config_t clk_cfg`

Standard mode clock configuration, can be generated by macro `I2S_STD_CLK_DEFAULT_CONFIG`

`i2s_std_slot_config_t slot_cfg`

Standard mode slot configuration, can be generated by macros `I2S_STD_[mode]_SLOT_DEFAULT_CONFIG`, [mode] can be replaced with PHILIPS/MSB/PCM

`i2s_std_gpio_config_t gpio_cfg`

Standard mode GPIO configuration, specified by user

Macros

`I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG` (bits_per_sample, mono_or_stereo)

Philips format in 2 slots.

This file is specified for I2S standard communication mode Features:

- Philips/MSB/PCM are supported in standard mode
- Fixed to 2 slots

参数

- `bits_per_sample` -- I2S data bit width
- `mono_or_stereo` -- `I2S_SLOT_MODE_MONO` or `I2S_SLOT_MODE_STEREO`

`I2S_STD_PCM_SLOT_DEFAULT_CONFIG` (bits_per_sample, mono_or_stereo)

PCM(short) format in 2 slots.

备注: PCM(long) is same as Philips in 2 slots

参数

- `bits_per_sample` -- I2S data bit width

- **mono_or_stereo** -- I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_STD_MSB_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)

MSB format in 2 slots.

参数

- **bits_per_sample** -- I2S data bit width
- **mono_or_stereo** -- I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_STD_CLK_DEFAULT_CONFIG (rate)

I2S default standard clock configuration.

备注: Please set the `mclk_multiple` to `I2S_MCLK_MULTIPLE_384` while using 24 bits data width. Otherwise the sample rate might be imprecise since the BCLK division is not a integer.

参数

- **rate** -- sample rate

PDM 模式

Header File

- [components/esp_driver_i2s/include/driver/i2s_pdm.h](#)
- This header file can be included with:

```
#include "driver/i2s_pdm.h"
```

- This header file is a part of the API provided by the `esp_driver_i2s` component. To declare that your component depends on `esp_driver_i2s`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_i2s
```

or

```
PRIV_REQUIRES esp_driver_i2s
```

Functions

`esp_err_t i2s_channel_init_pdm_rx_mode` (*i2s_chan_handle_t* handle, const *i2s_pdm_rx_config_t* *pdm_rx_cfg)

Initialize I2S channel to PDM RX mode.

备注: Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

参数

- **handle** -- **[in]** I2S RX channel handler
- **pdm_rx_cfg** -- **[in]** Configurations for PDM RX mode, including clock, slot and GPIO. The clock configuration can be generated by the helper macro `I2S_PDM_RX_CLK_DEFAULT_CONFIG`. The slot configuration can be generated by the helper macro `I2S_PDM_RX_SLOT_DEFAULT_CONFIG`.

返回

- `ESP_OK` Initialize successfully
- `ESP_ERR_NO_MEM` No memory for storing the channel information
- `ESP_ERR_INVALID_ARG` NULL pointer or invalid configuration

- `ESP_ERR_INVALID_STATE` This channel is not registered

`esp_err_t i2s_channel_reconfig_pdm_rx_clock` (*i2s_chan_handle_t* handle, const *i2s_pdm_rx_clk_config_t* *clk_cfg)

Reconfigure the I2S clock for PDM RX mode.

备注: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

备注: The input channel handle has to be initialized to PDM RX mode, i.e., `i2s_channel_init_pdm_rx_mode` has been called before reconfiguring

参数

- **handle** -- [in] I2S RX channel handler
- **clk_cfg** -- [in] PDM RX mode clock configuration, can be generated by `I2S_PDM_RX_CLK_DEFAULT_CONFIG`

返回

- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not PDM mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

`esp_err_t i2s_channel_reconfig_pdm_rx_slot` (*i2s_chan_handle_t* handle, const *i2s_pdm_rx_slot_config_t* *slot_cfg)

Reconfigure the I2S slot for PDM RX mode.

备注: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

备注: The input channel handle has to be initialized to PDM RX mode, i.e., `i2s_channel_init_pdm_rx_mode` has been called before reconfiguring

参数

- **handle** -- [in] I2S RX channel handler
- **slot_cfg** -- [in] PDM RX mode slot configuration, can be generated by `I2S_PDM_RX_SLOT_DEFAULT_CONFIG`

返回

- `ESP_OK` Set clock successfully
- `ESP_ERR_NO_MEM` No memory for DMA buffer
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not PDM mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

`esp_err_t i2s_channel_reconfig_pdm_rx_gpio` (*i2s_chan_handle_t* handle, const *i2s_pdm_rx_gpio_config_t* *gpio_cfg)

Reconfigure the I2S GPIO for PDM RX mode.

备注: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

备注: The input channel handle has to be initialized to PDM RX mode, i.e., `i2s_channel_init_pdm_rx_mode` has been called before reconfiguring

参数

- **handle** -- [in] I2S RX channel handler
- **gpio_cfg** -- [in] PDM RX mode GPIO configuration, specified by user

返回

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

esp_err_t `i2s_channel_init_pdm_tx_mode` (*i2s_chan_handle_t* handle, const *i2s_pdm_tx_config_t* *pdm_tx_cfg)

Initialize I2S channel to PDM TX mode.

备注: Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

参数

- **handle** -- [in] I2S TX channel handler
- **pdm_tx_cfg** -- [in] Configurations for PDM TX mode, including clock, slot and GPIO The clock configuration can be generated by the helper macro `I2S_PDM_TX_CLK_DEFAULT_CONFIG` The slot configuration can be generated by the helper macro `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

返回

- ESP_OK Initialize successfully
- ESP_ERR_NO_MEM No memory for storing the channel information
- ESP_ERR_INVALID_ARG NULL pointer or invalid configuration
- ESP_ERR_INVALID_STATE This channel is not registered

esp_err_t `i2s_channel_reconfig_pdm_tx_clock` (*i2s_chan_handle_t* handle, const *i2s_pdm_tx_clk_config_t* *clk_cfg)

Reconfigure the I2S clock for PDM TX mode.

备注: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

备注: The input channel handle has to be initialized to PDM TX mode, i.e., `i2s_channel_init_pdm_tx_mode` has been called before reconfiguring

参数

- **handle** -- [in] I2S TX channel handler
- **clk_cfg** -- [in] PDM TX mode clock configuration, can be generated by `I2S_PDM_TX_CLK_DEFAULT_CONFIG`

返回

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

esp_err_t **i2s_channel_reconfig_pdm_tx_slot** (*i2s_chan_handle_t* handle, const *i2s_pdm_tx_slot_config_t* *slot_cfg)

Reconfigure the I2S slot for PDM TX mode.

备注: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

备注: The input channel handle has to be initialized to PDM TX mode, i.e., `i2s_channel_init_pdm_tx_mode` has been called before reconfiguring

参数

- **handle** -- [in] I2S TX channel handler
- **slot_cfg** -- [in] PDM TX mode slot configuration, can be generated by `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

返回

- `ESP_OK` Set clock successfully
- `ESP_ERR_NO_MEM` No memory for DMA buffer
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not PDM mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

esp_err_t **i2s_channel_reconfig_pdm_tx_gpio** (*i2s_chan_handle_t* handle, const *i2s_pdm_tx_gpio_config_t* *gpio_cfg)

Reconfigure the I2S GPIO for PDM TX mode.

备注: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

备注: The input channel handle has to be initialized to PDM TX mode, i.e., `i2s_channel_init_pdm_tx_mode` has been called before reconfiguring

参数

- **handle** -- [in] I2S TX channel handler
- **gpio_cfg** -- [in] PDM TX mode GPIO configuration, specified by user

返回

- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not PDM mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

Structures

struct **i2s_pdm_rx_slot_config_t**

I2S slot configuration for PDM RX mode.

Public Members

i2s_data_bit_width_t **data_bit_width**

I2S sample data bit width (valid data bits per sample), only support 16 bits for PDM mode

***i2s_slot_bit_width_t* slot_bit_width**

I2S slot bit width (total bits per slot) , only support 16 bits for PDM mode

***i2s_slot_mode_t* slot_mode**

Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

***i2s_pdm_slot_mask_t* slot_mask**

Choose the slots to activate

bool hp_en

High pass filter enable

float hp_cut_off_freq_hz

High pass filter cut-off frequency, range 23.3Hz ~ 185Hz, see cut-off frequency sheet above

uint32_t amplify_num

The amplification number of the final conversion result. The data that have converted from PDM to PCM module, will time `amplify_num` additionally to amplify the final result. Note that it's only a multiplier of the digital PCM data, not the gain of the analog signal range 1~15, default 1

struct i2s_pdm_rx_clk_config_t

I2S clock configuration for PDM RX mode.

Public Members**uint32_t sample_rate_hz**

I2S sample rate

***i2s_clock_src_t* clk_src**

Choose clock source

***i2s_mclk_multiple_t* mclk_multiple**

The multiple of MCLK to the sample rate

***i2s_pdm_dsr_t* dn_sample_mode**

Down-sampling rate mode

uint32_t bclk_div

The division from MCLK to BCLK. The typical and minimum value is I2S_PDM_RX_BCLK_DIV_MIN. It will be set to I2S_PDM_RX_BCLK_DIV_MIN by default if it is smaller than I2S_PDM_RX_BCLK_DIV_MIN

struct i2s_pdm_rx_gpio_config_t

I2S PDM TX mode GPIO pins configuration.

Public Members

`gpio_num_t clk`

PDM clk pin, output

`gpio_num_t din`

DATA pin 0, input

`gpio_num_t dins`[(4)]

DATA pins, input, only take effect when corresponding `I2S_PDM_RX_LINEx_SLOT_xxx` is enabled in `i2s_pdm_rx_slot_config_t::slot_mask`

`uint32_t clk_inv`

Set 1 to invert the clk output

struct `i2s_pdm_rx_gpio_config_t`::[anonymous] `invert_flags`

GPIO pin invert flags

struct `i2s_pdm_rx_config_t`

I2S PDM RX mode major configuration that including clock/slot/GPIO configuration.

Public Members

`i2s_pdm_rx_clk_config_t clk_cfg`

PDM RX clock configurations, can be generated by macro `I2S_PDM_RX_CLK_DEFAULT_CONFIG`

`i2s_pdm_rx_slot_config_t slot_cfg`

PDM RX slot configurations, can be generated by macro `I2S_PDM_RX_SLOT_DEFAULT_CONFIG`

`i2s_pdm_rx_gpio_config_t gpio_cfg`

PDM RX slot configurations, specified by user

struct `i2s_pdm_tx_slot_config_t`

I2S slot configuration for PDM TX mode.

Public Members

`i2s_data_bit_width_t data_bit_width`

I2S sample data bit width (valid data bits per sample), only support 16 bits for PDM mode

`i2s_slot_bit_width_t slot_bit_width`

I2S slot bit width (total bits per slot), only support 16 bits for PDM mode

`i2s_slot_mode_t slot_mode`

Set mono or stereo mode with `I2S_SLOT_MODE_MONO` or `I2S_SLOT_MODE_STEREO` For PDM TX mode, mono means the data buffer only contains one slot data, Stereo means the data buffer contains two slots data

`uint32_t sd_prescale`

Sigma-delta filter prescale

i2s_pdm_sig_scale_t **sd_scale**

Sigma-delta filter scaling value

i2s_pdm_sig_scale_t **hp_scale**

High pass filter scaling value

i2s_pdm_sig_scale_t **lp_scale**

Low pass filter scaling value

i2s_pdm_sig_scale_t **sinc_scale**

Sinc filter scaling value

i2s_pdm_tx_line_mode_t **line_mode**

PDM TX line mode, one-line codec, one-line dac, two-line dac mode can be selected

bool **hp_en**

High pass filter enable

float **hp_cut_off_freq_hz**

High pass filter cut-off frequency, range 23.3Hz ~ 185Hz, see cut-off frequency sheet above

uint32_t **sd_dither**

Sigma-delta filter dither

uint32_t **sd_dither2**

Sigma-delta filter dither2

struct **i2s_pdm_tx_clk_config_t**

I2S clock configuration for PDM TX mode.

Public Members

uint32_t **sample_rate_hz**

I2S sample rate, not suggest to exceed 48000 Hz, otherwise more glitches and noise may appear

i2s_clock_src_t **clk_src**

Choose clock source

i2s_mclk_multiple_t **mclk_multiple**

The multiple of MCLK to the sample rate

uint32_t **up_sample_fp**

Up-sampling param fp

uint32_t **up_sample_fs**

Up-sampling param fs, not allowed to be greater than 480

uint32_t **bclk_div**

The division from MCLK to BCLK. The minimum value is I2S_PDM_TX_BCLK_DIV_MIN. It will be set to I2S_PDM_TX_BCLK_DIV_MIN by default if it is smaller than I2S_PDM_TX_BCLK_DIV_MIN

struct **i2s_pdm_tx_gpio_config_t**

I2S PDM TX mode GPIO pins configuration.

Public Members

gpio_num_t **clk**

PDM clk pin, output

gpio_num_t **dout**

DATA pin, output

gpio_num_t **dout2**

The second data pin for the DAC dual-line mode, only take effect when the line mode is I2S_PDM_TX_TWO_LINE_DAC

uint32_t **clk_inv**

Set 1 to invert the clk output

struct *i2s_pdm_tx_gpio_config_t*::[anonymous] **invert_flags**

GPIO pin invert flags

struct **i2s_pdm_tx_config_t**

I2S PDM TX mode major configuration that including clock/slot/GPIO configuration.

Public Members

i2s_pdm_tx_clk_config_t **clk_cfg**

PDM TX clock configurations, can be generated by macro I2S_PDM_TX_CLK_DEFAULT_CONFIG

i2s_pdm_tx_slot_config_t **slot_cfg**

PDM TX slot configurations, can be generated by macro I2S_PDM_TX_SLOT_DEFAULT_CONFIG

i2s_pdm_tx_gpio_config_t **gpio_cfg**

PDM TX GPIO configurations, specified by user

Macros

I2S_PDM_RX_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)

PDM format in 2 slots(RX)

This file is specified for I2S PDM communication mode Features:

- Only support PDM TX/RX mode
- Fixed to 2 slots
- Data bit width only support 16 bits

参数

- **bits_per_sample** -- I2S data bit width, only support 16 bits for PDM mode
- **mono_or_stereo** -- I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_PDM_RX_CLK_DEFAULT_CONFIG (rate)

I2S default PDM RX clock configuration.

参数

- **rate** -- sample rate

I2S_PDM_TX_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)

PDM style in 2 slots(TX) for codec line mode.

参数

- **bits_per_sample** -- I2S data bit width, only support 16 bits for PDM mode
- **mono_or_stereo** -- I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_PDM_TX_SLOT_DAC_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)

PDM style in 1 slots(TX) for DAC line mode.

备注: The noise might be different with different configurations, this macro provides a set of configurations that have relatively high SNR (Signal Noise Ratio), you can also adjust them to fit your case.

参数

- **bits_per_sample** -- I2S data bit width, only support 16 bits for PDM mode
- **mono_or_stereo** -- I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_PDM_TX_CLK_DEFAULT_CONFIG (rate)

I2S default PDM TX clock configuration for codec line mode.

备注: TX PDM can only be set to the following two up-sampling rate configurations: 1: fp = 960, fs = sample_rate_hz / 100, in this case, Fpdm = 128*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128*Fpcm = 128*sample_rate_hz If the PDM receiver do not care the PDM serial clock, it's recommended set Fpdm = 128*48000. Otherwise, the second configuration should be adopted.

参数

- **rate** -- sample rate (not suggest to exceed 48000 Hz, otherwise more glitches and noise may appear)

I2S_PDM_TX_CLK_DAC_DEFAULT_CONFIG (rate)

I2S default PDM TX clock configuration for DAC line mode.

备注: TX PDM can only be set to the following two up-sampling rate configurations: 1: fp = 960, fs = sample_rate_hz / 100, in this case, Fpdm = 128*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128*Fpcm = 128*sample_rate_hz If the PDM receiver do not care the PDM serial clock, it's recommended set Fpdm = 128*48000. Otherwise, the second configuration should be adopted.

备注: The noise might be different with different configurations, this macro provides a set of configurations that have relatively high SNR (Signal Noise Ratio), you can also adjust them to fit your case.

参数

- **rate** -- sample rate (not suggest to exceed 48000 Hz, otherwise more glitches and noise may appear)

```

Functions

`esp_err_t i2s_channel_init_tdm_mode` (`i2s_chan_handle_t` handle, const `i2s_tdm_config_t` *tdm_cfg)

Initialize I2S channel to TDM mode.

备注: Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

参数

- **handle** -- [in] I2S channel handler
- **tdm_cfg** -- [in] Configurations for TDM mode, including clock, slot and GPIO The clock configuration can be generated by the helper macro `I2S_TDM_CLK_DEFAULT_CONFIG` The slot configuration can be generated by the helper macro `I2S_TDM_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG`, `I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG` or `I2S_TDM_MSB_SLOT_DEFAULT_CONFIG`

返回

- `ESP_OK` Initialize successfully
- `ESP_ERR_NO_MEM` No memory for storing the channel information
- `ESP_ERR_INVALID_ARG` NULL pointer or invalid configuration
- `ESP_ERR_INVALID_STATE` This channel is not registered

`esp_err_t i2s_channel_reconfig_tdm_clock` (`i2s_chan_handle_t` handle, const `i2s_tdm_clk_config_t` *clk_cfg)

Reconfigure the I2S clock for TDM mode.

备注: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

备注: The input channel handle has to be initialized to TDM mode, i.e., `i2s_channel_init_tdm_mode` has been called before reconfiguring

参数

- **handle** -- [in] I2S channel handler

- **clk_cfg** -- **[in]** Standard mode clock configuration, can be generated by `I2S_TDM_CLK_DEFAULT_CONFIG`

返回

- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not TDM mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

esp_err_t `i2s_channel_reconfig_tdm_slot` (*i2s_chan_handle_t* handle, const *i2s_tdm_slot_config_t* *slot_cfg)

Reconfigure the I2S slot for TDM mode.

备注: Only allowed to be called when the channel state is `READY`, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

备注: The input channel handle has to be initialized to TDM mode, i.e., `i2s_channel_init_tdm_mode` has been called before reconfiguring

参数

- **handle** -- **[in]** I2S channel handler
- **slot_cfg** -- **[in]** Standard mode slot configuration, can be generated by `I2S_TDM_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG`, `I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG` or `I2S_TDM_MSB_SLOT_DEFAULT_CONFIG`.

返回

- `ESP_OK` Set clock successfully
- `ESP_ERR_NO_MEM` No memory for DMA buffer
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not TDM mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

esp_err_t `i2s_channel_reconfig_tdm_gpio` (*i2s_chan_handle_t* handle, const *i2s_tdm_gpio_config_t* *gpio_cfg)

Reconfigure the I2S GPIO for TDM mode.

备注: Only allowed to be called when the channel state is `READY`, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

备注: The input channel handle has to be initialized to TDM mode, i.e., `i2s_channel_init_tdm_mode` has been called before reconfiguring

参数

- **handle** -- **[in]** I2S channel handler
- **gpio_cfg** -- **[in]** Standard mode GPIO configuration, specified by user

返回

- `ESP_OK` Set clock successfully

- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

Structures

struct **i2s_tdm_slot_config_t**

I2S slot configuration for TDM mode.

Public Members

i2s_data_bit_width_t **data_bit_width**

I2S sample data bit width (valid data bits per sample)

i2s_slot_bit_width_t **slot_bit_width**

I2S slot bit width (total bits per slot)

i2s_slot_mode_t **slot_mode**

Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

i2s_tdm_slot_mask_t **slot_mask**

Slot mask. Activating slots by setting 1 to corresponding bits. When the activated slots is not consecutive, those data in inactivated slots will be ignored

uint32_t **ws_width**

WS signal width (i.e. the number of BCLK ticks that WS signal is high)

bool **ws_pol**

WS signal polarity, set true to enable high lever first

bool **bit_shift**

Set true to enable bit shift in Philips mode

bool **left_align**

Set true to enable left alignment

bool **big_endian**

Set true to enable big endian

bool **bit_order_lsb**

Set true to enable lsb first

bool **skip_mask**

Set true to enable skip mask. If it is enabled, only the data of the enabled channels will be sent, otherwise all data stored in DMA TX buffer will be sent

uint32_t **total_slot**

I2S total number of slots. If it is smaller than the biggest activated channel number, it will be set to this number automatically.

struct **i2s_tdm_clk_config_t**

I2S clock configuration for TDM mode.

Public Members

uint32_t **sample_rate_hz**

I2S sample rate

i2s_clock_src_t **clk_src**

Choose clock source, see `soc_periph_i2s_clk_src_t` for the supported clock sources. selected `I2S_CLK_SRC_EXTERNAL` (if supports) to enable the external source clock inputted via MCLK pin, please make sure the frequency inputted is equal or greater than `sample_rate_hz * mclk_multiple`

uint32_t **ext_clk_freq_hz**

External clock source frequency in Hz, only take effect when `clk_src = I2S_CLK_SRC_EXTERNAL`, otherwise this field will be ignored Please make sure the frequency inputted is equal or greater than BCLK, i.e. `sample_rate_hz * slot_bits * slot_num`

i2s_mclk_multiple_t **mclk_multiple**

The multiple of MCLK to the sample rate, only take effect for master role

uint32_t **bclk_div**

The division from MCLK to BCLK, only take effect for slave role, it shouldn't be smaller than 8. Increase this field when data sent by slave lag behind

struct **i2s_tdm_gpio_config_t**

I2S TDM mode GPIO pins configuration.

Public Members

gpio_num_t **mclk**

MCK pin, output by default, input if the clock source is selected to `I2S_CLK_SRC_EXTERNAL`

gpio_num_t **bclk**

BCK pin, input in slave role, output in master role

gpio_num_t **ws**

WS pin, input in slave role, output in master role

gpio_num_t **dout**

DATA pin, output

gpio_num_t **din**

DATA pin, input

uint32_t **mclk_inv**

Set 1 to invert the MCLK input/output

uint32_t **bclk_inv**

Set 1 to invert the BCLK input/output

uint32_t **ws_inv**

Set 1 to invert the WS input/output

struct *i2s_tdm_gpio_config_t*::[anonymous] **invert_flags**

GPIO pin invert flags

struct **i2s_tdm_config_t**

I2S TDM mode major configuration that including clock/slot/GPIO configuration.

Public Members

i2s_tdm_clk_config_t **clk_cfg**

TDM mode clock configuration, can be generated by macro I2S_TDM_CLK_DEFAULT_CONFIG

i2s_tdm_slot_config_t **slot_cfg**

TDM mode slot configuration, can be generated by macros I2S_TDM_[mode]_SLOT_DEFAULT_CONFIG, [mode] can be replaced with PHILIPS/MSB/PCM_SHORT/PCM_LONG

i2s_tdm_gpio_config_t **gpio_cfg**

TDM mode GPIO configuration, specified by user

Macros

I2S_TDM_AUTO_SLOT_NUM

This file is specified for I2S TDM communication mode Features:

- More than 2 slots

I2S_TDM_AUTO_WS_WIDTH

I2S_TDM_PHILIPS_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo, mask)

Philips format in active slot that enabled by mask.

参数

- **bits_per_sample** -- I2S data bit width
- **mono_or_stereo** -- I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
- **mask** -- active slot mask

I2S_TDM_MSB_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo, mask)

MSB format in active slot enabled that by mask.

参数

- **bits_per_sample** -- I2S data bit width
- **mono_or_stereo** -- I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
- **mask** -- active slot mask

I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo, mask)

PCM(short) format in active slot that enabled by mask.

参数

- **bits_per_sample** -- I2S data bit width
- **mono_or_stereo** -- I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
- **mask** -- active slot mask

I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo, mask)

PCM(long) format in active slot that enabled by mask.

参数

- **bits_per_sample** -- I2S data bit width
- **mono_or_stereo** -- I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
- **mask** -- active slot mask

I2S_TDM_CLK_DEFAULT_CONFIG (rate)

I2S default TDM clock configuration.

备注: Please set the mclk_multiple to I2S_MCLK_MULTIPLE_384 while the data width in slot configuration is set to 24 bits Otherwise the sample rate might be imprecise since the BCLK division is not a integer

参数

- **rate** -- sample rate

I2S 驱动

Header File

- [components/esp_driver_i2s/include/driver/i2s_common.h](#)
- This header file can be included with:

```
#include "driver/i2s_common.h"
```

- This header file is a part of the API provided by the `esp_driver_i2s` component. To declare that your component depends on `esp_driver_i2s`, add the following to your CMakeLists.txt:

```
REQUIRES esp_driver_i2s
```

or

```
PRIV_REQUIRES esp_driver_i2s
```

Functions

`esp_err_t i2s_new_channel` (const `i2s_chan_config_t` *chan_cfg, `i2s_chan_handle_t` *ret_tx_handle, `i2s_chan_handle_t` *ret_rx_handle)

Allocate new I2S channel(s)

备注: The new created I2S channel handle will be REGISTERED state after it is allocated successfully.

备注: When the port id in channel configuration is I2S_NUM_AUTO, driver will allocate I2S port automatically on one of the I2S controller, otherwise driver will try to allocate the new channel on the selected port.

备注: If both tx_handle and rx_handle are not NULL, it means this I2S controller will work at full-duplex mode, the RX and TX channels will be allocated on a same I2S port in this case. Note that some configurations of TX/RX channel are shared on ESP32 and ESP32S2, so please make sure they are working at same condition and under same status(start/stop). Currently, full-duplex mode can't guarantee TX/RX channels write/read synchronously, they can only share the clock signals for now.

备注: If tx_handle OR rx_handle is NULL, it means this I2S controller will work at simplex mode. For ESP32 and ESP32S2, the whole I2S controller (i.e. both RX and TX channel) will be occupied, even if only one of RX or TX channel is registered. For the other targets, another channel on this controller will still available.

参数

- **chan_cfg** -- [in] I2S controller channel configurations
- **ret_tx_handle** -- [out] I2S channel handler used for managing the sending channel(optional)
- **ret_rx_handle** -- [out] I2S channel handler used for managing the receiving channel(optional)

返回

- ESP_OK Allocate new channel(s) success
- ESP_ERR_NOT_SUPPORTED The communication mode is not supported on the current chip
- ESP_ERR_INVALID_ARG NULL pointer or illegal parameter in *i2s_chan_config_t*
- ESP_ERR_NOT_FOUND No available I2S channel found

esp_err_t **i2s_del_channel** (*i2s_chan_handle_t* handle)

Delete the I2S channel.

备注: Only allowed to be called when the I2S channel is at REGISTERED or READY state (i.e., it should stop before deleting it).

备注: Resource will be free automatically if all channels in one port are deleted

参数 handle -- [in] I2S channel handler

- ESP_OK Delete successfully
- ESP_ERR_INVALID_ARG NULL pointer

esp_err_t **i2s_channel_get_info** (*i2s_chan_handle_t* handle, *i2s_chan_info_t* *chan_info)

Get I2S channel information.

参数

- **handle** -- [in] I2S channel handler
- **chan_info** -- [out] I2S channel basic information

返回

- ESP_OK Get I2S channel information success
- ESP_ERR_NOT_FOUND The input handle doesn't match any registered I2S channels, it may not an I2S channel handle or not available any more
- ESP_ERR_INVALID_ARG The input handle or chan_info pointer is NULL

esp_err_t **i2s_channel_enable** (*i2s_chan_handle_t* handle)

Enable the I2S channel.

备注: Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started) the channel will enter RUNNING state once it is enabled successfully.

备注: Enable the channel can start the I2S communication on hardware. It will start outputting BCLK and WS signal. For MCLK signal, it will start to output when initialization is finished

参数 handle -- [in] I2S channel handler

- ESP_OK Start successfully
- ESP_ERR_INVALID_ARG NULL pointer
- ESP_ERR_INVALID_STATE This channel has not initialized or already started

esp_err_t **i2s_channel_disable** (*i2s_chan_handle_t* handle)

Disable the I2S channel.

备注: Only allowed to be called when the channel state is RUNNING, (i.e., channel has been started) the channel will enter READY state once it is disabled successfully.

备注: Disable the channel can stop the I2S communication on hardware. It will stop BCLK and WS signal but not MCLK signal

参数 **handle** -- [in] I2S channel handler

返回

- ESP_OK Stop successfully
- ESP_ERR_INVALID_ARG NULL pointer
- ESP_ERR_INVALID_STATE This channel has not started

esp_err_t **i2s_channel_preload_data** (*i2s_chan_handle_t* tx_handle, const void *src, size_t size, size_t *bytes_loaded)

Preload the data into TX DMA buffer.

备注: Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started)

备注: As the initial DMA buffer has no data inside, it will transmit the empty buffer after enabled the channel, this function is used to preload the data into the DMA buffer, so that the valid data can be transmitted immediately after the channel is enabled.

备注: This function can be called multiple times before enabling the channel, the buffer that loaded later will be concatenated behind the former loaded buffer. But when all the DMA buffers have been loaded, no more data can be preload then, please check the `bytes_loaded` parameter to see how many bytes are loaded successfully, when the `bytes_loaded` is smaller than the `size`, it means the DMA buffers are full.

参数

- **tx_handle** -- [in] I2S TX channel handler
- **src** -- [in] The pointer of the source buffer to be loaded
- **size** -- [in] The source buffer size
- **bytes_loaded** -- [out] The bytes that successfully been loaded into the TX DMA buffer

返回

- ESP_OK Load data successful
- ESP_ERR_INVALID_ARG NULL pointer or not TX direction
- ESP_ERR_INVALID_STATE This channel has not started

esp_err_t **i2s_channel_write** (*i2s_chan_handle_t* handle, const void *src, size_t size, size_t *bytes_written, uint32_t timeout_ms)

I2S write data.

备注: Only allowed to be called when the channel state is RUNNING, (i.e., TX channel has been started and is not writing now) but the RUNNING only stands for the software state, it doesn't mean there is no the signal transporting on line.

参数

- **handle** -- **[in]** I2S channel handler
- **src** -- **[in]** The pointer of sent data buffer
- **size** -- **[in]** Max data buffer length
- **bytes_written** -- **[out]** Byte number that actually be sent, can be NULL if not needed
- **timeout_ms** -- **[in]** Max block time

返回

- ESP_OK Write successfully
- ESP_ERR_INVALID_ARG NULL pointer or this handle is not TX handle
- ESP_ERR_TIMEOUT Writing timeout, no writing event received from ISR within ticks_to_wait
- ESP_ERR_INVALID_STATE I2S is not ready to write

`esp_err_t i2s_channel_read(i2s_chan_handle_t handle, void *dest, size_t size, size_t *bytes_read, uint32_t timeout_ms)`

I2S read data.

备注: Only allowed to be called when the channel state is RUNNING but the RUNNING only stands for the software state, it doesn't mean there is no the signal transporting on line.

参数

- **handle** -- **[in]** I2S channel handler
- **dest** -- **[in]** The pointer of receiving data buffer
- **size** -- **[in]** Max data buffer length
- **bytes_read** -- **[out]** Byte number that actually be read, can be NULL if not needed
- **timeout_ms** -- **[in]** Max block time

返回

- ESP_OK Read successfully
- ESP_ERR_INVALID_ARG NULL pointer or this handle is not RX handle
- ESP_ERR_TIMEOUT Reading timeout, no reading event received from ISR within ticks_to_wait
- ESP_ERR_INVALID_STATE I2S is not ready to read

`esp_err_t i2s_channel_register_event_callback(i2s_chan_handle_t handle, const i2s_event_callbacks_t *callbacks, void *user_data)`

Set event callbacks for I2S channel.

备注: Only allowed to be called when the channel state is REGISTERED / READY, (i.e., before channel starts)

备注: User can deregister a previously registered callback by calling this function and setting the callback member in the `callbacks` structure to NULL.

备注: When CONFIG_I2S_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data`

should also reside in SRAM or internal RAM as well.

参数

- **handle** -- **[in]** I2S channel handler
- **callbacks** -- **[in]** Group of callback functions
- **user_data** -- **[in]** User data, which will be passed to callback functions directly

返回

- ESP_OK Set event callbacks successfully
- ESP_ERR_INVALID_ARG Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE Set event callbacks failed because the current channel state is not REGISTERED or READY

Structures

struct **i2s_event_callbacks_t**

Group of I2S callbacks.

备注: The callbacks are all running under ISR environment

备注: When CONFIG_I2S_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

i2s_isr_callback_t **on_recv**

Callback of data received event, only for RX channel The event data includes DMA buffer address and size that just finished receiving data

i2s_isr_callback_t **on_recv_q_ovf**

Callback of receiving queue overflowed event, only for RX channel The event data includes buffer size that has been overwritten

i2s_isr_callback_t **on_sent**

Callback of data sent event, only for TX channel The event data includes DMA buffer address and size that just finished sending data

i2s_isr_callback_t **on_send_q_ovf**

Callback of sending queue overflowed event, only for TX channel The event data includes buffer size that has been overwritten

struct **i2s_chan_config_t**

I2S controller channel configuration.

Public Members

i2s_port_t **id**

I2S port id

***i2s_role_t* role**

I2S role, I2S_ROLE_MASTER or I2S_ROLE_SLAVE

uint32_t dma_desc_num

I2S DMA buffer number, it is also the number of DMA descriptor

uint32_t dma_frame_num

I2S frame number in one DMA buffer. One frame means one-time sample data in all slots, it should be the multiple of 3 when the data bit width is 24.

bool auto_clear

Alias of auto_clear_after_cb

bool auto_clear_after_cb

Set to auto clear DMA TX buffer after on_sent callback, I2S will always send zero automatically if no data to send. So that user can assign the data to the DMA buffers directly in the callback, and the data won't be cleared after quit the callback.

bool auto_clear_before_cb

Set to auto clear DMA TX buffer before on_sent callback, I2S will always send zero automatically if no data to send So that user can access data in the callback that just finished to send.

int intr_priority

I2S interrupt priority, range [0, 7], if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

struct i2s_chan_info_t

I2S channel information.

Public Members***i2s_port_t* id**

I2S port id

***i2s_role_t* role**

I2S role, I2S_ROLE_MASTER or I2S_ROLE_SLAVE

***i2s_dir_t* dir**

I2S channel direction

***i2s_comm_mode_t* mode**

I2S channel communication mode

***i2s_chan_handle_t* pair_chan**

I2S pair channel handle in duplex mode, always NULL in simplex mode

uint32_t total_dma_buf_size

Total size of all the allocated DMA buffers

- 0 if the channel has not been initialized
- non-zero if the channel has been initialized

Macros

I2S_CHANNEL_DEFAULT_CONFIG (i2s_num, i2s_role)

get default I2S property

I2S_GPIO_UNUSED

Used in `i2s_gpio_config_t` for signals which are not used

I2S 类型

Header File

- `components/esp_driver_i2s/include/driver/i2s_types.h`
- This header file can be included with:

```
#include "driver/i2s_types.h"
```

- This header file is a part of the API provided by the `esp_driver_i2s` component. To declare that your component depends on `esp_driver_i2s`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_i2s
```

or

```
PRIV_REQUIRES esp_driver_i2s
```

Structures

struct **i2s_event_data_t**

Event structure used in I2S event queue.

Public Members

void ***data**

(Deprecated) The secondary pointer of DMA buffer that just finished sending or receiving for `on_recv` and `on_sent` callback NULL for `on_recv_q_ovf` and `on_send_q_ovf` callback

void ***dma_buf**

The first level pointer of DMA buffer that just finished sending or receiving for `on_recv` and `on_sent` callback NULL for `on_recv_q_ovf` and `on_send_q_ovf` callback

size_t **size**

The buffer size of DMA buffer when success to send or receive, also the buffer size that dropped when queue overflow. It is related to the `dma_frame_num` and `data_bit_width`, typically it is fixed when `data_bit_width` is not changed.

Type Definitions

typedef struct `i2s_channel_obj_t` ***i2s_chan_handle_t**

I2S channel object handle, the control unit of the I2S driver

typedef bool (***i2s_isr_callback_t**)(`i2s_chan_handle_t` handle, `i2s_event_data_t` *event, void *user_ctx)

I2S event callback.

Param handle [in] I2S channel handle, created from `i2s_new_channel()`

Param event [in] I2S event data

Param user_ctx [in] User registered context, passed from
`i2s_channel_register_event_callback()`

Return Whether a high priority task has been waken up by this callback function

Enumerations

enum **i2s_port_t**

I2S controller port number, the max port number is (SOC_I2S_NUM -1).

Values:

enumerator **I2S_NUM_0**

I2S controller port 0

enumerator **I2S_NUM_1**

I2S controller port 1

enumerator **I2S_NUM_2**

I2S controller port 2

enumerator **I2S_NUM_AUTO**

Select whichever port is available

enum **i2s_comm_mode_t**

I2S controller communication mode.

Values:

enumerator **I2S_COMM_MODE_STD**

I2S controller using standard communication mode, support Philips/MSB/PCM format

enumerator **I2S_COMM_MODE_PDM**

I2S controller using PDM communication mode, support PDM output or input

enumerator **I2S_COMM_MODE_TDM**

I2S controller using TDM communication mode, support up to 16 slots per frame

enumerator **I2S_COMM_MODE_NONE**

Unspecified I2S controller mode

enum **i2s_mclk_multiple_t**

The multiple of MCLK to sample rate.

备注: MCLK is the minimum resolution of the I2S clock. Increasing mclk multiple can reduce the clock jitter of BCLK and WS, which is also useful for the codec that don't require MCLK but have strict requirement to BCLK. For the 24-bit slot width, please choose a multiple that can be divided by 3 (i.e. 24-bit compatible).

Values:

enumerator **I2S_MCLK_MULTIPLE_128**

$MCLK = sample_rate * 128$

enumerator **I2S_MCLK_MULTIPLE_192**
MCLK = sample_rate * 192 (24-bit compatible)

enumerator **I2S_MCLK_MULTIPLE_256**
MCLK = sample_rate * 256

enumerator **I2S_MCLK_MULTIPLE_384**
MCLK = sample_rate * 384 (24-bit compatible)

enumerator **I2S_MCLK_MULTIPLE_512**
MCLK = sample_rate * 512

enumerator **I2S_MCLK_MULTIPLE_576**
MCLK = sample_rate * 576 (24-bit compatible)

enumerator **I2S_MCLK_MULTIPLE_768**
MCLK = sample_rate * 768 (24-bit compatible)

enumerator **I2S_MCLK_MULTIPLE_1024**
MCLK = sample_rate * 1024

enumerator **I2S_MCLK_MULTIPLE_1152**
MCLK = sample_rate * 1152 (24-bit compatible)

Header File

- [components/hal/include/hal/i2s_types.h](#)
- This header file can be included with:

```
#include "hal/i2s_types.h"
```

Type Definitions

```
typedef soc_periph_i2s_clk_src_t i2s_clock_src_t  
I2S clock source
```

Enumerations

```
enum i2s_slot_mode_t  
I2S channel slot mode.
```

Values:

enumerator **I2S_SLOT_MODE_MONO**
I2S channel slot format mono, transmit same data in all slots for tx mode, only receive the data in the first slots for rx mode.

enumerator **I2S_SLOT_MODE_STEREO**
I2S channel slot format stereo, transmit different data in different slots for tx mode, receive the data in all slots for rx mode.

enum **i2s_dir_t**

I2S channel direction.

Values:

enumerator **I2S_DIR_RX**

I2S channel direction RX

enumerator **I2S_DIR_TX**

I2S channel direction TX

enum **i2s_role_t**

I2S controller role.

Values:

enumerator **I2S_ROLE_MASTER**

I2S controller master role, bclk and ws signal will be set to output

enumerator **I2S_ROLE_SLAVE**

I2S controller slave role, bclk and ws signal will be set to input

enum **i2s_data_bit_width_t**

Available data bit width in one slot.

Values:

enumerator **I2S_DATA_BIT_WIDTH_8BIT**

I2S channel data bit-width: 8

enumerator **I2S_DATA_BIT_WIDTH_16BIT**

I2S channel data bit-width: 16

enumerator **I2S_DATA_BIT_WIDTH_24BIT**

I2S channel data bit-width: 24

enumerator **I2S_DATA_BIT_WIDTH_32BIT**

I2S channel data bit-width: 32

enum **i2s_slot_bit_width_t**

Total slot bit width in one slot.

Values:

enumerator **I2S_SLOT_BIT_WIDTH_AUTO**

I2S channel slot bit-width equals to data bit-width

enumerator **I2S_SLOT_BIT_WIDTH_8BIT**

I2S channel slot bit-width: 8

enumerator **I2S_SLOT_BIT_WIDTH_16BIT**

I2S channel slot bit-width: 16

enumerator **I2S_SLOT_BIT_WIDTH_24BIT**

I2S channel slot bit-width: 24

enumerator **I2S_SLOT_BIT_WIDTH_32BIT**

I2S channel slot bit-width: 32

enum **i2s_pcm_compress_t**

A/U-law decompress or compress configuration.

Values:

enumerator **I2S_PCM_DISABLE**

Disable A/U law decompress or compress

enumerator **I2S_PCM_A_DECOMPRESS**

A-law decompress

enumerator **I2S_PCM_A_COMPRESS**

A-law compress

enumerator **I2S_PCM_U_DECOMPRESS**

U-law decompress

enumerator **I2S_PCM_U_COMPRESS**

U-law compress

enum **i2s_pdm_dsr_t**

I2S PDM RX down-sampling mode.

Values:

enumerator **I2S_PDM_DSR_8S**

downsampling number is 8 for PDM RX mode

enumerator **I2S_PDM_DSR_16S**

downsampling number is 16 for PDM RX mode

enumerator **I2S_PDM_DSR_MAX**

enum **i2s_pdm_sig_scale_t**

pdm tx signal scaling mode

Values:

enumerator **I2S_PDM_SIG_SCALING_DIV_2**

I2S TX PDM signal scaling: /2

enumerator **I2S_PDM_SIG_SCALING_MUL_1**

I2S TX PDM signal scaling: x1

enumerator **I2S_PDM_SIG_SCALING_MUL_2**

I2S TX PDM signal scaling: x2

enumerator **I2S_PDM_SIG_SCALING_MUL_4**

I2S TX PDM signal scaling: x4

enum **i2s_pdm_tx_line_mode_t**

PDM TX line mode.

备注: For the standard codec mode, PDM pins are connect to a codec which requires both clock signal and data signal For the DAC output mode, PDM data signal can be connected to a power amplifier directly with a low-pass filter, normally, DAC output mode doesn't need the clock signal.

Values:

enumerator **I2S_PDM_TX_ONE_LINE_CODEC**

Standard PDM format output, left and right slot data on a single line

enumerator **I2S_PDM_TX_ONE_LINE_DAC**

PDM DAC format output, left or right slot data on a single line

enumerator **I2S_PDM_TX_TWO_LINE_DAC**

PDM DAC format output, left and right slot data on separated lines

enum **i2s_std_slot_mask_t**

I2S slot select in standard mode.

备注: It has different meanings in tx/rx/mono/stereo mode, and it may have differen behaviors on different targets For the details, please refer to the I2S API reference

Values:

enumerator **I2S_STD_SLOT_LEFT**

I2S transmits or receives left slot

enumerator **I2S_STD_SLOT_RIGHT**

I2S transmits or receives right slot

enumerator **I2S_STD_SLOT_BOTH**

I2S transmits or receives both left and right slot

enum **i2s_pdm_slot_mask_t**

I2S slot select in PDM mode.

Values:

enumerator **I2S_PDM_SLOT_RIGHT**

I2S PDM only transmits or receives the PDM device whose 'select' pin is pulled up

enumerator **I2S_PDM_SLOT_LEFT**

I2S PDM only transmits or receives the PDM device whose 'select' pin is pulled down

enumerator **I2S_PDM_SLOT_BOTH**

I2S PDM transmits or receives both two slots

enumerator **I2S_PDM_RX_LINE0_SLOT_RIGHT**

I2S PDM receives the right slot on line 0

enumerator **I2S_PDM_RX_LINE0_SLOT_LEFT**

I2S PDM receives the left slot on line 0

enumerator **I2S_PDM_RX_LINE1_SLOT_RIGHT**

I2S PDM receives the right slot on line 1

enumerator **I2S_PDM_RX_LINE1_SLOT_LEFT**

I2S PDM receives the left slot on line 1

enumerator **I2S_PDM_RX_LINE2_SLOT_RIGHT**

I2S PDM receives the right slot on line 2

enumerator **I2S_PDM_RX_LINE2_SLOT_LEFT**

I2S PDM receives the left slot on line 2

enumerator **I2S_PDM_RX_LINE3_SLOT_RIGHT**

I2S PDM receives the right slot on line 3

enumerator **I2S_PDM_RX_LINE3_SLOT_LEFT**

I2S PDM receives the left slot on line 3

enumerator **I2S_PDM_LINE_SLOT_ALL**

I2S PDM receives all slots

enum **i2s_tdm_slot_mask_t**

tdm slot number

备注: Multiple slots in TDM mode. For TX module, only the active slot send the audio data, the inactive slot send a constant or will be skipped if 'skip_msk' is set. For RX module, only receive the audio data in active slots, the data in inactive slots will be ignored. the bit map of active slot can not exceed (0x1«total_slot_num). e.g: slot_mask = (I2S_TDM_SLOT0 | I2S_TDM_SLOT3), here the active slot number is 2 and total_slot is not supposed to be smaller than 4.

Values:

enumerator **I2S_TDM_SLOT0**

I2S slot 0 enabled

enumerator **I2S_TDM_SLOT1**

I2S slot 1 enabled

enumerator **I2S_TDM_SLOT2**

I2S slot 2 enabled

enumerator **I2S_TDM_SLOT3**

I2S slot 3 enabled

enumerator **I2S_TDM_SLOT4**

I2S slot 4 enabled

enumerator **I2S_TDM_SLOT5**

I2S slot 5 enabled

enumerator **I2S_TDM_SLOT6**

I2S slot 6 enabled

2.5.14 Image Signal Processor

Introduction

ESP32-P4 includes an Image Signal Processor (ISP), which is a feature pipeline that consists of many image processing algorithms. ISP receives image data from the DVP camera or MIPI-CSI camera, or system memory, and writes the processed image data to the system memory through DMA. ISP shall work with other modules to read and write data, it can not work alone.

Terminology

- MIPI-CSI: Camera serial interface, a high-speed serial interface for cameras compliant with MIPI specifications
- DVP: Digital video parallel interface, generally composed of vsync, hsync, de, and data signals
- RAW: Unprocessed data directly output from an image sensor, typically divided into R, Gr, Gb, and B four channels classified into RAW8, RAW10, RAW12, etc., based on bit width
- RGB: Colored image format composed of red, green, and blue colors classified into RGB888, RGB565, etc., based on the bit width of each color
- YUV: Colored image format composed of luminance and chrominance classified into YUV444, YUV422, YUV420, etc., based on the data arrangement
- BF: Bayer Domain Filter
- AF: Auto-focus
- AWB: Auto-white balance
- CCM: Color correction matrix

ISP Pipeline

图 15: ISP Pipeline

Functional Overview

The ISP driver offers following services:

- *Resource Allocation* - covers how to allocate ISP resources with properly set of configurations. It also covers how to recycle the resources when they finished working.
- *Enable and disable ISP processor* - covers how to enable and disable an ISP processor.
- *Get AF statistics in one shot or continuous way* - covers how to get AF statistics one-shot or continuously.

- *Get AWB statistics in one shot or continuous way* - covers how to get AWB white patches statistics one-shot or continuously.
- *Configure CCM* - covers how to config the Color Correction Matrix.
- *Register callback* - covers how to hook user specific code to ISP driver event callback function.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can bring different effects to the driver.
- *IRAM SAFE* - describes tips on how to make the ISP interrupt and control functions work better along with a disabled cache.

Resource Allocation

Install ISP Driver ISP driver requires the configuration that specified by `esp_isp_processor_cfg_t`.

If the configurations in `esp_isp_processor_cfg_t` is specified, users can call `esp_isp_new_processor()` to allocate and initialize an ISP processor. This function will return an ISP processor handle if it runs correctly. You can take following code as reference.

```
esp_isp_processor_cfg_t isp_config = {
    .clk_src = ISP_CLK_SRC_DEFAULT,
    .clk_hz = 80 * 1000 * 1000,
    .input_data_source = ISP_INPUT_DATA_SOURCE_CSI,
    .input_data_color_type = ISP_COLOR_RAW8,
    .output_data_color_type = ISP_COLOR_RGB565,
};

isp_proc_handle_t isp_proc = NULL;
ESP_ERROR_CHECK(esp_isp_new_processor(&isp_config, &isp_proc));
```

You can use the created handle to do driver enable / disable the ISP driver and do other ISP module installation.

Install ISP Auto-Focus (AF) Driver ISP auto-focus (AF) driver requires the configuration that specified by `esp_isp_af_config_t`.

If the configurations in `esp_isp_af_config_t` is specified, users can call `esp_isp_new_af_controller()` to allocate and initialize an ISP AF processor. This function will return an ISP AF processor handle if it runs correctly. You can take following code as reference.

```
esp_isp_af_config_t af_config = {
    .edge_thresh = 128,
};

isp_af_ctrlr_t af_ctrlr = NULL;
ESP_ERROR_CHECK(esp_isp_new_af_controller(isp_proc, &af_config, &af_ctrlr));
```

You can use the created handle to do driver enable / disable the ISP AF driver and ISP AF Env module installation.

Install ISP Auto-White-Balance (AWB) Driver ISP auto-white-balance (AWB) driver requires the configuration specified by `esp_isp_awb_config_t`.

If an `esp_isp_awb_config_t` configuration is specified, you can call `esp_isp_new_awb_controller()` to allocate and initialize an ISP AWB processor. This function will return an ISP AWB processor handle on success. You can take following code as reference.

```
isp_awb_ctrlr_t awb_ctrlr = NULL;
uint32_t image_width = 800;
uint32_t image_height = 600;
/* The AWB configuration, please refer to the API comment for how to tune these_
↳parameters */
esp_isp_awb_config_t awb_config = {
```

(下页继续)

```

        .sample_point = ISP_AWB_SAMPLE_POINT_AFTER_CCM,
        .window = {
            .top_left = {.x = image_width * 0.2, .y = image_height * 0.2},
            .btm_right = {.x = image_width * 0.8, .y = image_height * 0.8},
        },
        .white_patch = {
            .luminance = {.min = 0, .max = 220 * 3},
            .red_green_ratio = {.min = 0.0f, .max = 3.999f},
            .blue_green_ratio = {.min = 0.0f, .max = 3.999f},
        },
    };
ESP_ERROR_CHECK(esp_isp_new_awb_controller(isp_proc, &awb_config, &awb_ctrlr));

```

The AWB handle created in this step is required by other AWB APIs and AWB scheme.

Uninstall ISP Driver If a previously installed ISP processor is no longer needed, it's recommended to recycle the resource by calling `esp_isp_del_processor()`, so that to release the underlying hardware.

UnInstall ISP AF Driver If a previously installed ISP AF processor is no longer needed, it's recommended to recycle the resource by calling `esp_isp_del_af_controller()`, so that to release the underlying hardware.

UnInstall ISP AWB Driver If a previously installed ISP AWB processor is no longer needed, it's recommended to free the resource by calling `esp_isp_del_awb_controller()`, it will also release the underlying hardware.

Enable and Disable ISP

ISP

Before doing ISP pipeline, you need to enable the ISP processor first, by calling `esp_isp_enable()`. This function:

- Switches the driver state from **init** to **enable**.

Calling `esp_isp_disable()` does the opposite, that is, put the driver back to the **init** state.

ISP AF Processor

Before doing ISP AF, you need to enable the ISP AF processor first, by calling `esp_isp_af_controller_enable()`. This function:

- Switches the driver state from **init** to **enable**.

Calling `esp_isp_af_controller_disable()` does the opposite, that is, put the driver back to the **init** state.

AF One-shot and Continuous Statistics Calling `esp_isp_af_controller_get_oneshot_statistics()` to get oneshot AF statistics result. You can take following code as reference.

Aside from the above oneshot API, the ISP AF driver also provides a way to start AF statistics continuously. Calling `esp_isp_af_controller_start_continuous_statistics()` to start the continuous statistics and `esp_isp_af_controller_stop_continuous_statistics()` to stop it.

Note that if you want to use the continuous statistics, you need to register the `esp_isp_af_env_detector_evt_cbs_t::on_env_statistics_done` or `esp_isp_af_env_detector_evt_cbs_t::on_env_change` callback to get the statistics result. See how to register in [Register Event Callbacks](#)

```

esp_isp_af_config_t af_config = {
    .edge_thresh = 128,
};
isp_af_ctrlr_t af_ctrlr = NULL;
ESP_ERROR_CHECK(esp_isp_new_af_controller(isp_proc, &af_config, &af_ctrlr));
ESP_ERROR_CHECK(esp_isp_af_controller_enable(af_ctrlr));
isp_af_result_t result = {};
/* Trigger the AF statistics and get its result for one time with timeout value.
↳2000ms. */
ESP_ERROR_CHECK(esp_isp_af_controller_get_oneshot_statistics(af_ctrlr, 2000, &
↳result));

/* Start continuous AF statistics */
ESP_ERROR_CHECK(esp_isp_af_controller_start_continuous_statistics(af_ctrlr));
// You can do other stuffs here, the statistics result can be obtained in the.
↳callback
// .....
// vTaskDelay(pdMS_TO_TICKS(1000));
/* Stop continuous AF statistics */
ESP_ERROR_CHECK(esp_isp_af_controller_stop_continuous_statistics(af_ctrlr));

/* Disable the af controller */
ESP_ERROR_CHECK(esp_isp_af_controller_disable(af_ctrlr));
/* Delete the af controller and free the resources */
ESP_ERROR_CHECK(esp_isp_del_af_controller(af_ctrlr));

```

Set AF Environment Detector Calling `esp_isp_af_controller_set_env_detector()` to set an ISP AF environment detector. You can take following code as reference.

```

esp_isp_af_env_config_t env_config = {
    .interval = 10,
};
isp_af_ctrlr_t af_ctrlr = NULL;
ESP_ERROR_CHECK(esp_isp_new_af_controller(isp_proc, &af_config, &af_ctrlr));
ESP_ERROR_CHECK(esp_isp_af_controller_set_env_detector(af_ctrlr, &env_config));

```

Set AF Environment Detector Threshold Calling `esp_isp_af_env_detector_set_threshold()` to set the threshold of an ISP AF environment detector.

```

int definition_thresh = 0;
int luminance_thresh = 0;
ESP_ERROR_CHECK(esp_isp_af_env_detector_set_threshold(env_detector, definition_
↳thresh, luminance_thresh));

```

ISP AWB Processor

Before doing ISP AWB, you need to enable the ISP AWB processor first, by calling `esp_isp_awb_controller_enable()`. This function:

- Switches the driver state from **init** to **enable**.

Calling `esp_isp_awb_controller_disable()` does the opposite, that is, put the driver back to the **init** state.

AWB One-shot and Continuous Statistics Calling `esp_isp_awb_controller_get_oneshot_result()` to get oneshot AWB statistics result of white patches. You can take following code as reference.

Aside from the above oneshot API, the ISP AWB driver also provides a way to start AWB statistics continuously. Calling `esp_isp_awb_controller_start_continuous_statistics()` starts the continuous statistics and `esp_isp_awb_controller_stop_continuous_statistics()` stops it.

Note that if you want to use the continuous statistics, you need to register the `esp_isp_awb_cbs_t::on_statistics_done` callback to get the statistics result. See how to register it in [Register Event Callbacks](#)

```
bool example_isp_awb_on_statistics_done_cb(isp_awb_ctrl_t awb_ctrl, const esp_isp_
↳awb_evt_data_t *edata, void *user_data);
// ...
isp_awb_ctrl_t awb_ctrl = NULL;
uint32_t image_width = 800;
uint32_t image_height = 600;
/* The AWB configuration, please refer to the API comment for how to tune these_
↳parameters */
esp_isp_awb_config_t awb_config = {
    .sample_point = ISP_AWB_SAMPLE_POINT_AFTER_CCM,
    .window = {
        .top_left = {.x = image_width * 0.2, .y = image_height * 0.2},
        .btm_right = {.x = image_width * 0.8, .y = image_height * 0.8},
    },
    .white_patch = {
        .luminance = {.min = 0, .max = 220 * 3},
        .red_green_ratio = {.min = 0.0f, .max = 3.999f},
        .blue_green_ratio = {.min = 0.0f, .max = 3.999f},
    },
};
isp_awb_stat_result_t stat_res = {};
/* Create the awb controller */
ESP_ERROR_CHECK(esp_isp_new_awb_controller(isp_proc, &awb_config, &awb_ctrl));
/* Register AWB callback */
esp_isp_awb_cbs_t awb_cb = {
    .on_statistics_done = example_isp_awb_on_statistics_done_cb,
};
ESP_ERROR_CHECK(esp_isp_awb_register_event_callbacks(awb_ctrl, &awb_cb, NULL));
/* Enabled the awb controller */
ESP_ERROR_CHECK(esp_isp_awb_controller_enable(awb_ctrl));

/* Get oneshot AWB statistics result */
ESP_ERROR_CHECK(esp_isp_awb_controller_get_oneshot_statistics(awb_ctrl, -1, &stat_
↳res));

/* Start continuous AWB statistics, note that continuous statistics requires `on_
↳statistics_done` callback */
ESP_ERROR_CHECK(esp_isp_awb_controller_start_continuous_statistics(awb_ctrl));
// You can do other stuffs here, the statistics result can be obtained in the_
↳callback
// .....
// vTaskDelay(pdMS_TO_TICKS(1000));
/* Stop continuous AWB statistics */
ESP_ERROR_CHECK(esp_isp_awb_controller_stop_continuous_statistics(awb_ctrl));

/* Disable the awb controller */
ESP_ERROR_CHECK(esp_isp_awb_controller_disable(awb_ctrl));
/* Delete the awb controller and free the resources */
ESP_ERROR_CHECK(esp_isp_del_awb_controller(awb_ctrl));
```

Configure CCM Color Correction Matrix can scale the color ratio of RGB888 pixels. It can be used for adjusting the image color via some algorithms, for example, used for white balance by inputting the AWB computed result, or used as a Filter with some filter algorithms.

To adjust the color correction matrix, you can refer to the following code:

```
// ...
// Configure CCM
esp_isp_ccm_config_t ccm_cfg = {
    .matrix = {
        1.0, 0.0, 0.0,
        0.0, 1.0, 0.0,
        0.0, 0.0, 1.0
    },
    .saturation = false,
};
ESP_ERROR_CHECK(esp_isp_ccm_configure(isp_proc, &ccm_cfg));
// The configured CCM will be applied to the image once the CCM module is enabled
ESP_ERROR_CHECK(esp_isp_ccm_enable(isp_proc));
// CCM can also be configured after it is enabled
ccm_cfg.matrix[0][0] = 2.0;
ESP_ERROR_CHECK(esp_isp_ccm_configure(isp_proc, &ccm_cfg));
// Disable CCM if no longer needed
ESP_ERROR_CHECK(esp_isp_ccm_disable(isp_proc));
```

Register Event Callbacks

Register ISP AF Environment Detector Event Callbacks After the ISP AF environment detector starts up, it can generate a specific event dynamically. If you have some functions that should be called when the event happens, please hook your function to the interrupt service routine by calling `esp_isp_af_env_detector_register_event_callbacks()`. All supported event callbacks are listed in `esp_isp_af_env_detector_evt_cbs_t`:

- `esp_isp_af_env_detector_evt_cbs_t::on_env_statistics_done` sets a callback function for environment statistics done. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with ISR suffix are called from within the function). The function prototype is declared in `esp_isp_af_env_detector_callback_t`.
- `esp_isp_af_env_detector_evt_cbs_t::on_env_change` sets a callback function for environment change. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with ISR suffix are called from within the function). The function prototype is declared in `esp_isp_af_env_detector_callback_t`.

You can save your own context to `esp_isp_af_env_detector_register_event_callbacks()` as well, via the parameter `user_data`. The user data will be directly passed to the callback function.

Register ISP AWB Statistics Done Event Callbacks After the ISP AWB controller finished statistics of white patches, it can generate a specific event dynamically. If you want to be informed when the statistics done event takes place, please hook your function to the interrupt service routine by calling `esp_isp_awb_register_event_callbacks()`. All supported event callbacks are listed in `esp_isp_awb_cbs_t`:

- `esp_isp_awb_cbs_t::on_statistics_done` sets a callback function when finished statistics of the white patches. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with ISR suffix are called from within the function). The function prototype is declared in `esp_isp_awb_callback_t`.

You can save your own context via the parameter `user_data` of `esp_isp_awb_register_event_callbacks()`. The user data will be directly passed to the callback function.

Thread Safety The factory function `esp_isp_new_processor()`, `esp_isp_del_processor()`, `esp_isp_new_af_controller()`, `esp_isp_del_af_controller()`,

`esp_isp_new_af_env_detector()`, and `esp_isp_del_af_env_detector()` are guaranteed to be thread safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks.

Kconfig Options

- `CONFIG_ISP_ISR_IRAM_SAFE` controls whether the default ISR handler should be masked when the cache is disabled

IRAM Safe By default, the ISP interrupt will be deferred when the cache is disabled because of writing or erasing the flash.

There is a Kconfig option `CONFIG_ISP_ISR_IRAM_SAFE` that:

- Enables the interrupt being serviced even when the cache is disabled
- Places all functions that used by the ISR into IRAM
- Places driver object into DRAM (in case it is mapped to PSRAM by accident)

This allows the interrupt to run while the cache is disabled, but comes at the cost of increased IRAM consumption.

API Reference

Header File

- `components/esp_driver_isp/include/driver/isp.h`
- This header file can be included with:

```
#include "driver/isp.h"
```

- This header file is a part of the API provided by the `esp_driver_isp` component. To declare that your component depends on `esp_driver_isp`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_isp
```

or

```
PRIV_REQUIRES esp_driver_isp
```

Header File

```
PRIV_REQUIRES esp_driver_isp
```

Structures

struct `isp_u32_range_t`

ISP unsigned integer range type.

备注: Whether the edge value are included depends on the variable itself

Public Members

uint32_t **min**

Minimum unsigned int value.

uint32_t **max**

Maximum unsigned int value.

struct **isp_float_range_t**

ISP float range type.

备注: Whether the edge value are included depends on the variable itself

Public Members

float **min**

Minimum float value.

float **max**

Maximum float value.

struct **isp_af_result_t**

ISP AF result.

Public Members

int **definition**[ISP_AF_WINDOW_NUM]

Definition, it refers how clear and sharp an image is.

int **luminance**[ISP_AF_WINDOW_NUM]

Luminance, it refers how luminant an image is.

struct **isp_awb_stat_result_t**

ISP AWB result.

Public Members

uint32_t **white_patch_num**

white patch number that counted by AWB in the window

uint32_t **sum_r**

The sum of R channel of these white patches.

uint32_t **sum_g**

The sum of G channel of these white patches.

uint32_t **sum_b**

The sum of B channel of these white patches.

Type Definitions

typedef struct isp_processor_t ***isp_proc_handle_t**

Type of ISP processor handle.

typedef struct isp_af_controller_t ***isp_af_ctrlr_t**

Type of ISP AF controller handle.

typedef struct isp_awb_controller_t ***isp_awb_ctrlr_t**

Type of ISP AWB controller handle.

Functions

esp_err_t **esp_isp_new_af_controller** (*isp_proc_handle_t* isp_proc, const *esp_isp_af_config_t* *af_config, *isp_af_ctrlr_t* *ret_hdl)

New an ISP AF controller.

参数

- **isp_proc** -- [in] ISP Processor handle
- **af_config** -- [in] Pointer to AF config. Refer to [esp_isp_af_config_t](#).
- **ret_hdl** -- [out] AF controller handle

返回

- ESP_OK On success
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid
- ESP_ERR_INVALID_STATE Invalid state
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_NO_MEM If out of memory

esp_err_t **esp_isp_del_af_controller** (*isp_af_ctrlr_t* af_ctrlr)

Delete an ISP AF controller.

参数 **af_ctrlr** -- [in] AF controller handle

返回

- ESP_OK On success
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_ERR_INVALID_STATE Driver state is invalid.

esp_err_t **esp_isp_af_controller_enable** (*isp_af_ctrlr_t* af_ctrlr)

Enable an ISP AF controller.

参数 *af_ctrlr* -- **[in]** AF controller handle

返回

- ESP_OK On success
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_ERR_INVALID_STATE Driver state is invalid.

esp_err_t **esp_isp_af_controller_disable** (*isp_af_ctrlr_t* af_ctrlr)

Disable an ISP AF controller.

参数 *af_ctrlr* -- **[in]** AF controller handle

返回

- ESP_OK On success
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_ERR_INVALID_STATE Driver state is invalid.

esp_err_t **esp_isp_af_controller_get_onehot_statistics** (*isp_af_ctrlr_t* af_ctrlr, int timeout_ms, *isp_af_result_t* *out_res)

Trigger AF luminance and definition statistics for one time and get the result.

备注: This function is a synchronous and block function, it only returns when AF luminance and definition statistics is done or timeout. It's a simple method to get the result directly for one time.

参数

- **af_ctrlr** -- **[in]** AF controller handle
- **timeout_ms** -- **[in]** Timeout in millisecond
 - timeout_ms < 0: Won't return until finished
 - timeout_ms = 0: No timeout, trigger one time statistics and return immediately, in this case, the result won't be assigned in this function, but you can get the result in the callback [esp_isp_af_env_detector_evt_cbs_t::on_env_statistics_done](#)
 - timeout_ms > 0: Wait for specified milliseconds, if not finished, then return timeout error
- **out_res** -- **[out]** AF luminance and definition statistics result, can be NULL if timeout_ms = 0

返回

- ESP_OK On success
- ESP_ERR_TIMEOUT If the waiting time exceeds the specified timeout.
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_ERR_INVALID_STATE Driver state is invalid.

esp_err_t **esp_isp_af_controller_start_continuous_statistics** (*isp_af_ctrlr_t* af_ctrlr)

Start AF continuous statistics of the luminance and definition in the windows.

备注: This function is an asynchronous and non-block function, it will start the continuous statistics and return immediately. You have to register the AF callback and get the result from the callback event data.

参数 *af_ctrlr* -- **[in]** AF controller handle

返回

- ESP_OK On success
- ESP_ERR_INVALID_ARG Null pointer
- ESP_ERR_INVALID_STATE Driver state is invalid.

esp_err_t **esp_isp_af_controller_stop_continuous_statistics** (*isp_af_ctrlr_t* af_ctrlr)

Stop AF continuous statistics of the luminance and definition in the windows.

参数 **af_ctrlr** -- **[in]** AF controller handle

返回

- ESP_OK On success
- ESP_ERR_INVALID_ARG Null pointer
- ESP_ERR_INVALID_STATE Driver state is invalid.

esp_err_t **esp_isp_af_controller_set_env_detector** (*isp_af_ctrlr_t* af_ctrlr, const *esp_isp_af_env_config_t* *env_config)

Set ISP AF environment detector.

参数

- **af_ctrlr** -- **[in]** AF controller handle
- **env_config** -- **[in]** AF Env detector configuration

返回

- ESP_OK On success
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_ERR_INVALID_STATE Driver state is invalid.

esp_err_t **esp_isp_af_controller_set_env_detector_threshold** (*isp_af_ctrlr_t* af_ctrlr, int definition_thresh, int luminance_thresh)

Set ISP AF environment detector detecting threshold.

参数

- **af_ctrlr** -- **[in]** AF controller handle
- **definition_thresh** -- **[in]** Threshold for definition
- **luminance_thresh** -- **[in]** Threshold for luminance

返回

- ESP_OK On success
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_ERR_INVALID_STATE Driver state is invalid.

esp_err_t **esp_isp_af_env_detector_register_event_callbacks** (*isp_af_ctrlr_t* af_ctrlr, const *esp_isp_af_env_detector_evt_cbs_t* *cbs, void *user_data)

Register AF environment detector event callbacks.

备注: User can deregister a previously registered callback by calling this function and setting the to-be-deregistered callback member in the `cbs` structure to NULL.

备注: When CONFIG_ISP_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables (including `user_data`) should be in internal RAM as well.

参数

- **af_ctrlr** -- **[in]** AF controller handle
- **cbs** -- **[in]** Group of callback functions
- **user_data** -- **[in]** User data, which will be delivered to the callback functions directly

返回

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_INVALID_STATE: Driver state is invalid, you shouldn't call this API at this moment

Structures

struct **esp_isp_af_config_t**

AF controller config.

Public Members

isp_window_t **window**[ISP_AF_WINDOW_NUM]

The sampling windows of AF.

int **edge_thresh**

Edge threshold, definition higher than this value will be counted as a valid pixel for calculating AF result.

int **intr_priority**

The interrupt priority, range 0~7, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3) otherwise the larger the higher, 7 is NMI.

struct **esp_isp_af_env_config_t**

AF environment detector config.

Public Members

int **interval**

Interval between environment detection, in frames. i.e., AF controller will trigger the statistic periodically to detect the environment change.

struct **esp_isp_af_env_detector_evt_data_t**

Event data structure.

Public Members

isp_af_result_t **af_result**

The AF statistics result

struct **esp_isp_af_env_detector_evt_cbs_t**

Group of ISP AF Env detector callbacks.

备注: These callbacks are all running in an ISR environment.

备注: When CONFIG_ISP_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables should be in internal RAM as well.

Public Members

esp_isp_af_env_detector_callback_t **on_env_statistics_done**

Event callback, invoked when environment sample done.

esp_isp_af_env_detector_callback_t on_env_change

Event callback, invoked when environment change happens.

Type Definitions

```
typedef bool (*esp_isp_af_env_detector_callback_t)(isp_af_ctrl_t af_ctrlr, const
esp_isp_af_env_detector_evt_data_t *edata, void *user_data)
```

Prototype of ISP AF Env detector event callback.

Param af_ctrlr [in] ISP AF controller handle

Param edata [in] ISP AF Env detector event data

Param user_data [in] User registered context, registered when in
esp_isp_af_env_detector_register_event_callbacks()

Return Whether a high priority task is woken up by this function

2.5.15 LCD**Introduction**

ESP chips can generate various kinds of timings needed by common LCDs on the market, like SPI LCD, I2C LCD, Parallel LCD (Intel 8080), RGB/SRGB LCD, MIPI DSI LCD and etc. The `esp_lcd` component offers an abstracted driver framework to support them in a unified way.

An LCD typically consists of two main planes:

- **Control Plane:** This plane allows us to read and write to the internal registers of the LCD device controller. Host typically uses this plane for tasks such as initializing the LCD power supply and performing gamma calibration.
- **Data Plane:** The data plane is responsible for transmitting pixel data to the LCD device.

Functional Overview

In the context of `esp_lcd`, both the data plane and the control plane are represented by the `esp_lcd_panel_handle_t` type.

On some LCDs, these two planes may be combined into a single plane. In this configuration, pixel data is transmitted through the control plane, achieving functionality similar to that of the data plane. This merging is common in SPI LCDs and I2C LCDs. Additionally, there are LCDs that do not require a separate control plane. For instance, certain RGB LCDs automatically execute necessary initialization procedures after power-up. Host devices only need to continuously refresh pixel data through the data plane. However, it's essential to note that not all RGB LCDs eliminate the control plane entirely. Some LCD devices can simultaneously support multiple interfaces, requiring the host to send specific commands via the control plane (such as those based on the SPI interface) to enable the RGB mode.

This document will discuss how to create the control plane and data plane, as mentioned earlier, based on different types of LCDs.

SPI Interfaced LCD

1. Create an SPI bus. Please refer to *SPI Master API doc* for more details.

```
spi_bus_config_t buscfg = {
    .sclk_io_num = EXAMPLE_PIN_NUM_SCLK,
    .mosi_io_num = EXAMPLE_PIN_NUM_MOSI,
    .miso_io_num = EXAMPLE_PIN_NUM_MISO,
    .quadwp_io_num = -1, // Quad SPI LCD driver is not yet supported
    .quadhd_io_num = -1, // Quad SPI LCD driver is not yet supported
```

(下页继续)

(续上页)

```

        .max_transfer_sz = EXAMPLE_LCD_H_RES * 80 * sizeof(uint16_t), //
        ↪transfer 80 lines of pixels (assume pixel is RGB565) at most in one
        ↪SPI transaction
    };
    ESP_ERROR_CHECK(spi_bus_initialize(LCD_HOST, &buscfg, SPI_DMA_CH_
        ↪AUTO)); // Enable the DMA feature

```

2. Allocate an LCD IO device handle from the SPI bus. In this step, you need to provide the following information:

- `esp_lcd_panel_io_spi_config_t::dc_gpio_num`: Sets the gpio number for the DC signal line (some LCD calls this RS line). The LCD driver uses this GPIO to switch between sending command and sending data.
- `esp_lcd_panel_io_spi_config_t::cs_gpio_num`: Sets the gpio number for the CS signal line. The LCD driver uses this GPIO to select the LCD chip. If the SPI bus only has one device attached (i.e., this LCD), you can set the gpio number to -1 to occupy the bus exclusively.
- `esp_lcd_panel_io_spi_config_t::pclk_hz` sets the frequency of the pixel clock, in Hz. The value should not exceed the range recommended in the LCD spec.
- `esp_lcd_panel_io_spi_config_t::spi_mode` sets the SPI mode. The LCD driver uses this mode to communicate with the LCD. For the meaning of the SPI mode, please refer to the *SPI Master API doc*.
- `esp_lcd_panel_io_spi_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_spi_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.
- `esp_lcd_panel_io_spi_config_t::trans_queue_depth` sets the depth of the SPI transaction queue. A bigger value means more transactions can be queued up, but it also consumes more memory.

```

esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_spi_config_t io_config = {
    .dc_gpio_num = EXAMPLE_PIN_NUM_LCD_DC,
    .cs_gpio_num = EXAMPLE_PIN_NUM_LCD_CS,
    .pclk_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_PARAM_BITS,
    .spi_mode = 0,
    .trans_queue_depth = 10,
};
// Attach the LCD to the SPI bus
ESP_ERROR_CHECK(esp_lcd_new_panel_io_spi((esp_lcd_spi_bus_handle_t)LCD_
    ↪HOST, &io_config, &io_handle));

```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the SPI IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD's hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to -1.
- `esp_lcd_panel_dev_config_t::rgb_ele_order` sets the R-G-B element order of each color data.
- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.
- `esp_lcd_panel_dev_config_t::data_endian` specifies the data endian to be transmitted to the screen. No need to specify for color data within 1 byte, like RGB232. For drivers that do not support specifying data endian, this field would be ignored.

```

esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,

```

(下页继续)

```

    .rgb_ele_order = LCD_RGB_ELEMENT_ORDER_BGR,
    .bits_per_pixel = 16,
};
// Create LCD panel handle for ST7789, with the SPI IO device handle
ESP_ERROR_CHECK(esp_lcd_new_panel_st7789(io_handle, &panel_config, &
    ↪panel_handle));

```

API Reference

Header File

- `components/esp_lcd/include/esp_lcd_io_spi.h`
- This header file can be included with:

```
#include "esp_lcd_io_spi.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_lcd
```

or

```
PRIV_REQUIRES esp_lcd
```

Functions

`esp_err_t esp_lcd_new_panel_io_spi` (`esp_lcd_spi_bus_handle_t` bus, const `esp_lcd_panel_io_spi_config_t` *io_config, `esp_lcd_panel_io_handle_t` *ret_io)

Create LCD panel IO handle, for SPI interface.

参数

- **bus** -- [in] SPI bus handle
- **io_config** -- [in] IO configuration, for SPI interface
- **ret_io** -- [out] Returned IO handle

返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

Structures

struct `esp_lcd_panel_io_spi_config_t`

Panel IO configuration structure, for SPI interface.

Public Members

int **cs_gpio_num**

GPIO used for CS line

int **dc_gpio_num**

GPIO used to select the D/C line, set this to -1 if the D/C line is not used

int **spi_mode**

Traditional SPI mode (0~3)

unsigned int **pclk_hz**

Frequency of pixel clock

size_t **trans_queue_depth**

Size of internal transaction queue

esp_lcd_panel_io_color_trans_done_cb_t **on_color_trans_done**

Callback invoked when color data transfer has finished

void ***user_ctx**

User private data, passed directly to *on_color_trans_done*'s *user_ctx*

int **lcd_cmd_bits**

Bit-width of LCD command

int **lcd_param_bits**

Bit-width of LCD parameter

unsigned int **dc_high_on_cmd**

If enabled, DC level = 1 indicates command transfer

unsigned int **dc_low_on_data**

If enabled, DC level = 0 indicates color data transfer

unsigned int **dc_low_on_param**

If enabled, DC level = 0 indicates parameter transfer

unsigned int **octal_mode**

transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

unsigned int **quad_mode**

transmit with quad mode (4 data lines), this mode is useful when transmitting LCD parameters (Only use one line for command)

unsigned int **sio_mode**

Read and write through a single data line (MOSI)

unsigned int **lsb_first**

transmit LSB bit first

unsigned int **cs_high_active**

CS line is high active

struct *esp_lcd_panel_io_spi_config_t*::[anonymous] **flags**

Extra flags to fine-tune the SPI device

Type Definitions

typedef int **esp_lcd_spi_bus_handle_t**

Type of LCD SPI bus handle

I2C Interfaced LCD

1. Create I2C bus. Please refer to *I2C API doc* for more details.

```
i2c_master_bus_handle_t i2c_bus = NULL;
i2c_master_bus_config_t bus_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .glitch_ignore_cnt = 7,
    .i2c_port = I2C_BUS_PORT,
    .sda_io_num = EXAMPLE_PIN_NUM_SDA,
    .scl_io_num = EXAMPLE_PIN_NUM_SCL,
    .flags.enable_internal_pullup = true,
};
ESP_ERROR_CHECK(i2c_new_master_bus(&bus_config, &i2c_bus));
```

2. Allocate an LCD IO device handle from the I2C bus. In this step, you need to provide the following information:

- `esp_lcd_panel_io_i2c_config_t::dev_addr` sets the I2C device address of the LCD controller chip. The LCD driver uses this address to communicate with the LCD controller chip.
- `esp_lcd_panel_io_i2c_config_t::scl_speed_hz` sets the I2C clock frequency in Hz. The value should not exceed the range recommended in the LCD spec.
- `esp_lcd_panel_io_i2c_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_i2c_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.

```
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_i2c_config_t io_config = {
    .dev_addr = EXAMPLE_I2C_HW_ADDR,
    .scl_speed_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
    .control_phase_bytes = 1, // refer to LCD spec
    .dc_bit_offset = 6, // refer to LCD spec
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_CMD_BITS,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_io_i2c(i2c_bus, &io_config, &io_
↪handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the I2C IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD's hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to -1.
- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.

```
esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
    .bits_per_pixel = 1,
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_ssd1306(io_handle, &panel_config, &
↪panel_handle));
```

API Reference

```
PRIV_REQUIRES esp_lcd
```

Functions

`esp_err_t esp_lcd_new_panel_io_i2c_v1` (`uint32_t` bus, `const esp_lcd_panel_io_i2c_config_t` *io_config, `esp_lcd_panel_io_handle_t` *ret_io)

Create LCD panel IO handle, for I2C interface in legacy implementation.

备注: Please don't call this function in your project directly. Please call `esp_lcd_new_panel_to_i2c` instead.

参数

- **bus** -- **[in]** I2C bus handle, (in `uint32_t`)
- **io_config** -- **[in]** IO configuration, for I2C interface
- **ret_io** -- **[out]** Returned IO handle

返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

`esp_err_t esp_lcd_new_panel_io_i2c_v2` (`i2c_master_bus_handle_t` bus, `const esp_lcd_panel_io_i2c_config_t` *io_config, `esp_lcd_panel_io_handle_t` *ret_io)

Create LCD panel IO handle, for I2C interface in new implementation.

备注: Please don't call this function in your project directly. Please call `esp_lcd_new_panel_to_i2c` instead.

参数

- **bus** -- **[in]** I2C bus handle, (in `i2c_master_dev_handle_t`)
- **io_config** -- **[in]** IO configuration, for I2C interface
- **ret_io** -- **[out]** Returned IO handle

返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

Structures

struct `esp_lcd_panel_io_i2c_config_t`

Panel IO configuration structure, for I2C interface.

Public Members

uint32_t **dev_addr**

I2C device address

esp_lcd_panel_io_color_trans_done_cb_t **on_color_trans_done**

Callback invoked when color data transfer has finished

void ***user_ctx**

User private data, passed directly to *on_color_trans_done*'s *user_ctx*

size_t **control_phase_bytes**

I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int **dc_bit_offset**

Offset of the D/C selection bit in control phase

int **lcd_cmd_bits**

Bit-width of LCD command

int **lcd_param_bits**

Bit-width of LCD parameter

unsigned int **dc_low_on_data**

If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **disable_control_phase**

If this flag is enabled, the control phase isn't used

struct *esp_lcd_panel_io_i2c_config_t*::[anonymous] **flags**

Extra flags to fine-tune the I2C device

uint32_t **scl_speed_hz**

I2C LCD SCL frequency (hz)

Macros

esp_lcd_new_panel_io_i2c (bus, io_config, ret_io)

Create LCD panel IO handle.

参数

- **bus** -- [in] I2C bus handle
- **io_config** -- [in] IO configuration, for I2C interface
- **ret_io** -- [out] Returned IO handle

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Type Definitions

typedef uint32_t **esp_lcd_i2c_bus_handle_t**

Type of LCD I2C bus handle

MIPI DSI Interfaced LCD

1. Create a DSI bus, it will initialize the DPHY as well.

```
esp_lcd_dsi_bus_handle_t mipi_dsi_bus = NULL;
esp_lcd_dsi_bus_config_t bus_config = {
    .bus_id = 0, // index from 0, specify the DSI host to use
    .num_data_lanes = 2, // Number of data lanes to use, can't set a
    ↪value that exceeds the chip's capability
    .phy_clk_src = MIPI_DSI_PHY_CLK_SRC_DEFAULT, // Clock source for
    ↪the DPHY
    .lane_bit_rate_mbps = EXAMPLE_MIPI_DSI_LANE_BITRATE_MBPS, // Bit
    ↪rate of the data lanes, in Mbps
};
ESP_ERROR_CHECK(esp_lcd_new_dsi_bus(&bus_config, &mipi_dsi_bus));
```

2. Derive the DBI interface from the DSI bus. The DBI interface mostly is used as the control IO layer in the esp_lcd component. This interface provides the functions to read/write the configuration registers inside the LCD device. In this step, you need to provide the following information:

- `esp_lcd_dbi_io_config_t::virtual_channel`: The virtual channel number to use. The virtual channel is a logical channel that is used to multiplex the data from different sources. If you only have one LCD connected, you can set this to 0.
- `esp_lcd_dbi_io_config_t::lcd_cmd_bits`: The bit width of the command that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.
- `esp_lcd_dbi_io_config_t::lcd_param_bits`: The bit width of the parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.

```
esp_lcd_panel_io_handle_t mipi_dbi_io = NULL;
esp_lcd_dbi_io_config_t dbi_config = {
    .virtual_channel = 0,
    .lcd_cmd_bits = 8, // according to the LCD spec
    .lcd_param_bits = 8, // according to the LCD spec
};
ESP_ERROR_CHECK(esp_lcd_new_panel_io_dbi(mipi_dsi_bus, &dbi_config, &
    ↪mipi_dbi_io));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the MIPI DBI IO handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of each pixel. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.
- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the GPIO number of the reset pin. If the LCD controller chip does not have a reset pin, you can set this value to -1.
- `esp_lcd_panel_dev_config_t::rgb_ele_order` set the RGB element order of the pixel data, it can be **RGB** or **BGR**.

```
esp_lcd_panel_handle_t ili9881c_ctrl_panel = NULL;
esp_lcd_panel_dev_config_t lcd_dev_config = {
    .bits_per_pixel = 24, // MIPI LCD usually uses 24bit (i.e.,
    ↪RGB888) per pixel
    .rgb_ele_order = LCD_RGB_ELEMENT_ORDER_RGB,
    .reset_gpio_num = EXAMPLE_PIN_NUM_LCD_RST,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_ili9881c(mipi_dbi_io, &lcd_dev_
    ↪config, &ili9881c_ctrl_panel));
```

4. With the LCD control panel that returned in the last step, you can reset the LCD device followed by a basic initialization. After that, you can turn on the display.

```
ESP_ERROR_CHECK(esp_lcd_panel_reset(ili9881c_ctrl_panel));
ESP_ERROR_CHECK(esp_lcd_panel_init(ili9881c_ctrl_panel));
ESP_ERROR_CHECK(esp_lcd_panel_disp_on_off(ili9881c_ctrl_panel, true));
```

5. However, you still can't send pixel data to the MIPI LCD with the control panel, because MIPI LCD has a high resolution and there's no GRAM in the LCD controller. We need to maintain the LCD frame buffer and flush it to the LCD via the MIPI DSI DPI interface. To allocate a DPI data panel, you need to provide many essential parameters, including the DPI clock frequency, the pixel format, the video timing, and so on.

- `esp_lcd_dpi_panel_config_t::virtual_channel` Like the DBI interface, we also need to set the virtual channel for the DPI interface. If you only have one LCD connected, you can set this to 0.
- `esp_lcd_dpi_panel_config_t::dpi_clk_src` sets the clock source for the DPI interface. The available clock sources are listed in `mipi_dsi_dpi_clock_source_t`.
- `esp_lcd_dpi_panel_config_t::dpi_clock_freq_mhz` sets the DPI clock frequency in MHz. Higher pixel clock frequency results in higher refresh rate, but may cause flickering if the DMA bandwidth is not sufficient or the LCD controller chip does not support high pixel clock frequency.
- `esp_lcd_dpi_panel_config_t::pixel_format` sets the pixel format of the pixel data. The available pixel formats are listed in `lcd_color_rgb_pixel_format_t`. We usually use **RGB888** for MIPI LCD to get the best color depth.
- `esp_lcd_dpi_panel_config_t::video_timing` sets the LCD panel specific timing parameters. All required parameters are listed in the `esp_lcd_video_timing_t`, including the LCD resolution and blanking porches. Please fill them according to the datasheet of your LCD.
- `esp_lcd_dpi_panel_config_t::extra_flags::use_dma2d` sets whether to use the DMA2D peripheral to copy the user data to the frame buffer, asynchronously.

```
esp_lcd_panel_handle_t mipi_dpi_panel = NULL;
esp_lcd_dpi_panel_config_t dpi_config = {
    .virtual_channel = 0,
    .dpi_clk_src = MIPI_DSI_DPI_CLK_SRC_DEFAULT,
    .dpi_clock_freq_mhz = 1 * 1000,
    .pixel_format = LCD_COLOR_PIXEL_FORMAT_RGB888,
    .video_timing = {
        .h_size = EXAMPLE_MIPI_DSI_LCD_H_RES,
        .v_size = EXAMPLE_MIPI_DSI_LCD_V_RES,
        .hsync_back_porch = EXAMPLE_MIPI_DSI_LCD_HBP,
        .hsync_pulse_width = EXAMPLE_MIPI_DSI_LCD_HSYNC,
        .hsync_front_porch = EXAMPLE_MIPI_DSI_LCD_HFP,
        .vsync_back_porch = EXAMPLE_MIPI_DSI_LCD_VBP,
        .vsync_pulse_width = EXAMPLE_MIPI_DSI_LCD_VSYNC,
        .vsync_front_porch = EXAMPLE_MIPI_DSI_LCD_VFP,
    },
    .flags.use_dma2d = true,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_dpi(mipi_dsi_bus, &dpi_config, &mipi_
↪dpi_panel));
ESP_ERROR_CHECK(esp_lcd_panel_init(mipi_dpi_panel));
```

Functions

esp_err_t **esp_lcd_new_dsi_bus** (const *esp_lcd_dsi_bus_config_t* *bus_config, *esp_lcd_dsi_bus_handle_t* *ret_bus)

Create MIPI DSI bus handle.

参数

- **bus_config** -- [in] Bus configuration
- **ret_bus** -- [out] Returned bus handle

返回

- ESP_OK: Create MIPI DSI bus successfully
- ESP_ERR_INVALID_ARG: Create MIPI DSI bus failed because of invalid argument
- ESP_ERR_NO_MEM: Create MIPI DSI bus failed because of out of memory
- ESP_ERR_NOT_FOUND: Create MIPI DSI bus failed because no more free DSI hardware instance
- ESP_FAIL: Create MIPI DSI bus failed because of other error

esp_err_t **esp_lcd_del_dsi_bus** (*esp_lcd_dsi_bus_handle_t* bus)

Destroy MIPI DSI bus handle.

参数

- **bus** -- [in] MIPI DSI bus handle, returned from `esp_lcd_new_dsi_bus`

返回

- ESP_OK: Destroy MIPI DSI bus successfully
- ESP_ERR_INVALID_ARG: Destroy MIPI DSI bus failed because of invalid argument
- ESP_FAIL: Destroy MIPI DSI bus failed because of other error

esp_err_t **esp_lcd_new_panel_io_dbi** (*esp_lcd_dsi_bus_handle_t* bus, const *esp_lcd_dbi_io_config_t* *io_config, *esp_lcd_panel_io_handle_t* *ret_io)

Create LCD panel IO, for MIPI DSI DBI interface.

备注: Although we call it "DBI", internally the driver is using a co-called "generic" interface for transmitting/receiving LCD commands and parameters.

参数

- **bus** -- [in] MIPI DSI bus handle, returned from `esp_lcd_new_dsi_bus`
- **io_config** -- [in] IO configuration
- **ret_io** -- [out] Returned panel IO handle

返回

- ESP_OK: Create MIPI DSI command IO successfully
- ESP_ERR_INVALID_ARG: Create MIPI DSI command IO failed because of invalid argument
- ESP_ERR_NO_MEM: Create MIPI DSI command IO failed because of out of memory
- ESP_FAIL: Create MIPI DSI command IO failed because of other error

esp_err_t **esp_lcd_new_panel_dpi** (*esp_lcd_dsi_bus_handle_t* bus, const *esp_lcd_dpi_panel_config_t* *panel_config, *esp_lcd_panel_handle_t* *ret_panel)

Create LCD panel for MIPI DSI DPI interface.

参数

- **bus** -- [in] MIPI DSI bus handle, returned from `esp_lcd_new_dsi_bus`
- **panel_config** -- [in] DSI data panel configuration
- **ret_panel** -- [out] Returned LCD panel handle

返回

- **ESP_OK**: Create MIPI DSI data panel successfully
- **ESP_ERR_INVALID_ARG**: Create MIPI DSI data panel failed because of invalid argument
- **ESP_ERR_NO_MEM**: Create MIPI DSI data panel failed because of out of memory
- **ESP_ERR_NOT_SUPPORTED**: Create MIPI DSI data panel failed because of unsupported feature
- **ESP_FAIL**: Create MIPI DSI data panel failed because of other error

esp_err_t **esp_lcd_dpi_panel_get_frame_buffer** (*esp_lcd_panel_handle_t* dpi_panel, uint32_t fb_num, void **fb0, ...)

Get the address of the frame buffer(s) that allocated by the driver.

参数

- **dpi_panel** -- [in] MIPI DPI panel handle, returned from `esp_lcd_new_panel_dpi()`
- **fb_num** -- [in] Number of frame buffer(s) to get. This value must be the same as the number of the followed parameters.
- **fb0** -- [out] Address of the frame buffer 0 (first frame buffer)
- ... -- [out] List of other frame buffers if any

返回

- **ESP_ERR_INVALID_ARG**: Get frame buffer address failed because of invalid argument
- **ESP_OK**: Get frame buffer address successfully

esp_err_t **esp_lcd_dpi_panel_set_pattern** (*esp_lcd_panel_handle_t* dpi_panel, *mipi_dsi_pattern_type_t* pattern)

Set pre-defined pattern to the screen for testing or debugging purpose.

参数

- **dpi_panel** -- [in] MIPI DPI panel handle, returned from `esp_lcd_new_panel_dpi()`
- **pattern** -- [in] Pattern type

返回

- **ESP_OK**: Set pattern successfully
- **ESP_ERR_INVALID_ARG**: Set pattern failed because of invalid argument
- **ESP_FAIL**: Set pattern failed because of other error

esp_err_t **esp_lcd_dpi_panel_register_event_callbacks** (*esp_lcd_panel_handle_t* dpi_panel, const *esp_lcd_dpi_panel_event_callbacks_t* *cbs, void *user_ctx)

Register LCD DPI panel callbacks.

参数

- **dpi_panel** -- [in] LCD DPI panel handle, which is returned from `esp_lcd_new_panel_dpi()`
- **cbs** -- [in] structure with all LCD panel callbacks
- **user_ctx** -- [in] User private data, passed directly to callback's `user_ctx`

返回

- **ESP_ERR_INVALID_ARG**: Register callbacks failed because of invalid argument
- **ESP_OK**: Register callbacks successfully

Structures

struct **esp_lcd_dsi_bus_config_t**

MIPI DSI bus configuration structure.

Public Members

int **bus_id**

Select which DSI controller, index from 0

uint8_t **num_data_lanes**

Number of data lanes, if set to 0, the driver will fallback to use maximum number of lanes

mipl_dsi_phy_clock_source_t **phy_clk_src**

MIPI DSI PHY clock source

uint32_t **lane_bit_rate_mbps**

Lane bit rate in Mbps

struct **esp_lcd_dbi_io_config_t**

Panel IO configuration structure, for MIPI DSI command interface.

Public Members

uint8_t **virtual_channel**

Virtual channel ID, index from 0

int **lcd_cmd_bits**

Bit-width of LCD command

int **lcd_param_bits**

Bit-width of LCD parameter

struct **esp_lcd_dpi_panel_config_t**

MIPI DSI DPI panel configuration structure.

Public Members

uint8_t **virtual_channel**

Virtual channel ID, index from 0

mipl_dsi_dpi_clock_source_t **dpi_clk_src**

MIPI DSI DPI clock source

uint32_t **dpi_clock_freq_mhz**

DPI clock frequency in MHz

lcd_color_rgb_pixel_format_t **pixel_format**

Pixel format that used by the MIPI LCD device

uint8_t **num_fbs**

Number of screen-sized frame buffers that allocated by the driver. By default (set to either 0 or 1) only one frame buffer will be created.

esp_lcd_video_timing_t **video_timing**

Video timing

struct *esp_lcd_dpi_panel_config_t::extra_flags* **flags**

Extra configuration flags

struct **extra_flags**

Extra configuration flags for MIPI DSI DPI panel.

Public Members

uint32_t **use_dma2d**

Use DMA2D to copy user buffer to the frame buffer when necessary

struct **esp_lcd_dpi_panel_event_data_t**

Type of LCD DPI panel event data.

struct **esp_lcd_dpi_panel_event_callbacks_t**

Type of LCD DPI panel callbacks.

Public Members

esp_lcd_dpi_panel_color_trans_done_cb_t **on_color_trans_done**

Invoked when user's color buffer copied to the internal frame buffer. This is an indicator that the draw buffer can be recycled safely. But doesn't mean the draw buffer finishes the refreshing to the screen.

esp_lcd_dpi_panel_refresh_done_cb_t **on_refresh_done**

Invoked when the internal frame buffer finishes refreshing to the screen

Type Definitions

typedef struct esp_lcd_dsi_bus_t ***esp_lcd_dsi_bus_handle_t**

Type of MIPI DSI bus handle

typedef bool (***esp_lcd_dpi_panel_general_cb_t**)(*esp_lcd_panel_handle_t* panel,
esp_lcd_dpi_panel_event_data_t *edata, void *user_ctx)

A general function callback prototype for DPI panel driver.

Param panel [in] LCD panel handle, which is created by factory API like
`esp_lcd_new_panel_dpi()`

Param edata [in] DPI panel event data, fed by driver

Param user_ctx [in] User data

Return Whether a high priority task has been waken up by this function

typedef *esp_lcd_dpi_panel_general_cb_t* **esp_lcd_dpi_panel_color_trans_done_cb_t**

Declare the prototype of the function that will be invoked when driver finishes coping user's color buffer to frame buffer.

typedef *esp_lcd_dpi_panel_general_cb_t* **esp_lcd_dpi_panel_refresh_done_cb_t**

Declare the prototype of the function that will be invoked when driver finishes refreshing the frame buffer to the screen.

备注: ESP-IDF provides only a limited number of LCD device controller drivers out of the box (e.g., ST7789), more drivers are available in the [Espressif Component Registry](#).

LCD Control Panel Operations

- `esp_lcd_panel_reset()` can reset the LCD control panel.
- `esp_lcd_panel_init()` performs a basic initialization of the control panel. To perform more manufacture specific initialization, please refer to [Steps to Add Manufacture Specific Initialization](#).
- By combining using `esp_lcd_panel_swap_xy()` and `esp_lcd_panel_mirror()`, you can achieve the functionality of rotating or mirroring the LCD screen.
- `esp_lcd_panel_disp_on_off()` can turn on or off the LCD screen by cutting down the output path from the frame buffer to the LCD screen. Please note, this is not controlling the LCD backlight. Backlight control is not covered by the `esp_lcd` driver.
- `esp_lcd_panel_disp_sleep()` can reduce the power consumption of the LCD screen by entering the sleep mode. The internal frame buffer is still retained.

LCD Data Panel Operations

- `esp_lcd_panel_reset()` can reset the LCD data panel.
- `esp_lcd_panel_init()` performs a basic initialization of the data panel.
- `esp_lcd_panel_draw_bitmap()` is the function which does the magic to flush the user draw buffer to the LCD screen, where the target draw window is configurable. Please note, this function expects the draw buffer is a 1-D array and there's no stride in between each lines.

Steps to Add Manufacture Specific Initialization

The LCD controller drivers (e.g., st7789) in ESP-IDF only provide basic initialization in the `esp_lcd_panel_init()`, leaving the vast majority of settings to the default values. Some LCD modules needs to set a bunch of manufacture specific configurations before it can display normally. These configurations usually include gamma, power voltage and so on. If you want to add manufacture specific initialization, please follow the steps below:

```
esp_lcd_panel_reset(panel_handle);
esp_lcd_panel_init(panel_handle);
// set extra configurations e.g., gamma control
// with the underlying IO handle
// please consult your manufacture for special commands and corresponding values
esp_lcd_panel_io_tx_param(io_handle, GAMMA_CMD, (uint8_t[]) {
    GAMMA_ARRAY
}, N);
// turn on the display
esp_lcd_panel_disp_on_off(panel_handle, true);
```

Application Example

- Software JPEG decoding and display - [peripherals/lcd/tjpgd](#)
- Universal SPI LCD example with SPI touch - [peripherals/lcd/spi_lcd_touch](#)
- I2C interfaced OLED display scrolling text - [peripherals/lcd/i2c_oled](#)
- MIPI DSI display example - [peripherals/lcd/mipi_dsi](#)

API Reference

Header File

- [components/hal/include/hal/lcd_types.h](#)
- This header file can be included with:

```
#include "hal/lcd_types.h"
```

Type Definitions

typedef int **lcd_clock_source_t**

Enumerations

enum **lcd_rgb_data_endian_t**

RGB data endian.

Values:

enumerator **LCD_RGB_DATA_ENDIAN_BIG**

RGB data endian: MSB first

enumerator **LCD_RGB_DATA_ENDIAN_LITTLE**

RGB data endian: LSB first

enum **lcd_color_space_t**

LCD color space.

Values:

enumerator **LCD_COLOR_SPACE_RGB**

Color space: RGB

enumerator **LCD_COLOR_SPACE_YUV**

Color space: YUV

enum **lcd_color_rgb_pixel_format_t**

LCD color pixel format in RGB color space.

Values:

enumerator **LCD_COLOR_PIXEL_FORMAT_RGB565**

16 bits, 5 bits per R/B value, 6 bits for G value

enumerator **LCD_COLOR_PIXEL_FORMAT_RGB666**

18 bits, 6 bits per R/G/B value

enumerator **LCD_COLOR_PIXEL_FORMAT_RGB888**

24 bits, 8 bits per R/G/B value

enum `lcd_color_range_t`

LCD color range.

Values:

enumerator `LCD_COLOR_RANGE_LIMIT`

Limited color range

enumerator `LCD_COLOR_RANGE_FULL`

Full color range

enum `lcd_yuv_sample_t`

YUV sampling method.

Values:

enumerator `LCD_YUV_SAMPLE_422`

YUV 4:2:2 sampling

enumerator `LCD_YUV_SAMPLE_420`

YUV 4:2:0 sampling

enumerator `LCD_YUV_SAMPLE_411`

YUV 4:1:1 sampling

enum `lcd_yuv_conv_std_t`

The standard used for conversion between RGB and YUV.

Values:

enumerator `LCD_YUV_CONV_STD_BT601`

YUV<->RGB conversion standard: BT.601

enumerator `LCD_YUV_CONV_STD_BT709`

YUV<->RGB conversion standard: BT.709

```

Structures

struct **esp_lcd_video_timing_t**

Timing parameters for the video data transmission.

Public Members

uint32_t **h_size**

Horizontal resolution, i.e. the number of pixels in a line

uint32_t **v_size**

Vertical resolution, i.e. the number of lines in the frame

uint32_t **hsync_pulse_width**

Horizontal sync width, in pixel clock

uint32_t **hsync_back_porch**

Horizontal back porch, number of pixel clock between hsync and start of line active data

uint32_t **hsync_front_porch**

Horizontal front porch, number of pixel clock between the end of active data and the next hsync

uint32_t **vsync_pulse_width**

Vertical sync width, in number of lines

uint32_t **vsync_back_porch**

Vertical back porch, number of invalid lines between vsync and start of frame

uint32_t **vsync_front_porch**

Vertical front porch, number of invalid lines between the end of frame and the next vsync

struct **esp_lcd_panel_io_event_data_t**

Type of LCD panel IO event data.

struct **esp_lcd_panel_io_callbacks_t**

Type of LCD panel IO callbacks.

Public Members

esp_lcd_panel_io_color_trans_done_cb_t **on_color_trans_done**

Callback invoked when color data transfer has finished

Type Definitions

typedef struct esp_lcd_panel_io_t ***esp_lcd_panel_io_handle_t**

Type of LCD panel IO handle

typedef struct esp_lcd_panel_t ***esp_lcd_panel_handle_t**

Type of LCD panel handle

```
typedef bool (*esp_lcd_panel_io_color_trans_done_cb_t)(esp_lcd_panel_io_handle_t panel_io,
esp_lcd_panel_io_event_data_t *edata, void *user_ctx)
```

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

Param panel_io [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

Param edata [in] Panel IO event data, fed by driver

Param user_ctx [in] User data, passed from `esp_lcd_panel_io_XXX_config_t`

Return Whether a high priority task has been waken up by this function

Enumerations

```
enum lcd_rgb_element_order_t
```

RGB element order.

Values:

```
enumerator LCD_RGB_ELEMENT_ORDER_RGB
```

RGB element order: RGB

```
enumerator LCD_RGB_ELEMENT_ORDER_BGR
```

RGB element order: BGR

Header File

- This header file can be included with:

```
#include "esp_lcd_panel_io.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_lcd
```

or

```
PRIV_REQUIRES esp_lcd
```

Functions

```
esp_err_t esp_lcd_panel_io_rx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, void *param, size_t
param_size)
```

Transmit LCD command and receive corresponding parameters.

备注: Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

参数

- **io -- [in]** LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd_cmd -- [in]** The specific LCD command, set to -1 if no command needed
- **param -- [out]** Buffer for the command data
- **param_size -- [in]** Size of param buffer

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if read is not supported by transport
- ESP_OK on success

esp_err_t **esp_lcd_panel_io_tx_param** (*esp_lcd_panel_io_handle_t* io, int lcd_cmd, const void *param, size_t param_size)

Transmit LCD command and corresponding parameters.

备注: Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

参数

- **io** -- **[in]** LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd_cmd** -- **[in]** The specific LCD command, set to -1 if no command needed
- **param** -- **[in]** Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- **param_size** -- **[in]** Size of `param` in memory, in bytes, set to zero if no parameter is needed for the command

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **esp_lcd_panel_io_tx_color** (*esp_lcd_panel_io_handle_t* io, int lcd_cmd, const void *color, size_t color_size)

Transmit LCD RGB data.

备注: This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the `color` buffer. Recycling of color buffer should be done in the callback `on_color_trans_done()`.

参数

- **io** -- **[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **lcd_cmd** -- **[in]** The specific LCD command, set to -1 if no command needed
- **color** -- **[in]** Buffer that holds the RGB color data
- **color_size** -- **[in]** Size of `color` in memory, in bytes

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **esp_lcd_panel_io_del** (*esp_lcd_panel_io_handle_t* io)

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

参数 **io** -- **[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **esp_lcd_panel_io_register_event_callbacks** (*esp_lcd_panel_io_handle_t* io, const *esp_lcd_panel_io_callbacks_t* *cbs, void *user_ctx)

Register LCD panel IO callbacks.

参数

- **io** -- **[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **cbs** -- **[in]** structure with all LCD panel IO callbacks
- **user_ctx** -- **[in]** User private data, passed directly to callback's `user_ctx`

返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

Header File

- `components/esp_lcd/include/esp_lcd_panel_ops.h`
- This header file can be included with:

```
#include "esp_lcd_panel_ops.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_lcd
```

or

```
PRIV_REQUIRES esp_lcd
```

Functions

`esp_err_t esp_lcd_panel_reset(esp_lcd_panel_handle_t panel)`

Reset LCD panel.

备注: Panel reset must be called before attempting to initialize the panel using `esp_lcd_panel_init()`.

参数 **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

返回

- `ESP_OK` on success

`esp_err_t esp_lcd_panel_init(esp_lcd_panel_handle_t panel)`

Initialize LCD panel.

备注: Before calling this function, make sure the LCD panel has finished the `reset` stage by `esp_lcd_panel_reset()`.

参数 **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

返回

- `ESP_OK` on success

`esp_err_t esp_lcd_panel_del(esp_lcd_panel_handle_t panel)`

Deinitialize the LCD panel.

参数 **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

返回

- ESP_OK on success

esp_err_t **esp_lcd_panel_draw_bitmap** (*esp_lcd_panel_handle_t* panel, int x_start, int y_start, int x_end, int y_end, const void *color_data)

Draw bitmap on LCD panel.

参数

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x_start** -- [in] Start pixel index in the target frame buffer, on x-axis (x_start is included)
- **y_start** -- [in] Start pixel index in the target frame buffer, on y-axis (y_start is included)
- **x_end** -- [in] End pixel index in the target frame buffer, on x-axis (x_end is not included)
- **y_end** -- [in] End pixel index in the target frame buffer, on y-axis (y_end is not included)
- **color_data** -- [in] RGB color data that will be dumped to the specific window range

返回

- ESP_OK on success

esp_err_t **esp_lcd_panel_mirror** (*esp_lcd_panel_handle_t* panel, bool mirror_x, bool mirror_y)

Mirror the LCD panel on specific axis.

备注: Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation

参数

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **mirror_x** -- [in] Whether the panel will be mirrored about the x axis
- **mirror_y** -- [in] Whether the panel will be mirrored about the y axis

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

esp_err_t **esp_lcd_panel_swap_xy** (*esp_lcd_panel_handle_t* panel, bool swap_axes)

Swap/Exchange x and y axis.

备注: Combined with `esp_lcd_panel_mirror()`, one can realize screen rotation

参数

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **swap_axes** -- [in] Whether to swap the x and y axis

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

esp_err_t **esp_lcd_panel_set_gap** (*esp_lcd_panel_handle_t* panel, int x_gap, int y_gap)

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

备注: Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

参数

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

- **x_gap** -- [in] Extra gap on x axis, in pixels
- **y_gap** -- [in] Extra gap on y axis, in pixels

返回

- ESP_OK on success

esp_err_t **esp_lcd_panel_invert_color** (*esp_lcd_panel_handle_t* panel, bool invert_color_data)

Invert the color (bit-wise invert the color data line)

参数

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **invert_color_data** -- [in] Whether to invert the color data

返回

- ESP_OK on success

esp_err_t **esp_lcd_panel_disp_on_off** (*esp_lcd_panel_handle_t* panel, bool on_off)

Turn on or off the display.

参数

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **on_off** -- [in] True to turns on display, False to turns off display

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

esp_err_t **esp_lcd_panel_disp_off** (*esp_lcd_panel_handle_t* panel, bool off)

Turn off the display.

参数

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **off** -- [in] Whether to turn off the screen

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

esp_err_t **esp_lcd_panel_disp_sleep** (*esp_lcd_panel_handle_t* panel, bool sleep)

Enter or exit sleep mode.

参数

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **sleep** -- [in] True to enter sleep mode, False to wake up

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

2.5.16 低压差线性稳压器 (LDO)

简介

ESP32-P4 芯片内部集成了 4 路低压差线性稳压器 (LDO)，每路的电压都是可编程调节的。在硬件的参考设计中，我们通常会将其一些 LDO 输出作为内部 Flash 和 PSRAM 的电源，剩余的一些 LDO 可以用于给外部设备供电。

备注：使用前请阅读手册，确保你需要的电流不会超过芯片的规格。

功能概述

下文将分节介绍 LDO 驱动的功能：

- [LDO 通道申请](#) - 介绍 LDO 通道的种类以及如何申请 LDO 通道资源
- [LDO 通道电压调节](#) - 介绍如何调节 LDO 通道的输出电压

LDO 通道申请 LDO 通道可以分为两种，一种是电压固定的，另一种是电压可调的。对于同一个输出通道，如果电压固定，那么可以允许有多个用户同时使用（软件允许一个变量拥有多个不可变引用）。如果电压可调，那么只能允许一个用户使用（软件上不允许一个变量有多个可变引用或者可变和不可变引用同时存在）。

LDO 通道在驱动软件中由 `esp_ldo_channel_handle_t` 句柄表示。申请 LDO 通道资源的函数是 `esp_ldo_acquire_channel()`。申请成功后，会返回一个 LDO 通道的句柄，这个句柄可以用于后续的电压调节操作。在申请通道的时候，我们需要通过 `esp_ldo_channel_config_t` 结构体来指定 LDO 通道的基本信息，包括通道 ID，期望的输出电压，以及电压是否可以动态调节。

- `esp_ldo_channel_config_t::chan_id` - LDO 通道的唯一标记，用于区分不同的 LDO 通道。注意，这需要你根据电路原理图和芯片数据手册来确定。比如，一个标记着“LDO_VO3”的 LDO 通道，对应的 ID 是 3。
- `esp_ldo_channel_config_t::voltage_mv` - 期望的输出电压，单位是毫伏。
- `esp_ldo_channel_config_t::ldo_extra_flags::adjustable` - 是否允许调节输出电压。只有设置为 `true`，才允许使用 `esp_ldo_channel_adjust_voltage()` 函数来动态地调节输出电压。

由于允许多个用户同时使用固定电压的 LDO 通道，所以驱动内部会维持一个引用计数器。当最后一个用户释放 LDO 通道资源时，LDO 通道会被自动关闭。释放 LDO 通道资源的函数是 `esp_ldo_release_channel()`。另外还需要注意，申请和释放 LDO 通道在使用的时候需要对出现。

LDO 通道电压调节 `esp_ldo_channel_adjust_voltage()` 函数用来在运行时调整 LDO 通道的输出电压。但是，这个函数只能用于可调节电压的 LDO 通道，否则会返回错误。

注意，由于硬件限制，LDO 通道电压的精度可能会 50~100mV 左右的偏差，请勿依赖于 LDO 通道的输出电压来进行精确的模拟量控制。

应用示例

- Use the internal LDO channel to power up the MIPI DPHY: [peripherals/lcd/mipi_dsi](#)

API 参考

Header File

- [components/esp_hw_support/ldo/include/esp_ldo_regulator.h](#)
- This header file can be included with:

```
#include "esp_ldo_regulator.h"
```

Functions

esp_err_t **esp_ldo_acquire_channel** (const *esp_ldo_channel_config_t* *config, *esp_ldo_channel_handle_t* *out_handle)

Acquire an LDO channel with the specified configuration.

备注: This function can't automatically search a LDO channel for you, you must specify a LDO channel ID manually, based on your schematic.

备注: The same channel can be acquired multiple times in different places of the application code, however, if the LDO channel is adjustable, you can't acquire it multiple times, in case user A changes the voltage and breaks the voltage setting of user B.

备注: You should release the channel by `esp_ldo_release_channel` when it's no longer needed.

参数

- **config** -- **[in]** The configuration of the LDO channel
- **out_handle** -- **[out]** The returned LDO channel handle

返回

- ESP_OK: Acquire the LDO channel successfully
- ESP_ERR_INVALID_ARG: Acquire the LDO channel failed due to invalid arguments
- ESP_FAIL: Acquire the LDO channel failed due to other reasons

esp_err_t **esp_ldo_release_channel** (*esp_ldo_channel_handle_t* chan)

Release the LDO channel.

参数 **chan** -- **[in]** The LDO channel handle returned from `esp_ldo_acquire_channel`

返回

- ESP_OK: Release the LDO channel successfully
- ESP_ERR_INVALID_ARG: Release the LDO channel failed due to invalid arguments
- ESP_ERR_INVALID_STATE: Release the LDO channel failed due to invalid state, e.g., the channel handle is double released
- ESP_FAIL: Release the LDO channel failed due to other reasons

esp_err_t **esp_ldo_channel_adjust_voltage** (*esp_ldo_channel_handle_t* chan, int voltage_mv)

Adjust the voltage of the LDO channel.

参数

- **chan** -- **[in]** The LDO channel handle returned from `esp_ldo_acquire_channel`
- **voltage_mv** -- **[in]** The voltage value to be set to the LDO channel, in millivolts

返回

- ESP_OK: Adjust the voltage of the LDO channel successfully
- ESP_ERR_INVALID_ARG: Adjust the voltage of the LDO channel failed due to invalid arguments
- ESP_ERR_NOT_SUPPORTED: Adjust the voltage of the LDO channel failed due to the channel is not adjustable
- ESP_FAIL: Adjust the voltage of the LDO channel failed due to other reasons

esp_err_t **esp_ldo_dump** (FILE *stream)

Dump LDO channel status to the specified stream.

参数 *stream* -- [in] IO stream. Can be stdout, stderr, or a file/string stream.

返回

- ESP_OK: Dump the LDO channel status successfully
- ESP_FAIL: Dump the LDO channel status failed

Structures

struct **esp_ldo_channel_config_t**

LDO channel configurations.

Public Members

int **chan_id**

You must set the LDO channel ID according to the datasheet, e.g., set it to 1 for LDO_VO1

int **voltage_mv**

The voltage value to be set to the LDO channel

struct *esp_ldo_channel_config_t::ldo_extra_flags* **flags**

Flags for the LDO channel

struct **ldo_extra_flags**

Extra flags of a LDO channel.

Public Members

uint32_t **adjustable**

Whether the LDO channel is adjustable, and the voltage can be updated by `esp_ldo_channel_adjust_voltage`

Type Definitions

typedef struct ldo_regulator_channel_t ***esp_ldo_channel_handle_t**

Type of LDO regulator channel handle.

2.5.17 LED PWM 控制器

概述

LED 控制器 (LEDC) 主要用于控制 LED，也可产生 PWM 信号用于其他设备的控制。该控制器有 8 路通道，可以产生独立的波形，驱动 RGB LED 等设备。

LED PWM 控制器可在无需 CPU 干预的情况下自动改变占空比，实现亮度和颜色渐变。

功能概览

设置 LEDC 通道分三步完成。注意，与 ESP32 不同，ESP32-P4 仅支持设置通道为低速模式。

1. **定时器配置** 指定 PWM 信号的频率和占空比分辨率。
2. **通道配置** 绑定定时器和输出 PWM 信号的 GPIO。
3. **改变 PWM 信号** 输出 PWM 信号来驱动 LED。可通过软件控制或使用硬件渐变功能来改变 LED 的亮度。

另一个可选步骤是可以在渐变终端设置一个中断。

图 16: LED PWM 控制器 API 的关键配置

备注：首次 LEDC 配置时，建议先配置定时器（调用函数 `ledc_timer_config()`），再配置通道（调用函数 `ledc_channel_config()`）。这样可以确保 IO 脚上的 PWM 信号自有输出开始其频率就是正确的。

定时器配置 要设置定时器，可调用函数 `ledc_timer_config()`，并将包括如下配置参数的数据结构 `ledc_timer_config_t` 传递给该函数：

- 速度模式（值必须为 `LEDC_LOW_SPEED_MODE`）
- 定时器索引 `ledc_timer_t`
- PWM 信号频率（Hz）
- PWM 占空比分辨率
- 时钟源 `ledc_clk_cfg_t`

频率和占空比分辨率相互关联。PWM 频率越高，占空比分辨率越低，反之亦然。如果 API 不是用来改变 LED 亮度，而是用于其它目的，这种相互关系可能会很重要。更多信息详见 [频率和占空比分辨率支持范围](#) 一节。

时钟源同样可以限制 PWM 频率。选择的时钟源频率越高，可以配置的 PWM 频率上限就越高。

表 4: ESP32-P4 LEDC 时钟源特性

时钟名称	时钟频率	时钟功能
PLL_80M_CLK	80 MHz	/
RC_FAST_CLK	~ 20 MHz	支持动态调频 (DFS) 功能, 支持 Light-sleep 模式
XTAL_CLK	40 MHz	支持动态调频 (DFS) 功能

备注:

1. 如果 ESP32-P4 的定时器选用了 RC_FAST_CLK 作为其时钟源，驱动会通过内部校准来得知这个时钟源的实际频率。这样确保了输出 PWM 信号频率的精准性。
2. ESP32-P4 的所有定时器共用一个时钟源。因此 ESP32-P4 不支持给不同的定时器配置不同的时钟源。

LEDC 驱动提供了一个辅助函数 `ledc_find_suitable_duty_resolution()`。传入时钟源频率及期望的 PWM 信号频率，这个函数可以直接找到最大可配的占空比分辨率值。

当一个定时器不再被任何通道所需要时，可以通过调用相同的函数 `ledc_timer_config()` 来重置这个定时器。此时，函数入参的配置结构体需要指定：

- `ledc_timer_config_t::speed_mode` 重置定时器的所属速度模式 (`ledc_mode_t`)
- `ledc_timer_config_t::timer_num` 重置定时器的索引 (`ledc_timer_t`)
- `ledc_timer_config_t::deconfigure` 将指定定时器重置必须配置此项为 `true`

通道配置 定时器设置好后，请配置所需的通道 (`ledc_channel_t` 之一)。配置通道需调用函数 `ledc_channel_config()`。

通道的配置与定时器设置类似，需向通道配置函数传递包括通道配置参数的结构体 `ledc_channel_config_t`。

此时，通道会按照 `ledc_channel_config_t` 的配置开始运作，并在选定的 GPIO 上生成由定时器设置指定的频率和占空比的 PWM 信号。在通道运作过程中，可以随时通过调用函数 `ledc_stop()` 将其暂停。

改变 PWM 信号 通道开始运行、生成具有恒定占空比和频率的 PWM 信号之后，有几种方式可以改变该信号。驱动 LED 时，主要通过改变占空比来变化光线亮度。

以下两节介绍了如何使用软件和硬件改变占空比。如有需要，PWM 信号的频率也可更改，详见 [改变 PWM 频率](#) 一节。

备注: 在 ESP32-P4 的 LED PWM 控制器中，所有的定时器和通道都只支持低速模式。对 PWM 设置的任何改变，都需要由软件显式地触发 (见下文)。

使用软件改变 PWM 占空比 调用函数 `ledc_set_duty()` 可以设置新的占空比。之后，调用函数 `ledc_update_duty()` 使新配置生效。要查看当前设置的占空比，可使用 `_get_` 函数 `ledc_get_duty()`。

另外一种设置占空比和其他通道参数的方式是调用 [通道配置](#) 一节提到的函数 `ledc_channel_config()`。

传递给函数的占空比数值范围取决于选定的 `duty_resolution`，应为 0 至 $(2^{**} \text{duty_resolution})$ 。例如，如选定的占空比分辨率为 10，则占空比的数值范围为 0 至 1024。此时分辨率为 ~0.1%。

警告：在 ESP32-P4 上，当通道绑定的定时器配置了其最大 PWM 占空比分辨率 (`MAX_DUTY_RES`)，通道的占空比不能被设置到 $(2 ** MAX_DUTY_RES)$ 。否则，硬件内部占空比计数器会溢出，并导致占空比计算错误。

使用硬件改变 PWM 占空比 LED PWM 控制器硬件可逐渐改变占空比的数值。要使用此功能，需用函数 `ledc_fade_func_install()` 使能渐变，之后用下列可用渐变函数之一配置：

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

ESP32-P4 的硬件额外支持多达 16 次，无需 CPU 介入的连续渐变。此功能可以更加有效便捷得实现一个带伽马校正的渐变。

众所周知，人眼所感知的亮度与 PWM 占空比并非成线性关系。为了能使人感观上认为一盏灯明暗的变化是线性的，我们对其 PWM 信号的占空比控制必须为非线性的，俗称伽马校正。LED PWM 控制器可以通过多段线型拟合来模仿伽马曲线渐变。你需要自己在应用程序中分配一段用以保存渐变参数的内存块，并提供开始和结束的占空比，伽马校正公式，以及期望的线性渐变段数信息，`ledc_fill_multi_fade_param_list()` 就能快速生成所有分段线性渐变的参数。或者你也可以自己直接构造一个 `ledc_fade_param_config_t` 的数组。在获得所有渐变参数后，通过将 `ledc_fade_param_config_t` 数组的指针和渐变区间数传入 `ledc_set_multi_fade()`，一次连续渐变的配置就完成了。

最后需要调用 `ledc_fade_start()` 开启渐变。渐变可以在阻塞或非阻塞模式下运行，具体区别请查看 `ledc_fade_mode_t`。需要特别注意的是，不管在何种模式下，下一次渐变或是单次占空比配置的指令生效都必须等到前一次渐变完成或被中止。中止一个正在运行中的渐变需要调用函数 `ledc_fade_stop()`。

此外，在使能渐变后，每个通道都可以额外通过调用 `ledc_cb_register()` 注册一个回调函数用以获得渐变完成的事件通知。回调函数的原型被定义在 `ledc_cb_t`。每个回调函数都应当返回一个布尔值给驱动的中断处理函数，用以表示是否有高优先级任务被其唤醒。此外，值得注意的是，由于驱动的中断处理函数被放在了 IRAM 中，回调函数和其调用的函数也需要被放在 IRAM 中。`ledc_cb_register()` 会检查回调函数及函数上下文的指针地址是否在正确的存储区域。

如不需要渐变和渐变中断，可用函数 `ledc_fade_func_uninstall()` 关闭。

改变 PWM 频率 LED PWM 控制器 API 有多种方式即时改变 PWM 频率：

- 通过调用函数 `ledc_set_freq()` 设置频率。可用函数 `ledc_get_freq()` 查看当前频率。
- 通过调用函数 `ledc_bind_channel_timer()` 将其他定时器绑定到该通道来改变频率和占空比分辨率。
- 通过调用函数 `ledc_channel_config()` 改变通道的定时器。

控制 PWM 的更多方式 有一些较底层的定时器特定函数可用于更改 PWM 设置：

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

前两个功能可通过函数 `ledc_channel_config()` 在后台运行，在定时器配置后启动。

使用中断 配置 LED PWM 控制器通道时，可在 `ledc_channel_config_t` 中选取参数 `ledc_intr_type_t`，在渐变完成时触发中断。

要注册处理程序来处理中断，可调用函数 `ledc_isr_register()`。

频率和占空比分辨率支持范围

LED PWM 控制器主要用于驱动 LED。该控制器 PWM 占空比设置的分辨率范围较广。比如，PWM 频率为 5 kHz 时，占空比分辨率最大可为 13 位。这意味着占空比可为 0 至 100% 之间的任意值，分辨率为 ~0.012% ($2^{13} = 8192$ LED 亮度的离散电平)。然而，这些参数取决于为 LED PWM 控制器定时器计时的时钟信号，LED PWM 控制器为通道提供时钟（具体可参考[定时器配置](#)和[ESP32-P4 技术参考手册 > LED PWM 计时器 \(LEDC\) \[PDF\]](#)）。

LED PWM 控制器可用于生成频率较高的信号，足以为数码相机模组等其他设备提供时钟。此时，最大频率可为 40 MHz，占空比分辨率为 1 位。也就是说，占空比固定为 50%，无法调整。

LED PWM 控制器 API 会在设定的频率和占空比分辨率超过 LED PWM 控制器硬件范围时报错。例如，试图将频率设置为 20 MHz、占空比分辨率设置为 3 位时，串行端口监视器上会报告如下错误：

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↳reducing freq_hz or duty_resolution. div_param=128
```

此时，占空比分辨率或频率必须降低。比如，将占空比分辨率设置为 2 会解决这一问题，让占空比设置为 25% 的倍数，即 25%、50% 或 75%。

如设置的频率和占空比分辨率低于所支持的最低值，LED PWM 驱动器也会反映并报告，如：

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↳increasing freq_hz or duty_resolution. div_param=128000000
```

占空比分辨率通常用 `ledc_timer_bit_t` 设置，范围是 10 至 15 位。如需较低的占空比分辨率（上至 10，下至 1），可直接输入相应数值。

应用实例

使用 LEDC 基本实例请参照 [peripherals/ledc/ledc_basic](#)。

使用 LEDC 改变占空比和渐变控制的实例请参照 [peripherals/ledc/ledc_fade](#)。

使用 LEDC 对 RGB LED 实现带伽马校正的颜色控制实例请参照 [peripherals/ledc/ledc_gamma_curve_fade](#)。

API 参考

Header File

- [components/esp_driver_ledc/include/driver/ledc.h](#)
- This header file can be included with:

```
#include "driver/ledc.h"
```

- This header file is a part of the API provided by the `esp_driver_ledc` component. To declare that your component depends on `esp_driver_ledc`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_ledc
```

or

```
PRIV_REQUIRES esp_driver_ledc
```

Functions

`esp_err_t ledc_channel_config` (const `ledc_channel_config_t` *ledc_conf)

LEDC channel configuration Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty.

参数 `ledc_conf` -- Pointer of LEDC channel configure struct

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

uint32_t **ledc_find_suitable_duty_resolution** (uint32_t src_clk_freq, uint32_t timer_freq)

Helper function to find the maximum possible duty resolution in bits for ledc_timer_config()

参数

- **src_clk_freq** -- LEDC timer source clock frequency (Hz) (See doxygen comments of ledc_clk_cfg_t or get from esp_clk_tree_src_get_freq_hz)
- **timer_freq** -- Desired LEDC timer frequency (Hz)

返回

- 0 The timer frequency cannot be achieved
- Others The largest duty resolution value to be set

esp_err_t **ledc_timer_config** (const *ledc_timer_config_t* *timer_conf)

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

参数 **timer_conf** -- Pointer of LEDC timer configure struct

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.
- ESP_ERR_INVALID_STATE Timer cannot be de-configured because timer is not configured or is not paused

esp_err_t **ledc_update_duty** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel)

LEDC update channel parameters.

备注: Call this function to activate the LEDC updated parameters. After ledc_set_duty, we need to call this function to update the settings. And the new LEDC parameters don't take effect until the next PWM cycle.

备注: ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update

备注: If CONFIG_LEDC_CTRL_FUNC_IN_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Cache is disabled.

备注: This function is allowed to run within ISR context.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_set_pin** (int gpio_num, *ledc_mode_t* speed_mode, *ledc_channel_t* ledc_channel)

Set LEDC output gpio.

备注: This function only routes the LEDC signal to GPIO through matrix, other LEDC resources initialization are not involved. Please use `ledc_channel_config()` instead to fully configure a LEDC channel.

参数

- **gpio_num** -- The LEDC output gpio
- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **ledc_channel** -- LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_stop** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t idle_level)

LEDC stop. Disable LEDC output, and set idle level.

备注: If `CONFIG_LEDC_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Cache is disabled.

备注: This function is allowed to run within ISR context.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **idle_level** -- Set output idle level after LEDC stops.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_set_freq** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_num, uint32_t freq_hz)

LEDC set channel frequency (Hz)

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_num** -- LEDC timer index (0-3), select from `ledc_timer_t`
- **freq_hz** -- Set the LEDC frequency

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

uint32_t **ledc_get_freq** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_num)

LEDC get channel frequency (Hz)

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_num** -- LEDC timer index (0-3), select from `ledc_timer_t`

返回

- 0 error

- Others Current LEDC frequency

esp_err_t **ledc_set_duty_with_hpoint** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t duty, uint32_t hpoint)

LEDC set duty and hpoint value Only after calling ledc_update_duty will the duty update.

备注: ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update

备注: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty** -- Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]
- **hpoint** -- Set the LEDC hpoint value, the range is [0, (2**duty_resolution)-1]

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

int **ledc_get_hpoint** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel)

LEDC get hpoint value, the counter value when the output is set high level.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

返回

- LEDC_ERR_VAL if parameter error
- Others Current hpoint value of LEDC channel

esp_err_t **ledc_set_duty** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t duty)

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call ledc_set_duty_with_hpoint. only after calling ledc_update_duty will the duty update.

备注: ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update.

备注: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty** -- Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

uint32_t **ledc_get_duty** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel)

LEDC get duty This function returns the duty at the present PWM cycle. You shouldn't expect the function to return the new duty in the same cycle of calling `ledc_update_duty`, because duty update doesn't take effect until the next cycle.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

返回

- LEDC_ERR_DUTY if parameter error
- Others Current LEDC duty

esp_err_t **ledc_set_fade** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t duty, *ledc_duty_direction_t* fade_direction, uint32_t step_num, uint32_t duty_cycle_num, uint32_t duty_scale)

LEDC set gradient Set LEDC gradient, After the function calls the `ledc_update_duty` function, the function can take effect.

备注: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **duty** -- Set the start of the gradient duty, the range of duty setting is [0, (2**duty_resolution)]
- **fade_direction** -- Set the direction of the gradient
- **step_num** -- Set the number of the gradient
- **duty_cycle_num** -- Set how many LEDC tick each time the gradient lasts
- **duty_scale** -- Set gradient change amplitude

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_isr_register** (void (*fn)(void*), void *arg, int intr_alloc_flags, *ledc_isr_handle_t* *handle)

Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

参数

- **fn** -- Interrupt handler function.
- **arg** -- User-supplied argument passed to the handler function.
- **intr_alloc_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- **handle** -- Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Failed to find available interrupt source

esp_err_t **ledc_timer_set** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel, uint32_t clock_divider, uint32_t duty_resolution, *ledc_clk_src_t* clk_src)

Configure LEDC settings.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** -- Timer index (0-3), there are 4 timers in LEDC module
- **clock_divider** -- Timer clock divide value, the timer clock is divided from the selected clock source
- **duty_resolution** -- Resolution of duty setting in number of bits. The range is [1, SOC_LEDC_TIMER_BIT_WIDTH]
- **clk_src** -- Select LEDC source clock.

返回

- (-1) Parameter error
- Other Current LEDC duty

esp_err_t **ledc_timer_rst** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel)

Reset LEDC timer.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** -- LEDC timer index (0-3), select from *ledc_timer_t*

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **ledc_timer_pause** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel)

Pause LEDC timer counter.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** -- LEDC timer index (0-3), select from *ledc_timer_t*

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **ledc_timer_resume** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel)

Resume LEDC timer.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** -- LEDC timer index (0-3), select from *ledc_timer_t*

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **ledc_bind_channel_timer** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *ledc_timer_t* timer_sel)

Bind LEDC channel with the selected timer.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from *ledc_channel_t*
- **timer_sel** -- LEDC timer index (0-3), select from *ledc_timer_t*

返回

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **ledc_set_fade_with_step** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num)

Set LEDC fade function.

备注: Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

备注: `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

备注: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** -- Target duty of fading [0, (2**duty_resolution)]
- **scale** -- Controls the increase or decrease step scale.
- **cycle_num** -- increase or decrease the duty every `cycle_num` cycles

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t **ledc_set_fade_with_time** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, int max_fade_time_ms)

Set LEDC fade function, with a limited time.

备注: Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

备注: `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

备注: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.

- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** -- Target duty of fading [0, (2**duty_resolution)]
- **max_fade_time_ms** -- The maximum time of the fading (ms).

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t **ledc_fade_func_install** (int intr_alloc_flags)

Install LEDC fade function. This function will occupy interrupt of LEDC module.

参数 intr_alloc_flags -- Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See `esp_intr_alloc.h` for more info.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Intr flag error
- ESP_ERR_NOT_FOUND Failed to find available interrupt source
- ESP_ERR_INVALID_STATE Fade function already installed

void **ledc_fade_func_uninstall** (void)

Uninstall LEDC fade function.

esp_err_t **ledc_fade_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *ledc_fade_mode_t* fade_mode)

Start LEDC fading.

备注: Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

备注: Starting fade operation with this API is not thread-safe, use with care.

备注: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel number
- **fade_mode** -- Whether to block until fading done. See `ledc_types.h` `ledc_fade_mode_t` for more info. Note that this function will not return until fading to the target duty if LEDC_FADE_WAIT_DONE mode is selected.

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE Channel not initialized or fade function not installed.
- ESP_ERR_INVALID_ARG Parameter error.

esp_err_t **ledc_fade_stop** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel)

Stop LEDC fading. The duty of the channel is guaranteed to be fixed at most one PWM cycle after the function returns.

备注: This API can be called if a new fixed duty or a new fade want to be set while the last fade operation is

still running in progress.

备注: Call this API will abort the fading operation only if it was started by calling `ledc_fade_start` with `LEDC_FADE_NO_WAIT` mode.

备注: If a fade was started with `LEDC_FADE_WAIT_DONE` mode, calling this API afterwards has no use in stopping the fade. Fade will continue until it reaches the target duty.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel number

返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Channel not initialized
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Fade function init error

`esp_err_t ledc_set_duty_and_update` (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t duty, uint32_t hpoint)

A thread-safe API to set duty for LEDC channel and return when duty updated.

备注: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`
- **duty** -- Set the LEDC duty, the range of duty setting is `[0, (2**duty_resolution)]`
- **hpoint** -- Set the LEDC hpoint value, the range is `[0, (2**duty_resolution)-1]`

返回

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Channel not initialized
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Fade function init error

`esp_err_t ledc_set_fade_time_and_start` (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, uint32_t max_fade_time_ms, *ledc_fade_mode_t* fade_mode)

A thread-safe API to set and start LEDC fade function, with a limited time.

备注: Call `ledc_fade_func_install()` once, before calling this function.

备注: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** -- Target duty of fading [0, (2**duty_resolution)]
- **max_fade_time_ms** -- The maximum time of the fading (ms).
- **fade_mode** -- choose blocking or non-blocking mode

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t **ledc_set_fade_step_and_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num, *ledc_fade_mode_t* fade_mode)

A thread-safe API to set and start LEDC fade function.

备注: Call `ledc_fade_func_install()` once before calling this function.

备注: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** -- Target duty of fading [0, (2**duty_resolution)]
- **scale** -- Controls the increase or decrease step scale.
- **cycle_num** -- increase or decrease the duty every cycle_num cycles
- **fade_mode** -- choose blocking or non-blocking mode

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t **ledc_cb_register** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *ledc_cbs_t* *cbs, void *user_arg)

LEDC callback registration function.

备注: The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **cbs** -- Group of LEDC callback functions
- **user_arg** -- user registered data for the callback function

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t **ledc_set_multi_fade** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t start_duty, const *ledc_fade_param_config_t* *fade_params_list, uint32_t list_len)

Set a LEDC multi-fade.

备注: Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

备注: This function is not thread-safe, do not call it to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_multi_fade_and_start`

备注: This function does not prohibit from duty overflow. User should take care of this by themselves. If duty overflow happens, the PWM signal will suddenly change from 100% duty cycle to 0%, or the other way around.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **start_duty** -- Set the start of the gradient duty, the range of duty setting is [0, (2**duty_resolution)]
- **fade_params_list** -- Pointer to the array of fade parameters for a multi-fade
- **list_len** -- Length of the `fade_params_list`, i.e. number of fade ranges for a multi-fade (1 - SOC_LEDC_GAMMA_CURVE_FADE_RANGE_MAX)

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t **ledc_set_multi_fade_and_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t start_duty, const *ledc_fade_param_config_t* *fade_params_list, uint32_t list_len, *ledc_fade_mode_t* fade_mode)

A thread-safe API to set and start LEDC multi-fade function.

备注: Call `ledc_fade_func_install()` once before calling this function.

备注: Fade will always begin from the current duty cycle. Make sure it is stable and synchronized to the desired initial value before calling this function. Otherwise, you may see unexpected duty change.

备注: This function does not prohibit from duty overflow. User should take care of this by themselves. If duty overflow happens, the PWM signal will suddenly change from 100% duty cycle to 0%, or the other way around.

参数

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **start_duty** -- Set the start of the gradient duty, the range of duty setting is [0, (2**duty_resolution)]
- **fade_params_list** -- Pointer to the array of fade parameters for a multi-fade
- **list_len** -- Length of the `fade_params_list`, i.e. number of fade ranges for a multi-fade (1 - SOC_LEDC_GAMMA_CURVE_FADE_RANGE_MAX)
- **fade_mode** -- Choose blocking or non-blocking mode

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

`esp_err_t ledc_fill_multi_fade_param_list` (`ledc_mode_t` speed_mode, `ledc_channel_t` channel, `uint32_t` start_duty, `uint32_t` end_duty, `uint32_t` linear_phase_num, `uint32_t` max_fade_time_ms, `uint32_t` (*gamma_correction_operator)(`uint32_t`), `uint32_t` fade_params_list_size, `ledc_fade_param_config_t` *fade_params_list, `uint32_t` *hw_fade_range_num)

Helper function to fill the fade params for a multi-fade. Useful if desires a gamma curve fading.

备注: The fade params are calculated based on the given start_duty and end_duty. If the duty is not at the start duty (gamma-corrected) when the fade begins, you may see undesired brightness change. Therefore, please always remember that when passing the fade_params to either `ledc_set_multi_fade` or `ledc_set_multi_fade_and_start`, the start_duty argument has to be the gamma-corrected start_duty.

参数

- **speed_mode** -- [in] Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- [in] LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **start_duty** -- [in] Duty cycle [0, (2**duty_resolution)] where the multi-fade begins with. This value should be a non-gamma-corrected duty cycle.
- **end_duty** -- [in] Duty cycle [0, (2**duty_resolution)] where the multi-fade ends with. This value should be a non-gamma-corrected duty cycle.
- **linear_phase_num** -- [in] Number of linear fades to simulate a gamma curved fade (1 - SOC_LEDC_GAMMA_CURVE_FADE_RANGE_MAX)
- **max_fade_time_ms** -- [in] The maximum time of the fading (ms).
- **gamma_correction_operator** -- [in] User provided gamma correction function. The function argument should be able to take any value within [0, (2**duty_resolution)]. And returns the gamma-corrected duty cycle.
- **fade_params_list_size** -- [in] The size of the `fade_params_list` user allocated (1 - SOC_LEDC_GAMMA_CURVE_FADE_RANGE_MAX)
- **fade_params_list** -- [out] Pointer to the array of `ledc_fade_param_config_t` structure
- **hw_fade_range_num** -- [out] Number of fade ranges for this multi-fade

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized

- **ESP_FAIL** Required number of hardware ranges exceeds the size of the *ledc_fade_param_config_t* array user allocated

esp_err_t **ledc_read_fade_param** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t range, uint32_t *dir, uint32_t *cycle, uint32_t *scale, uint32_t *step)

Get the fade parameters that are stored in gamma ram for a certain fade range.

Gamma ram is where saves the fade parameters for each fade range. The fade parameters are written in during fade configuration. When fade begins, the duty will change according to the parameters in gamma ram.

参数

- **speed_mode** -- **[in]** Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- **[in]** LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from *ledc_channel_t*
- **range** -- **[in]** Range index (0 - (SOC_LEDC_GAMMA_CURVE_FADE_RANGE_MAX-1)), it specifies to which range in gamma ram to read
- **dir** -- **[out]** Pointer to accept fade direction value
- **cycle** -- **[out]** Pointer to accept fade cycle value
- **scale** -- **[out]** Pointer to accept fade scale value
- **step** -- **[out]** Pointer to accept fade step value

返回

- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Parameter error
- **ESP_ERR_INVALID_STATE** Channel not initialized

Structures

struct **ledc_channel_config_t**

Configuration parameters of LEDC channel for *ledc_channel_config* function.

Public Members

int **gpio_num**

the LEDC output gpio_num, if you want to use gpio16, gpio_num = 16

ledc_mode_t **speed_mode**

LEDC speed speed_mode, high-speed mode (only exists on esp32) or low-speed mode

ledc_channel_t **channel**

LEDC channel (0 - LEDC_CHANNEL_MAX-1)

ledc_intr_type_t **intr_type**

configure interrupt, Fade interrupt enable or Fade interrupt disable

ledc_timer_t **timer_sel**

Select the timer source of channel (0 - LEDC_TIMER_MAX-1)

uint32_t **duty**

LEDC channel duty, the range of duty setting is [0, (2**duty_resolution)]

int **hpoint**

LEDC channel hpoint value, the range is [0, (2**duty_resolution)-1]

unsigned int **output_invert**

Enable (1) or disable (0) gpio output invert

struct *ledc_channel_config_t*::[anonymous] **flags**

LEDC flags

struct **ledc_timer_config_t**

Configuration parameters of LEDC timer for ledc_timer_config function.

Public Members

ledc_mode_t **speed_mode**

LEDC speed speed_mode, high-speed mode (only exists on esp32) or low-speed mode

ledc_timer_bit_t **duty_resolution**

LEDC channel duty resolution

ledc_timer_t **timer_num**

The timer source of channel (0 - LEDC_TIMER_MAX-1)

uint32_t **freq_hz**

LEDC timer frequency (Hz)

ledc_clk_cfg_t **clk_cfg**

Configure LEDC source clock from ledc_clk_cfg_t. Note that LEDC_USE_RC_FAST_CLK and LEDC_USE_XTAL_CLK are non-timer-specific clock sources. You can not have one LEDC timer uses RC_FAST_CLK as the clock source and have another LEDC timer uses XTAL_CLK as its clock source. All chips except esp32 and esp32s2 do not have timer-specific clock sources, which means clock source for all timers must be the same one.

bool **deconfigure**

Set this field to de-configure a LEDC timer which has been configured before Note that it will not check whether the timer wants to be de-configured is binded to any channel. Also, the timer has to be paused first before it can be de-configured. When this field is set, duty_resolution, freq_hz, clk_cfg fields are ignored.

struct **ledc_cb_param_t**

LEDC callback parameter.

Public Members

ledc_cb_event_t **event**

Event name

uint32_t **speed_mode**

Speed mode of the LEDC channel group

uint32_t **channel**

LEDC channel (0 - LEDC_CHANNEL_MAX-1)

uint32_t **duty**

LEDC current duty of the channel, the range of duty is [0, (2**duty_resolution)]

struct **ledc_cbs_t**

Group of supported LEDC callbacks.

备注: The callbacks are all running under ISR environment

Public Members

ledc_cb_t **fade_cb**

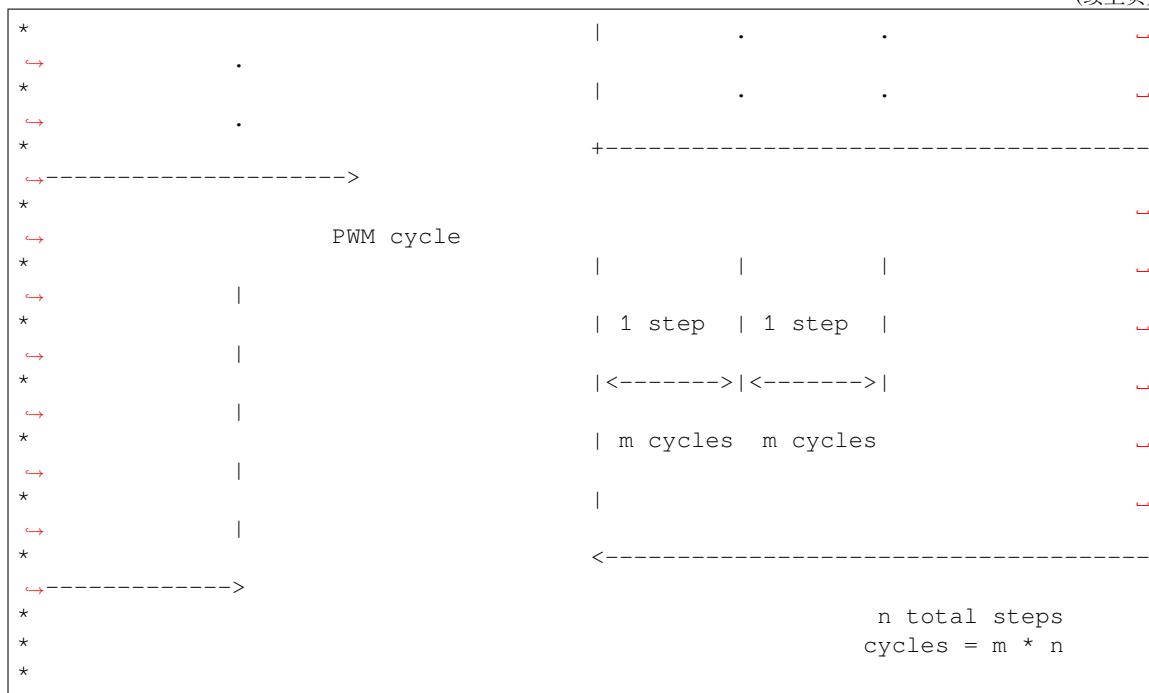

LEDC fade_end callback function

struct **ledc_fade_param_config_t**

Structure for the fade parameters for one hardware fade to be written to gamma wr register.

(下页继续)

备注: Be aware of the maximum value available on each element

Public Members

uint32_t **dir**

Duty change direction. Set 1 as increase, 0 as decrease

uint32_t **cycle_num**

Number of PWM cycles of each step [0, 2**SOC_LEDC_FADE_PARAMS_BIT_WIDTH-1]

uint32_t **scale**

Duty change of each step [0, 2**SOC_LEDC_FADE_PARAMS_BIT_WIDTH-1]

uint32_t **step_num**

Total number of steps in one hardware fade [0, 2**SOC_LEDC_FADE_PARAMS_BIT_WIDTH-1]

Macros

LEDC_ERR_DUTY

LEDC_ERR_VAL

Type Definitions

typedef *intr_handle_t* **ledc_isr_handle_t**

typedef bool (***ledc_cb_t**)(const *ledc_cb_param_t* *param, void *user_arg)

Type of LEDC event callback.

Param param LEDC callback parameter

Param user_arg User registered data

Return Whether a high priority task has been waken up by this function

Enumerations

enum **ledc_cb_event_t**

LEDC callback event type.

Values:

enumerator **LEDC_FADE_END_EVT**

LEDC fade end event

Header File

- [components/hal/include/hal/ledc_types.h](#)
- This header file can be included with:

```
#include "hal/ledc_types.h"
```

Type Definitions

typedef *soc_periph_ledc_clk_src_legacy_t* **ledc_clk_cfg_t**

LEDC clock source configuration struct.

In theory, the following enumeration shall be placed in LEDC driver's header. However, as the next enumeration, `ledc_clk_src_t`, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

Enumerations

enum **ledc_mode_t**

Values:

enumerator **LEDC_LOW_SPEED_MODE**

LEDC low speed speed_mode

enumerator **LEDC_SPEED_MODE_MAX**

LEDC speed limit

enum **ledc_intr_type_t**

Values:

enumerator **LEDC_INTR_DISABLE**

Disable LEDC interrupt

enumerator **LEDC_INTR_FADE_END**

Enable LEDC interrupt

enumerator **LEDC_INTR_MAX**

enum **ledc_duty_direction_t**

Values:

enumerator **LEDC_DUTY_DIR_DECREASE**

LEDC duty decrease direction

enumerator **LEDC_DUTY_DIR_INCREASE**

LEDC duty increase direction

enumerator **LEDC_DUTY_DIR_MAX**

enum **ledc_slow_clk_sel_t**

LEDC global clock sources.

Values:

enumerator **LEDC_SLOW_CLK_RC_FAST**

LEDC low speed timer clock source is RC_FAST clock

enumerator **LEDC_SLOW_CLK_PLL_DIV**

LEDC low speed timer clock source is a PLL_DIV clock

enumerator **LEDC_SLOW_CLK_XTAL**

LEDC low speed timer clock source XTAL clock

enumerator **LEDC_SLOW_CLK_RTC8M**

Alias of 'LEDC_SLOW_CLK_RC_FAST'

enum **ledc_clk_src_t**

LEDC timer-specific clock sources.

Note: Setting numeric values to match `ledc_clk_cfg_t` values are a hack to avoid collision with `LEDC_AUTO_CLK` in the driver, as these enums have very similar names and user may pass one of these by mistake.

Values:

enumerator **LEDC_SCLK**

Selecting this value for `LEDC_TICK_SEL_TIMER` let the hardware take its source clock from `LEDC_CLK_SEL`

enum **ledc_timer_t**

Values:

enumerator **LEDC_TIMER_0**

LEDC timer 0

enumerator **LEDC_TIMER_1**

LEDC timer 1

enumerator **LEDC_TIMER_2**

LEDC timer 2

enumerator **LEDC_TIMER_3**

LEDC timer 3

enumerator **LEDC_TIMER_MAX**

enum **ledc_channel_t**

Values:

enumerator **LEDC_CHANNEL_0**

LEDC channel 0

enumerator **LEDC_CHANNEL_1**

LEDC channel 1

enumerator **LEDC_CHANNEL_2**

LEDC channel 2

enumerator **LEDC_CHANNEL_3**

LEDC channel 3

enumerator **LEDC_CHANNEL_4**

LEDC channel 4

enumerator **LEDC_CHANNEL_5**

LEDC channel 5

enumerator **LEDC_CHANNEL_6**

LEDC channel 6

enumerator **LEDC_CHANNEL_7**

LEDC channel 7

enumerator **LEDC_CHANNEL_MAX**

enum **ledc_timer_bit_t**

Values:

enumerator **LEDC_TIMER_1_BIT**

LEDC PWM duty resolution of 1 bits

enumerator **LEDC_TIMER_2_BIT**

LEDC PWM duty resolution of 2 bits

enumerator **LEDC_TIMER_3_BIT**

LEDC PWM duty resolution of 3 bits

- enumerator **LEDC_TIMER_4_BIT**
LEDC PWM duty resolution of 4 bits
- enumerator **LEDC_TIMER_5_BIT**
LEDC PWM duty resolution of 5 bits
- enumerator **LEDC_TIMER_6_BIT**
LEDC PWM duty resolution of 6 bits
- enumerator **LEDC_TIMER_7_BIT**
LEDC PWM duty resolution of 7 bits
- enumerator **LEDC_TIMER_8_BIT**
LEDC PWM duty resolution of 8 bits
- enumerator **LEDC_TIMER_9_BIT**
LEDC PWM duty resolution of 9 bits
- enumerator **LEDC_TIMER_10_BIT**
LEDC PWM duty resolution of 10 bits
- enumerator **LEDC_TIMER_11_BIT**
LEDC PWM duty resolution of 11 bits
- enumerator **LEDC_TIMER_12_BIT**
LEDC PWM duty resolution of 12 bits
- enumerator **LEDC_TIMER_13_BIT**
LEDC PWM duty resolution of 13 bits
- enumerator **LEDC_TIMER_14_BIT**
LEDC PWM duty resolution of 14 bits
- enumerator **LEDC_TIMER_15_BIT**
LEDC PWM duty resolution of 15 bits
- enumerator **LEDC_TIMER_16_BIT**
LEDC PWM duty resolution of 16 bits
- enumerator **LEDC_TIMER_17_BIT**
LEDC PWM duty resolution of 17 bits
- enumerator **LEDC_TIMER_18_BIT**
LEDC PWM duty resolution of 18 bits
- enumerator **LEDC_TIMER_19_BIT**
LEDC PWM duty resolution of 19 bits

enumerator **LEDC_TIMER_20_BIT**

LEDC PWM duty resolution of 20 bits

enumerator **LEDC_TIMER_BIT_MAX**

enum **ledc_fade_mode_t**

Values:

enumerator **LEDC_FADE_NO_WAIT**

LEDC fade function will return immediately

enumerator **LEDC_FADE_WAIT_DONE**

LEDC fade function will block until fading to the target duty

enumerator **LEDC_FADE_MAX**

2.5.18 Camera Controller Driver

Introduction

ESP32-P4 has the following hardware that is intended for communication with external camera sensor:

- MIPI Camera Serial Interface (CSI)

The Camera Controller Driver is designed for this hardware peripheral.

Functional Overview

- *Resource Allocation* - covers how to allocate camera controller instances with properly set of configurations. It also covers how to recycle the resources when they are no longer needed.
- *Enable and disable a camera controller* - covers how to enable and disable a camera controller.
- *Start and stop a camera controller* - covers how to start and stop a camera controller.
- *Receive from a camera sensor or something else* - covers how to receive camera signal from a sensor or something else.
- *Register callback* - covers how to hook user specific code to camera controller driver event callback function.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can bring different effects to the driver.
- *IRAM SAFE* - describes tips on how to make the CSI interrupt and control functions work better along with a disabled cache.

Resource Allocation

Install Camera Controller Driver A Camera Controller Driver can be implemented by the CSI peripheral, which requires the configuration that specified by `esp_cam_ctlr_csi_config_t`.

If the configurations in `esp_cam_ctlr_csi_config_t` is specified, users can call `esp_cam_new_csi_ctlr()` to allocate and initialize a CSI camera controller handle. This function will return an CSI camera controller handle if it runs correctly. You can take following code as reference.

```

esp_cam_ctlr_csi_config_t csi_config = {
    .ctlr_id = 0,
    .h_res = MIPI_CSI_DISP_HSIZE,
    .v_res = MIPI_CSI_DISP_VSIZE_640P,
    .lane_bit_rate_mbps = MIPI_CSI_LANE_BITRATE_MBPS,
    .input_data_color_type = CAM_CTLR_COLOR_RAW8,
    .output_data_color_type = CAM_CTLR_COLOR_RGB565,
    .data_lane_num = 2,
    .byte_swap_en = false,
    .queue_items = 1,
};
esp_cam_ctlr_handle_t handle = NULL;
ESP_ERROR_CHECK(esp_cam_new_csi_ctlr(&csi_config, &handle));

```

Uninstall Camera Controller Driver If a previously installed Camera Controller Driver is no longer needed, it's recommended to recycle the resource by calling `esp_cam_ctlr_del()`, so that to release the underlying hardware.

Enable and Disable Camera Controller Driver Before starting camera controller operation, you need to enable the camera controller controller first, by calling `esp_cam_ctlr_enable()`. This function:

- Switches the driver state from **init** to **enable**.

```
ESP_ERROR_CHECK(esp_cam_ctlr_enable(handle));
```

Calling `esp_cam_ctlr_disable()` does the opposite, that is, put the driver back to the **init** state.

```
ESP_ERROR_CHECK(esp_cam_ctlr_disable(handle));
```

Start and Stop Camera Controller Driver Before receiving camera signal from camera sensor, you need to start the Camera Controller Driver first, by calling `esp_cam_ctlr_start()`. This function:

- Switches the driver stat from **enable** to **start**

```
ESP_ERROR_CHECK(esp_cam_ctlr_start(handle));
```

Calling `esp_cam_ctlr_stop()` does the opposite, that is, put the driver back to the **enable** state.

```
ESP_ERROR_CHECK(esp_cam_ctlr_stop(handle));
```

Receive from A Camera Sensor Now you can call `esp_cam_ctlr_receive()` to receive from a camera sensor or something else.

```
ESP_ERROR_CHECK(esp_cam_ctlr_receive(handle, &my_trans, ESP_CAM_CTLR_MAX_DELAY));
```

Register Event Callbacks After the Camera Controller Driver starts receiving, it can generate a specific event dynamically. If you have some functions that should be called when the event happens, please hook your function to the interrupt service routine by calling `esp_cam_ctlr_register_event_callbacks()`. All supported event callbacks are listed in `esp_cam_ctlr_evt_cbs_t`:

- `esp_cam_ctlr_evt_cbs_t::on_get_new_trans` sets a callback function when the Camera Controller Driver gets a new transaction which is passed from `esp_cam_ctlr_receive()`. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with ISR suffix are called from within the function).

- `esp_cam_ctrl_evt_cbs_t::on_trans_finished` sets a callback function when the Camera Controller Driver finishes a transaction. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function).

Thread Safety The factory function `esp_cam_new_csi_ctrl()` and `esp_cam_ctrl_del()` are guaranteed to be thread safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks.

Kconfig Options

- `CONFIG_CAM_CTRL_MIPI_CSI_ISR_IRAM_SAFE` controls whether the default ISR handler should be masked when the cache is disabled

IRAM Safe By default, the CSI interrupt will be deferred when the cache is disabled because of writing or erasing the flash.

There is a Kconfig option `CONFIG_CAM_CTRL_MIPI_CSI_ISR_IRAM_SAFE` that:

- Enables the interrupt being serviced even when the cache is disabled
- Places all functions that used by the ISR into IRAM
- Places driver object into DRAM (in case it is mapped to PSRAM by accident)

This allows the interrupt to run while the cache is disabled, but comes at the cost of increased IRAM consumption. So user callbacks need to notice that the code and data inside (the callback) should be IRAM-safe or DRAM-safe, when cache is disabled.

API Reference

Header File

- `components/esp_driver_cam/include/esp_cam_ctrl.h`
- This header file can be included with:

```
#include "esp_cam_ctrl.h"
```

- This header file is a part of the API provided by the `esp_driver_cam` component. To declare that your component depends on `esp_driver_cam`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_cam
```

```
PRIV_REQUIRES esp_driver_cam
```

Functions

`esp_err_t esp_cam_ctrl_enable(esp_cam_ctrl_handle_t handle)`

Enable ESP CAM controller.

参数 `handle` -- [in] ESP CAM controller handle

返回

- `ESP_OK`
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_INVALID_STATE`: Invalid state

`esp_err_t esp_cam_ctrl_start(esp_cam_ctrl_handle_t handle)`

Start ESP CAM controller.

参数 `handle` -- [in] ESP CAM controller handle

返回

- ESP_OK
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_INVALID_STATE: Invalid state

esp_err_t **esp_cam_ctrl_stop** (*esp_cam_ctrl_handle_t* handle)

Stop ESP CAM controller.

参数 **handle** -- [in] ESP CAM controller handle

返回

- ESP_OK
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_INVALID_STATE: Invalid state

esp_err_t **esp_cam_ctrl_disable** (*esp_cam_ctrl_handle_t* handle)

Disable ESP CAM controller.

参数 **handle** -- [in] ESP CAM controller handle

返回

- ESP_OK
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_INVALID_STATE: Invalid state

esp_err_t **esp_cam_ctrl_receive** (*esp_cam_ctrl_handle_t* handle, *esp_cam_ctrl_trans_t* *trans, uint32_t timeout_ms)

Receive data to the given transaction.

参数

- **handle** -- [in] ESP CAM controller handle
- **trans** -- [in] ESP CAM controller transaction type
- **timeout_ms** -- [in] Timeout in ms

返回

- ESP_OK
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_INVALID_STATE: Invalid state

esp_err_t **esp_cam_ctrl_del** (*esp_cam_ctrl_handle_t* handle)

Delete ESP CAM controller handle.

参数 **handle** -- [in] ESP CAM controller handle

返回

- ESP_OK
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_INVALID_STATE: Invalid state

esp_err_t **esp_cam_ctrl_register_event_callbacks** (*esp_cam_ctrl_handle_t* handle, const *esp_cam_ctrl_evt_cbs_t* *cbs, void *user_data)

Register ESP CAM controller event callbacks.

参数

- **handle** -- [in] ESP CAM controller handle
- **cbs** -- [in] ESP CAM controller event callbacks
- **user_data** -- [in] User data

返回

- ESP_OK
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_INVALID_STATE: Invalid state

esp_err_t **esp_cam_ctrl_get_frame_buffer** (*esp_cam_ctrl_handle_t* handle, uint32_t fb_num, const void **fb0, ...)

Get ESP CAM controller internal malloced backup buffer(s) addr.

备注: Generally, data in internal buffer is ready when `on_trans_finished` event

参数

- **handle** -- **[in]** ESP CAM controller handle
- **fb_num** -- **[in]** Number of frame buffer(s) to get. This value must be the same as the number of the followed `fbN` parameters
- **fb0** -- **[out]** Address of the frame buffer 0 (first frame buffer)
- ... -- **[out]** List of other frame buffers if any

返回

- ESP_OK
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_INVALID_STATE: Invalid driver state

`esp_err_t esp_cam_ctrl_get_frame_buffer_len(esp_cam_ctrl_handle_t handle, size_t *ret_fb_len)`

Get ESP CAM controller internal backup buffer length.

参数

- **handle** -- **[in]** ESP CAM controller handle
- **ret_fb_len** -- **[out]** Optional, The size of each frame buffer, in bytes.

返回

- ESP_OK
- ESP_ERR_INVALID_ARG: NULL ptr
- ESP_ERR_INVALID_STATE: Invalid driver state

Header File

- [components/esp_driver_cam/include/esp_cam_ctrl_types.h](#)
- This header file can be included with:

```
#include "esp_cam_ctrl_types.h"
```

- This header file is a part of the API provided by the `esp_driver_cam` component. To declare that your component depends on `esp_driver_cam`, add the following to your `CMakeLists.txt`:

```

Structures

struct **esp_cam_ctrl_trans_t**

ESP CAM controller transaction type.

Public Members

void ***buffer**

Transaction buffer.

size_t **buflen**

Len of the transaction buffer.

size_t **received_size**

Received size, this received_size will be written by the driver, indicating the real received size.

struct **esp_cam_ctrl_evt_cbs_t**

ESP CAM controller event callbacks.

Public Members

bool (***on_get_new_trans**)(*esp_cam_ctrl_handle_t* handle, *esp_cam_ctrl_trans_t* *trans, void *user_data)

On get new transaction callback.

Param handle [in] ESP CAM controller handle

Param trans [in] New transaction

Param user_data [in] User registered data

Return Whether a high priority task is woken up by this function

bool (***on_trans_finished**)(*esp_cam_ctrl_handle_t* handle, *esp_cam_ctrl_trans_t* *trans, void *user_data)

On transaction finish callback.

Param handle [in] ESP CAM controller handle

Param trans [out] Finished transaction

Param user_data [in] User registered data

Return Whether a high priority task is woken up by this function

Macros

ESP_CAM_CTRL_MAX_DELAY

ESP CAM controller max timeout value.

Type Definitions

typedef struct esp_cam_ctrl_t ***esp_cam_ctrl_handle_t**

ESP CAM controller handle.

Header File

- [components/esp_driver_cam/csi/include/esp_cam_ctrl_csi.h](#)
- This header file can be included with:

```
#include "esp_cam_ctrl_csi.h"
```

- This header file is a part of the API provided by the `esp_driver_cam` component. To declare that your component depends on `esp_driver_cam`, add the following to your `CMakeLists.txt`:

PRIV_REQUIRES esp_driver_cam
```

Functions

`esp_err_t esp_cam_new_csi_ctrlr` (const `esp_cam_ctrlr_csi_config_t` *config, `esp_cam_ctrlr_handle_t` *ret_handle)

New ESP CAM CSI controller.

参数

- **config** -- [in] CSI controller configurations
- **ret_handle** -- [out] Returned ESP CAM controller handle

返回

- ESP_OK
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_NO_MEM: Out of memory
- ESP_ERR_NOT_SUPPORTED: Currently not support modes or types
- ESP_ERR_NOT_FOUND: CSI is registered already

Structures

struct `esp_cam_ctrlr_csi_config_t`

ESP CAM CSI controller configurations.

Public Members

int `ctrlr_id`

CSI controller ID.

`mipi_csi_phy_clock_source_t` `clk_src`

CSI phy clock source.

uint32_t `h_res`

Input horizontal resolution, i.e. the number of pixels in a line.

uint32_t `v_res`

Input vertical resolution, i.e. the number of lines in a frame.

uint8_t `data_lane_num`

Data lane num.

int `lane_bit_rate_mbps`

Lane bit rate in Mbps.

`cam_ctrlr_color_t` `input_data_color_type`

Input color type.

`cam_ctrlr_color_t` `output_data_color_type`

Output color type.

int `queue_items`

Queue items.

uint32_t `byte_swap_en`

Enable byte swap.

```
uint32_t bk_buffer_dis
```

Disable backup buffer.

```
struct esp_cam_ctrl_csi_config_t:[anonymous] [anonymous]
```

Boolean Flags.

2.5.19 电机控制脉宽调制器 (MCPWM)

MCPWM 外设是一个多功能 PWM 生成器，集成多个子模块，在电力电子应用（如电机控制、数字电源等）中至关重要。MCPWM 外设通常适用于以下场景：

- 数字电机控制，如有刷/无刷直流电机、RC 伺服电机
- 基于开关模式的数字电源转换
- 功率数模转换器 (Power DAC)，其中占空比等于 DAC 的模拟值
- 计算外部脉宽，并将其转换为其他模拟值，如速度、距离
- 为磁场定向控制 (FOC) 生成空间矢量调制 (SVPWM) 信号

外设的主要子模块如下图所示：

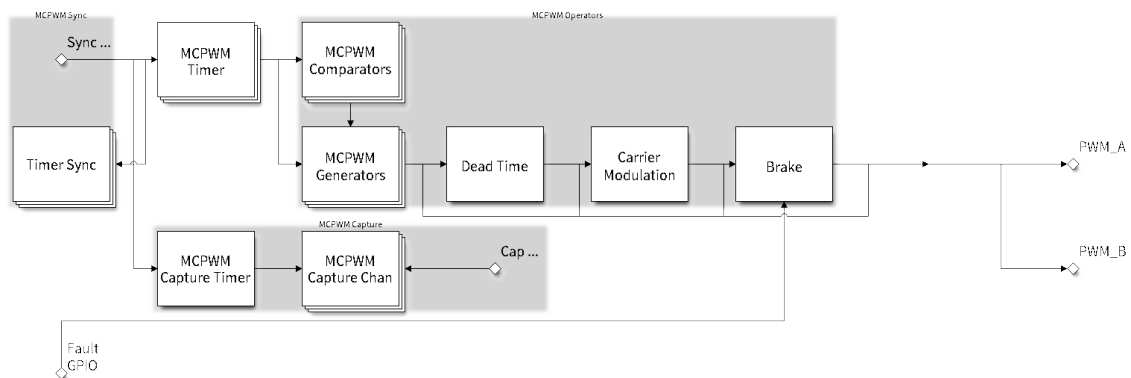

图 17: MCPWM 概述

- **MCPWM 定时器模块：**最终输出 PWM 信号的时间基准。它也决定了其他子模块的事件时序。
- **MCPWM 操作器模块：**生成 PWM 波形的关键模块。它由其他子模块组成，如比较器、PWM 生成器、死区生成器和载波调制器。
- **MCPWM 比较器模块：**输入时间基准值，并不断与配置的阈值进行比较。当定时器计数值等于任何一个阈值时，生成一个比较事件，MCPWM 生成器随即相应更新其电平。
- **MCPWM 生成器模块：**根据 MCPWM 定时器、MCPWM 比较器等子模块触发的各种事件，生成一对独立或互补的 PWM 波形。
- **MCPWM 故障检测模块：**通过 GPIO 交换矩阵检测外部的故障情况。检测到故障信号时，MCPWM 操作器将强制所有生成器进入预先定义的状态，从而保护系统。
- **MCPWM 同步模块：**同步 MCPWM 定时器，以确保由不同的 MCPWM 生成器最终生成的 PWM 信号具有固定的相位差。可以通过 GPIO 交换矩阵和 MCPWM 定时器事件生成同步信号。
- **死区生成器模块：**在此前生成的 PWM 边沿上插入额外的延迟。
- **载波模块：**可通过 PWM 波形生成器和死区生成器，将一个高频载波信号调制为 PWM 波形，这是控制功率开关器件的必需功能。
- **制动控制：**MCPWM 操作器支持配置检测到特定故障时生成器的制动控制方式。根据故障的严重程度，可以选择立即关闭或是逐周期调节 PWM 输出。
- **MCPWM 捕获模块：**独立子模块，不依赖于上述 MCPWM 操作器工作。捕获模块包括一个专用的定时器和几个独立的通道，每个通道都与 GPIO 相连。GPIO 上的脉冲触发捕获定时器以存储时间基准值，随后通过中断进行通知。此模块有助于更加精准地测量脉宽。此外，捕获定时器也可以通过 MCPWM 同步子模块进行同步。

功能概述

下文将分节概述 MCPWM 的功能：

- **资源配置及初始化** - 介绍各类 MCPWM 模块的分配，如定时器、操作器、比较器、生成器等。随后介绍的 IO 设置和控制功能也将围绕这些模块进行。
- **定时器操作和事件** - 介绍 MCPWM 定时器支持的控制功能和事件回调。
- **比较器操作和事件** - 介绍 MCPWM 比较器支持的控制功能和事件回调。
- **生成器对事件执行的操作** - 介绍如何针对 MCPWM 定时器和比较器生成的特定事件，设置 MCPWM 生成器的相应执行操作。
- **经典 PWM 波形的生成器配置** - 介绍一些经典 PWM 波形的生成器配置。
- **死区** - 介绍如何设置 MCPWM 生成器的死区时间。
- **经典 PWM 波形的死区配置** - 介绍一些经典 PWM 波形的死区配置。
- **载波调制** - 介绍如何在最终输出的 PWM 波形上调制高频载波。
- **故障检测和制动控制** - 介绍如何为 MCPWM 操作器配置特定故障事件下的制动操作。
- **生成器强制操作** - 介绍如何强制异步控制生成器的输出水平。
- **同步模块** - 介绍如何同步 MCPWM 定时器，并确保生成的最终输出 PWM 信号具有固定的相位差。
- **捕获模块** - 介绍如何使用 MCPWM 捕获模块测量信号脉宽。
- **ETM 事件与任务** - MCPWM 提供了哪些事件和任务可以连接到 ETM 通道上。
- **电源管理** - 介绍不同的时钟源对功耗的影响。
- **IRAM 安全** - 介绍如何协调 RMT 中断与禁用缓存。
- **线程安全** - 列出了由驱动程序认证为线程安全的 API。
- **Kconfig 选项** - 列出了针对驱动的数个 Kconfig 支持选项。

资源配置及初始化 如上图所示，MCPWM 外设由数个模块组成。本节将介绍各个子模块的资源配置方式。

MCPWM 定时器 调用 `mcpwm_new_timer()` 函数，以配置结构体 `mcpwm_timer_config_t` 为参数，分配一个 MCPWM 定时器为对象。结构体定义为：

- `mcpwm_timer_config_t::group_id` 指定 MCPWM 组 ID，范围为 [0, `SOC_MCPWM_GROUPS` - 1]。需注意，位于不同组的定时器彼此独立。
- `mcpwm_timer_config_t::intr_priority` 设置中断的优先级。如果设置为 0，则会分配一个默认优先级的中断，否则会使用指定的优先级。
- `mcpwm_timer_config_t::clk_src` 设置定时器的时钟源。
- `mcpwm_timer_config_t::resolution_hz` 设置定时器的预期分辨率。内部驱动将根据时钟源和分辨率设置合适的分频器。
- `mcpwm_timer_config_t::count_mode` 设置定时器的计数模式。
- `mcpwm_timer_config_t::period_ticks` 设置定时器的周期，以 Tick 为单位（通过 `mcpwm_timer_config_t::resolution_hz` 设置 Tick 分辨率）。
- `mcpwm_timer_config_t::update_period_on_empty` 设置当定时器计数为零时是否更新周期值。
- `mcpwm_timer_config_t::update_period_on_sync` 设置当定时器接收同步信号时是否更新周期值。

分配成功后，`mcpwm_new_timer()` 将返回一个指向已分配定时器的指针。否则，函数将返回错误代码。具体来说，当 MCPWM 组中没有空闲定时器时，将返回 `ESP_ERR_NOT_FOUND` 错误。¹

反之，调用 `mcpwm_del_timer()` 函数将释放已分配的定时器。

MCPWM 操作器 调用 `mcpwm_new_operator()` 函数，以配置结构体 `mcpwm_operator_config_t` 为参数，分配一个 MCPWM 操作器为对象。结构体定义为：

¹ 不同的 ESP 芯片上的 MCPWM 资源数量可能存在差异（如组、定时器、比较器、操作器、生成器、触发器等）。详情请参见 [TRM]。当分配了超出资源数量的 MCPWM 资源时，在检测到没有可用硬件资源后，驱动程序将返回错误。请在进行资源配置及初始化时务必检查返回值。

- `mcpwm_operator_config_t::group_id` 指定 MCPWM 组 ID，范围为 [0, `SOC_MCPWM_GROUPS` - 1]。需注意，位于不同组的操作器彼此独立。
- `mcpwm_operator_config_t::intr_priority` 设置中断的优先级。如果设置为 0，则会分配一个默认优先级的中断，否则会使用指定的优先级。
- `mcpwm_operator_config_t::update_gen_action_on_tez` 设置是否在定时器计数为零时更新生成器操作。此处及下文提到的定时器指通过 `mcpwm_operator_connect_timer()` 连接到操作器的定时器。
- `mcpwm_operator_config_t::update_gen_action_on_tep` 设置当定时器计数达到峰值时是否更新生成器操作。
- `mcpwm_operator_config_t::update_gen_action_on_sync` 设置当定时器接收同步信号时是否更新生成器操作。
- `mcpwm_operator_config_t::update_dead_time_on_tez` 设置当定时器计数为零时是否更新死区时间。
- `mcpwm_operator_config_t::update_dead_time_on_tep` 设置当定时器计数达到峰值时是否更新死区时间。
- `mcpwm_operator_config_t::update_dead_time_on_sync` 设置当定时器接收同步信号时是否更新死区时间。

分配成功后，`mcpwm_new_operator()` 将返回一个指向已分配操作器的指针。否则，函数将返回错误代码。具体来说，当 MCPWM 组中没有空闲操作器时，将返回 `ESP_ERR_NOT_FOUND` 错误。^{Page 508, 1}

反之，调用 `mcpwm_del_operator()` 函数将释放已分配的操作器。

MCPWM 比较器 调用 `mcpwm_new_comparator()` 函数，以一个 MCPWM 操作器句柄和配置结构体 `mcpwm_comparator_config_t` 为参数，分配一个 MCPWM 比较器为对象。操作器句柄由 `mcpwm_new_operator()` 生成，结构体定义为：

- `mcpwm_comparator_config_t::intr_priority` 设置中断的优先级。如果设置为 0，则会分配一个默认优先级的中断，否则会使用指定的优先级。
- `mcpwm_comparator_config_t::update_cmp_on_tez` 设置当定时器计数为零时是否更新比较阈值。
- `mcpwm_comparator_config_t::update_cmp_on_tep` 设置当定时器计数达到峰值时是否更新比较阈值。
- `mcpwm_comparator_config_t::update_cmp_on_sync` 设置当定时器接收同步信号时是否更新比较阈值。

分配成功后，`mcpwm_new_comparator()` 将返回一个指向已分配比较器的指针。否则，函数将返回错误代码。具体来说，当 MCPWM 操作器中没有空闲比较器时，将返回 `ESP_ERR_NOT_FOUND` 错误。^{Page 508, 1}

反之，调用 `mcpwm_del_comparator()` 函数将释放已分配的比较器。

MCPWM 中还有另外一种比较器——“事件比较器”，它不能直接控制 PWM 的输出，只能用来产生 EMT 子系统中使用到的事件。事件比较器能够设置的阈值也是可配的。调用 `mcpwm_new_event_comparator()` 函数可以申请一个事件比较器，该函数返回的句柄类型和 `mcpwm_new_comparator()` 函数一样，但是需要的配置结构体是不同的。事件比较器的配置位于 `mcpwm_event_comparator_config_t`。更多相关内容请参阅 [ETM 事件与任务](#)。

MCPWM 生成器 调用 `mcpwm_new_generator()` 函数，以一个 MCPWM 操作器句柄和配置结构体 `mcpwm_generator_config_t` 为参数，分配一个 MCPWM 生成器为对象。操作器句柄由 `mcpwm_new_operator()` 生成，结构体定义为：

- `mcpwm_generator_config_t::gen_gpio_num` 设置生成器使用的 GPIO 编号。
- `mcpwm_generator_config_t::invert_pwm` 设置是否反相 PWM 信号。
- `mcpwm_generator_config_t::io_loop_back` 设置是否启用回环模式。该模式仅用于调试，使用 GPIO 交换矩阵外设同时启用 GPIO 输入和输出。
- `mcpwm_generator_config_t::io_od_mode` 设置是否启用漏极开路输出。
- `mcpwm_generator_config_t::pull_up` 和 `mcpwm_generator_config_t::pull_down` 用来设置是否启用内部上下拉电阻。

分配成功后，`mcpwm_new_generator()` 将返回一个指向已分配生成器的指针。否则，函数将返回错误代码。具体来说，当 MCPWM 操作器中没有空闲生成器时，将返回 `ESP_ERR_NOT_FOUND` 错误。^{Page 508, 1}

反之，调用 `mcpwm_del_generator()` 函数将释放已分配的生成器。

MCPWM 故障 MCPWM 故障分为两种类型：来自 GPIO 的故障信号和软件故障。

调用 `mcpwm_new_gpio_fault()` 函数，以配置结构体 `mcpwm_gpio_fault_config_t` 为参数，分配一个 GPIO 故障为对象。结构体定义为：

- `mcpwm_gpio_fault_config_t::group_id` 设置 MCPWM 组 ID，范围为 [0, `SOC_MCPWM_GROUPS` - 1]。需注意，位于不同组的 GPIO 故障彼此独立，也就是说，1 组的操作器无法检测到 0 组的 GPIO 故障。
- `mcpwm_gpio_fault_config_t::intr_priority` 设置中断的优先级。如果设置为 0，则会分配一个默认优先级的中断，否则会使用指定的优先级。
- `mcpwm_gpio_fault_config_t::gpio_num` 设置故障所使用的 GPIO 编号。
- `mcpwm_gpio_fault_config_t::active_level` 设置故障信号的有效电平。
- `mcpwm_gpio_fault_config_t::pull_up` 和 `mcpwm_gpio_fault_config_t::pull_down` 设置是否在内部拉高和/或拉低 GPIO。
- `mcpwm_gpio_fault_config_t::io_loop_back` 设置是否启用回环模式。该模式仅用于调试，使用 GPIO 交换矩阵外设同时启用 GPIO 输入和输出。

分配成功后，`mcpwm_new_gpio_fault()` 将返回一个指向已分配故障的指针。否则，函数将返回错误代码。具体来说，当指定 MCPWM 组中没有空闲 GPIO 故障时，将返回 `ESP_ERR_NOT_FOUND` 错误。[Page 508, 1](#)

调用函数 `mcpwm_soft_fault_activate()` 使一个软件故障对象触发故障，无需等待来自 GPIO 的真实故障信号。调用 `mcpwm_new_soft_fault()` 函数，以配置结构体 `mcpwm_soft_fault_config_t` 为参数，分配一个软件故障为对象。该结构体暂时保留，供后续使用。

分配成功后，`mcpwm_new_soft_fault()` 将返回一个指向已分配故障的指针。否则，函数将返回错误代码。具体来说，当内存不足以支持该故障对象时，将返回 `ESP_ERR_NO_MEM` 错误。虽然软件故障和 GPIO 故障是不同类型的故障，但返回的故障句柄为同一类型。

反之，调用 `mcpwm_del_fault()` 函数将释放已分配的故障。此函数同时适用于软件故障和 GPIO 故障。

MCPWM 同步源 同步源用于同步 MCPWM 定时器和 MCPWM 捕获定时器，分为三种类型：来自 GPIO 的同步源、软件生成的同步源和 MCPWM 定时器事件生成的同步源。

调用 `mcpwm_new_gpio_sync_src()` 函数，以配置结构体 `mcpwm_gpio_sync_src_config_t` 为参数，分配一个 GPIO 同步源。结构体定义为：

- `mcpwm_gpio_sync_src_config_t::group_id` 指定 MCPWM 组 ID，范围为 [0, `SOC_MCPWM_GROUPS` - 1]。需注意，位于不同组的 GPIO 同步源彼此独立，也就是说，1 组的定时器无法检测到 0 组的 GPIO 同步源。
- `mcpwm_gpio_sync_src_config_t::gpio_num` 设置同步源使用的 GPIO 编号。
- `mcpwm_gpio_sync_src_config_t::active_neg` 设置同步信号在下降沿是否有效。
- `mcpwm_gpio_sync_src_config_t::pull_up` 和 `mcpwm_gpio_sync_src_config_t::pull_down` 设置是否在内部拉高和/或拉低 GPIO。
- `mcpwm_gpio_sync_src_config_t::io_loop_back` 设置是否启用回环模式。该模式仅用于调试，使用 GPIO 交换矩阵外设同时启用 GPIO 输入和输出。

分配成功后，`mcpwm_new_gpio_sync_src()` 将返回一个指向已分配同步源的指针。否则，函数将返回错误代码。具体来说，当 MCPWM 组中没有空闲 GPIO 时钟源时，将返回 `ESP_ERR_NOT_FOUND` 错误。[Page 508, 1](#)

调用 `mcpwm_new_timer_sync_src()` 函数，以配置结构体 `mcpwm_timer_sync_src_config_t` 为参数，分配一个定时器事件同步源。结构体定义为：

- `mcpwm_timer_sync_src_config_t::timer_event` 指定产生同步信号的定时器事件。
- `mcpwm_timer_sync_src_config_t::propagate_input_sync` 是否广播输入同步信号（即将输入同步信号传输到其同步输出）。

分配成功后，`mcpwm_new_timer_sync_src()` 将返回一个指向已分配同步源的指针。否则，函数将返回错误代码。具体来说，若是分配的同步源此前已分配给了同一个定时器，将返回 `ESP_ERR_INVALID_STATE` 错误。

也可以调用 `mcpwm_new_soft_sync_src()` 函数，以配置结构体 `mcpwm_soft_sync_config_t` 为参数，分配一个软件同步源。该结构体暂时保留，供后续使用。

分配成功后，`mcpwm_new_soft_sync_src()` 将返回一个指向已分配同步源的指针。否则，函数将返回错误代码。具体来说，当内存不足以支持分配的同步源时，将返回 `ESP_ERR_NO_MEM` 错误。需注意，为确保软件同步源能够正常工作，应预先调用 `mcpwm_soft_sync_activate()`。

相反，调用 `mcpwm_del_sync_src()` 函数将释放分配的同步源对象。此函数适用于所有类型的同步源。

MCPWM 捕获定时器和通道 MCPWM 组有一个专用定时器，用于捕获特定事件发生时的时间戳。捕获定时器连接了数个独立通道，每个通道都分配了各自的 GPIO。

调用 `mcpwm_new_capture_timer()` 函数，以配置结构体 `mcpwm_capture_timer_config_t` 为参数，分配一个捕获定时器。结构体定义为：

- `mcpwm_capture_timer_config_t::group_id` 设置 MCPWM 组 ID，范围为 [0, `SOC_MCPWM_GROUPS - 1`]。
- `mcpwm_capture_timer_config_t::clk_src` 设置捕获定时器的时钟源。
- `mcpwm_capture_timer_config_t::resolution_hz` 设置捕获定时器的预期分辨率。内部驱动将根据时钟源和分辨率设置合适的分频器。设置为 0 时，驱动会自己选取一个适当的分辨率，后续你可以通过 `mcpwm_capture_timer_get_resolution()` 查看当前定时器的分辨率。

分配成功后，`mcpwm_new_capture_timer()` 将返回一个指向已分配捕获定时器的指针。否则，函数将返回错误代码。具体来说，当 MCPWM 组中没有空闲捕获定时器时，将返回 `ESP_ERR_NOT_FOUND` 错误。Page 508, 1

接下来，可以调用 `mcpwm_new_capture_channel()` 函数，以一个捕获定时器句柄和配置结构体 `mcpwm_capture_channel_config_t` 为参数，分配一个捕获通道。结构体定义为：

- `mcpwm_capture_channel_config_t::intr_priority` 设置中断的优先级。如果设置为 0，则会分配一个默认优先级的中断，否则会使用指定的优先级。
- `mcpwm_capture_channel_config_t::gpio_num` 设置捕获通道使用的 GPIO 编号。
- `mcpwm_capture_channel_config_t::prescale` 设置输入信号的预分频器。
- `mcpwm_capture_channel_config_t::extra_flags::pos_edge` 和 `mcpwm_capture_channel_config_t::extra_flags::neg_edge` 设置是否在输入信号的上升沿和/或下降沿捕获时间戳。
- `mcpwm_capture_channel_config_t::extra_flags::pull_up` 和 `mcpwm_capture_channel_config_t::extra_flags::pull_down` 设置是否在内部拉高和/或拉低 GPIO。
- `mcpwm_capture_channel_config_t::extra_flags::invert_cap_signal` 设置是否取反捕获信号。
- `mcpwm_capture_channel_config_t::extra_flags::io_loop_back` 设置是否启用回环模式。该模式仅用于调试，使用 GPIO 交换矩阵外设同时启用 GPIO 输入和输出。
- `mcpwm_capture_channel_config_t::extra_flags::keep_io_conf_at_exit` 设置是否在删除通道时保留 GPIO 的相关配置。

分配成功后，`mcpwm_new_capture_channel()` 将返回一个指向已分配捕获通道的指针。否则，函数将返回错误代码。具体来说，当捕获定时器中没有空闲捕获通道时，将返回 `ESP_ERR_NOT_FOUND` 错误。

反之，调用 `mcpwm_del_capture_channel()` 和 `mcpwm_del_capture_timer()` 将释放已分配的捕获通道和定时器。

MCPWM 中断优先级 MCPWM 允许为定时器、操作器、比较器、故障以及捕获事件分别配置中断，中断优先级由各自的 `config_t::intr_priority` 决定。且同一个 MCPWM 组中的事件共享同一个中断源。注册多个中断事件时，中断优先级需要保持一致。

备注： MCPWM 组注册多个中断事件时，驱动将以第一个事件的中断优先级作为 MCPWM 组的中断优先级。

定时器操作和事件

更新定时器周期 定时器周期在创建定时器时就已经通过 `mcpwm_timer_config_t::period_ticks` 被初始化过了。你还可以在运行期间，调用 `mcpwm_timer_set_period()` 函数来更新定时周期。新周期的生效时机由 `mcpwm_timer_config_t::update_period_on_empty` 和 `mcpwm_timer_config_t::update_period_on_sync` 共同决定。如果他们两个参数都是 `false`，那么新的定时周期会立即生效。

注册定时器事件回调 MCPWM 定时器运行时会生成不同的事件。若有函数需在特定事件发生时调用，则应预先调用 `mcpwm_timer_register_event_callbacks()`，将所需函数挂载至中断服务程序 (ISR) 中。驱动中定时器回调函数原型声明为 `mcpwm_timer_event_cb_t`，其所支持的事件回调类型则列在 `mcpwm_timer_event_callbacks_t` 中：

- `mcpwm_timer_event_callbacks_t::on_full` 设置定时器计数达到峰值时的回调函数。
- `mcpwm_timer_event_callbacks_t::on_empty` 设置定时器计数为零时的回调函数。
- `mcpwm_timer_event_callbacks_t::on_stop` 设置定时器停止时的回调函数。

由于上述回调函数是在 ISR 中调用的，因此，这些函数 **不应** 涉及 `block` 操作。可以检查调用 API 的后缀，确保在函数中只调用了后缀为 ISR 的 FreeRTOS API。

函数 `mcpwm_timer_register_event_callbacks()` 中的 `user_data` 参数用于保存用户上下文，将直接传递至各个回调函数。

此函数会在不启用 MCPWM 定时器的情况下延迟安装其中断服务。因此，需在调用 `mcpwm_timer_enable()` 函数前调用该函数，否则将返回 `ESP_ERR_INVALID_STATE` 错误。更多信息请参见 [启用和禁用定时器](#)。

启用和禁用定时器 在对定时器进行 IO 控制前，需要预先调用 `mcpwm_timer_enable()` 函数启用定时器。这个函数将：

- 将定时器的状态从 `init` 切换到 `enable`。
- 若中断服务此前已通过 `mcpwm_timer_register_event_callbacks()` 函数延迟安装，则启用中断服务。
- 若选择了特定时钟源（例如 PLL_160M 时钟），则获取相应的电源管理锁。更多信息请参见 [电源管理](#)。

反之，调用 `mcpwm_timer_disable()` 会将定时器切换回 `init` 状态、禁用中断服务并释放电源管理锁。

启动和停止定时器 通过基本的 IO 控制，即可启动和停止定时器。使用不同的 `mcpwm_timer_start_stop_cmd_t` 命令调用 `mcpwm_timer_start_stop()` 便可立即启动定时器，或在发生特定事件时停止定时器。此外，还可以通过配置，让定时器仅计数一轮。也就是说，在计数达到峰值或零后，定时器自行停止。

连接定时器和操作器 调用 `mcpwm_operator_connect_timer()` 函数，连接分配的 MCPWM 定时器和 MCPWM 操作器。连接后，操作器即可将定时器作为时基，生成所需的 PWM 波形。需注意，MCPWM 定时器和操作器必须位于同一个组中。否则，将返回 `ESP_ERR_INVALID_ARG` 错误。

比较器操作和事件

注册比较器事件回调 MCPWM 比较器可以在定时器计数器等于比较值时发送通知。若有函数需在比较事件发生时调用，则应预先调用 `mcpwm_comparator_register_event_callbacks()`，将所需函数挂载至中断服务程序 (ISR) 中。驱动中比较器回调函数原型声明为 `mcpwm_compare_event_cb_t`，其所支持的事件回调类型则列在 `mcpwm_comparator_event_callbacks_t` 中：

- `mcpwm_comparator_event_callbacks_t::on_reach` 设置当定时器计数器等于比较值时的比较器回调函数。

回调函数会提供类型为 `mcpwm_compare_event_data_t` 的事件特定数据。由于上述回调函数是在 ISR 中调用的，因此，这些函数 **不应** 涉及 `block` 操作。可以检查调用 API 的后缀，确保在函数中只调用了后缀为 ISR 的 FreeRTOS API。

函数 `mcpwm_comparator_register_event_callbacks()` 中的 `user_data` 参数用于保存用户上下文，将直接传递至各个回调函数。

此函数会延迟安装 MCPWM 比较器的中断服务。中断服务只能通过 `mcpwm_del_comparator` 移除。

备注： 对于事件比较器，你无法通过该函数来注册回调函数，因为事件比较器触发产生任何中断事件。

设置比较值 运行 MCPWM 比较器时，可以调用 `mcpwm_comparator_set_compare_value()` 设置比较值。需注意以下几点：

- 重新设置的比较值可能不会立即生效。比较值的更新时间通过 `mcpwm_comparator_config_t::update_cmp_on_tez` 或 `mcpwm_comparator_config_t::update_cmp_on_tep` 或 `mcpwm_comparator_config_t::update_cm` 配置。
- 请确保已经预先调用 `mcpwm_operator_connect_timer()` 将操作器连接至 MCPWM 定时器。否则，将返回 `ESP_ERR_INVALID_STATE` 错误。
- 比较值不应超过定时器的计数峰值。否则，将无法触发比较事件。

生成器对事件执行的操作

设置生成器对定时器事件执行的操作 调用 `mcpwm_generator_set_actions_on_timer_event()` 并辅以若干操作配置，可以针对不同的定时器事件，为生成器设置不同的操作。操作配置定义在 `mcpwm_gen_timer_event_action_t` 中：

- `mcpwm_gen_timer_event_action_t::direction` 指定定时器计数方向，可以调用 `mcpwm_timer_direction_t` 查看支持的方向。
- `mcpwm_gen_timer_event_action_t::event` 指定定时器事件，可以调用 `mcpwm_timer_event_t` 查看支持的定时器事件。
- `mcpwm_gen_timer_event_action_t::action` 指定随即进行的生成器操作，可以调用 `mcpwm_generator_action_t` 查看支持的操作。

可借助辅助宏 `MCPWM_GEN_TIMER_EVENT_ACTION` 构建定时器事件操作条目。

需注意，`mcpwm_generator_set_actions_on_timer_event()` 的参数列表 **必须** 以 `MCPWM_GEN_TIMER_EVENT_ACTION_END` 结束。

也可以调用 `mcpwm_generator_set_action_on_timer_event()` 逐一设置定时器操作，无需涉及变量参数。

设置生成器对比较器事件执行的操作 调用 `mcpwm_generator_set_actions_on_compare_event()` 并辅以若干操作配置，可以针对不同的比较器事件，为生成器设置不同的操作。操作配置定义在 `mcpwm_gen_compare_event_action_t` 中：

- `mcpwm_gen_compare_event_action_t::direction` 指定定时器计数方向，可以调用 `mcpwm_timer_direction_t` 查看支持的方向。
- `mcpwm_gen_compare_event_action_t::comparator` 指定比较器句柄。有关分配比较器的方法，请参见 [MCPWM 比较器](#)。
- `mcpwm_gen_compare_event_action_t::action` 指定随即进行的生成器操作，可以调用 `mcpwm_generator_action_t` 查看支持的操作。

可借助辅助宏 `MCPWM_GEN_COMPARE_EVENT_ACTION` 构建比较事件操作条目。

需注意，`mcpwm_generator_set_actions_on_compare_event()` 的参数列表 **必须** 以 `MCPWM_GEN_COMPARE_EVENT_ACTION_END` 结束。

也可以调用 `mcpwm_generator_set_action_on_compare_event()` 逐一设置比较器操作，无需涉及变量参数。

设置生成器对故障事件执行的操作 调用 `mcpwm_generator_set_action_on_fault_event()` 并辅以操作配置，可以针对故障事件，为生成器设置操作。操作配置定义在 `mcpwm_gen_fault_event_action_t` 中：

- `mcpwm_gen_fault_event_action_t::direction` 指定定时器计数方向，可以调用 `mcpwm_timer_direction_t` 查看支持的方向。
- `mcpwm_gen_fault_event_action_t::fault` 指定用于触发器的故障。有关分配故障的方法，请参见 **MCPWM 故障**。
- `mcpwm_gen_fault_event_action_t::action` 指定随即进行的生成器操作，可以调用 `mcpwm_generator_action_t` 查看支持的操作。

当生成器所属的操作器中没有空闲触发器时，将返回 `ESP_ERR_NOT_FOUND` 错误。[Page 508, 1](#)

触发器支持的故障仅为 GPIO 故障，当传入故障不为 GPIO 故障时，将返回 `ESP_ERR_NOT_SUPPORTED` 错误。

可借助辅助宏 `MCPWM_GEN_FAULT_EVENT_ACTION` 构建触发事件操作条目。

需注意，故障事件没有类似 `mcpwm_generator_set_actions_on_fault_event()` 这样的可变参数函数。

设置生成器对同步事件执行的操作 调用 `mcpwm_generator_set_action_on_sync_event()` 并辅以操作配置，可以针对同步事件，为生成器设置操作。操作配置定义在 `mcpwm_gen_sync_event_action_t` 中：

- `mcpwm_gen_sync_event_action_t::direction` 指定定时器计数方向，可以调用 `mcpwm_timer_direction_t` 查看支持的方向。
- `mcpwm_gen_sync_event_action_t::sync` 指定用于触发器的同步源。有关分配同步源的方法，请参见 **MCPWM 同步源**。
- `mcpwm_gen_sync_event_action_t::action` 指定随即进行的生成器操作，可以调用 `mcpwm_generator_action_t` 查看支持的操作。

当生成器所属的操作器中没有空闲触发器时，将返回 `ESP_ERR_NOT_FOUND` 错误。[Page 508, 1](#)

无论同步为何种类型，触发器仅支持一种同步操作，如果多次设置同步操作，将返回 `ESP_ERR_INVALID_STATE` 错误。

可借助辅助宏 `MCPWM_GEN_SYNC_EVENT_ACTION` 构建触发事件操作条目。

需注意，同步事件没有类似 `mcpwm_generator_set_actions_on_sync_event()` 这样的可变参数函数。

经典 PWM 波形的生成器配置 本节提供了一些生成器支持生成的经典 PWM 波形，同时提供用于生成这些波形的代码片段。总的来说：

- 生成波形为 **对称波形** 还是 **不对称波形** 取决于 MCPWM 定时器的计数模式。
- 波形对的 **激活电平** 取决于占空比较小的 PWM 波形的电平。
- PWM 波形的周期取决于定时器的周期和计数模式。
- PWM 波形的占空比取决于生成器的各种操作配置组合。

单边不对称波形 - 高电平

```

static void gen_action_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb,
↪mcpwm_cmpr_handle_t cmpa, mcpwm_cmpr_handle_t cmpb)
{
    ESP_ERROR_CHECK(mcpwm_generator_set_action_on_timer_event(gena,

        MCPWM_GEN_COMPARE_EVENT_ACTION(MCPWM_TIMER_DIRECTION_DOWN,
↪cmpb, MCPWM_GEN_ACTION_HIGH),
        MCPWM_GEN_COMPARE_EVENT_ACTION_END()));
}

```

死区 在电力电子学中，常常会用到整流器和逆变器，这就涉及到了整流桥和逆变桥的应用。每个桥臂配有两个功率电子器件，例如 MOSFET、IGBT 等。同一桥臂上的两个 MOSFET 不能同时导通，否则会造成短路。实际应用中，在 PWM 波形显示 MOSFET 开关已关闭后，仍需要一段时间窗口才能完全关闭 MOSFET。因此，需要设置生成器对事件执行的操作，在已生成的 PWM 波形上添加额外延迟。

死区驱动器的工作方式与装饰器类似。在 `mcpwm_generator_set_dead_time()` 函数的参数中，驱动接收主要生成器句柄 (`in_generator`)，并在应用死区后返回一个新的生成器 (`out_generator`)。需注意，如果 `out_generator` 和 `in_generator` 相同，这表示 PWM 波形中的时间延迟是以“就地”的方式添加的。反之，如果 `out_generator` 和 `in_generator` 不同，则代表在原 `in_generator` 的基础上派生出了一个新的 PWM 波形。

结构体 `mcpwm_dead_time_config_t` 中列出了死区相关的具体配置：

- `mcpwm_dead_time_config_t::posedge_delay_ticks` 和 `mcpwm_dead_time_config_t::negedge_delay_ticks` 设置 PWM 波形上升沿和下降沿上的延迟时间，以 Tick 为单位。若将这两个参数设置为 0，则代表绕过死区模块。死区的 Tick 分辨率与通过 `mcpwm_operator_connect_timer()` 连接操作器的定时器相同。
- `mcpwm_dead_time_config_t::invert_output` 设置是否在应用死区后取反信号，以控制延迟边沿的极性。

警告： 由于硬件限制，同一种 delay 模块 (posedge delay 或者 negedge delay) 不能同时被应用在不同的 MCPWM 生成器中。例如，以下配置是无效的：

```

mcpwm_dead_time_config_t dt_config = {
    .posedge_delay_ticks = 10,
};
// 给 generator A 叠加上沿 delay
mcpwm_generator_set_dead_time(mcpwm_gen_a, mcpwm_gen_a, &dt_config);
// NOTE: 下面的操作是无效的，不能将同一种 delay 应用于不同的 generator 上
mcpwm_generator_set_dead_time(mcpwm_gen_b, mcpwm_gen_b, &dt_config);

```

然而，你可以为生成器 A 设置 posedge delay，为生成器 B 设置 negedge delay。另外，也可以为生成器 A 同时设置 posedge delay 和 negedge delay，而让生成器 B 绕过死区模块。

备注： 也可以通过设置生成器对事件执行的操作来生成所需的死区，通过不同的比较器来控制边沿位置。但是，如果需要使用经典的基于边沿延迟并附带极性控制的死区，则应使用死区子模块。

经典 PWM 波形的死区配置 本节提供了一些死区子模块支持生成的经典 PWM 波形，同时在图片下方提供用于生成这些波形的代码片段。

```
static void gen_action_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb,
↪mcpwm_cmpr_handle_t cmpa, mcpwm_cmpr_handle_t cmpb)

```

载波调制 MCPWM 操作器具有载波子模块，可以根据需要（例如隔离式数字电源应用中）使用变压器传递 PWM 输出信号，实现电机驱动器的电气隔离。在电机需要在全负荷下稳定运行时，各个 PWM 输出信号都将占空比稳定保持在 100% 左右。由于变压器无法直接耦合非交替信号，需要使用载波子模块调制信号，生成交流电波形，从而实现耦合。

调用 `mcpwm_operator_apply_carrier()`，并提供配置结构体 `mcpwm_carrier_config_t`，配置载波子模块：

- `mcpwm_carrier_config_t::clk_src` 设置载波的时钟源。
- `mcpwm_carrier_config_t::frequency_hz` 表示载波频率，单位为赫兹。内部驱动将根据时钟源和载波频率设置合适的分频器。
- `mcpwm_carrier_config_t::duty_cycle` 表示载波的占空比。需注意，支持的占空比选项并不连续，驱动程序将根据配置查找最近的占空比。
- `mcpwm_carrier_config_t::first_pulse_duration_us` 表示第一个脉冲的脉宽，单位为微秒。该脉冲的分辨率由 `mcpwm_carrier_config_t::frequency_hz` 中的配置决定。第一个脉冲的脉宽不能为零，且至少为一个载波周期。脉宽越长，电感传导越快。
- `mcpwm_carrier_config_t::invert_before_modulate` 和 `mcpwm_carrier_config_t::invert_after_modulate` 设置是否在调制前和调制后取反载波输出。

具体而言，可调用 `mcpwm_operator_apply_carrier()` 并将其配置为 NULL，禁用载波子模块。

故障检测和制动控制 MCPWM 操作器能够感知外部信号，接收有关电机故障、功率驱动器及其他连接设备的信息。这些故障信号封装在 MCPWM 故障对象中。

电机需配置故障模式以及检测到特定故障时的对应操作，例如拉低有刷电机的所有输出，或是锁定步进电机的电流状态等。此操作应使电机重回安全状态，降低故障导致损坏的可能性。

设置故障时操作器的制动模式 MCPWM 操作器对故障的响应方式为 **制动**。可以调用 `mcpwm_operator_set_brake_on_fault()`，为每个故障对象配置不同的制动模式。制动的配置包含在结构体 `mcpwm_brake_config_t` 中：

- `mcpwm_brake_config_t::fault` 设置操作器响应的故障类型。
- `mcpwm_brake_config_t::brake_mode` 设置对应故障的制动模式，可以调用 `mcpwm_operator_brake_mode_t` 查看支持的制动模式。在 `MCPWM_OPER_BRAKE_MODE_CBC` 模式下，操作器将在故障消失后自

行恢复正常，可以通过 `mcpwm_brake_config_t::cbc_recover_on_tez` 和 `mcpwm_brake_config_t::cbc_recover_on_tep` 配置恢复时间。在 `MCPWM_OPER_BRAKE_MODE_OST` 模式下，即使故障消失，操作器也无法恢复正常。此时，需要调用 `mcpwm_operator_recover_from_fault()`，手动恢复操作器。

设置发生制动事件时的生成器操作 调用 `mcpwm_generator_set_actions_on_brake_event()` 并辅以若干操作配置，可以针对不同的制动事件，为生成器设置不同的对应操作。操作配置定义在 `mcpwm_gen_brake_event_action_t` 中：

- `mcpwm_gen_brake_event_action_t::direction` 指定定时器的方向，可以调用 `mcpwm_timer_direction_t` 查看支持的方向。
- `mcpwm_gen_brake_event_action_t::brake_mode` 指定制动模式，可以调用 `mcpwm_operator_brake_mode_t` 查看支持的制动模式。
- `mcpwm_gen_brake_event_action_t::action` 指定生成器操作，可以调用 `mcpwm_generator_action_t` 查看支持的操作。

可借助辅助宏 `MCPWM_GEN_BRAKE_EVENT_ACTION` 构建制动事件操作条目。

需注意，`mcpwm_generator_set_actions_on_brake_event()` 的参数列表必须以 `MCPWM_GEN_BRAKE_EVENT_ACTION_END` 结束。

也可以调用 `mcpwm_generator_set_action_on_brake_event()` 逐一设置制动操作，无需涉及变量参数。

注册故障事件回调 MCPWM 故障检测器支持在检测到实际故障或故障信号消失时发送通知。若有函数需在特定事件发生时调用，则应预先调用 `mcpwm_fault_register_event_callbacks()`，将所需函数挂载至中断服务程序 (ISR) 中。驱动中故障事件回调函数原型声明为 `mcpwm_fault_event_cb_t`，其所支持的事件回调类型则列在 `mcpwm_fault_event_callbacks_t` 中：

- `mcpwm_fault_event_callbacks_t::on_fault_enter` 设置检测到故障时调用的回调函数。
- `mcpwm_fault_event_callbacks_t::on_fault_exit` 设置故障消失后调用的回调函数。

由于上述回调函数在 ISR 中调用，因此，这些函数不应涉及 block 操作。可以检查调用 API 的后缀，确保在函数中只调用了后缀为 ISR 的 FreeRTOS API。

函数 `mcpwm_fault_register_event_callbacks()` 中的 `user_data` 参数用于保存用户上下文，将直接传递至各个回调函数。

此函数会延迟安装 MCPWM 故障的中断服务。中断服务只能通过 `mcpwm_del_fault` 移除。

寄存器制动事件回调 MCPWM 操作器支持在进行制动操作前发送通知。若有函数需在特定事件发生时调用，则应预先调用 `mcpwm_operator_register_event_callbacks()`，将所需函数挂载至中断服务程序 (ISR) 中。驱动中制动事件回调函数原型声明为 `mcpwm_brake_event_cb_t`，其所支持的事件回调类型则列在 `mcpwm_operator_event_callbacks_t` 中：

- `mcpwm_operator_event_callbacks_t::on_brake_cbc` 设置操作器进行 **逐周期 (CBC)** 操作前调用的回调函数。
- `mcpwm_operator_event_callbacks_t::on_brake_ost` 设置操作器进行 **一次性 (OST)** 操作前调用的回调函数。

由于上述回调函数在 ISR 中调用，因此，这些函数不应涉及 block 操作。可以检查调用 API 的后缀，确保在函数中只调用了后缀为 ISR 的 FreeRTOS API。

函数 `mcpwm_operator_register_event_callbacks()` 中的 `user_data` 参数用于保存用户上下文，将直接传递至各个回调函数。

此函数会延迟安装 MCPWM 故障的中断服务。中断服务只能通过 `mcpwm_del_operator` 移除。

生成器强制操作 调用 `mcpwm_generator_set_force_level()`，使能软件强制决定运行时的生成器输出电平。相较于通过 `mcpwm_generator_set_actions_on_timer_event()` 配置的其他事件操作，软件强制事件优先级最高。

- 设置 `level` 为 `-1`，代表禁用强制操作，生成器的输出电平重新交由事件操作控制。
- 设置 `hold_on` 为 `true`，代表强制输出电平将保持不变，直到设置 `level` 为 `-1` 来移除该电平。
- 设置 `hole_on` 为 `false`，代表强制输出电平仅在短时间有效，随后发生的任何事件都可以改变该电平。

同步模块 MCPWM 定时器接收到同步信号后，定时器将强制进入一个预定义的 **相位**，该相位由计数值和计数方向共同决定。调用 `mcpwm_timer_set_phase_on_sync()`，设置同步相位。同步相位配置定义在 `mcpwm_timer_sync_phase_config_t` 结构体中：

- `mcpwm_timer_sync_phase_config_t::sync_src` 设置同步信号源。创建同步源对象的相关操作，请参见 [MCPWM 同步源](#)。具体来说，当此参数设置为 `NULL` 时，驱动器将禁用 MCPWM 定时器的同步功能。
- `mcpwm_timer_sync_phase_config_t::count_value` 设置接收同步信号后加载至计数器的值。
- `mcpwm_timer_sync_phase_config_t::direction` 设置接收同步信号后的计数方向。

备注： 当 MCPWM 定时器在 `MCPWM_TIMER_COUNT_MODE_UP_DOWN` 模式下工作时，需要特别注意。在该模式下，计数器范围 `[0 -> peak-1]` 属于 **递增**阶段，`[peak -> 1]` 属于 **递减**阶段。因此，如果你将 `mcpwm_timer_sync_phase_config_t::count_value` 设置为零，则可能还需要将 `mcpwm_timer_sync_phase_config_t::direction` 设置为 `MCPWM_TIMER_DIRECTION_UP`。否则，计时器将继续维持递减阶段，计数值会下溢至峰值。

同理，[MCPWM 捕获定时器](#)和[通道](#)也支持同步。调用 `mcpwm_capture_timer_set_phase_on_sync()`，设置捕获定时器的同步相位。同步相位配置定义在 `mcpwm_capture_timer_sync_phase_config_t` 结构体中：

- `mcpwm_capture_timer_sync_phase_config_t::sync_src` 设置同步信号源。关于如何创建一个同步源对象，请参见 [MCPWM 同步源](#)。具体来说，当此参数设置为 `NULL` 时，驱动器将禁用 MCPWM 捕获定时器的同步功能。
- `mcpwm_capture_timer_sync_phase_config_t::count_value` 设置接收同步信号后加载至计数器的值。
- `mcpwm_capture_timer_sync_phase_config_t::direction` 设置接收同步信号后的计数方向。需注意，不同于 MCPWM 定时器，捕获定时器只支持 `MCPWM_TIMER_DIRECTION_UP` 这一个计数方向。

使用 GPIO 同步定时器

```
static void example_setup_sync_strategy(mcpwm_timer_handle_t timers[])
{
    mcpwm_sync_handle_t gpio_sync_source = NULL;
    mcpwm_gpio_sync_src_config_t gpio_sync_config = {
        .group_id = 0, // GPIO 故障应与以上定时器位于同一组中
        .gpio_num = EXAMPLE_SYNC_GPIO,
        .flags.pull_down = true,
        .flags.active_neg = false, // 默认情况下，一个上升沿脉冲可以触发一个同步事件
    };
    ESP_ERROR_CHECK(mcpwm_new_gpio_sync_src(&gpio_sync_config, &gpio_sync_source));

    mcpwm_timer_sync_phase_config_t sync_phase_config = {
        .count_value = 0, // 同步相位：目标计数值
        .direction = MCPWM_TIMER_DIRECTION_UP, // 同步相位：计数方向
        .sync_src = gpio_sync_source, // 同步源
    };
    for (int i = 0; i < 3; i++) {
        ESP_ERROR_CHECK(mcpwm_timer_set_phase_on_sync(timers[i], &sync_phase_
        ↪ config));
    }
}
```

图 18: GPIO Sync All MCPWM Timers

捕获模块 MCPWM 捕获的主要功能是记录捕获信号的脉冲边沿的有效时间。可以通过捕获得到脉宽，随后使用捕获回调函数将脉宽转换为其他物理量，如距离或速度。例如，在下图的无刷直流电机 (BLDC) 方案中，可以使用捕获子模块来确认来自霍尔传感器的转子位置。

通常，捕获定时器连接了数个捕获通道。有关资源分配的相关信息，请参见 [MCPWM 捕获定时器和通道](#)。

注册捕获事件回调 MCPWM 捕获通道支持在信号上检测到有效边沿时发送通知。须调用 `mcpwm_capture_channel_register_event_callbacks()`，注册一个回调函数来获得捕获的定时器计数值。回调函数原型声明在 `mcpwm_capture_event_cb_t` 中，可以调用 `mcpwm_capture_event_callbacks_t` 查看支持的捕获回调：

- `mcpwm_capture_event_callbacks_t::on_cap` 设置检测到有效边沿时捕获通道的回调函数。

回调函数会针对特定事件，提供 `mcpwm_capture_event_data_t` 类型的数据，由此，可以通过 `mcpwm_capture_event_data_t::cap_edge` 和 `mcpwm_capture_event_data_t::cap_value` 分别得到捕获信号的边沿及该捕获的计数值。随后，调用 `mcpwm_capture_timer_get_resolution()`，获取捕获定时器的分辨率，以将捕获计数转换为时间戳。

由于上述回调函数在 ISR 中调用，因此，这些函数 **不应** 涉及 block 操作。可以检查调用 API 的后缀，确保在函数中只调用了后缀为 ISR 的 FreeRTOS API。

函数 `mcpwm_capture_channel_register_event_callbacks()` 中的 `user_data` 参数用于保存用户上下文，将直接传递至各个回调函数。

此函数会延迟安装 MCPWM 捕获的中断服务。中断服务只能通过 `mcpwm_del_capture_channel` 移除。

启用或禁用捕获通道 调用 `mcpwm_new_capture_channel()` 进行分配后，捕获通道不会自动启用。应调用 `mcpwm_capture_channel_enable()` 或 `mcpwm_capture_channel_disable()` 来启用或禁用该通道。如果在为通道注册事件回调时，由于调用

图 19: 带霍尔传感器的 MCPWM 无刷直流电机

了 `mcpwm_capture_channel_register_event_callbacks()`，致使延迟安装中断服务，则调用 `mcpwm_capture_channel_enable()` 启用通道时，也将启用中断服务。

启用或禁用捕获定时器 在对捕获定时器进行 IO 控制之前，需要首先调用 `mcpwm_capture_timer_enable()`，启用定时器。此函数将进行如下内部操作：

- 将捕获定时器的状态从 **init** 切换到 **enable**。
- 如果选择了一个特定时钟源（例如 APB 时钟），则获取一个对应的电源管理锁。更多信息请参见 [电源管理](#)。

反之，调用 `mcpwm_capture_timer_disable()` 将使定时器驱动程序切换回 **init** 状态，并释放电源管理锁。

启动或停止捕获定时器 通过基本的 IO 控制，即可启动或停止捕获定时器。调用 `mcpwm_capture_timer_start()` 启动捕获定时器，或调用 `mcpwm_capture_timer_stop()` 立即停止捕获定时器。

触发软件捕获事件 某些场景下，可能存在需要软件触发“虚假”捕获事件的需求。此时，可以调用 `mcpwm_capture_channel_trigger_soft_catch()` 实现。需注意，此类“虚假”捕获事件仍然会触发中断，并从而调用捕获事件回调函数。

ETM 事件与任务 MCPWM 比较器可以产生事件，这些事件可以连接到 **ETM** 模块。`mcpwm_comparator_etm_event_type_t` 中列出了 MCPWM 比较器能够产生的事件类型。用户可以通过调用 `mcpwm_comparator_new_etm_event()` 来获得相应事件的 ETM event 句柄。

关于如何将 MCPWM 比较器事件连接到 ETM 通道中，请参阅 [ETM](#) 文档。

电源管理 启用电源管理（即开启 `CONFIG_PM_ENABLE`）时，系统会在进入 Light-sleep 前调整 PLL 和 APB 频率。该操作有可能会改变 MCPWM 定时器的计数步长，导致计时偏差。

不过，驱动程序可以获取 `ESP_PM_APB_FREQ_MAX` 类型的电源管理锁，防止系统改变 APB 频率。每当驱动创建以 `MCPWM_TIMER_CLK_SRC_PLL160M` 作为时钟源的 MCPWM 定时器实例时，都会通过 `mcpwm_timer_enable()` 启用定时器时获取电源管理锁。反之，调用 `mcpwm_timer_disable()` 时，驱动程序释放锁。

同理，每当驱动创建一个以 `MCPWM_CAPTURE_CLK_SRC_APB` 作为时钟源的 MCPWM 捕获定时器实例时，都会通过 `mcpwm_capture_timer_enable()` 启用定时器时获取电源管理锁，并在调用 `mcpwm_capture_timer_disable()` 时释放锁。

IRAM 安全 默认情况下，禁用 cache 时，写入/擦除 flash 等原因将导致 MCPWM 中断延迟，事件回调函数也将延迟执行。在实时应用程序中，应避免此类情况。

因此，可以启用 Kconfig 选项 `CONFIG_MCPWM_ISR_IRAM_SAFE`，该选项：

- 支持在禁用 cache 时启用所需中断
- 支持将 ISR 使用的所有函数存放在 IRAM 中²
- 支持将驱动程序存放在 DRAM 中（以防其意外映射到 PSRAM 中）

启用该选项可以保证 cache 禁用时的中断运行，但会相应增加 IRAM 占用。

另一个 Kconfig 选项 `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM` 也支持将常用的 IO 控制函数存放在 IRAM 中，以保证在禁用 cache 时可以正常使用函数。IO 控制函数如下所示：

- `mcpwm_comparator_set_compare_value()`
- `mcpwm_timer_set_period()`

线程安全 驱动程序会确保工厂函数（如 `mcpwm_new_timer()`）的线程安全，使用时，可以直接从不同的 RTOS 任务中调用此类函数，无需额外锁保护。

驱动程序设置了临界区，以防函数同时在任务和 ISR 中调用。因此，以下函数支持在 ISR 上下文运行：

- `mcpwm_comparator_set_compare_value()`
- `mcpwm_timer_set_period()`

资源配置及初始化 中尚未提及的函数并非线程安全。在没有设置互斥锁保护的任務中，应避免调用这些函数。

Kconfig 选项

- `CONFIG_MCPWM_ISR_IRAM_SAFE` 控制默认 ISR 处理程序能否在禁用 cache 的情况下工作。更多信息请参见 **IRAM 安全**。
- `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM` 控制 MCPWM 控制函数的存放位置（IRAM 或 flash）。更多信息请参见 **IRAM 安全**。
- `CONFIG_MCPWM_ENABLE_DEBUG_LOG` 用于启用调试日志输出。启用此选项将增加固件的二进制文件大小。

应用示例

- 通过 PID 算法控制有刷直流电机速度：[peripherals/mcpwm/mcpwm_bdc_speed_control](#)
- 控制带霍尔传感器反馈的无刷直流电机：[peripherals/mcpwm/mcpwm_bldc_hall_control](#)
- 使用超声波传感器 (HC-SR04) 测量距离：[peripherals/mcpwm/mcpwm_capture_hc_sr04](#)
- 控制伺服电机角度：[peripherals/mcpwm/mcpwm_servo_control](#)
- 定时器之间的 MCPWM 同步：[peripherals/mcpwm/mcpwm_sync](#)

² 回调函数及其调用的子函数需手动存放在 IRAM 中。

API Reference

Header File

- `components/esp_driver_mcpwm/include/driver/mcpwm_timer.h`

PRIV_REQUIRES esp_driver_mcpwm
```

Functions

`esp_err_t mcpwm_new_timer` (const `mcpwm_timer_config_t` *config, `mcpwm_timer_handle_t` *ret_timer)

Create MCPWM timer.

参数

- **config** -- [in] MCPWM timer configuration
- **ret_timer** -- [out] Returned MCPWM timer handle

返回

- `ESP_OK`: Create MCPWM timer successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM timer failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM timer failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create MCPWM timer failed because all hardware timers are used up and no more free one
- `ESP_FAIL`: Create MCPWM timer failed because of other error

`esp_err_t mcpwm_del_timer` (`mcpwm_timer_handle_t` timer)

Delete MCPWM timer.

参数 **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer` ()

返回

- `ESP_OK`: Delete MCPWM timer successfully
- `ESP_ERR_INVALID_ARG`: Delete MCPWM timer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Delete MCPWM timer failed because timer is not in init state
- `ESP_FAIL`: Delete MCPWM timer failed because of other error

`esp_err_t mcpwm_timer_set_period` (`mcpwm_timer_handle_t` timer, `uint32_t` period_ticks)

Set a new period for MCPWM timer.

备注: If `mcpwm_timer_config_t::update_period_on_empty` and `mcpwm_timer_config_t::update_period_on_sync` are not set, the new period will take effect immediately. Otherwise, the new period will take effect when timer counts to zero or on sync event.

备注: You may need to use `mcpwm_comparator_set_compare_value` to set a new compare value for MCPWM comparator in order to keep the same PWM duty cycle.

参数

- **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer`
- **period_ticks** -- [in] New period in count ticks

返回

- ESP_OK: Set new period for MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Set new period for MCPWM timer failed because of invalid argument
- ESP_FAIL: Set new period for MCPWM timer failed because of other error

esp_err_t **mcpwm_timer_enable** (*mcpwm_timer_handle_t* timer)

Enable MCPWM timer.

参数 **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

返回

- ESP_OK: Enable MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Enable MCPWM timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable MCPWM timer failed because timer is enabled already
- ESP_FAIL: Enable MCPWM timer failed because of other error

esp_err_t **mcpwm_timer_disable** (*mcpwm_timer_handle_t* timer)

Disable MCPWM timer.

参数 **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

返回

- ESP_OK: Disable MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Disable MCPWM timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable MCPWM timer failed because timer is disabled already
- ESP_FAIL: Disable MCPWM timer failed because of other error

esp_err_t **mcpwm_timer_start_stop** (*mcpwm_timer_handle_t* timer, *mcpwm_timer_start_stop_cmd_t* command)

Send specific start/stop commands to MCPWM timer.

参数

- **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **command** -- [in] Supported command list for MCPWM timer

返回

- ESP_OK: Start or stop MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Start or stop MCPWM timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start or stop MCPWM timer failed because timer is not enabled
- ESP_FAIL: Start or stop MCPWM timer failed because of other error

esp_err_t **mcpwm_timer_register_event_callbacks** (*mcpwm_timer_handle_t* timer, const *mcpwm_timer_event_callbacks_t* *cbs, void *user_data)

Set event callbacks for MCPWM timer.

备注: The first call to this function needs to be before the call to `mcpwm_timer_enable`

备注: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

参数

- **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **cbs** -- [in] Group of callback functions
- **user_data** -- [in] User data, which will be passed to callback functions directly

返回

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set event callbacks failed because timer is not in init state
- ESP_FAIL: Set event callbacks failed because of other error

esp_err_t **mcpwm_timer_set_phase_on_sync** (*mcpwm_timer_handle_t* timer, const *mcpwm_timer_sync_phase_config_t* *config)

Set sync phase for MCPWM timer.

参数

- **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **config** -- [in] MCPWM timer sync phase configuration

返回

- ESP_OK: Set sync phase for MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Set sync phase for MCPWM timer failed because of invalid argument
- ESP_FAIL: Set sync phase for MCPWM timer failed because of other error

Structures

struct **mcpwm_timer_event_callbacks_t**

Group of supported MCPWM timer event callbacks.

备注: The callbacks are all running under ISR environment

Public Members

mcpwm_timer_event_cb_t **on_full**

callback function when MCPWM timer counts to peak value

mcpwm_timer_event_cb_t **on_empty**

callback function when MCPWM timer counts to zero

mcpwm_timer_event_cb_t **on_stop**

callback function when MCPWM timer stops

struct **mcpwm_timer_config_t**

MCPWM timer configuration.

Public Members

int **group_id**

Specify from which group to allocate the MCPWM timer

mcpwm_timer_clock_source_t **clk_src**

MCPWM timer clock source

uint32_t **resolution_hz**

Counter resolution in Hz The step size of each count tick equals to (1 / resolution_hz) seconds

mcpwm_timer_count_mode_t **count_mode**

Count mode

uint32_t **period_ticks**

Number of count ticks within a period

int **intr_priority**

MCPWM timer interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t **update_period_on_empty**

Whether to update period when timer counts to zero

uint32_t **update_period_on_sync**

Whether to update period on sync event

struct *mcpwm_timer_config_t*::[anonymous] **flags**

Extra configuration flags for timer

struct **mcpwm_timer_sync_phase_config_t**

MCPWM Timer sync phase configuration.

Public Members

mcpwm_sync_handle_t **sync_src**

The sync event source. Set to NULL will disable the timer being synced by others

uint32_t **count_value**

The count value that should lock to upon sync event

mcpwm_timer_direction_t **direction**

The count direction that should lock to upon sync event

Header File

- This header file can be included with:

```
#include "driver/mcpwm_oper.h"
```

- This header file is a part of the API provided by the `esp_driver_mcpwm` component. To declare that your component depends on `esp_driver_mcpwm`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_mcpwm
```

or

```
PRIV_REQUIRES esp_driver_mcpwm
```

Functions

esp_err_t **mcpwm_new_operator** (const *mcpwm_operator_config_t* *config, *mcpwm_oper_handle_t* *ret_oper)

Create MCPWM operator.

参数

- **config** -- [in] MCPWM operator configuration
- **ret_oper** -- [out] Returned MCPWM operator handle

返回

- ESP_OK: Create MCPWM operator successfully
- ESP_ERR_INVALID_ARG: Create MCPWM operator failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM operator failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM operator failed because can't find free resource
- ESP_FAIL: Create MCPWM operator failed because of other error

esp_err_t **mcpwm_del_operator** (*mcpwm_oper_handle_t* oper)

Delete MCPWM operator.

参数 **oper** -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`

返回

- ESP_OK: Delete MCPWM operator successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM operator failed because of invalid argument
- ESP_FAIL: Delete MCPWM operator failed because of other error

esp_err_t **mcpwm_operator_connect_timer** (*mcpwm_oper_handle_t* oper, *mcpwm_timer_handle_t* timer)

Connect MCPWM operator and timer, so that the operator can be driven by the timer.

参数

- **oper** -- [in] MCPWM operator handle, allocated by `mcpwm_new_operator()`
- **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

返回

- ESP_OK: Connect MCPWM operator and timer successfully
- ESP_ERR_INVALID_ARG: Connect MCPWM operator and timer failed because of invalid argument
- ESP_FAIL: Connect MCPWM operator and timer failed because of other error

esp_err_t **mcpwm_operator_set_brake_on_fault** (*mcpwm_oper_handle_t* oper, const *mcpwm_brake_config_t* *config)

Set brake method for MCPWM operator.

参数

- **oper** -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- **config** -- [in] MCPWM brake configuration

返回

- ESP_OK: Set trip for operator successfully
- ESP_ERR_INVALID_ARG: Set trip for operator failed because of invalid argument
- ESP_FAIL: Set trip for operator failed because of other error

esp_err_t **mcpwm_operator_recover_from_fault** (*mcpwm_oper_handle_t* oper, *mcpwm_fault_handle_t* fault)

Try to make the operator recover from fault.

备注: To recover from fault or escape from trip, you make sure the fault signal has disappeared already. Otherwise the recovery can't succeed.

参数

- **oper** -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- **fault** -- [in] MCPWM fault handle

返回

- ESP_OK: Recover from fault successfully
- ESP_ERR_INVALID_ARG: Recover from fault failed because of invalid argument
- ESP_ERR_INVALID_STATE: Recover from fault failed because the fault source is still active
- ESP_FAIL: Recover from fault failed because of other error

esp_err_t **mcpwm_operator_register_event_callbacks** (*mcpwm_oper_handle_t* oper, const *mcpwm_operator_event_callbacks_t* *cbs, void *user_data)

Set event callbacks for MCPWM operator.

备注: User can deregister a previously registered callback by calling this function and setting the callback member in the *cbs* structure to NULL.

参数

- **oper** -- **[in]** MCPWM operator handle, allocated by *mcpwm_new_operator()*
- **cbs** -- **[in]** Group of callback functions
- **user_data** -- **[in]** User data, which will be passed to callback functions directly

返回

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

esp_err_t **mcpwm_operator_apply_carrier** (*mcpwm_oper_handle_t* oper, const *mcpwm_carrier_config_t* *config)

Apply carrier feature for MCPWM operator.

参数

- **oper** -- **[in]** MCPWM operator, allocated by *mcpwm_new_operator()*
- **config** -- **[in]** MCPWM carrier specific configuration

返回

- ESP_OK: Set carrier for operator successfully
- ESP_ERR_INVALID_ARG: Set carrier for operator failed because of invalid argument
- ESP_FAIL: Set carrier for operator failed because of other error

Structures

struct **mcpwm_operator_config_t**

MCPWM operator configuration.

Public Members

int **group_id**

Specify from which group to allocate the MCPWM operator

int **intr_priority**

MCPWM operator interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t **update_gen_action_on_tez**

Whether to update generator action when timer counts to zero

uint32_t **update_gen_action_on_tep**

Whether to update generator action when timer counts to peak

uint32_t **update_gen_action_on_sync**

Whether to update generator action on sync event

uint32_t **update_dead_time_on_tez**

Whether to update dead time when timer counts to zero

uint32_t **update_dead_time_on_tep**

Whether to update dead time when timer counts to peak

uint32_t **update_dead_time_on_sync**

Whether to update dead time on sync event

struct *mcpwm_operator_config_t*::[anonymous] **flags**

Extra configuration flags for operator

struct **mcpwm_brake_config_t**

MCPWM brake configuration structure.

Public Members

mcpwm_fault_handle_t **fault**

Which fault causes the operator to brake

mcpwm_operator_brake_mode_t **brake_mode**

Brake mode

uint32_t **cbc_recover_on_tez**

Recovery CBC brake state on tez event

uint32_t **cbc_recover_on_tep**

Recovery CBC brake state on tep event

struct *mcpwm_brake_config_t*::[anonymous] **flags**

Extra flags for brake configuration

struct **mcpwm_operator_event_callbacks_t**

Group of supported MCPWM operator event callbacks.

备注: The callbacks are all running under ISR environment

Public Members

mcpwm_brake_event_cb_t **on_brake_cbc**

callback function when mcpwm operator brakes in CBC

mcpwm_brake_event_cb_t **on_brake_ost**

callback function when mcpwm operator brakes in OST

struct **mcpwm_carrier_config_t**

MCPWM carrier configuration structure.

Public Members

mcpwm_carrier_clock_source_t **clk_src**

MCPWM carrier clock source

uint32_t **frequency_hz**

Carrier frequency in Hz

uint32_t **first_pulse_duration_us**

The duration of the first PWM pulse, in us

float **duty_cycle**

Carrier duty cycle

uint32_t **invert_before_modulate**

Invert the raw signal

uint32_t **invert_after_modulate**

Invert the modulated signal

struct *mcpwm_carrier_config_t*::[anonymous] **flags**

Extra flags for carrier configuration

Header File

- [components/esp_driver_mcpwm/include/driver/mcpwm_cmpr.h](#)
- This header file can be included with:

```
#include "driver/mcpwm_cmpr.h"
```

REQUIRES esp_driver_mcpwm
```

or

```
PRIV_REQUIRES esp_driver_mcpwm
```

Functions

esp_err_t **mcpwm_new_comparator** (*mcpwm_oper_handle_t* oper, const *mcpwm_comparator_config_t* *config, *mcpwm_cmpr_handle_t* *ret_cmpr)

Create MCPWM comparator.

参数

- **oper** -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`, the new comparator will be allocated from this operator
- **config** -- [in] MCPWM comparator configuration
- **ret_cmpr** -- [out] Returned MCPWM comparator

返回

- ESP_OK: Create MCPWM comparator successfully
- ESP_ERR_INVALID_ARG: Create MCPWM comparator failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM comparator failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM comparator failed because can't find free resource
- ESP_FAIL: Create MCPWM comparator failed because of other error

esp_err_t `mcpwm_del_comparator` (*mcpwm_cmpr_handle_t* cmpr)

Delete MCPWM comparator.

参数 **cmpr** -- [in] MCPWM comparator handle, allocated by `mcpwm_new_comparator()`

返回

- ESP_OK: Delete MCPWM comparator successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM comparator failed because of invalid argument
- ESP_FAIL: Delete MCPWM comparator failed because of other error

esp_err_t `mcpwm_new_event_comparator` (*mcpwm_oper_handle_t* oper, const *mcpwm_event_comparator_config_t* *config, *mcpwm_cmpr_handle_t* *ret_cmpr)

Create MCPWM event comparator.

参数

- **oper** -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`, the new event comparator will be allocated from this operator
- **config** -- [in] MCPWM comparator configuration
- **ret_cmpr** -- [out] Returned MCPWM event comparator

返回

- ESP_OK: Create MCPWM event comparator successfully
- ESP_ERR_INVALID_ARG: Create MCPWM event comparator failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM event comparator failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM event comparator failed because can't find free resource
- ESP_FAIL: Create MCPWM event comparator failed because of other error

esp_err_t `mcpwm_comparator_register_event_callbacks` (*mcpwm_cmpr_handle_t* cmpr, const *mcpwm_comparator_event_callbacks_t* *cbs, void *user_data)

Set event callbacks for MCPWM comparator.

备注: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

参数

- **cmpr** -- [in] MCPWM comparator handle, allocated by `mcpwm_new_comparator()`
- **cbs** -- [in] Group of callback functions
- **user_data** -- [in] User data, which will be passed to callback functions directly

返回

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

esp_err_t **mcpwm_comparator_set_compare_value** (*mcpwm_cmpr_handle_t* cmpr, uint32_t cmp_ticks)

Set MCPWM comparator's compare value.

参数

- **cmpr** -- [in] MCPWM comparator handle, allocated by `mcpwm_new_comparator()`
- **cmp_ticks** -- [in] The new compare value

返回

- **ESP_OK**: Set MCPWM compare value successfully
- **ESP_ERR_INVALID_ARG**: Set MCPWM compare value failed because of invalid argument (e.g. the `cmp_ticks` is out of range)
- **ESP_ERR_INVALID_STATE**: Set MCPWM compare value failed because the operator doesn't have a timer connected
- **ESP_FAIL**: Set MCPWM compare value failed because of other error

Structures

struct **mcpwm_comparator_config_t**

MCPWM comparator configuration.

Public Members

int **intr_priority**

MCPWM comparator interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t **update_cmp_on_tez**

Whether to update compare value when timer count equals to zero (tez)

uint32_t **update_cmp_on_tep**

Whether to update compare value when timer count equals to peak (tep)

uint32_t **update_cmp_on_sync**

Whether to update compare value on sync event

struct *mcpwm_comparator_config_t*::[anonymous] **flags**

Extra configuration flags for comparator

struct **mcpwm_event_comparator_config_t**

MCPWM event comparator configuration.

struct **mcpwm_comparator_event_callbacks_t**

Group of supported MCPWM compare event callbacks.

备注: The callbacks are all running under ISR environment

Public Members

mcpwm_compare_event_cb_t **on_reach**

ISR callback function which would be invoked when counter reaches compare value

Header File

- [components/esp_driver_mcpwm/include/driver/mcpwm_gen.h](#)
- This header file can be included with:

```
#include "driver/mcpwm_gen.h"
```

- This header file is a part of the API provided by the `esp_driver_mcpwm` component. To declare that your component depends on `esp_driver_mcpwm`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_mcpwm
```

or

```
PRIV_REQUIRES esp_driver_mcpwm
```

Functions

`esp_err_t mcpwm_new_generator` (*mcpwm_oper_handle_t* oper, const *mcpwm_generator_config_t* *config, *mcpwm_gen_handle_t* *ret_gen)

Allocate MCPWM generator from given operator.

参数

- **oper** -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- **config** -- [in] MCPWM generator configuration
- **ret_gen** -- [out] Returned MCPWM generator

返回

- `ESP_OK`: Create MCPWM generator successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM generator failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM generator failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create MCPWM generator failed because can't find free resource
- `ESP_FAIL`: Create MCPWM generator failed because of other error

`esp_err_t mcpwm_del_generator` (*mcpwm_gen_handle_t* gen)

Delete MCPWM generator.

参数 **gen** -- [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`

返回

- `ESP_OK`: Delete MCPWM generator successfully
- `ESP_ERR_INVALID_ARG`: Delete MCPWM generator failed because of invalid argument
- `ESP_FAIL`: Delete MCPWM generator failed because of other error

`esp_err_t mcpwm_generator_set_force_level` (*mcpwm_gen_handle_t* gen, int level, bool hold_on)

Set force level for MCPWM generator.

备注: The force level will be applied to the generator immediately, regardless any other events that would change the generator's behaviour.

备注: If the `hold_on` is true, the force level will retain forever, until user removes the force level by setting the force level to `-1`.

备注: If the `hold_on` is false, the force level can be overridden by the next event action.

备注: The force level set by this function can be inverted by GPIO matrix or dead-time module. So the level set here doesn't equal to the final output level.

参数

- **gen** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **level** -- **[in]** GPIO level to be applied to MCPWM generator, specially, -1 means to remove the force level
- **hold_on** -- **[in]** Whether the forced PWM level should retain (i.e. will remain unchanged until manually remove the force level)

返回

- ESP_OK: Set force level for MCPWM generator successfully
- ESP_ERR_INVALID_ARG: Set force level for MCPWM generator failed because of invalid argument
- ESP_FAIL: Set force level for MCPWM generator failed because of other error

esp_err_t `mcpwm_generator_set_action_on_timer_event` (*mcpwm_gen_handle_t* gen, *mcpwm_gen_timer_event_action_t* ev_act)

Set generator action on MCPWM timer event.

参数

- **gen** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** -- **[in]** MCPWM timer event action, can be constructed by `MCPWM_GEN_TIMER_EVENT_ACTION` helper macro

返回

- ESP_OK: Set generator action successfully
- ESP_ERR_INVALID_ARG: Set generator action failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set generator action failed because of timer is not connected to operator
- ESP_FAIL: Set generator action failed because of other error

esp_err_t `mcpwm_generator_set_actions_on_timer_event` (*mcpwm_gen_handle_t* gen, *mcpwm_gen_timer_event_action_t* ev_act, ...)

Set generator actions on multiple MCPWM timer events.

备注: This is an aggregation version of `mcpwm_generator_set_action_on_timer_event`, which allows user to set multiple actions in one call.

参数

- **gen** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** -- **[in]** MCPWM timer event action list, must be terminated by `MCPWM_GEN_TIMER_EVENT_ACTION_END()`

返回

- ESP_OK: Set generator actions successfully
- ESP_ERR_INVALID_ARG: Set generator actions failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set generator actions failed because of timer is not connected to operator
- ESP_FAIL: Set generator actions failed because of other error

esp_err_t `mcpwm_generator_set_action_on_compare_event` (*mcpwm_gen_handle_t* generator, *mcpwm_gen_compare_event_action_t* ev_act)

Set generator action on MCPWM compare event.

参数

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** -- **[in]** MCPWM compare event action, can be constructed by `MCPWM_GEN_COMPARE_EVENT_ACTION` helper macro

返回

- `ESP_OK`: Set generator action successfully
- `ESP_ERR_INVALID_ARG`: Set generator action failed because of invalid argument
- `ESP_FAIL`: Set generator action failed because of other error

esp_err_t `mcpwm_generator_set_actions_on_compare_event` (*mcpwm_gen_handle_t* generator, *mcpwm_gen_compare_event_action_t* ev_act, ...)

Set generator actions on multiple MCPWM compare events.

备注: This is an aggregation version of `mcpwm_generator_set_action_on_compare_event`, which allows user to set multiple actions in one call.

参数

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** -- **[in]** MCPWM compare event action list, must be terminated by `MCPWM_GEN_COMPARE_EVENT_ACTION_END()`

返回

- `ESP_OK`: Set generator actions successfully
- `ESP_ERR_INVALID_ARG`: Set generator actions failed because of invalid argument
- `ESP_FAIL`: Set generator actions failed because of other error

esp_err_t `mcpwm_generator_set_action_on_brake_event` (*mcpwm_gen_handle_t* generator, *mcpwm_gen_brake_event_action_t* ev_act)

Set generator action on MCPWM brake event.

参数

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** -- **[in]** MCPWM brake event action, can be constructed by `MCPWM_GEN_BRAKE_EVENT_ACTION` helper macro

返回

- `ESP_OK`: Set generator action successfully
- `ESP_ERR_INVALID_ARG`: Set generator action failed because of invalid argument
- `ESP_FAIL`: Set generator action failed because of other error

esp_err_t `mcpwm_generator_set_actions_on_brake_event` (*mcpwm_gen_handle_t* generator, *mcpwm_gen_brake_event_action_t* ev_act, ...)

Set generator actions on multiple MCPWM brake events.

备注: This is an aggregation version of `mcpwm_generator_set_action_on_brake_event`, which allows user to set multiple actions in one call.

参数

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** -- **[in]** MCPWM brake event action list, must be terminated by `MCPWM_GEN_BRAKE_EVENT_ACTION_END()`

返回

- ESP_OK: Set generator actions successfully
- ESP_ERR_INVALID_ARG: Set generator actions failed because of invalid argument
- ESP_FAIL: Set generator actions failed because of other error

esp_err_t **mcpwm_generator_set_action_on_fault_event** (*mcpwm_gen_handle_t* generator, *mcpwm_gen_fault_event_action_t* ev_act)

Set generator action on MCPWM Fault event.

参数

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** -- **[in]** MCPWM trigger event action, can be constructed by `MCPWM_GEN_FAULT_EVENT_ACTION` helper macro

返回

- ESP_OK: Set generator action successfully
- ESP_ERR_INVALID_ARG: Set generator action failed because of invalid argument
- ESP_FAIL: Set generator action failed because of other error

esp_err_t **mcpwm_generator_set_action_on_sync_event** (*mcpwm_gen_handle_t* generator, *mcpwm_gen_sync_event_action_t* ev_act)

Set generator action on MCPWM Sync event.

备注: The trigger only support one sync action, regardless of the kinds. Should not call this function more than once.

参数

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** -- **[in]** MCPWM trigger event action, can be constructed by `MCPWM_GEN_SYNC_EVENT_ACTION` helper macro

返回

- ESP_OK: Set generator action successfully
- ESP_ERR_INVALID_ARG: Set generator action failed because of invalid argument
- ESP_FAIL: Set generator action failed because of other error

esp_err_t **mcpwm_generator_set_dead_time** (*mcpwm_gen_handle_t* in_generator, *mcpwm_gen_handle_t* out_generator, const *mcpwm_dead_time_config_t* *config)

Set dead time for MCPWM generator.

备注: Due to a hardware limitation, you can't set rising edge delay for both MCPWM generator 0 and 1 at the same time, otherwise, there will be a conflict inside the dead time module. The same goes for the falling edge setting. But you can set both the rising edge and falling edge delay for the same MCPWM generator.

参数

- **in_generator** -- **[in]** MCPWM generator, before adding the dead time
- **out_generator** -- **[in]** MCPWM generator, after adding the dead time
- **config** -- **[in]** MCPWM dead time configuration

返回

- ESP_OK: Set dead time for MCPWM generator successfully
- ESP_ERR_INVALID_ARG: Set dead time for MCPWM generator failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set dead time for MCPWM generator failed because of invalid state (e.g. delay module is already in use by other generator)

- `ESP_FAIL`: Set dead time for MCPWM generator failed because of other error

Structures

struct `mcpwm_generator_config_t`

MCPWM generator configuration.

Public Members

int `gen_gpio_num`

The GPIO number used to output the PWM signal

uint32_t `invert_pwm`

Whether to invert the PWM signal (done by GPIO matrix)

uint32_t `io_loop_back`

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32_t `io_od_mode`

Configure the GPIO as open-drain mode

uint32_t `pull_up`

Whether to pull up internally

uint32_t `pull_down`

Whether to pull down internally

struct `mcpwm_generator_config_t::[anonymous] flags`

Extra configuration flags for generator

struct `mcpwm_gen_timer_event_action_t`

Generator action on specific timer event.

Public Members

`mcpwm_timer_direction_t` `direction`

Timer direction

`mcpwm_timer_event_t` `event`

Timer event

`mcpwm_generator_action_t` `action`

Generator action should perform

struct `mcpwm_gen_compare_event_action_t`

Generator action on specific comparator event.

Public Members

mcpwm_timer_direction_t **direction**

Timer direction

mcpwm_cmpr_handle_t **comparator**

Comparator handle

mcpwm_generator_action_t **action**

Generator action should perform

struct **mcpwm_gen_brake_event_action_t**

Generator action on specific brake event.

Public Members

mcpwm_timer_direction_t **direction**

Timer direction

mcpwm_operator_brake_mode_t **brake_mode**

Brake mode

mcpwm_generator_action_t **action**

Generator action should perform

struct **mcpwm_gen_fault_event_action_t**

Generator action on specific fault event.

Public Members

mcpwm_timer_direction_t **direction**

Timer direction

mcpwm_fault_handle_t **fault**

Which fault as the trigger. Only support GPIO fault

mcpwm_generator_action_t **action**

Generator action should perform

struct **mcpwm_gen_sync_event_action_t**

Generator action on specific sync event.

Public Members

mcpwm_timer_direction_t **direction**

Timer direction

mcpwm_sync_handle_t **sync**

Which sync as the trigger

mcpwm_generator_action_t **action**

Generator action should perform

struct **mcpwm_dead_time_config_t**

MCPWM dead time configuration structure.

Public Members

uint32_t **posedge_delay_ticks**

delay time applied to rising edge, 0 means no rising delay time

uint32_t **negedge_delay_ticks**

delay time applied to falling edge, 0 means no falling delay time

uint32_t **invert_output**

Invert the signal after applied the dead time

struct *mcpwm_dead_time_config_t*::[anonymous] **flags**

Extra flags for dead time configuration

Macros

MCPWM_GEN_TIMER_EVENT_ACTION (dir, ev, act)

Help macros to construct a *mcpwm_gen_timer_event_action_t* entry.

MCPWM_GEN_TIMER_EVENT_ACTION_END ()

MCPWM_GEN_COMPARE_EVENT_ACTION (dir, cmp, act)

Help macros to construct a *mcpwm_gen_compare_event_action_t* entry.

MCPWM_GEN_COMPARE_EVENT_ACTION_END ()

MCPWM_GEN_BRAKE_EVENT_ACTION (dir, mode, act)

Help macros to construct a *mcpwm_gen_brake_event_action_t* entry.

MCPWM_GEN_BRAKE_EVENT_ACTION_END ()

MCPWM_GEN_FAULT_EVENT_ACTION (dir, flt, act)

Help macros to construct a *mcpwm_gen_fault_event_action_t* entry.

MCPWM_GEN_SYNC_EVENT_ACTION (dir, syn, act)

Help macros to construct a *mcpwm_gen_sync_event_action_t* entry.

```

Functions

esp_err_t **mcpwm_new_gpio_fault** (const *mcpwm_gpio_fault_config_t* *config, *mcpwm_fault_handle_t* *ret_fault)

Create MCPWM GPIO fault.

参数

- **config** -- [in] MCPWM GPIO fault configuration
- **ret_fault** -- [out] Returned GPIO fault handle

返回

- ESP_OK: Create MCPWM GPIO fault successfully
- ESP_ERR_INVALID_ARG: Create MCPWM GPIO fault failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM GPIO fault failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM GPIO fault failed because can't find free resource
- ESP_FAIL: Create MCPWM GPIO fault failed because of other error

esp_err_t **mcpwm_new_soft_fault** (const *mcpwm_soft_fault_config_t* *config, *mcpwm_fault_handle_t* *ret_fault)

Create MCPWM software fault.

参数

- **config** -- [in] MCPWM software fault configuration
- **ret_fault** -- [out] Returned software fault handle

返回

- ESP_OK: Create MCPWM software fault successfully
- ESP_ERR_INVALID_ARG: Create MCPWM software fault failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM software fault failed because out of memory
- ESP_FAIL: Create MCPWM software fault failed because of other error

esp_err_t **mcpwm_del_fault** (*mcpwm_fault_handle_t* fault)

Delete MCPWM fault.

参数

- **fault** -- [in] MCPWM fault handle allocated by `mcpwm_new_gpio_fault()` or `mcpwm_new_soft_fault()`

返回

- ESP_OK: Delete MCPWM fault successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM fault failed because of invalid argument
- ESP_FAIL: Delete MCPWM fault failed because of other error

esp_err_t **mcpwm_soft_fault_activate** (*mcpwm_fault_handle_t* fault)

Activate the software fault, trigger the fault event for once.

参数

- **fault** -- [in] MCPWM soft fault, allocated by `mcpwm_new_soft_fault()`

返回

- ESP_OK: Trigger MCPWM software fault event successfully
- ESP_ERR_INVALID_ARG: Trigger MCPWM software fault event failed because of invalid argument
- ESP_FAIL: Trigger MCPWM software fault event failed because of other error

esp_err_t **mcpwm_fault_register_event_callbacks** (*mcpwm_fault_handle_t* fault, const *mcpwm_fault_event_callbacks_t* *cbs, void *user_data)

Set event callbacks for MCPWM fault.

备注: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

参数

- **fault** -- **[in]** MCPWM GPIO fault handle, allocated by `mcpwm_new_gpio_fault()`
- **cbs** -- **[in]** Group of callback functions
- **user_data** -- **[in]** User data, which will be passed to callback functions directly

返回

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

Structures

struct **mcpwm_gpio_fault_config_t**

MCPWM GPIO fault configuration structure.

Public Members

int **group_id**

In which MCPWM group that the GPIO fault belongs to

int **intr_priority**

MCPWM GPIO fault interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

int **gpio_num**

GPIO used by the fault signal

uint32_t **active_level**

On which level the fault signal is treated as active

uint32_t **io_loop_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32_t **pull_up**

Whether to pull up internally

uint32_t **pull_down**

Whether to pull down internally

struct *mcpwm_gpio_fault_config_t*::[anonymous] **flags**

Extra configuration flags for GPIO fault

struct **mcpwm_soft_fault_config_t**

MCPWM software fault configuration structure.

struct **mcpwm_fault_event_callbacks_t**

Group of supported MCPWM fault event callbacks.

备注: The callbacks are all running under ISR environment

Public Members

mcpwm_fault_event_cb_t **on_fault_enter**

ISR callback function that would be invoked when fault signal becomes active

mcpwm_fault_event_cb_t **on_fault_exit**

ISR callback function that would be invoked when fault signal becomes inactive

```

Functions

esp_err_t **mcpwm_new_timer_sync_src** (*mcpwm_timer_handle_t* timer, const *mcpwm_timer_sync_src_config_t* *config, *mcpwm_sync_handle_t* *ret_sync)

Create MCPWM timer sync source.

参数

- **timer** -- **[in]** MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **config** -- **[in]** MCPWM timer sync source configuration
- **ret_sync** -- **[out]** Returned MCPWM sync handle

返回

- **ESP_OK**: Create MCPWM timer sync source successfully
- **ESP_ERR_INVALID_ARG**: Create MCPWM timer sync source failed because of invalid argument
- **ESP_ERR_NO_MEM**: Create MCPWM timer sync source failed because out of memory
- **ESP_ERR_INVALID_STATE**: Create MCPWM timer sync source failed because the timer has created a sync source before
- **ESP_FAIL**: Create MCPWM timer sync source failed because of other error

esp_err_t **mcpwm_new_gpio_sync_src** (const *mcpwm_gpio_sync_src_config_t* *config, *mcpwm_sync_handle_t* *ret_sync)

Create MCPWM GPIO sync source.

参数

- **config** -- **[in]** MCPWM GPIO sync source configuration
- **ret_sync** -- **[out]** Returned MCPWM GPIO sync handle

返回

- **ESP_OK**: Create MCPWM GPIO sync source successfully
- **ESP_ERR_INVALID_ARG**: Create MCPWM GPIO sync source failed because of invalid argument
- **ESP_ERR_NO_MEM**: Create MCPWM GPIO sync source failed because out of memory
- **ESP_ERR_NOT_FOUND**: Create MCPWM GPIO sync source failed because can't find free resource
- **ESP_FAIL**: Create MCPWM GPIO sync source failed because of other error

esp_err_t **mcpwm_new_soft_sync_src** (const *mcpwm_soft_sync_config_t* *config, *mcpwm_sync_handle_t* *ret_sync)

Create MCPWM software sync source.

参数

- **config** -- **[in]** MCPWM software sync source configuration
- **ret_sync** -- **[out]** Returned software sync handle

返回

- **ESP_OK**: Create MCPWM software sync successfully
- **ESP_ERR_INVALID_ARG**: Create MCPWM software sync failed because of invalid argument
- **ESP_ERR_NO_MEM**: Create MCPWM software sync failed because out of memory
- **ESP_FAIL**: Create MCPWM software sync failed because of other error

esp_err_t **mcpwm_del_sync_src** (*mcpwm_sync_handle_t* sync)

Delete MCPWM sync source.

参数

- **sync** -- **[in]** MCPWM sync handle, allocated by `mcpwm_new_timer_sync_src()` or `mcpwm_new_gpio_sync_src()` or `mcpwm_new_soft_sync_src()`

返回

- **ESP_OK**: Delete MCPWM sync source successfully
- **ESP_ERR_INVALID_ARG**: Delete MCPWM sync source failed because of invalid argument
- **ESP_FAIL**: Delete MCPWM sync source failed because of other error

esp_err_t **mcpwm_soft_sync_activate** (*mcpwm_sync_handle_t* sync)

Activate the software sync, trigger the sync event for once.

参数

- **sync** -- **[in]** MCPWM soft sync handle, allocated by `mcpwm_new_soft_sync_src()`

返回

- **ESP_OK**: Trigger MCPWM software sync event successfully
- **ESP_ERR_INVALID_ARG**: Trigger MCPWM software sync event failed because of invalid argument
- **ESP_FAIL**: Trigger MCPWM software sync event failed because of other error

Structures

struct **mcpwm_timer_sync_src_config_t**

MCPWM timer sync source configuration.

Public Members

mcpwm_timer_event_t **timer_event**

Timer event, upon which MCPWM timer will generate the sync signal

uint32_t **propagate_input_sync**

The input sync signal would be routed to its sync output

```
struct mcpwm_timer_sync_src_config_t::[anonymous] flags
```

Extra configuration flags for timer sync source

```
struct mcpwm_gpio_sync_src_config_t
```

MCPWM GPIO sync source configuration.

Public Members

```
int group_id
```

MCPWM group ID

```
int gpio_num
```

GPIO used by sync source

```
uint32_t active_neg
```

Whether the sync signal is active on negedge, by default, the sync signal's posedge is treated as active

```
uint32_t io_loop_back
```

For debug/test, the signal output from the GPIO will be fed to the input path as well

```
uint32_t pull_up
```

Whether to pull up internally

```
uint32_t pull_down
```

Whether to pull down internally

```
struct mcpwm_gpio_sync_src_config_t::[anonymous] flags
```

Extra configuration flags for GPIO sync source

```
struct mcpwm_soft_sync_config_t
```

MCPWM software sync configuration structure.

```

Functions

`esp_err_t mcpwm_new_capture_timer` (const `mcpwm_capture_timer_config_t` *config, `mcpwm_cap_timer_handle_t` *ret_cap_timer)

Create MCPWM capture timer.

参数

- **config** -- [in] MCPWM capture timer configuration
- **ret_cap_timer** -- [out] Returned MCPWM capture timer handle

返回

- ESP_OK: Create MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Create MCPWM capture timer failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM capture timer failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM capture timer failed because can't find free resource
- ESP_FAIL: Create MCPWM capture timer failed because of other error

`esp_err_t mcpwm_del_capture_timer` (`mcpwm_cap_timer_handle_t` cap_timer)

Delete MCPWM capture timer.

参数 **cap_timer** -- [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`

返回

- ESP_OK: Delete MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM capture timer failed because of invalid argument
- ESP_FAIL: Delete MCPWM capture timer failed because of other error

`esp_err_t mcpwm_capture_timer_enable` (`mcpwm_cap_timer_handle_t` cap_timer)

Enable MCPWM capture timer.

参数 **cap_timer** -- [in] MCPWM capture timer handle, allocated by `mcpwm_new_capture_timer()`

返回

- ESP_OK: Enable MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Enable MCPWM capture timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable MCPWM capture timer failed because timer is enabled already
- ESP_FAIL: Enable MCPWM capture timer failed because of other error

`esp_err_t mcpwm_capture_timer_disable` (`mcpwm_cap_timer_handle_t` cap_timer)

Disable MCPWM capture timer.

参数 **cap_timer** -- [in] MCPWM capture timer handle, allocated by `mcpwm_new_capture_timer()`

返回

- ESP_OK: Disable MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Disable MCPWM capture timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable MCPWM capture timer failed because timer is disabled already
- ESP_FAIL: Disable MCPWM capture timer failed because of other error

`esp_err_t mcpwm_capture_timer_start` (`mcpwm_cap_timer_handle_t` cap_timer)

Start MCPWM capture timer.

参数 **cap_timer** -- [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`

返回

- ESP_OK: Start MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Start MCPWM capture timer failed because of invalid argument

- ESP_FAIL: Start MCPWM capture timer failed because of other error

esp_err_t **mcpwm_capture_timer_stop** (*mcpwm_cap_timer_handle_t* cap_timer)

Stop MCPWM capture timer.

参数 **cap_timer** -- **[in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`

返回

- ESP_OK: Stop MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Stop MCPWM capture timer failed because of invalid argument
- ESP_FAIL: Stop MCPWM capture timer failed because of other error

esp_err_t **mcpwm_capture_timer_get_resolution** (*mcpwm_cap_timer_handle_t* cap_timer, `uint32_t` *out_resolution)

Get MCPWM capture timer resolution, in Hz.

参数

- **cap_timer** -- **[in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`
- **out_resolution** -- **[out]** Returned capture timer resolution, in Hz

返回

- ESP_OK: Get capture timer resolution successfully
- ESP_ERR_INVALID_ARG: Get capture timer resolution failed because of invalid argument
- ESP_FAIL: Get capture timer resolution failed because of other error

esp_err_t **mcpwm_capture_timer_set_phase_on_sync** (*mcpwm_cap_timer_handle_t* cap_timer, `const mcpwm_capture_timer_sync_phase_config_t` *config)

Set sync phase for MCPWM capture timer.

参数

- **cap_timer** -- **[in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`
- **config** -- **[in]** MCPWM capture timer sync phase configuration

返回

- ESP_OK: Set sync phase for MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Set sync phase for MCPWM capture timer failed because of invalid argument
- ESP_FAIL: Set sync phase for MCPWM capture timer failed because of other error

esp_err_t **mcpwm_new_capture_channel** (*mcpwm_cap_timer_handle_t* cap_timer, `const mcpwm_capture_channel_config_t` *config, *mcpwm_cap_channel_handle_t* *ret_cap_channel)

Create MCPWM capture channel.

备注: The created capture channel won't be enabled until calling `mcpwm_capture_channel_enable`

参数

- **cap_timer** -- **[in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`, will be connected to the new capture channel
- **config** -- **[in]** MCPWM capture channel configuration
- **ret_cap_channel** -- **[out]** Returned MCPWM capture channel

返回

- ESP_OK: Create MCPWM capture channel successfully
- ESP_ERR_INVALID_ARG: Create MCPWM capture channel failed because of invalid argument

- ESP_ERR_NO_MEM: Create MCPWM capture channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM capture channel failed because can't find free resource
- ESP_FAIL: Create MCPWM capture channel failed because of other error

esp_err_t **mcpwm_del_capture_channel** (*mcpwm_cap_channel_handle_t* cap_channel)

Delete MCPWM capture channel.

参数 **cap_channel** -- [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

返回

- ESP_OK: Delete MCPWM capture channel successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM capture channel failed because of invalid argument
- ESP_FAIL: Delete MCPWM capture channel failed because of other error

esp_err_t **mcpwm_capture_channel_enable** (*mcpwm_cap_channel_handle_t* cap_channel)

Enable MCPWM capture channel.

备注: This function will transit the channel state from init to enable.

备注: This function will enable the interrupt service, if it's lazy installed in `mcpwm_capture_channel_register_event_callbacks()`.

参数 **cap_channel** -- [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

返回

- ESP_OK: Enable MCPWM capture channel successfully
- ESP_ERR_INVALID_ARG: Enable MCPWM capture channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable MCPWM capture channel failed because the channel is already enabled
- ESP_FAIL: Enable MCPWM capture channel failed because of other error

esp_err_t **mcpwm_capture_channel_disable** (*mcpwm_cap_channel_handle_t* cap_channel)

Disable MCPWM capture channel.

参数 **cap_channel** -- [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

返回

- ESP_OK: Disable MCPWM capture channel successfully
- ESP_ERR_INVALID_ARG: Disable MCPWM capture channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable MCPWM capture channel failed because the channel is not enabled yet
- ESP_FAIL: Disable MCPWM capture channel failed because of other error

esp_err_t **mcpwm_capture_channel_register_event_callbacks** (*mcpwm_cap_channel_handle_t* cap_channel, const *mcpwm_capture_event_callbacks_t* *cbs, void *user_data)

Set event callbacks for MCPWM capture channel.

备注: The first call to this function needs to be before the call to `mcpwm_capture_channel_enable`

备注: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

参数

- **cap_channel** -- [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`
- **cbs** -- [in] Group of callback functions
- **user_data** -- [in] User data, which will be passed to callback functions directly

返回

- **ESP_OK**: Set event callbacks successfully
- **ESP_ERR_INVALID_ARG**: Set event callbacks failed because of invalid argument
- **ESP_ERR_INVALID_STATE**: Set event callbacks failed because the channel is not in init state
- **ESP_FAIL**: Set event callbacks failed because of other error

`esp_err_t mcpwm_capture_channel_trigger_soft_catch(mcpwm_cap_channel_handle_t cap_channel)`

Trigger a catch by software.

参数 **cap_channel** -- [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

返回

- **ESP_OK**: Trigger software catch successfully
- **ESP_ERR_INVALID_ARG**: Trigger software catch failed because of invalid argument
- **ESP_ERR_INVALID_STATE**: Trigger software catch failed because the channel is not enabled yet
- **ESP_FAIL**: Trigger software catch failed because of other error

Structures

struct **mcpwm_capture_timer_config_t**

MCPWM capture timer configuration structure.

Public Members

int **group_id**

Specify from which group to allocate the capture timer

`mcpwm_capture_clock_source_t` **clk_src**

MCPWM capture timer clock source

uint32_t **resolution_hz**

Resolution of capture timer

struct **mcpwm_capture_timer_sync_phase_config_t**

MCPWM Capture timer sync phase configuration.

Public Members

`mcpwm_sync_handle_t` **sync_src**

The sync event source

uint32_t **count_value**

The count value that should lock to upon sync event

mcpwm_timer_direction_t **direction**

The count direction that should lock to upon sync event

struct **mcpwm_capture_channel_config_t**

MCPWM capture channel configuration structure.

Public Members

int **gpio_num**

GPIO used capturing input signal

int **intr_priority**

MCPWM capture interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t **prescale**

Prescale of input signal, effective frequency = cap_input_clk/prescale

struct *mcpwm_capture_channel_config_t::extra_flags* **flags**

Extra configuration flags for capture channel

struct **extra_flags**

Extra configuration flags for capture channel.

Public Members

uint32_t **pos_edge**

Whether to capture on positive edge

uint32_t **neg_edge**

Whether to capture on negative edge

uint32_t **pull_up**

Whether to pull up internally

uint32_t **pull_down**

Whether to pull down internally

uint32_t **invert_cap_signal**

Invert the input capture signal

uint32_t **io_loop_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32_t **keep_io_conf_at_exit**

For debug/test, whether to keep the GPIO configuration when capture channel is deleted. By default, driver will reset the GPIO pin at exit.

struct **mcpwm_capture_event_callbacks_t**

Group of supported MCPWM capture event callbacks.

备注: The callbacks are all running under ISR environment

Public Members

mcpwm_capture_event_cb_t **on_cap**

Callback function that would be invoked when capture event occurred

Functions

esp_err_t **mcpwm_comparator_new_etm_event** (*mcpwm_cmpr_handle_t* cmpr, const *mcpwm_cmpr_etm_event_config_t* *config, *esp_etm_event_handle_t* *out_event)

Get the ETM event for MCPWM comparator.

备注: The created ETM event object can be deleted later by calling `esp_etm_del_event`

参数

- **cmpr** -- [in] MCPWM comparator, allocated by `mcpwm_new_comparator()` or `mcpwm_new_event_comparator()`
- **config** -- [in] MCPWM ETM comparator event configuration
- **out_event** -- [out] Returned ETM event handle

返回

- `ESP_OK`: Get ETM event successfully
- `ESP_ERR_INVALID_ARG`: Get ETM event failed because of invalid argument
- `ESP_FAIL`: Get ETM event failed because of other error

Structures

struct **mcpwm_cmpr_etm_event_config_t**

MCPWM event comparator ETM event configuration.

Public Members

mcpwm_comparator_etm_event_type_t **event_type**

MCPWM comparator ETM event type

Header File

Structures

struct **mcpwm_timer_event_data_t**

MCPWM timer event data.

Public Members

uint32_t **count_value**

MCPWM timer count value

mcpwm_timer_direction_t **direction**

MCPWM timer count direction

struct **mcpwm_brake_event_data_t**

MCPWM brake event data.

struct **mcpwm_fault_event_data_t**

MCPWM fault event data.

struct **mcpwm_compare_event_data_t**

MCPWM compare event data.

Public Members

uint32_t **compare_ticks**

Compare value

mcpwm_timer_direction_t **direction**

Count direction

struct **mcpwm_capture_event_data_t**

MCPWM capture event data.

Public Members

uint32_t **cap_value**

Captured value

mcpwm_capture_edge_t **cap_edge**

Capture edge

Type Definitions

typedef struct mcpwm_timer_t ***mcpwm_timer_handle_t**

Type of MCPWM timer handle.

typedef struct mcpwm_oper_t ***mcpwm_oper_handle_t**

Type of MCPWM operator handle.

typedef struct mcpwm_cmpr_t ***mcpwm_cmpr_handle_t**

Type of MCPWM comparator handle.

typedef struct mcpwm_gen_t ***mcpwm_gen_handle_t**

Type of MCPWM generator handle.

typedef struct mcpwm_fault_t ***mcpwm_fault_handle_t**

Type of MCPWM fault handle.

typedef struct mcpwm_sync_t ***mcpwm_sync_handle_t**

Type of MCPWM sync handle.

typedef struct mcpwm_cap_timer_t ***mcpwm_cap_timer_handle_t**

Type of MCPWM capture timer handle.

typedef struct mcpwm_cap_channel_t ***mcpwm_cap_channel_handle_t**

Type of MCPWM capture channel handle.

typedef bool (***mcpwm_timer_event_cb_t**)(*mcpwm_timer_handle_t* timer, const *mcpwm_timer_event_data_t* *edata, void *user_ctx)

MCPWM timer event callback function.

Param timer [in] MCPWM timer handle

Param edata [in] MCPWM timer event data, fed by driver

Param user_ctx [in] User data, set in `mcpwm_timer_register_event_callbacks()`

Return Whether a high priority task has been waken up by this function

typedef bool (***mcpwm_brake_event_cb_t**)(*mcpwm_oper_handle_t* oper, const *mcpwm_brake_event_data_t* *edata, void *user_ctx)

MCPWM operator brake event callback function.

Param oper [in] MCPWM operator handle

Param edata [in] MCPWM brake event data, fed by driver
Param user_ctx [in] User data, set in `mcpwm_operator_register_event_callbacks()`
Return Whether a high priority task has been waken up by this function

```
typedef bool (*mcpwm_fault_event_cb_t)(mcpwm_fault_handle_t fault, const mcpwm_fault_event_data_t *edata, void *user_ctx)
```

MCPWM fault event callback function.

Param fault MCPWM fault handle
Param edata MCPWM fault event data, fed by driver
Param user_ctx User data, set in `mcpwm_fault_register_event_callbacks()`
Return whether a task switch is needed after the callback returns

```
typedef bool (*mcpwm_compare_event_cb_t)(mcpwm_cmpr_handle_t comparator, const mcpwm_compare_event_data_t *edata, void *user_ctx)
```

MCPWM comparator event callback function.

Param comparator MCPWM comparator handle
Param edata MCPWM comparator event data, fed by driver
Param user_ctx User data, set in `mcpwm_comparator_register_event_callbacks()`
Return Whether a high priority task has been waken up by this function

```
typedef bool (*mcpwm_capture_event_cb_t)(mcpwm_cap_channel_handle_t cap_channel, const mcpwm_capture_event_data_t *edata, void *user_ctx)
```

MCPWM capture event callback function.

Param cap_channel MCPWM capture channel handle
Param edata MCPWM capture event data, fed by driver
Param user_ctx User data, set in `mcpwm_capture_channel_register_event_callbacks()`
Return Whether a high priority task has been waken up by this function

```

MCPWM capture clock source.

```
typedef soc_periph_mcpwm_carrier_clk_src_t mcpwm_carrier_clock_source_t
```

MCPWM carrier clock source.

Enumerations

```
enum mcpwm_timer_direction_t
```

MCPWM timer count direction.

Values:

enumerator **MCPWM_TIMER_DIRECTION_UP**

Counting direction: Increase

enumerator **MCPWM_TIMER_DIRECTION_DOWN**

Counting direction: Decrease

enum **mcpwm_timer_event_t**

MCPWM timer events.

Values:

enumerator **MCPWM_TIMER_EVENT_EMPTY**

MCPWM timer counts to zero (i.e. counter is empty)

enumerator **MCPWM_TIMER_EVENT_FULL**

MCPWM timer counts to peak (i.e. counter is full)

enumerator **MCPWM_TIMER_EVENT_INVALID**

MCPWM timer invalid event

enum **mcpwm_timer_count_mode_t**

MCPWM timer count modes.

Values:

enumerator **MCPWM_TIMER_COUNT_MODE_PAUSE**

MCPWM timer paused

enumerator **MCPWM_TIMER_COUNT_MODE_UP**

MCPWM timer counting up

enumerator **MCPWM_TIMER_COUNT_MODE_DOWN**

MCPWM timer counting down

enumerator **MCPWM_TIMER_COUNT_MODE_UP_DOWN**

MCPWM timer counting up and down

enum **mcpwm_timer_start_stop_cmd_t**

MCPWM timer commands, specify the way to start or stop the timer.

Values:

enumerator **MCPWM_TIMER_STOP_EMPTY**

MCPWM timer stops when next count reaches zero

enumerator **MCPWM_TIMER_STOP_FULL**

MCPWM timer stops when next count reaches peak

enumerator **MCPWM_TIMER_START_NO_STOP**

MCPWM timer starts counting, and don't stop until received stop command

enumerator **MCPWM_TIMER_START_STOP_EMPTY**

MCPWM timer starts counting and stops when next count reaches zero

enumerator **MCPWM_TIMER_START_STOP_FULL**

MCPWM timer starts counting and stops when next count reaches peak

enum **mcpwm_generator_action_t**

MCPWM generator actions.

Values:

enumerator **MCPWM_GEN_ACTION_KEEP**

Generator action: Keep the same level

enumerator **MCPWM_GEN_ACTION_LOW**

Generator action: Force to low level

enumerator **MCPWM_GEN_ACTION_HIGH**

Generator action: Force to high level

enumerator **MCPWM_GEN_ACTION_TOGGLE**

Generator action: Toggle level

enum **mcpwm_operator_brake_mode_t**

MCPWM operator brake mode.

Values:

enumerator **MCPWM_OPER_BRAKE_MODE_CBC**

Brake mode: CBC (cycle by cycle)

enumerator **MCPWM_OPER_BRAKE_MODE_OST**

Brake mode: OST (one shot)

enumerator **MCPWM_OPER_BRAKE_MODE_INVALID**

MCPWM operator invalid brake mode

enum **mcpwm_capture_edge_t**

MCPWM capture edge.

Values:

enumerator **MCPWM_CAP_EDGE_POS**

Capture on the positive edge

enumerator **MCPWM_CAP_EDGE_NEG**

Capture on the negative edge

enum **mcpwm_comparator_etm_event_type_t**

MCPWM comparator specific events that supported by the ETM module.

Values:

enumerator `MCPWM_CMPR_ETM_EVENT_EQUAL`

The count value equals the value of comparator

enumerator `MCPWM_CMPR_ETM_EVENT_MAX`

Maximum number of comparator events

2.5.20 并行 IO

简介

并行 IO 外设是一个通用的并行接口，可用于连接外部设备，如 LED 矩阵、LCD 显示器、打印机和摄像头。该外设具有独立的 TX 和 RX 单元。每个单元最多可以具有 8 或 16 个数据信号以及 1 或 2 个时钟信号。¹

并行 IO 外设的 TX 和 RX 驱动程序有各自独立的设计，可分别通过包含头文件 `driver/parlio_tx.h` 或 `driver/parlio_rx.h` 来使用。

应用示例

- 带有 HUB75 接口的简单 REG LED 矩阵：[peripherals/parlio/parlio_tx/simple_rgb_led_matrix](#)。
- 逻辑分析仪：[peripherals/parlio/parlio_rx/logic_analyzer](#)。

API 参考

Header File

- `components/esp_driver_parlio/include/driver/parlio_tx.h`
- This header file can be included with:

```
#include "driver/parlio_tx.h"
```

- This header file is a part of the API provided by the `esp_driver_parlio` component. To declare that your component depends on `esp_driver_parlio`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_parlio
```

or

```
PRIV_REQUIRES esp_driver_parlio
```

Functions

`esp_err_t parlio_new_tx_unit` (const `parlio_tx_unit_config_t` *config, `parlio_tx_unit_handle_t` *ret_unit)

Create a Parallel IO TX unit.

参数

¹ 不同的 ESP 系列芯片可能具有不同数量的并行 IO TX/RX 实例，数据总线的最大宽度也会有所不同。更多信息，请参阅 [ESP32-P4 技术参考手册 > 并行 IO 控制器 \(PARLIO\) 章节 \[PDF\]](#)。驱动程序允许你创建更多的驱动程序对象，但当所有可用的硬件资源都被用完时，将会显示返回错误。在进行资源分配时，请时刻注意返回值 (e.g., `parlio_new_tx_unit()`)。

- **config** -- **[in]** Parallel IO TX unit configuration
- **ret_unit** -- **[out]** Returned Parallel IO TX unit handle

返回

- ESP_OK: Create Parallel IO TX unit successfully
- ESP_ERR_INVALID_ARG: Create Parallel IO TX unit failed because of invalid argument
- ESP_ERR_NO_MEM: Create Parallel IO TX unit failed because of out of memory
- ESP_ERR_NOT_FOUND: Create Parallel IO TX unit failed because all TX units are used up and no more free one
- ESP_ERR_NOT_SUPPORTED: Create Parallel IO TX unit failed because some feature is not supported by hardware, e.g. clock gating
- ESP_FAIL: Create Parallel IO TX unit failed because of other error

esp_err_t **parlio_del_tx_unit** (*parlio_tx_unit_handle_t* unit)

Delete a Parallel IO TX unit.

参数 **unit** -- **[in]** Parallel IO TX unit that created by `parlio_new_tx_unit`

返回

- ESP_OK: Delete Parallel IO TX unit successfully
- ESP_ERR_INVALID_ARG: Delete Parallel IO TX unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete Parallel IO TX unit failed because it is still in working
- ESP_FAIL: Delete Parallel IO TX unit failed because of other error

esp_err_t **parlio_tx_unit_enable** (*parlio_tx_unit_handle_t* unit)

Enable the Parallel IO TX unit.

备注: This function will transit the driver state from init to enable

备注: This function will acquire a PM lock that might be installed during channel allocation

备注: If there're transaction pending in the queue, this function will pick up the first one and start the transfer

参数 **unit** -- **[in]** Parallel IO TX unit that created by `parlio_new_tx_unit`

返回

- ESP_OK: Enable Parallel IO TX unit successfully
- ESP_ERR_INVALID_ARG: Enable Parallel IO TX unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable Parallel IO TX unit failed because it is already enabled
- ESP_FAIL: Enable Parallel IO TX unit failed because of other error

esp_err_t **parlio_tx_unit_disable** (*parlio_tx_unit_handle_t* unit)

Disable the Parallel IO TX unit.

备注: This function will transit the driver state from enable to init

备注: This function will release the PM lock that might be installed during channel allocation

备注: If one transaction is undergoing, this function will terminate it immediately

参数 `unit` -- **[in]** Parallel IO TX unit that created by `parlio_new_tx_unit`

返回

- `ESP_OK`: Disable Parallel IO TX unit successfully
- `ESP_ERR_INVALID_ARG`: Disable Parallel IO TX unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable Parallel IO TX unit failed because it's not enabled yet
- `ESP_FAIL`: Disable Parallel IO TX unit failed because of other error

`esp_err_t parlio_tx_unit_register_event_callbacks` (`parlio_tx_unit_handle_t` tx_unit, const `parlio_tx_event_callbacks_t` *cbs, void *user_data)

Set event callbacks for Parallel IO TX unit.

备注: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

备注: When `CONFIG_PARLIO_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

参数

- `tx_unit` -- **[in]** Parallel IO TX unit that created by `parlio_new_tx_unit`
- `cbs` -- **[in]** Group of callback functions
- `user_data` -- **[in]** User data, which will be passed to callback functions directly

返回

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_FAIL`: Set event callbacks failed because of other error

`esp_err_t parlio_tx_unit_transmit` (`parlio_tx_unit_handle_t` tx_unit, const void *payload, size_t payload_bits, const `parlio_transmit_config_t` *config)

Transmit data on by Parallel IO TX unit.

备注: After the function returns, it doesn't mean the transaction is finished. This function only constructs a transaction structure and push into a queue.

参数

- `tx_unit` -- **[in]** Parallel IO TX unit that created by `parlio_new_tx_unit`
- `payload` -- **[in]** Pointer to the data to be transmitted
- `payload_bits` -- **[in]** Length of the data to be transmitted, in bits
- `config` -- **[in]** Transmit configuration

返回

- `ESP_OK`: Transmit data successfully
- `ESP_ERR_INVALID_ARG`: Transmit data failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Transmit data failed because the Parallel IO TX unit is not enabled
- `ESP_FAIL`: Transmit data failed because of other error

`esp_err_t parlio_tx_unit_wait_all_done` (`parlio_tx_unit_handle_t` tx_unit, int timeout_ms)

Wait for all pending TX transactions done.

参数

- **tx_unit** -- [in] Parallel IO TX unit that created by `parlio_new_tx_unit`
- **timeout_ms** -- [in] Timeout in milliseconds, `-1` means to wait forever

返回

- **ESP_OK**: All pending TX transactions is finished and recycled
- **ESP_ERR_INVALID_ARG**: Wait for all pending TX transactions done failed because of invalid argument
- **ESP_ERR_TIMEOUT**: Wait for all pending TX transactions done timeout
- **ESP_FAIL**: Wait for all pending TX transactions done failed because of other error

Structures

struct **parlio_tx_unit_config_t**

Parallel IO TX unit configuration.

Public Members

parlio_clock_source_t **clk_src**

Parallel IO internal clock source

gpio_num_t **clk_in_gpio_num**

If the clock source is input from external, set the corresponding GPIO number. Otherwise, set to `-1` and the driver will use the internal `clk_src` as clock source. This option has higher priority than `clk_src`

uint32_t **input_clk_src_freq_hz**

Frequency of the input clock source, valid only if `clk_in_gpio_num` is not `-1`

uint32_t **output_clk_freq_hz**

Frequency of the output clock. It's divided from either internal `clk_src` or external clock source

size_t **data_width**

Parallel IO data width, can set to `1/2/4/8/...`, but can't bigger than `PARLIO_TX_UNIT_MAX_DATA_WIDTH`

gpio_num_t **data_gpio_nums**[`PARLIO_TX_UNIT_MAX_DATA_WIDTH`]

Parallel IO data GPIO numbers, if any GPIO is not used, you can set it to `-1`

gpio_num_t **clk_out_gpio_num**

GPIO number of the output clock signal, the clock is synced with TX data

gpio_num_t **valid_gpio_num**

GPIO number of the valid signal, which stays high when transferring data. Note that, the valid signal will always occupy the MSB data bit

size_t **trans_queue_depth**

Depth of internal transaction queue

size_t **max_transfer_size**

Maximum transfer size in one transaction, in bytes. This decides the number of DMA nodes will be used for each transaction

***parlio_sample_edge_t* sample_edge**

Parallel IO sample edge

***parlio_bit_pack_order_t* bit_pack_order**

Set the order of packing the bits into bytes (only works when `data_width < 8`)

uint32_t clk_gate_en

Enable TX clock gating, the output clock will be controlled by the MSB bit of the data bus, i.e. by `data_gpio_nums[PARLIO_TX_UNIT_MAX_DATA_WIDTH-1]`. High level to enable the clock output, low to disable

uint32_t io_loop_back

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct *parlio_tx_unit_config_t*::[anonymous] flags

Extra configuration flags

struct *parlio_tx_done_event_data_t*

Type of Parallel IO TX done event data.

struct *parlio_tx_event_callbacks_t*

Group of Parallel IO TX callbacks.

备注: The callbacks are all running under ISR environment

备注: When `CONFIG_PARLIO_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

***parlio_tx_done_callback_t* on_trans_done**

Event callback, invoked when one transmission is finished

struct *parlio_transmit_config_t*

Parallel IO transmit configuration.

Public Members

uint32_t idle_value

The value on the data line when the parallel IO is in idle state

uint32_t queue_nonblocking

If set, when the transaction queue is full, driver will not block the thread but return directly

struct *parlio_transmit_config_t*::[anonymous] flags

Transmit specific config flags

Type Definitions

```
typedef bool (*parlio_tx_done_callback_t)(parlio_tx_unit_handle_t tx_unit, const
parlio_tx_done_event_data_t *edata, void *user_ctx)
```

Prototype of parlio tx event callback.

Param tx_unit [in] Parallel IO TX unit that created by `parlio_new_tx_unit`

Param edata [in] Point to Parallel IO TX event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

Param user_ctx [in] User registered context, passed from `parlio_tx_unit_register_event_callbacks`

Return Whether a high priority task has been waken up by this callback function

Header File

- `components/esp_driver_parlio/include/driver/parlio_rx.h`
- This header file can be included with:

```
#include "driver/parlio_rx.h"
```

- This header file is a part of the API provided by the `esp_driver_parlio` component. To declare that your component depends on `esp_driver_parlio`, add the following to your CMakeLists.txt:

```
REQUIRES esp_driver_parlio
```

or

```
PRIV_REQUIRES esp_driver_parlio
```

Functions

```
esp_err_t parlio_new_rx_unit (const parlio_rx_unit_config_t *config, parlio_rx_unit_handle_t *ret_unit)
```

Create a Parallel IO RX unit.

参数

- **config** -- [in] Parallel IO RX unit configuration
- **ret_unit** -- [out] Returned Parallel IO RX unit handle

返回

- `ESP_ERR_INVALID_ARG` Invalid arguments in the parameter list or the rx unit configuration
- `ESP_ERR_NOT_FOUND` No available rx unit found
- `ESP_ERR_NO_MEM` No enough memory for the rx unit resources
- `ESP_OK` Success to allocate the rx unit

```
esp_err_t parlio_del_rx_unit (parlio_rx_unit_handle_t rx_unit)
```

Delete a Parallel IO RX unit.

参数 rx_unit -- [in] Parallel IO RX unit handle that created by `parlio_new_rx_unit`

返回

- `ESP_ERR_INVALID_ARG` rx_unit is NULL
- `ESP_ERR_INVALID_STATE` The rx unit is enabled, can't delete an enabled rx unit
- `ESP_OK` Success to delete the rx unit

```
esp_err_t parlio_new_rx_level_delimiter (const parlio_rx_level_delimiter_config_t *config,
parlio_rx_delimiter_handle_t *ret_delimiter)
```

Create a level delimiter.

备注: This function only allocate the software resources, the hardware configurations will lazy installed while the transaction that using this delimiter start processing

备注: The enable signal must be aligned with the valid data.

备注: There're at most `SOC_PARLIO_RX_UNIT_MAX_DATA_WIDTH - 1` IO pins left for RXD

参数

- **config** -- **[in]** Level delimiter configuration
- **ret_delimiter** -- **[out]** Returned delimiter handle

返回

- `ESP_ERR_INVALID_ARG` Invalid arguments in the parameter list or the level delimiter configuration
- `ESP_ERR_NO_MEM` No enough memory for the level delimiter resources
- `ESP_OK` Success to allocate the level delimiter

`esp_err_t parlio_new_rx_pulse_delimiter` (const `parlio_rx_pulse_delimiter_config_t` *config, `parlio_rx_delimiter_handle_t` *ret_delimiter)

Create a pulse delimiter.

备注: This function only allocate the software resources, the hardware configurations will lazy installed while the transaction that using this delimiter start processing

备注: There're at most `SOC_PARLIO_RX_UNIT_MAX_DATA_WIDTH - 1` IO pins left for RXD

参数

- **config** -- **[in]** Pulse delimiter configuration
- **ret_delimiter** -- **[out]** Returned delimiter handle

返回

- `ESP_ERR_INVALID_ARG` Invalid arguments in the parameter list or the pulse delimiter configuration
- `ESP_ERR_NO_MEM` No enough memory for the pulse delimiter resources
- `ESP_OK` Success to allocate the pulse delimiter

`esp_err_t parlio_new_rx_soft_delimiter` (const `parlio_rx_soft_delimiter_config_t` *config, `parlio_rx_delimiter_handle_t` *ret_delimiter)

Create a pulse delimiter.

备注: This function only allocate the software resources, the hardware configurations will lazy installed while the transaction that using this delimiter start processing

参数

- **config** -- **[in]** Soft delimiter configuration
- **ret_delimiter** -- **[out]** Returned delimiter handle

返回

- `ESP_ERR_INVALID_ARG` Invalid arguments in the parameter list or the soft delimiter configuration
- `ESP_ERR_NO_MEM` No enough memory for the soft delimiter resources
- `ESP_OK` Success to allocate the soft delimiter

`esp_err_t parlio_rx_soft_delimiter_start_stop` (`parlio_rx_unit_handle_t` rx_unit, `parlio_rx_delimiter_handle_t` delimiter, bool start_stop)

Start/stop the soft delimiter.

备注: Soft delimiter need to start or stop manually because it has no validating/enabling signal to indicate the data has started or stopped

参数

- **rx_unit** -- **[in]** Parallel IO RX unit handle that created by `parlio_new_rx_unit`
- **delimiter** -- **[in]** Delimiter handle
- **start_stop** -- **[in]** Set true to start, set false to stop

返回

- `ESP_ERR_INVALID_ARG` Invalid arguments in the parameter list or not soft delimiter
- `ESP_ERR_INVALID_STATE` The rx unit not enabled
- `ESP_OK` Success to start or stop the soft delimiter

esp_err_t **parlio_del_rx_delimiter** (*parlio_rx_delimiter_handle_t* delimiter)

Delete the delimiter.

备注: To delete the delimiter safely, please delete it after disable all the RX units

参数 **delimiter** -- **[in]** Delimiter handle

返回

- `ESP_ERR_INVALID_ARG` The input delimiter is NULL
- `ESP_ERR_INVALID_STATE` The delimiter is on receiving
- `ESP_OK` Success to delete the delimiter

esp_err_t **parlio_rx_unit_enable** (*parlio_rx_unit_handle_t* rx_unit, bool reset_queue)

Enable the Parallel IO RX unit.

参数

- **rx_unit** -- **[in]** Parallel IO RX unit handle that created by `parlio_new_rx_unit`
- **reset_queue** -- **[in]** Whether to reset the receiving queue. If set to false, the legacy receive transactions in the queue are still available, If set to true, the legacy receive transactions in the queue are dropped.

返回

- `ESP_ERR_INVALID_ARG` The input rx_unit is NULL
- `ESP_ERR_INVALID_STATE` The rx unit has been enabled
- `ESP_OK` Success to enable the rx unit

esp_err_t **parlio_rx_unit_disable** (*parlio_rx_unit_handle_t* rx_unit)

Disable the Parallel IO RX unit.

参数 **rx_unit** -- **[in]** Parallel IO RX unit handle that created by `parlio_new_rx_unit`

返回

- `ESP_ERR_INVALID_ARG` The input rx_unit is NULL
- `ESP_ERR_INVALID_STATE` The rx unit has been disabled
- `ESP_OK` Success to disable the rx unit

esp_err_t **parlio_rx_unit_receive** (*parlio_rx_unit_handle_t* rx_unit, void *payload, size_t payload_size, const *parlio_receive_config_t* *recv_cfg)

Receive data by Parallel IO RX unit.

备注: This is a non-blocking and asynchronous function. To block or realize synchronous receive, please call `parlio_rx_unit_wait_all_done` after this function

备注: The receive transaction will start immediately when there is not other transaction on receiving, Otherwise it will be sent to the transaction queue to wait for the bus.

参数

- **rx_unit** -- **[in]** Parallel IO RX unit handle that created by `parlio_new_rx_unit`
- **payload** -- **[in]** The payload buffer pointer
- **payload_size** -- **[in]** The size of the payload buffer, in bytes.
- **recv_cfg** -- **[in]** The configuration of this receive transaction

返回

- **ESP_ERR_INVALID_ARG** Invalid arguments in the parameter list or the receive configuration
- **ESP_ERR_NO_MEM** No memory for the internal DMA buffer (only when `parlio_receive_config_t::indirect_mount` enabled)
- **ESP_ERR_INVALID_STATE** Transaction queue is full, failed to queue the current transaction. Or the internal buffer is under using by an infinite transaction, can't allocate a new one
- **ESP_OK** Success to queue the current receiving transaction

`esp_err_t parlio_rx_unit_wait_all_done` (`parlio_rx_unit_handle_t` rx_unit, int timeout_ms)

Wait for all pending RX transactions done.

备注: This function will block until all receiving transactions done or timeout. When timeout occurs, either the timeout limitation too short for all transactions done, or the peripheral got stuck and no more interrupts trigger (e.g., external clock stopped).

参数

- **rx_unit** -- **[in]** Parallel IO RX unit handle that created by `parlio_new_rx_unit`
- **timeout_ms** -- **[in]** Timeout in milliseconds, -1 means to wait forever (software timeout)

返回

- **ESP_ERR_INVALID_ARG** The input rx_unit is NULL
- **ESP_ERR_TIMEOUT** Wait for all transactions done timeout
- **ESP_OK** All transaction done

`esp_err_t parlio_rx_unit_register_event_callbacks` (`parlio_rx_unit_handle_t` rx_unit, const `parlio_rx_event_callbacks_t` *cbs, void *user_data)

Register event callbacks for Parallel IO RX unit.

参数

- **rx_unit** -- **[in]** Parallel IO RX unit handle that created by `parlio_new_rx_unit`
- **cbs** -- **[in]** Callback group, set callback to NULL to deregister the corresponding callback (callback group pointer shouldn't be NULL)
- **user_data** -- **[in]** User specified data that will be transported to the callbacks

返回

- **ESP_ERR_INVALID_ARG** The input rx_unit is NULL
- **ESP_ERR_INVALID_STATE** The rx unit has been enabled, callback should be registered before enabling the unit
- **ESP_OK** Success to register the callbacks

Structures

struct `parlio_rx_unit_config_t`

Parallel IO RX unit configuration.

Public Members

`size_t trans_queue_depth`

Depth of internal transaction queue

`size_t max_recv_size`

Maximum receive size in one transaction, in bytes. This decides the number of DMA nodes will be used for each transaction

`size_t data_width`

Parallel IO data width, can set to 1/2/4/8/..., but can't be greater than `PARLIO_RX_UNIT_MAX_DATA_WIDTH`

`parlio_clock_source_t clk_src`

Parallel IO clock source

`uint32_t ext_clk_freq_hz`

The external source clock frequency. Only be valid when select `PARLIO_CLK_SRC_EXTERNAL` as clock source

`uint32_t exp_clk_freq_hz`

The expected sample/bit clock frequency, which is divided from the internal or external clock regarding the clock source

`gpio_num_t clk_in_gpio_num`

The the external clock input pin. Only be valid when select `PARLIO_CLK_SRC_EXTERNAL` as clock source. Set to -1 if not needed

`gpio_num_t clk_out_gpio_num`

The sample/bit clock output pin. Set to -1 if not needed

`gpio_num_t valid_gpio_num`

GPIO number of the valid signal. The signal on this pin is used to indicate whether the data on the data lines are valid. Only takes effect when using level or pulse delimiter, set to -1 if only use the soft delimiter

`gpio_num_t data_gpio_nums[PARLIO_RX_UNIT_MAX_DATA_WIDTH]`

Parallel IO data GPIO numbers, set to -1 if it's not used, The driver will take [0 .. (data_width - 1)] as the data pins

`uint32_t free_clk`

Whether the input external clock is a free-running clock. A free-running clock will always keep running (e.g. I2S bclk), a non-free-running clock will start when there are data transporting and stop when the bus idle (e.g. SPI). This flag only takes effect when select `PARLIO_CLK_SRC_EXTERNAL` as clock source

`uint32_t clk_gate_en`

Enable RX clock gating, only available when the clock direction is output(not supported on ESP32-C6) the output clock will be controlled by the valid gpio, i.e. high level of valid gpio to enable the clock output, low to disable

uint32_t io_loop_back

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32_t io_no_init

Set to skip initializing the GPIO, but only attach the parlio rx signals to those GPIOs via IO Matrix. So that the signals that have attached to those GPIO won't be overwritten. Mainly used for self communication or self monitoring

struct *parlio_rx_unit_config_t*::[anonymous] **flags**

RX driver flags

struct **parlio_rx_level_delimiter_config_t**

Configuration of level delimiter.

Public Members**uint32_t valid_sig_line_id**

The data line id of valid/enable signal. The selected data line will be used as the valid/enable signal (i.e. level signal) in this delimiter. As the line of valid/enable signal is shared with the data line, this line_id will be conflict with the data line if set the id within 'data_width', therefore the range is (data_width, PARLIO_RX_UNIT_MAX_DATA_WIDTH].

parlio_sample_edge_t **sample_edge**

Parallel IO sample edge

parlio_bit_pack_order_t **bit_pack_order**

Set how we pack the bits into one bytes

uint32_t eof_data_len

Set the data length to trigger the End Of Frame (EOF, i.e. transaction done) interrupt, if the data length is set to 0, that mean the EOF will only triggers when the enable signal inactivated

uint32_t timeout_ticks

The number of source clock ticks to trigger timeout interrupt. Set 0 to disable the receive timeout interrupt
The timeout counter starts when the valid/enable signal is invalid/disabled.

uint32_t active_low_en

Set true to set the valid signal active when the level is low, otherwise, the valid signal becomes active when its level is high

struct *parlio_rx_level_delimiter_config_t*::[anonymous] **flags**

Extra flags

struct **parlio_rx_pulse_delimiter_config_t**

Configuration of pulse delimiter.

Public Members

uint32_t valid_sig_line_id

The data line id of valid/enable signal. The selected data line will be used as the valid/enable signal (i.e. pulse signal) in this delimiter. As the line of valid/enable signal is shared with the data line, this line_id will be conflict with the data line if set the id within 'data_width', therefore the range is (data_width, PARLIO_RX_UNIT_MAX_DATA_WIDTH].

parlio_sample_edge_t **sample_edge**

Parallel IO sample edge

parlio_bit_pack_order_t **bit_pack_order**

Set how we pack the bits into one bytes

uint32_t eof_data_len

Set the data length to trigger the End Of Frame (EOF, i.e. transaction done) interrupt, if the data length is set to 0, that mean the EOF will only triggers when the end pulse detected, please ensure there is an end pulse for a frame and `has_end_pulse` flag is set

uint32_t timeout_ticks

The number of source clock ticks to trigger timeout interrupt. Set 0 to disable the receive timeout interrupt. The timeout counter starts when the valid/enable signal is invalid/disabled.

uint32_t start_bit_included

Whether data bit is included in the start pulse

uint32_t end_bit_included

Whether data bit is included in the end pulse, only valid when `has_end_pulse` is true

uint32_t has_end_pulse

Whether there's an end pulse to terminate the transaction, if no, the transaction will be terminated by user configured transaction length

uint32_t pulse_invert

Whether to invert the pulse

struct *parlio_rx_pulse_delimiter_config_t*::[anonymous] **flags**

Extra flags

struct **parlio_rx_soft_delimiter_config_t**

Configuration of soft delimiter.

Public Members*parlio_sample_edge_t* **sample_edge**

Parallel IO sample edge

parlio_bit_pack_order_t **bit_pack_order**

Set how we pack the bits into one bytes, set 1 to pack the bits into a byte from LSB, otherwise from MSB

uint32_t eof_data_len

Set the data length to trigger the End Of Frame (EOF, i.e. transaction done) interrupt, if the data length is set to 0, that mean the EOF will only triggers when the end pulse detected, please ensure there is an end pulse for a frame and `parlio_rx_pulse_delimiter_config_t::has_end_pulse` flag is set

uint32_t timeout_ticks

The number of APB clock ticks to trigger timeout interrupt. Set 0 to disable the receive timeout interrupt

struct **parlio_receive_config_t**

Configuration of a receive transaction.

Public Members*parlio_rx_delimiter_handle_t* **delimiter**

The delimiter of this receiving transaction

uint32_t partial_rx_en

Whether this is an infinite transaction that supposed to receive continuously and partially

uint32_t indirect_mount

This flag only take effect when `partial_rx_en` is enabled. Enable this flag, an INTERNAL DMA buffer will be mounted to the DMA descriptor instead, The data will be copy to the payload in every interrupt. So that to guarantee the payload buffer is valid during the `on_receive_done` callback. Either `partial_rx_en` or `indirect_mount` is disabled, the user given finite payload will be mounted to the DMA descriptor directly. By default, the user given receive payload will be mounted to the DMA descriptor directly.

struct *parlio_receive_config_t*::[anonymous] **flags**

Extra flags

struct **parlio_rx_event_data_t**

Event callback data.

Public Members*parlio_rx_delimiter_handle_t* **delimiter**

The current delimiter of this receiving event

void ***data**

The data buffer address that just finished receiving

size_t **recv_bytes**

The number of received bytes in the data buffer

struct **parlio_rx_event_callbacks_t**

Parallel IO RX event callbacks.

Public Members

parlio_rx_callback_t **on_partial_receive**

Callback of received partial data

parlio_rx_callback_t **on_receive_done**

Callback of receiving transaction done

parlio_rx_callback_t **on_timeout**

Callback of hardware receiving timeout

Type Definitions

```
typedef bool (*parlio_rx_callback_t)(parlio_rx_unit_handle_t rx_unit, const parlio_rx_event_data_t
*edata, void *user_data)
```

The template of the Parallel IO RX callback function.

Param rx_unit [in] Parallel IO RX unit handle that given from ISR

Param edata [in] The event data that given from ISR

Param user_data [in] The user specified data that given while registering the callbacks

Return

- True: to awake high priority tasks
- False: not to awake high priority tasks

Values:

enumerator **PARLIO_BIT_PACK_ORDER_LSB**

Bit pack order: LSB

enumerator **PARLIO_BIT_PACK_ORDER_MSB**

Bit pack order: MSB

2.5.21 脉冲计数器 (PCNT)

概述

PCNT 用于统计输入信号的上升沿和/或下降沿的数量。ESP32-P4 集成了多个脉冲计数单元¹，每个单元都是包含多个通道的独立计数器。通道可独立配置为统计上升沿或下降沿数量的递增计数器或递减计数器。

PCNT 通道可检测 **边沿信号**及 **电平信号**。对于比较简单的应用，检测边沿信号就足够了。PCNT 通道可检测上升沿信号、下降沿信号，同时也能设置为递增计数，递减计数，或停止计数。电平信号就是所谓的 **控制信号**，可用来控制边沿信号的计数模式。通过设置电平信号与边沿信号的检测模式，PCNT 单元可用作 **正交解码器**。

每个 PCNT 单元还包含一个滤波器，用于滤除线路毛刺。

PCNT 模块通常用于：

- 对一段时间内的脉冲计数，进而计算得到周期信号的频率；
- 对正交信号进行解码，进而获得速度和方向信息。

功能描述

PCNT 的功能从以下几个方面进行说明：

- **分配资源** - 说明如何通过配置分配 PCNT 单元和通道，以及在相应操作完成之后，如何回收单元和通道。
- **设置通道操作** - 说明如何设置通道针对不同信号沿和电平进行操作。
- **PCNT 观察点** - 说明如何配置观察点，即当计数达到某个数值时，命令 PCNT 单元触发某个事件。
- **注册事件回调函数** - 说明如何将您的代码挂载到观察点事件的回调函数上。
- **设置毛刺滤波器** - 说明如何使能毛刺滤波器并设置其时序参数。
- **使用外部清零信号** - 说明如何使能外部清零信号并设置其参数。
- **使能和禁用单元** - 说明如何使能和关闭 PCNT 单元。
- **控制单元 IO 操作** - 说明 PCNT 单元的 IO 控制功能，例如使能毛刺滤波器，开启和停用 PCNT 单元，获取和清除计数。
- **电源管理** - 说明哪些功能会阻止芯片进入低功耗模式。
- **支持 IRAM 安全中断** - 说明在缓存禁用的情况下，如何执行 PCNT 中断和 IO 控制功能。
- **支持线程安全** - 列出线程安全的 API。
- **支持的 Kconfig 选项** - 列出了支持的 Kconfig 选项，这些选项可实现不同的驱动效果。

分配资源 PCNT 单元和通道分别用 `pcnt_unit_handle_t` 与 `pcnt_channel_handle_t` 表示。所有的可用单元和通道都由驱动在资源池中进行维护，无需了解底层实例 ID。

安装 PCNT 单元 安装 PCNT 单元时，需要先完成配置 `pcnt_unit_config_t`：

- `pcnt_unit_config_t::low_limit` 与 `pcnt_unit_config_t::high_limit` 用于指定内部计数器的最小值和最大值。当计数器超过任一限值时，计数器将归零。
- `pcnt_unit_config_t::accum_count` 用于设置是否需要软件在硬件计数值溢出的时候进行累加保存，这有助于“拓宽”计数器的实际位宽。默认情况下，计数器的位宽最高只有 16 比特。请参考 [计数溢出补偿](#) 了解如何利用此功能来补偿硬件计数器的溢出损失。
- `pcnt_unit_config_t::intr_priority` 设置中断的优先级。如果设置为 0，则会分配一个默认优先级的中断，否则会使用指定的优先级。

备注： 由于所有 PCNT 单元共享一个中断源，安装多个 PCNT 单元时请确保每个单元的中断优先级 `pcnt_unit_config_t::intr_priority` 一致。

¹ 在不同的 ESP 芯片系列中，PCNT 单元和通道的数量可能会有差异，具体信息请参考 [TRM]。驱动程序对通道申请数量不做限制，但当硬件资源用尽时，驱动程序将返回错误。因此分配资源时，应注意检查返回值，如 `pcnt_new_unit()`。

调用函数 `pcnt_new_unit()` 并将 `pcnt_unit_config_t` 作为其输入值，可对 PCNT 单元进行分配和初始化。该函数正常运行时，会返回一个 PCNT 单元句柄。没有可用的 PCNT 单元时（即 PCNT 单元全部被占用），该函数会返回错误 `ESP_ERR_NOT_FOUND`。可用的 PCNT 单元总数记录在 `SOC_PCNT_UNITS_PER_GROUP` 中，以供参考。

如果不再需要之前创建的某个 PCNT 单元，建议通过调用 `pcnt_del_unit()` 来回收该单元，从而该单元可用于其他用途。删除某个 PCNT 单元之前，需要满足以下条件：

- 该单元处于初始状态，即该单元要么已经被 `pcnt_unit_disable()` 禁用，要么尚未使能。
- 附属于该单元的通道已全部被 `pcnt_del_channel()` 删除。

```
#define EXAMPLE_PCNT_HIGH_LIMIT 100
#define EXAMPLE_PCNT_LOW_LIMIT -100

pcnt_unit_config_t unit_config = {
    .high_limit = EXAMPLE_PCNT_HIGH_LIMIT,
    .low_limit = EXAMPLE_PCNT_LOW_LIMIT,
};
pcnt_unit_handle_t pcnt_unit = NULL;
ESP_ERROR_CHECK(pcnt_new_unit(&unit_config, &pcnt_unit));
```

安装 PCNT 通道 安装 PCNT 通道时，需要先初始化 `pcnt_chan_config_t`，然后调用 `pcnt_new_channel()`。对 `pcnt_chan_config_t` 配置如下所示：

- `pcnt_chan_config_t::edge_gpio_num` 与 `pcnt_chan_config_t::level_gpio_num` 用于指定 **边沿**信号和 **电平**信号对应的 GPIO 编号。请注意，这两个参数未被使用时，可以设置为 `-1`，即成为 **虚拟 IO**。对于一些简单的脉冲计数应用，电平信号或边沿信号是固定的（即不会发生改变），可将其设置为虚拟 IO，然后该信号会被连接到一个固定的高/低逻辑电平，这样就可以在通道分配时回收一个 GPIO，节省一个 GPIO 管脚资源。
- `pcnt_chan_config_t::virt_edge_io_level` 与 `pcnt_chan_config_t::virt_level_io_level` 用于指定 **边沿**信号和 **电平**信号的虚拟 IO 电平，以保证这些控制信号处于确定状态。请注意，只有在 `pcnt_chan_config_t::edge_gpio_num` 或 `pcnt_chan_config_t::level_gpio_num` 设置为 `-1` 时，这两个参数才有效。
- `pcnt_chan_config_t::invert_edge_input` 与 `pcnt_chan_config_t::invert_level_input` 用于确定信号在输入 PCNT 之前是否需要被翻转，信号翻转由 GPIO 矩阵（不是 PCNT 单元）执行。
- `pcnt_chan_config_t::io_loop_back` 仅用于调试，它可以使能 GPIO 的输入和输出路径。这样，就可以通过调用位于同一 GPIO 上的函数 `gpio_set_level()` 来模拟脉冲信号。

调用函数 `pcnt_new_channel()`，将 `pcnt_chan_config_t` 作为输入值并调用 `pcnt_new_unit()` 返回的 PCNT 单元句柄，可对 PCNT 通道进行分配和初始化。如果该函数正常运行，会返回一个 PCNT 通道句柄。如果没有可用的 PCNT 通道（PCNT 通道资源全部被占用），该函数会返回错误 `ESP_ERR_NOT_FOUND`。可用的 PCNT 通道总数记录在 `SOC_PCNT_CHANNELS_PER_UNIT`，以供参考。注意，为某个单元安装 PCNT 通道时，应确保该单元处于初始状态，否则函数 `pcnt_new_channel()` 会返回错误 `ESP_ERR_INVALID_STATE`。

如果不再需要之前创建的某个 PCNT 通道，建议通过调用 `pcnt_del_channel()` 回收该通道，从而该通道可用于其他用途。

```
#define EXAMPLE_CHAN_GPIO_A 0
#define EXAMPLE_CHAN_GPIO_B 2

pcnt_chan_config_t chan_config = {
    .edge_gpio_num = EXAMPLE_CHAN_GPIO_A,
    .level_gpio_num = EXAMPLE_CHAN_GPIO_B,
};
pcnt_channel_handle_t pcnt_chan = NULL;
ESP_ERROR_CHECK(pcnt_new_channel(pcnt_unit, &chan_config, &pcnt_chan));
```

设置通道操作 当输入脉冲信号切换时，PCNT 通道会增加，减少或停止计数。边沿信号及电平信号可设置为不同的计数器操作。

- `pcnt_channel_set_edge_action()` 为输入到 `pcnt_chan_config_t::edge_gpio_num` 的信号上升沿和下降沿设置操作, `pcnt_channel_edge_action_t` 中列出了支持的操作。
- `pcnt_channel_set_level_action()` 为输入到 `pcnt_chan_config_t::level_gpio_num` 的信号高电平和低电平设置操作, `pcnt_channel_level_action_t` 中列出了支持的操作。使用 `pcnt_new_channel()` 分配 PCNT 通道时, 如果 `pcnt_chan_config_t::level_gpio_num` 被设置为 `-1`, 就无需对该函数进行设置了。

```
// decrease the counter on rising edge, increase the counter on falling edge
ESP_ERROR_CHECK(pcnt_channel_set_edge_action(pcnt_chan, PCNT_CHANNEL_EDGE_ACTION_
↳DECREASE, PCNT_CHANNEL_EDGE_ACTION_INCREASE));
// keep the counting mode when the control signal is high level, and reverse the_
↳counting mode when the control signal is low level
ESP_ERROR_CHECK(pcnt_channel_set_level_action(pcnt_chan, PCNT_CHANNEL_LEVEL_ACTION_
↳KEEP, PCNT_CHANNEL_LEVEL_ACTION_INVERSE));
```

PCNT 观察点 PCNT 单元可被设置为观察几个特定的数值, 这些被观察的数值被称为 **观察点**。观察点不能超过 `pcnt_unit_config_t` 设置的范围, 最小值和最大值分别为 `pcnt_unit_config_t::low_limit` 和 `pcnt_unit_config_t::high_limit`。当计数器到达任一观察点时, 会触发一个观察事件, 如果在 `pcnt_unit_register_event_callbacks()` 注册过事件回调函数, 该事件就会通过中断发送通知。关于如何注册事件回调函数, 请参考 [注册事件回调函数](#)。

观察点分别可以通过 `pcnt_unit_add_watch_point()` 和 `pcnt_unit_remove_watch_point()` 进行添加和删除。常用的观察点包括 **过零**、**最大/最小计数** 以及其他的阈值。可用的观察点是有限的, 如果 `pcnt_unit_add_watch_point()` 无法获得空闲硬件资源来存储观察点, 会返回错误 `ESP_ERR_NOT_FOUND`。不能多次添加同一个观察点, 否则将返回错误 `ESP_ERR_INVALID_STATE`。

建议通过 `pcnt_unit_remove_watch_point()` 删除未使用的观察点来回收资源。

```
// add zero across watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, 0));
// add high limit watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, EXAMPLE_PCNT_HIGH_LIMIT));
```

注册事件回调函数 当 PCNT 单元的数值达到任一使能的观察点的数值时, 会触发相应的事件并通过中断通知 CPU。如果要在事件触发时执行相关函数, 可通过调用 `pcnt_unit_register_event_callbacks()` 将函数挂载到中断服务程序 (ISR) 上。 `pcnt_event_callbacks_t` 列出了所有支持的事件回调函数:

- `pcnt_event_callbacks_t::on_reach` 用于为观察点事件设置回调函数。由于该回调函数是在 ISR 的上下文中被调用的, 必须确保该函数不会阻塞调用的任务, (例如, 可确保只有以 ISR 为后级的 FreeRTOS API 才能在函数中调用)。 `pcnt_watch_cb_t` 中声明了该回调函数的原型。

可通过 `user_ctx` 将函数上下文保存到 `pcnt_unit_register_event_callbacks()` 中, 这些数据会直接传递给回调函数。

驱动程序会将特定事件的数据写入回调函数中, 例如, 观察点事件数据被声明为 `pcnt_watch_event_data_t`:

- `pcnt_watch_event_data_t::watch_point_value` 用于保存触发该事件的观察点数值。
- `pcnt_watch_event_data_t::zero_cross_mode` 用于保存上一次 PCNT 单元的过零模式, `pcnt_unit_zero_cross_mode_t` 中列出了所有可能的过零模式。通常, 不同的过零模式意味着不同的 **计数方向** 和 **计数步长**。

注册回调函数会导致中断服务延迟安装, 因此回调函数只能在 PCNT 单元被 `pcnt_unit_enable()` 使能之前调用。否则, 回调函数会返回错误 `ESP_ERR_INVALID_STATE`。

```
static bool example_pcnt_on_reach(pcnt_unit_handle_t unit, const pcnt_watch_event_
↳data_t *edata, void *user_ctx)
{
    BaseType_t high_task_wakeup;
```

(下页继续)

```

QueueHandle_t queue = (QueueHandle_t)user_ctx;
// send watch point to queue, from this interrupt callback
xQueueSendFromISR(queue, &(edata->watch_point_value), &high_task_wakeup);
// return whether a high priority task has been waken up by this function
return (high_task_wakeup == pdTRUE);
}

pcnt_event_callbacks_t cbs = {
    .on_reach = example_pcnt_on_reach,
};
QueueHandle_t queue = xQueueCreate(10, sizeof(int));
ESP_ERROR_CHECK(pcnt_unit_register_event_callbacks(pcnt_unit, &cbs, queue));

```

设置毛刺滤波器 PCNT 单元的滤波器可滤除信号中的短时毛刺，`pcnt_glitch_filter_config_t` 中列出了毛刺滤波器的配置参数：

- `pcnt_glitch_filter_config_t::max_glitch_ns` 设置了最大的毛刺宽度，单位为纳秒。如果一个信号脉冲的宽度小于该数值，则该信号会被认定为噪声而不会触发计数器操作。

可通过调用 `pcnt_unit_set_glitch_filter()` 来使能毛刺滤波器，并对上述参数进行配置。之后，还可通过调用 `pcnt_unit_set_glitch_filter()` 来关闭毛刺滤波器，并将上述参数设置为 `NULL`。

调用该函数时，PCNT 单元应处于初始状态。否则，函数将返回错误 `ESP_ERR_INVALID_STATE`。

备注：毛刺滤波器的时钟信息来自 APB。为确保 PCNT 单元不会滤除脉冲信号，最大毛刺宽度应大于一个 APB_CLK 周期（如果 APB 的频率为 80 MHz，则最大毛刺宽度为 12.5 ns）。使能动态频率缩放 (DFS) 后，APB 的频率会发生变化，从而最大毛刺宽度也会发生变化，这会导致计数器无法正常工作。因此，第一次使能毛刺滤波器时，驱动会为 PCNT 单元安装 PM 锁。关于 PCNT 驱动电源管理的更多信息，请参考 [电源管理](#)。

```

pcnt_glitch_filter_config_t filter_config = {
    .max_glitch_ns = 1000,
};
ESP_ERROR_CHECK(pcnt_unit_set_glitch_filter(pcnt_unit, &filter_config));

```

使用外部清零信号 PCNT 单元的可以接收来自 GPIO 的清零信号，`pcnt_clear_signal_config_t` 中列出了清零信号的配置参数：

- `pcnt_clear_signal_config_t::clear_signal_gpio_num` 用于指定 清零信号对应的 GPIO 编号。默认有效电平为高，使能下拉输入。
- `pcnt_clear_signal_config_t::invert_clear_signal` 用于确定信号在输入 PCNT 之前是否需要被翻转，信号翻转由 GPIO 矩阵 (不是 PCNT 单元) 执行。驱动会使能上拉输入，以确保信号在未连接时保持高电平。
- `pcnt_clear_signal_config_t::io_loop_back` 仅用于调试，它可以使能 GPIO 的输入和输出路径。这样，就可以通过 `gpio_set_level()` 函数来模拟外部输入的清零信号。

该输入信号的作用与调用 `pcnt_unit_clear_count()` 函数相同，但它不受软件延迟的限制，更适用于需要低延迟的场合。请注意，该信号的翻转频率不能太高。

```

pcnt_clear_signal_config_t clear_signal_config = {
    .clear_signal_gpio_num = PCNT_CLEAR_SIGNAL_GPIO,
};
ESP_ERROR_CHECK(pcnt_unit_set_clear_signal(pcnt_unit, &clear_signal_config));

```

使能和禁用单元 在对 PCNT 单元进行 IO 控制之前，需要通过调用函数 `pcnt_unit_enable()` 来使能该 PCNT 单元。该函数将完成以下操作：

- 将 PCNT 单元的驱动状态从 **初始**切换到 **使能**。
- 如果中断服务已经在 `pcnt_unit_register_event_callbacks()` 延迟安装，使能中断服务。
- 如果电源管理锁已经在 `pcnt_unit_set_glitch_filter()` 延迟安装，获取该电源管理锁。请参考 [电源管理](#) 获取更多信息。

调用函数 `pcnt_unit_disable()` 会进行相反的操作，即将 PCNT 单元的驱动状态切换回 **初始**状态，禁用中断服务并释放电源管理锁。

控制单元 IO 操作

启用/停用及清零 通过调用 `pcnt_unit_start()` 可启用 PCNT 单元，根据不同脉冲信号进行递增或递减计数；通过调用 `pcnt_unit_stop()` 可停用 PCNT 单元，当前的计数值会保留；通过调用 `pcnt_unit_clear_count()` 可将计数器清零。

注意 `pcnt_unit_start()` 和 `pcnt_unit_stop()` 应该在 PCNT 单元被 `pcnt_unit_enable()` 使能后调用，否则将返回错误 `ESP_ERR_INVALID_STATE`。

获取计数器数值 调用 `pcnt_unit_get_count()` 可随时获取当前计数器的数值。返回的计数值是一个 **带符号的整型数**，其符号反映了计数的方向。

```
int pulse_count = 0;
ESP_ERROR_CHECK(pcnt_unit_get_count(pcnt_unit, &pulse_count));
```

计数溢出补偿 PCNT 内部的硬件计数器会在计数达到高/低门限的时候自动清零。如果你想补偿该计数值的溢出损失，以期进一步拓宽计数器的实际位宽，你可以：

1. 在安装 PCNT 计数单元的时候使能 `pcnt_unit_config_t::accum_count` 选项。
2. 将高/低计数门限设置为 **PCNT 观察点**。
3. 现在，`pcnt_unit_get_count()` 函数返回的计数值就会包含硬件计数器当前的计数值，累加上计数器溢出造成的损失。

备注： `pcnt_unit_clear_count()` 会复位该软件累加器。

电源管理 使能电源管理（即 `CONFIG_PM_ENABLE` 开启）后，在进入 Light-sleep 模式之前，系统会调整 APB 的频率。这会改变 PCNT 毛刺滤波器的参数，从而可能导致有效信号被滤除。

驱动通过获取 `ESP_PM_APB_FREQ_MAX` 类型的电源管理锁来防止系统修改 APB 频率。每当通过 `pcnt_unit_set_glitch_filter()` 使能毛刺滤波器时，驱动可以保证系统在 `pcnt_unit_enable()` 使能 PCNT 单元后获取电源管理锁。而系统调用 `pcnt_unit_disable()` 之后，驱动会释放电源管理锁。

支持 IRAM 安全中断 当缓存由于写入/擦除 flash 等原因被禁用时，PCNT 中断会默认被延迟。这会导致报警中断无法及时执行，从而无法满足实时性应用的要求。

Konfig 选项 `CONFIG_PCNT_ISR_IRAM_SAFE` 可以实现以下功能：

1. 即使缓存被禁用也可以使能中断服务
2. 将 ISR 使用的所有函数都放入 IRAM 中²
3. 将驱动对象放入 DRAM（防止驱动对象被意外映射到 PSRAM 中）

这样，在缓存被禁用时，中断也可运行，但是这也会增加 IRAM 的消耗。

另外一个 Konfig 选项 `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` 也可以把常用的 IO 控制函数放在 IRAM 中。这样，当缓存禁用时，这些函数仍然可以执行。这些 IO 控制函数如下所示：

² `pcnt_event_callbacks_t::on_reach` 回调函数和其调用的函数也应该放在 IRAM 中。

- `pcnt_unit_start()`
- `pcnt_unit_stop()`
- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

支持线程安全 驱动保证工厂函数 `pcnt_new_unit()` 与 `pcnt_new_channel()` 是线程安全的，因此可以从 RTOS 任务中调用这些函数，而无需使用额外的电源管理锁。

以下函数可以在 ISR 上下文中运行，驱动可以防止这些函数在任务和 ISR 中同时被调用。

- `pcnt_unit_start()`
- `pcnt_unit_stop()`
- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

其他以 `pcnt_unit_handle_t` 和 `pcnt_channel_handle_t` 作为第一个参数的函数被视为线程不安全函数，在多任务场景下应避免调用这些函数。

支持的 Kconfig 选项

- `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` 用于确定 PCNT 控制函数的位置（放在 IRAM 还是 flash 中），请参考支持 *IRAM 安全中断* 获取更多信息。
- `CONFIG_PCNT_ISR_IRAM_SAFE` 用于控制当缓存禁用时，默认的 ISR 句柄是否可以工作，请参考支持 *IRAM 安全中断* 获取更多信息。
- `CONFIG_PCNT_ENABLE_DEBUG_LOG` 用于使能调试日志输出，而这会增大固件二进制文件。

应用实例

- 对旋转编码器的正交信号进行解码的实例请参考：[peripherals/pcnt/rotary_encoder](#)。

API 参考

Header File

- `components/esp_driver_pcnt/include/driver/pulse_cnt.h`
- This header file can be included with:

```
#include "driver/pulse_cnt.h"
```

- This header file is a part of the API provided by the `esp_driver_pcnt` component. To declare that your component depends on `esp_driver_pcnt`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_pcnt
```

or

```
PRIV_REQUIRES esp_driver_pcnt
```

Functions

`esp_err_t pcnt_new_unit` (const `pcnt_unit_config_t` *config, `pcnt_unit_handle_t` *ret_unit)

Create a new PCNT unit, and return the handle.

备注: The newly created PCNT unit is put in the init state.

参数

- **config** -- [in] PCNT unit configuration
- **ret_unit** -- [out] Returned PCNT unit handle

返回

- ESP_OK: Create PCNT unit successfully
- ESP_ERR_INVALID_ARG: Create PCNT unit failed because of invalid argument (e.g. high/low limit value out of the range)
- ESP_ERR_NO_MEM: Create PCNT unit failed because out of memory
- ESP_ERR_NOT_FOUND: Create PCNT unit failed because all PCNT units are used up and no more free one
- ESP_FAIL: Create PCNT unit failed because of other error

esp_err_t **pcnt_del_unit** (*pcnt_unit_handle_t* unit)

Delete the PCNT unit handle.

备注: A PCNT unit can't be in the enable state when this function is invoked. See also `pcnt_unit_disable()` for how to disable a unit.

参数 **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`

返回

- ESP_OK: Delete the PCNT unit successfully
- ESP_ERR_INVALID_ARG: Delete the PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete the PCNT unit failed because the unit is not in init state or some PCNT channel is still in working
- ESP_FAIL: Delete the PCNT unit failed because of other error

esp_err_t **pcnt_unit_set_glitch_filter** (*pcnt_unit_handle_t* unit, const *pcnt_glitch_filter_config_t* *config)

Set glitch filter for PCNT unit.

备注: The glitch filter module is clocked from APB, and APB frequency can be changed during DFS, which in return make the filter out of action. So this function will lazy-install a PM lock internally when the power management is enabled. With this lock, the APB frequency won't be changed. The PM lock can be uninstalled in `pcnt_del_unit()`.

备注: This function should be called when the PCNT unit is in the init state (i.e. before calling `pcnt_unit_enable()`)

参数

- **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`
- **config** -- [in] PCNT filter configuration, set config to NULL means disabling the filter function

返回

- ESP_OK: Set glitch filter successfully
- ESP_ERR_INVALID_ARG: Set glitch filter failed because of invalid argument (e.g. glitch width is too big)
- ESP_ERR_INVALID_STATE: Set glitch filter failed because the unit is not in the init state
- ESP_FAIL: Set glitch filter failed because of other error

esp_err_t **pcnt_unit_set_clear_signal** (*pcnt_unit_handle_t* unit, const *pcnt_clear_signal_config_t* *config)

Set clear signal for PCNT unit.

备注: The function of clear signal is the same as `pcnt_unit_clear_count()`. High-level Active

参数

- **unit** -- **[in]** PCNT unit handle created by `pcnt_new_unit()`
- **config** -- **[in]** PCNT clear signal configuration, set config to NULL means disabling the clear signal

返回

- ESP_OK: Set clear signal successfully
- ESP_ERR_INVALID_ARG: Set clear signal failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set clear signal failed because set clear signal repeatedly or disable clear signal before set it
- ESP_FAIL: Set clear signal failed because of other error

esp_err_t **pcnt_unit_enable** (*pcnt_unit_handle_t* unit)

Enable the PCNT unit.

备注: This function will transit the unit state from init to enable.

备注: This function will enable the interrupt service, if it's lazy installed in `pcnt_unit_register_event_callbacks()`.

备注: This function will acquire the PM lock if it's lazy installed in `pcnt_unit_set_glitch_filter()`.

备注: Enable a PCNT unit doesn't mean to start it. See also `pcnt_unit_start()` for how to start the PCNT counter.

参数 **unit** -- **[in]** PCNT unit handle created by `pcnt_new_unit()`

返回

- ESP_OK: Enable PCNT unit successfully
- ESP_ERR_INVALID_ARG: Enable PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable PCNT unit failed because the unit is already enabled
- ESP_FAIL: Enable PCNT unit failed because of other error

esp_err_t **pcnt_unit_disable** (*pcnt_unit_handle_t* unit)

Disable the PCNT unit.

备注: This function will do the opposite work to the `pcnt_unit_enable()`

备注: Disable a PCNT unit doesn't mean to stop it. See also `pcnt_unit_stop()` for how to stop the PCNT counter.

参数 **unit** -- **[in]** PCNT unit handle created by `pcnt_new_unit()`

返回

- ESP_OK: Disable PCNT unit successfully
- ESP_ERR_INVALID_ARG: Disable PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable PCNT unit failed because the unit is not enabled yet
- ESP_FAIL: Disable PCNT unit failed because of other error

esp_err_t pcnt_unit_start (*pcnt_unit_handle_t* unit)

Start the PCNT unit, the counter will start to count according to the edge and/or level input signals.

备注: This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

备注: This function is allowed to run within ISR context

备注: This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` is on, so that it's allowed to be executed when Cache is disabled

参数 `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

返回

- `ESP_OK`: Start PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Start PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Start PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Start PCNT unit failed because of other error

esp_err_t pcnt_unit_stop (*pcnt_unit_handle_t* unit)

Stop PCNT from counting.

备注: This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

备注: The stop operation won't clear the counter. Also see `pcnt_unit_clear_count()` for how to clear pulse count value.

备注: This function is allowed to run within ISR context

备注: This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it is allowed to be executed when Cache is disabled

参数 `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

返回

- `ESP_OK`: Stop PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Stop PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Stop PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Stop PCNT unit failed because of other error

esp_err_t pcnt_unit_clear_count (*pcnt_unit_handle_t* unit)

Clear PCNT pulse count value to zero.

备注: It's recommended to call this function after adding a watch point by `pcnt_unit_add_watch_point()`, so that the newly added watch point is effective immediately.

备注: This function is allowed to run within ISR context

备注: This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it's allowed to be executed when Cache is disabled

参数 `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

返回

- `ESP_OK`: Clear PCNT pulse count successfully
- `ESP_ERR_INVALID_ARG`: Clear PCNT pulse count failed because of invalid argument
- `ESP_FAIL`: Clear PCNT pulse count failed because of other error

esp_err_t `pcnt_unit_get_count` (*pcnt_unit_handle_t* unit, int *value)

Get PCNT count value.

备注: This function is allowed to run within ISR context

备注: This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it's allowed to be executed when Cache is disabled

参数

- `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`
- `value` -- [out] Returned count value

返回

- `ESP_OK`: Get PCNT pulse count successfully
- `ESP_ERR_INVALID_ARG`: Get PCNT pulse count failed because of invalid argument
- `ESP_FAIL`: Get PCNT pulse count failed because of other error

esp_err_t `pcnt_unit_register_event_callbacks` (*pcnt_unit_handle_t* unit, const *pcnt_event_callbacks_t* *cbs, void *user_data)

Set event callbacks for PCNT unit.

备注: User registered callbacks are expected to be runnable within ISR context

备注: The first call to this function needs to be before the call to `pcnt_unit_enable`

备注: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

参数

- `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`
- `cbs` -- [in] Group of callback functions
- `user_data` -- [in] User data, which will be passed to callback functions directly

返回

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set event callbacks failed because the unit is not in init state

- `ESP_FAIL`: Set event callbacks failed because of other error

esp_err_t `pcnt_unit_add_watch_point` (*pcnt_unit_handle_t* unit, int watch_point)

Add a watch point for PCNT unit, PCNT will generate an event when the counter value reaches the watch point value.

参数

- **unit** -- **[in]** PCNT unit handle created by `pcnt_new_unit()`
- **watch_point** -- **[in]** Value to be watched

返回

- `ESP_OK`: Add watch point successfully
- `ESP_ERR_INVALID_ARG`: Add watch point failed because of invalid argument (e.g. the value to be watched is out of the limitation set in `pcnt_unit_config_t`)
- `ESP_ERR_INVALID_STATE`: Add watch point failed because the same watch point has already been added
- `ESP_ERR_NOT_FOUND`: Add watch point failed because no more hardware watch point can be configured
- `ESP_FAIL`: Add watch point failed because of other error

esp_err_t `pcnt_unit_remove_watch_point` (*pcnt_unit_handle_t* unit, int watch_point)

Remove a watch point for PCNT unit.

参数

- **unit** -- **[in]** PCNT unit handle created by `pcnt_new_unit()`
- **watch_point** -- **[in]** Watch point value

返回

- `ESP_OK`: Remove watch point successfully
- `ESP_ERR_INVALID_ARG`: Remove watch point failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Remove watch point failed because the watch point was not added by `pcnt_unit_add_watch_point()` yet
- `ESP_FAIL`: Remove watch point failed because of other error

esp_err_t `pcnt_new_channel` (*pcnt_unit_handle_t* unit, const *pcnt_chan_config_t* *config, *pcnt_channel_handle_t* *ret_chan)

Create PCNT channel for specific unit, each PCNT has several channels associated with it.

备注: This function should be called when the unit is in init state (i.e. before calling `pcnt_unit_enable()`)

参数

- **unit** -- **[in]** PCNT unit handle created by `pcnt_new_unit()`
- **config** -- **[in]** PCNT channel configuration
- **ret_chan** -- **[out]** Returned channel handle

返回

- `ESP_OK`: Create PCNT channel successfully
- `ESP_ERR_INVALID_ARG`: Create PCNT channel failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create PCNT channel failed because of insufficient memory
- `ESP_ERR_NOT_FOUND`: Create PCNT channel failed because all PCNT channels are used up and no more free one
- `ESP_ERR_INVALID_STATE`: Create PCNT channel failed because the unit is not in the init state
- `ESP_FAIL`: Create PCNT channel failed because of other error

esp_err_t `pcnt_del_channel` (*pcnt_channel_handle_t* chan)

Delete the PCNT channel.

参数 **chan** -- **[in]** PCNT channel handle created by `pcnt_new_channel()`

返回

- ESP_OK: Delete the PCNT channel successfully
- ESP_ERR_INVALID_ARG: Delete the PCNT channel failed because of invalid argument
- ESP_FAIL: Delete the PCNT channel failed because of other error

esp_err_t **pcnt_channel_set_edge_action** (*pcnt_channel_handle_t* chan, *pcnt_channel_edge_action_t* pos_act, *pcnt_channel_edge_action_t* neg_act)

Set channel actions when edge signal changes (e.g. falling or rising edge occurred). The edge signal is input from the `edge_gpio_num` configured in *pcnt_chan_config_t*. We use these actions to control when and how to change the counter value.

参数

- **chan** -- [in] PCNT channel handle created by `pcnt_new_channel()`
- **pos_act** -- [in] Action on posedge signal
- **neg_act** -- [in] Action on negedge signal

返回

- ESP_OK: Set edge action for PCNT channel successfully
- ESP_ERR_INVALID_ARG: Set edge action for PCNT channel failed because of invalid argument
- ESP_FAIL: Set edge action for PCNT channel failed because of other error

esp_err_t **pcnt_channel_set_level_action** (*pcnt_channel_handle_t* chan, *pcnt_channel_level_action_t* high_act, *pcnt_channel_level_action_t* low_act)

Set channel actions when level signal changes (e.g. signal level goes from high to low). The level signal is input from the `level_gpio_num` configured in *pcnt_chan_config_t*. We use these actions to control when and how to change the counting mode.

参数

- **chan** -- [in] PCNT channel handle created by `pcnt_new_channel()`
- **high_act** -- [in] Action on high level signal
- **low_act** -- [in] Action on low level signal

返回

- ESP_OK: Set level action for PCNT channel successfully
- ESP_ERR_INVALID_ARG: Set level action for PCNT channel failed because of invalid argument
- ESP_FAIL: Set level action for PCNT channel failed because of other error

Structures

struct **pcnt_watch_event_data_t**

PCNT watch event data.

Public Members

int **watch_point_value**

Watch point value that triggered the event

pcnt_unit_zero_cross_mode_t **zero_cross_mode**

Zero cross mode

struct **pcnt_event_callbacks_t**

Group of supported PCNT callbacks.

备注: The callbacks are all running under ISR environment

备注: When CONFIG_PCNT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

Public Members

pcnt_watch_cb_t **on_reach**

Called when PCNT unit counter reaches any watch point

struct **pcnt_unit_config_t**

PCNT unit configuration.

Public Members

int **low_limit**

Low limitation of the count unit, should be lower than 0

int **high_limit**

High limitation of the count unit, should be higher than 0

int **intr_priority**

PCNT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t **accum_count**

Whether to accumulate the count value when overflows at the high/low limit

struct *pcnt_unit_config_t*::[anonymous] **flags**

Extra flags

struct **pcnt_chan_config_t**

PCNT channel configuration.

Public Members

int **edge_gpio_num**

GPIO number used by the edge signal, input mode with pull up enabled. Set to -1 if unused

int **level_gpio_num**

GPIO number used by the level signal, input mode with pull up enabled. Set to -1 if unused

uint32_t **invert_edge_input**

Invert the input edge signal

uint32_t **invert_level_input**

Invert the input level signal

uint32_t **virt_edge_io_level**

Virtual edge IO level, 0: low, 1: high. Only valid when edge_gpio_num is set to -1

uint32_t **virt_level_io_level**

Virtual level IO level, 0: low, 1: high. Only valid when level_gpio_num is set to -1

uint32_t **io_loop_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct *pcnt_chan_config_t*::[anonymous] **flags**

Channel config flags

struct **pcnt_glitch_filter_config_t**

PCNT glitch filter configuration.

Public Members

uint32_t **max_glitch_ns**

Pulse width smaller than this threshold will be treated as glitch and ignored, in the unit of ns

struct **pcnt_clear_signal_config_t**

PCNT clear signal configuration.

Public Members

int **clear_signal_gpio_num**

GPIO number used by the clear signal, the default active level is high, input mode with pull down enabled

uint32_t **invert_clear_signal**

Invert the clear input signal and set input mode with pull up

uint32_t **io_loop_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct *pcnt_clear_signal_config_t*::[anonymous] **flags**

clear signal config flags

Type Definitions

typedef struct pcnt_unit_t ***pcnt_unit_handle_t**

Type of PCNT unit handle.

typedef struct pcnt_chan_t ***pcnt_channel_handle_t**

Type of PCNT channel handle.

typedef bool (***pcnt_watch_cb_t**)(*pcnt_unit_handle_t* unit, const *pcnt_watch_event_data_t* *edata, void *user_ctx)

PCNT watch event callback prototype.

备注: The callback function is invoked from an ISR context, so it should meet the restrictions of not calling any blocking APIs when implementing the callback. e.g. must use ISR version of FreeRTOS APIs.

Param unit [in] PCNT unit handle

Param edata [in] PCNT event data, fed by the driver

Param user_ctx [in] User data, passed from `pcnt_unit_register_event_callbacks()`

Return Whether a high priority task has been woken up by this function

Header File

- [components/hal/include/hal/pcnt_types.h](#)
- This header file can be included with:

```
#include "hal/pcnt_types.h"
```

Enumerations

enum `pcnt_channel_level_action_t`

PCNT channel action on control level.

Values:

enumerator `PCNT_CHANNEL_LEVEL_ACTION_KEEP`

Keep current count mode

enumerator `PCNT_CHANNEL_LEVEL_ACTION_INVERSE`

Invert current count mode (increase -> decrease, decrease -> increase)

enumerator `PCNT_CHANNEL_LEVEL_ACTION_HOLD`

Hold current count value

enum `pcnt_channel_edge_action_t`

PCNT channel action on signal edge.

Values:

enumerator `PCNT_CHANNEL_EDGE_ACTION_HOLD`

Hold current count value

enumerator `PCNT_CHANNEL_EDGE_ACTION_INCREASE`

Increase count value

enumerator `PCNT_CHANNEL_EDGE_ACTION_DECREASE`

Decrease count value

enum `pcnt_unit_zero_cross_mode_t`

PCNT unit zero cross mode.

Values:

enumerator `PCNT_UNIT_ZERO_CROSS_POS_ZERO`

start from positive value, end to zero, i.e. $+N \rightarrow 0$

enumerator `PCNT_UNIT_ZERO_CROSS_NEG_ZERO`

start from negative value, end to zero, i.e. $-N \rightarrow 0$

enumerator `PCNT_UNIT_ZERO_CROSS_NEG_POS`

start from negative value, end to positive value, i.e. $-N \rightarrow +M$

enumerator `PCNT_UNIT_ZERO_CROSS_POS_NEG`

start from positive value, end to negative value, i.e. $+N \rightarrow -M$

2.5.22 Pixel-Processing Accelerator (PPA)

Introduction

ESP32-P4 includes a pixel-processing accelerator (PPA) module, to realize hardware-level acceleration of image algorithms, such as image rotation, scaling, mirroring, and blending.

Terminology

The terms used in relation to the PPA driver are given in the table and the diagram below.

Term	Definition
Picture (pic)	A complete image stored in the system memory.
Block	A portion cropped from a picture at a certain size, with the maximum size equivalent to the entire picture.
Pixel	The unit to be used in the PPA context.
PPA Operation	Types of image algorithm accelerations, includes scale-rotate-mirror (SRM), blend, and fill.
PPA Client	Who wants to do the PPA operations. Typically, every PPA client is hold by a specific task.
PPA Transaction	One request from a PPA client to do a PPA operation is one PPA transaction.

Functional Overview

The following sections detail the design of the PPA driver:

- *Register PPA Client* - Covers how to register a PPA client to perform any PPA operations.
- *Register PPA Event Callbacks* - Covers how to hook user specific code to PPA driver event callback function.
- *Perform PPA Operations* - Covers how to perform a PPA operation.
- *Thread Safety* - Covers the usage of the PPA operation APIs in thread safety aspect.
- *Performance Overview* - Covers the performance of PPA operations.

Register PPA Client Requests to perform PPA operations are made by PPA clients. Therefore, PPA clients need to be registered first before doing any PPA operations. Call `ppa_register_client()` function to register a new client. `ppa_client_config_t` structure is used to specific the properties of the client.

- `ppa_client_config_t::oper_type` - Each PPA operation type corresponds to one PPA client type, a registered PPA client can only request one specific type of PPA operations.
- `ppa_client_config_t::max_pending_trans_num` - Decides the maximum number of pending PPA transactions the client can hold.

图 20: PPA picture/block terminology

It is recommended that every task to register its own PPA clients. For example, an application contains two tasks: Task A requires both the PPA SRM and the PPA fill functionalities, so one PPA SRM client and one PPA fill client should be registered in Task A; While Task B also requires the PPA SRM functionality, then another PPA SRM client should be registered in Task B.

If the task no longer needs to do PPA operations, the corresponding PPA clients can be deregistered with `ppa_unregister_client()` function.

Register PPA Event Callbacks When an event occurs (e.g., a PPA transaction is completed), the CPU is notified of this event via an interrupt. If some specific functions need to be called when a particular event occurs, a callback can be registered for that event by calling `ppa_client_register_event_callbacks()`. This can be specifically useful when `PPA_TRANS_MODE_NON_BLOCKING` mode is selected to perform the PPA operations. It is worth noticing that the event callbacks are bound to PPA clients, but the user context is provided per transaction in the call to the PPA operation APIs. This allows the maximum flexibility in utilizing the event callbacks.

The registered callback functions are called in the interrupt context, therefore, the callback functions should follow common ISR (Interrupt Service Routine) rules.

Perform PPA Operations Once the PPA client is registered, a PPA operation can be requested with the returned `ppa_client_handle_t`.

PPA operations includes:

Scale, Rotate, Mirror (SRM) Call `ppa_do_scale_rotate_mirror()` to apply one or more of the scaling, rotation, mirroring operations to the target block inside a picture.

Some notes to avoid confusion in configuring `ppa_srm_oper_config_t`:

- `ppa_in_pic_blk_config_t::buffer` and `ppa_out_pic_blk_config_t::buffer` have to be the pointers to different picture buffers for a SRM operation.
- The precision of `ppa_srm_oper_config_t::scale_x` and `ppa_srm_oper_config_t::scale_y` will be truncated to a step size of 1/16.

- Output block's width/height is totally determined by the input block's width/height, scaling factor, and rotation angle, so output block's width/height does not need to be configured. However, please make sure the output block can fit at the offset location in the output picture.
- If the color mode of the input or output picture is `PPA_SRM_COLOR_MODE_YUV420`, then its `pic_w`, `pic_h`, `block_w`, `block_h`, `block_offset_x`, `block_offset_y` fields must be even.

Blend Call `ppa_do_blend()` to blend the two target blocks of two so-called foreground (FG) and background (BG) pictures.

Blend follows the normal Alpha Blending formula:

$$A_{out} = A_b + A_f - A_b \times A_f$$

$$C_{out} = (C_b \times A_b \times (1 - A_f) + C_f \times A_f) / (A_b + A_f - A_b \times A_f)$$

where A_b is the Alpha channel of the background layer, A_f is the Alpha channel of the foreground layer, C_b corresponds to the R, G, B components of the background layer, and C_f corresponds to the R, G, B components of the foreground layer.

Note that this formula is not symmetric to FG and BG. When $A_f = 1$, it calculates $C_{out} = C_f$, $A_{out} = 1$, which means if the color mode of the FG picture is `PPA_BLEND_COLOR_MODE_RGB565` or `PPA_BLEND_COLOR_MODE_RGB888`, since a Alpha value of 255 will be filled by the PPA hardware (i.e. $A_f = 1$), the blended result will be identical to the FG block.

If `ppa_blend_oper_config_t::bg_ck_en` or `ppa_blend_oper_config_t::fg_ck_en` is set to `true`, the pixels fall into the color-key (also known as Chroma-key) range does not follow Alpha Blending process. Please check [ESP32-P4 Technical Reference Manual > Pixel-Processing Accelerator \(PPA\) > Functional Description > Layer Blending \(BLEND\) \[PDF\]](#) for the detailed rules.

Similarly, some notes to avoid confusion in configuring `ppa_blend_oper_config_t`:

- `ppa_out_pic_blk_config_t::buffer` can be the same pointer to one of the input's `ppa_in_pic_blk_config_t::buffer` for a blend operation.
- The blocks' width/height of FG and BG should be identical, and are the width/height values for the output block.
- If the color mode of the input picture is `PPA_BLEND_COLOR_MODE_A4`, then its `block_w` and `block_offset_x` fields must be even.

Fill Call `ppa_do_fill()` to fill a target block inside a picture.

`ppa_trans_mode_t` is a field configurable to all the PPA operation APIs. It decides whether you want the call to the PPA operation API to block until the transaction finishes or to return immediately after the transaction is pushed to the internal queue.

Thread Safety The PPA driver has guaranteed the thread safety of calling the PPA operation APIs in all following situations:

- Among clients of different types in one task
- Among clients of same type in different tasks
- Among clients of different types in different tasks

Performance Overview The PPA operations are acted on the target block of an input picture. Therefore, the time it takes to complete a PPA transaction is proportional to the amount of the data in the block. The size of the entire picture has no influence on the performance. More importantly, the PPA performance highly relies on the PSRAM bandwidth if the pictures are located in the PSRAM section. When there are quite a few peripherals reading and writing to the PSRAM at the same time, the performance of PPA operation will be greatly reduced.

API Reference

Header File

- `components/esp_driver_ppa/include/driver/ppa.h`
- This header file can be included with:

```
#include "driver/ppa.h"
```

- This header file is a part of the API provided by the `esp_driver_ppa` component. To declare that your component depends on `esp_driver_ppa`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_ppa
```

or

```
PRIV_REQUIRES esp_driver_ppa
```

Functions

`esp_err_t ppa_register_client` (const `ppa_client_config_t` *config, `ppa_client_handle_t` *ret_client)

Register a PPA client to do a specific PPA operation.

参数

- **config** -- [in] Pointer to a collection of configurations for the client
- **ret_client** -- [out] Returned client handle

返回

- `ESP_OK`: Register the PPA client successfully
- `ESP_ERR_INVALID_ARG`: Register the PPA client failed because of invalid argument
- `ESP_ERR_NO_MEM`: Register the PPA client failed because out of memory
- `ESP_FAIL`: Register the PPA client failed because of other error

`esp_err_t ppa_unregister_client` (`ppa_client_handle_t` ppa_client)

Unregister a PPA client.

备注: This will also free the resources occupied by the client

参数 `ppa_client` -- [in] PPA client handle, allocated by `ppa_register_client`

返回

- `ESP_OK`: Unregister the PPA client successfully
- `ESP_ERR_INVALID_ARG`: Unregister the PPA client failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Unregister the PPA client failed because there are unfinished transactions

`esp_err_t ppa_client_register_event_callbacks` (`ppa_client_handle_t` ppa_client, const `ppa_event_callbacks_t` *cbs)

Register event callbacks for a PPA client.

备注: Any user private data that wants to be passed directly to callback's `user_data` is provided per PPA transaction. Please check the `user_data` field in `ppa_XXX_oper_config_t` structure.

参数

- **ppa_client** -- [in] PPA client handle
- **cbs** -- [in] Structure with all PPA callbacks

返回

- `ESP_OK`: Register event callbacks for the PPA client successfully
- `ESP_ERR_INVALID_ARG`: Register event callbacks for the PPA client failed because of invalid argument

esp_err_t **ppa_do_scale_rotate_mirror** (*ppa_client_handle_t* ppa_client, const *ppa_srm_oper_config_t* *config)

Perform a scaling-rotating-mirroring (SRM) operation to a picture.

参数

- **ppa_client** -- [in] PPA client handle that has been registered to do SRM operations
- **config** -- [in] Pointer to a collection of configurations for the SRM operation transaction, *ppa_srm_oper_config_t*

返回

- ESP_OK: Perform a SRM operation successfully
- ESP_ERR_INVALID_ARG: Perform a SRM operation failed because of invalid argument
- ESP_FAIL: Perform a SRM operation failed because the client's pending transactions has reached its maximum capacity

esp_err_t **ppa_do_blend** (*ppa_client_handle_t* ppa_client, const *ppa_blend_oper_config_t* *config)

Perform a blending operation to a picture.

参数

- **ppa_client** -- [in] PPA client handle that has been registered to do blend operations
- **config** -- [in] Pointer to a collection of configurations for the blend operation transaction, *ppa_blend_oper_config_t*

返回

- ESP_OK: Perform a blend operation successfully
- ESP_ERR_INVALID_ARG: Perform a blend operation failed because of invalid argument
- ESP_FAIL: Perform a blend operation failed because the client's pending transactions has reached its maximum capacity

esp_err_t **ppa_do_fill** (*ppa_client_handle_t* ppa_client, const *ppa_fill_oper_config_t* *config)

Perform a filling operation to a picture.

参数

- **ppa_client** -- [in] PPA client handle that has been registered to do fill operations
- **config** -- [in] Pointer to a collection of configurations for the fill operation transaction, *ppa_fill_oper_config_t*

返回

- ESP_OK: Perform a fill operation successfully
- ESP_ERR_INVALID_ARG: Perform a fill operation failed because of invalid argument
- ESP_FAIL: Perform a fill operation failed because the client's pending transactions has reached its maximum capacity

Structures

struct **ppa_client_config_t**

A collection of configuration items that used for registering a PPA client.

Public Members

ppa_operation_t **oper_type**

The desired PPA operation for the client

uint32_t **max_pending_trans_num**

The maximum number of pending transactions for the client. By default, it will be 1, which is sufficient if all transactions are performed with PPA_TRANS_MODE_BLOCKING

ppa_data_burst_length_t data_burst_length

The desired data burst length for all the transactions of the client. Use a small burst length will decrease PPA performance, but can save burst bandwidth for other peripheral usages. By default, it will be at the maximum burst length, PPA_DATA_BURST_LENGTH_128

struct **ppa_event_data_t**

Type of PPA event data.

struct **ppa_event_callbacks_t**

Group of supported PPA callbacks.

Public Members***ppa_event_callback_t on_trans_done***

Invoked when a PPA transaction finishes

struct **ppa_in_pic_blk_config_t**

A collection of configuration items for an input picture and the target block inside the picture.

Public Members

const void ***buffer**

Pointer to the input picture buffer

uint32_t **pic_w**

Input picture width (unit: pixel)

uint32_t **pic_h**

Input picture height (unit: pixel)

uint32_t **block_w**

Target block width (unit: pixel)

uint32_t **block_h**

Target block height (unit: pixel)

uint32_t **block_offset_x**

Target block offset in x direction in the picture (unit: pixel)

uint32_t **block_offset_y**

Target block offset in y direction in the picture (unit: pixel)

ppa_srm_color_mode_t srm_cm

Color mode of the picture in a PPA SRM operation. Supported color mode in *ppa_srm_color_mode_t*

***ppa_blend_color_mode_t* blend_cm**

Color mode of the picture in a PPA blend operation. Supported color mode in `ppa_blend_color_mode_t`

***ppa_fill_color_mode_t* fill_cm**

Color mode of the picture in a PPA fill operation. Supported color mode in `ppa_fill_color_mode_t`

***ppa_color_range_t* yuv_range**

When the color mode is any YUV color space, this field is to describe its color range

***ppa_color_conv_std_rgb_yuv_t* yuv_std**

When the color mode is any YUV color space, this field is to describe its YUV<->RGB conversion standard

struct `ppa_out_pic_blk_config_t`

A collection of configuration items for an output picture and the target block inside the picture.

Public Members**void *`buffer`**

Pointer to the output picture buffer (requires alignment: internal memory needs align to L1 cache line size, external memory needs align to L1 and L2 cache line size)

uint32_t `buffer_size`

Size of the output picture buffer (requires alignment: internal memory needs align to L1 cache line size, external memory needs align to L1 and L2 cache line size)

uint32_t `pic_w`

Output picture width (unit: pixel)

uint32_t `pic_h`

Output picture height (unit: pixel)

uint32_t `block_offset_x`

Target block offset in x direction in the picture (unit: pixel)

uint32_t `block_offset_y`

Target block offset in y direction in the picture (unit: pixel)

***ppa_srm_color_mode_t* srm_cm**

Color mode of the picture in a PPA SRM operation. Supported color mode in `ppa_srm_color_mode_t`

***ppa_blend_color_mode_t* blend_cm**

Color mode of the picture in a PPA blend operation. Supported color mode in `ppa_blend_color_mode_t`

ppa_fill_color_mode_t fill_cm

Color mode of the picture in a PPA fill operation. Supported color mode in `ppa_fill_color_mode_t`

ppa_color_range_t yuv_range

When the color mode is any YUV color space, this field is to describe its color range

ppa_color_conv_std_rgb_yuv_t yuv_std

When the color mode is any YUV color space, this field is to describe its YUV<->RGB conversion standard

struct **ppa_srm_oper_config_t**

A collection of configuration items to do a PPA SRM operation transaction.

Public Members***ppa_in_pic_blk_config_t in***

Information of the input picture and the target block

ppa_out_pic_blk_config_t out

Information of the output picture and the target block

ppa_srm_rotation_angle_t rotation_angle

Rotation (counter-clockwise) to the target block, select from `ppa_srm_rotation_angle_t`

float **scale_x**

Scaling factor to the target block in the x direction

float **scale_y**

Scaling factor to the target block in the y direction

bool **mirror_x**

Whether to mirror the target block in the x direction

bool **mirror_y**

Whether to mirror the target block in the y direction

bool **rgb_swap**

Whether to swap the input data in RGB (e.g. ARGB becomes BGRA, RGB becomes BGR)

bool **byte_swap**

Whether to swap the input data in byte. Only available feature if input picture color mode is ARGB8888 or RGB565

ppa_alpha_update_mode_t alpha_update_mode

Select whether the alpha channel of the input picture needs update

uint32_t alpha_fix_val

Range: [0, 255] When PPA_ALPHA_FIX_VALUE mode is selected, alpha_fix_val is the new alpha value to replace the input alpha value (output_alpha = alpha_fix_val)

float alpha_scale_ratio

Range: (0, 1) When PPA_ALPHA_SCALE mode is selected, alpha_scale_ratio is the multiplier to the input alpha value (output_alpha = alpha_scale_ratio * input_alpha) Ratio resolution is 1/256

***ppa_trans_mode_t* mode**

Determines whether to block inside the operation functions, see `ppa_trans_mode_t`

void *user_data

User registered data to be passed into `done_cb` callback function

struct ppa_blend_oper_config_t

A collection of configuration items to do a PPA blend operation transaction.

Public Members***ppa_in_pic_blk_config_t* in_bg**

Information of the input background picture and the target block

***ppa_in_pic_blk_config_t* in_fg**

Information of the input foreground picture and the target block

***ppa_out_pic_blk_config_t* out**

Information of the output picture and the target block

bool bg_rgb_swap

Whether to swap the background input data in RGB (e.g. ARGB becomes BGRA, RGB becomes BGR)

bool bg_byte_swap

Whether to swap the background input data in byte. Only available feature if input BG picture color mode is ARGB8888 or RGB565

***ppa_alpha_update_mode_t* bg_alpha_update_mode**

Select whether the alpha channel of the input background picture needs update

uint32_t bg_alpha_fix_val

Range: [0, 255] When PPA_ALPHA_FIX_VALUE mode is selected, alpha_fix_val is the new alpha value to replace the input alpha value (output_alpha = alpha_fix_val)

float bg_alpha_scale_ratio

Range: (0, 1) When PPA_ALPHA_SCALE mode is selected, alpha_scale_ratio is the multiplier to the input alpha value (output_alpha = alpha_scale_ratio * input_alpha) Ratio resolution is 1/256

bool fg_rgb_swap

Whether to swap the foreground input data in RGB (e.g. ARGB becomes BGRA, RGB becomes BGR)

bool fg_byte_swap

Whether to swap the foreground input data in byte. Only available feature if input FG picture color mode is ARGB8888 or RGB565

ppa_alpha_update_mode_t fg_alpha_update_mode

Select whether the alpha channel of the input foreground picture needs update

uint32_t fg_alpha_fix_val

Range: [0, 255] When PPA_ALPHA_FIX_VALUE mode is selected, alpha_fix_val is the new alpha value to replace the input alpha value (output_alpha = alpha_fix_val)

float fg_alpha_scale_ratio

Range: (0, 1) When PPA_ALPHA_SCALE mode is selected, alpha_scale_ratio is the multiplier to the input alpha value (output_alpha = alpha_scale_ratio * input_alpha) Ratio resolution is 1/256

color_pixel_rgb888_data_t fg_fix_rgb_val

When in_fg_blend_cm is PPA_BLEND_COLOR_MODE_A8/4, this field can be used to set a fixed color for the foreground, in RGB888 format

bool bg_ck_en

Whether to enable color keying for background If not enabled, all background pixels are considered as out of the color-keying range

color_pixel_rgb888_data_t bg_ck_rgb_low_thres

The lower threshold of the color-keying range for the background, in RGB888 format

color_pixel_rgb888_data_t bg_ck_rgb_high_thres

The higher threshold of the color-keying range for the background, in RGB888 format

bool fg_ck_en

Whether to enable color keying for foreground If not enabled, all foreground pixels are considered as out of the color-keying range

color_pixel_rgb888_data_t fg_ck_rgb_low_thres

The lower threshold of the color-keying range for the foreground, in RGB888 format

color_pixel_rgb888_data_t fg_ck_rgb_high_thres

The higher threshold of the color-keying range for the foreground, in RGB888 format

color_pixel_rgb888_data_t ck_rgb_default_val

The color to overwrite when a pixel, where its background element and foreground element are both within their color-keying ranges, in RGB888 format

bool ck_reverse_bg2fg

If this bit is set, in color-keying, for the pixel, where its background element is in the color range, but its foreground element is not in the color range, it will output the foreground element instead of the background element

ppa_trans_mode_t mode

Determines whether to block inside the operation functions, see ppa_trans_mode_t

void ***user_data**

User registered data to be passed into `done_cb` callback function

struct **ppa_fill_oper_config_t**

A collection of configuration items to do a PPA fill operation transaction.

Public Members

ppa_out_pic_blk_config_t **out**

Information of the output picture and the target block

uint32_t **fill_block_w**

The width of the block to be filled (unit: pixel)

uint32_t **fill_block_h**

The height of the block to be filled (unit: pixel)

color_pixel_argb8888_data_t **fill_argb_color**

The color to be filled, in ARGB8888 format

ppa_trans_mode_t **mode**

Determines whether to block inside the operation functions, see `ppa_trans_mode_t`

void ***user_data**

User registered data to be passed into `done_cb` callback function

Type Definitions

typedef struct ppa_client_t ***ppa_client_handle_t**

Type of PPA client handle.

typedef bool (***ppa_event_callback_t**)(*ppa_client_handle_t* ppa_client, *ppa_event_data_t* *event_data, void *user_data)

Type of PPA event callback.

Param ppa_client [in] PPA client handle

Param event_data [in] PPA event data

Param user_data [in] User registered data from calling `ppa_do_xxx` to perform an operation

Return Whether a task switch is needed after the callback function returns, this is usually due to the callback wakes up some high priority task.

Enumerations

enum **ppa_operation_t**

Enumeration of all PPA available operations.

Values:

enumerator **PPA_OPERATION_SRM**

Do scale-rotate-mirror operation

enumerator **PPA_OPERATION_BLEND**

Do blend operation

enumerator **PPA_OPERATION_FILL**

Do fill operation, use one constant pixel to fill a target window

enumerator **PPA_OPERATION_INVALID**

Invalid PPA operations, indicates the quantity of available PPA operations

enum **ppa_trans_mode_t**

Modes to perform the PPA operations.

Values:

enumerator **PPA_TRANS_MODE_BLOCKING**

ppa_do_xxx function will block until the PPA operation is finished

enumerator **PPA_TRANS_MODE_NON_BLOCKING**

ppa_do_xxx function will return immediately after the PPA operation is pushed to the internal queue

Header File

- [components/hal/include/hal/ppa_types.h](#)
- This header file can be included with:

```
#include "hal/ppa_types.h"
```

Enumerations

enum **ppa_engine_type_t**

Enumeration of engines in PPA modules.

Values:

enumerator **PPA_ENGINE_TYPE_SRM**

PPA Scaling-Rotating-Mirroring (SRM) engine, used to perform scale, rotate, mirror

enumerator **PPA_ENGINE_TYPE_BLEND**

PPA Blending engine, used to perform blend or fill

enum **ppa_srm_rotation_angle_t**

Enumeration of PPA Scaling-Rotating-Mirroring available rotation angle (in the counterclockwise direction)

Values:

enumerator **PPA_SRM_ROTATION_ANGLE_0**

Picture does no rotation

enumerator **PPA_SRM_ROTATION_ANGLE_90**

Picture rotates 90 degrees CCW

enumerator **PPA_SRM_ROTATION_ANGLE_180**

Picture rotates 180 degrees CCW

enumerator **PPA_SRM_ROTATION_ANGLE_270**

Picture rotates 270 degrees CCW

enum **ppa_srm_color_mode_t**

Enumeration of PPA Scaling-Rotating-Mirroring available color mode.

Values:

enumerator **PPA_SRM_COLOR_MODE_ARGB8888**

PPA SRM color mode: ARGB8888

enumerator **PPA_SRM_COLOR_MODE_RGB888**

PPA SRM color mode: RGB888

enumerator **PPA_SRM_COLOR_MODE_RGB565**

PPA SRM color mode: RGB565

enumerator **PPA_SRM_COLOR_MODE_YUV420**

PPA SRM color mode: YUV420

enumerator **PPA_SRM_COLOR_MODE_YUV444**

PPA SRM color mode: YUV444 (limited range only)

enum **ppa_blend_color_mode_t**

Enumeration of PPA blend available color mode.

Values:

enumerator **PPA_BLEND_COLOR_MODE_ARGB8888**

PPA blend color mode: ARGB8888

enumerator **PPA_BLEND_COLOR_MODE_RGB888**

PPA blend color mode: RGB888

enumerator **PPA_BLEND_COLOR_MODE_RGB565**

PPA blend color mode: RGB565

enumerator **PPA_BLEND_COLOR_MODE_A8**

PPA blend color mode: A8, only available on blend foreground input

enumerator **PPA_BLEND_COLOR_MODE_A4**

PPA blend color mode: A4, only available on blend foreground input

enum **ppa_fill_color_mode_t**

Enumeration of PPA fill available color mode.

Values:

enumerator **PPA_FILL_COLOR_MODE_ARGB8888**

PPA fill color mode: ARGB8888

enumerator **PPA_FILL_COLOR_MODE_RGB888**

PPA fill color mode: RGB888

enumerator **PPA_FILL_COLOR_MODE_RGB565**

PPA fill color mode: RGB565

enum **ppa_alpha_update_mode_t**

Enumeration of PPA alpha compositing update mode.

Values:

enumerator **PPA_ALPHA_NO_CHANGE**

Do not replace alpha value ($A' = A$). If input format does not contain alpha info, alpha value 255 will be used.

enumerator **PPA_ALPHA_FIX_VALUE**

Replace the alpha value in received pixel with a new, fixed alpha value ($A' = \text{val}$)

enumerator **PPA_ALPHA_SCALE**

Scale the alpha value in received pixel to be a new alpha value ($A' = (A * \text{val}) \gg 8$). If input format does not contain alpha info, $A' = (255 * \text{val}) \gg 8$.

enumerator **PPA_ALPHA_INVERT**

Invert the alpha value in received pixel ($A' = 255 - A$). If input format does not contain alpha info, $A' = 0$, i.e. a layer with 0% opacity.

enum **ppa_color_conv_std_rgb_yuv_t**

Enumeration of PPA supported color conversion standard between RGB and YUV (determines the YUV<->RGB conversion equation)

Values:

enumerator **PPA_COLOR_CONV_STD_RGB_YUV_BT601**

YUV<->RGB conversion standard: BT.601

enumerator **PPA_COLOR_CONV_STD_RGB_YUV_BT709**

YUV<->RGB conversion standard: BT.709

enum **ppa_color_range_t**

Enumeration of PPA supported color range (determines the YUV<->RGB conversion equation)

Values:

enumerator **PPA_COLOR_RANGE_LIMIT**

Limited color range, 16 is the darkest black and 235 is the brightest white

enumerator **PPA_COLOR_RANGE_FULL**

Full color range, 0 is the darkest black and 255 is the brightest white

enum **ppa_data_burst_length_t**

Enumeration of PPA supported data burst length.

Values:

enumerator **PPA_DATA_BURST_LENGTH_8**

Data burst length: 8 bytes

enumerator **PPA_DATA_BURST_LENGTH_16**

Data burst length: 16 bytes

enumerator **PPA_DATA_BURST_LENGTH_32**

Data burst length: 32 bytes

enumerator **PPA_DATA_BURST_LENGTH_64**

Data burst length: 64 bytes

enumerator **PPA_DATA_BURST_LENGTH_128**

Data burst length: 128 bytes

2.5.23 红外遥控 (RMT)

简介

红外遥控 (RMT) 外设是一个红外发射和接收控制器。其数据格式灵活，可进一步扩展为多功能的通用收发器，发送或接收多种类型的信号。就网络分层而言，RMT 硬件包含物理层和数据链路层。物理层定义通信介质和比特信号的表示方式，数据链路层定义 RMT 帧的格式。RMT 帧的最小数据单元称为 **RMT 符号**，在驱动程序中以 `rmt_symbol_word_t` 表示。

ESP32-P4 的 RMT 外设存在多个通道¹，每个通道都可以独立配置为发射器或接收器。

RMT 外设通常支持以下场景：

- 发送或接收红外信号，支持所有红外线协议，如 NEC 协议
- 生成通用序列
- 有限或无限次地在硬件控制的循环中发送信号
- 多通道同时发送
- 将载波调制到输出信号或从输入信号解调载波

RMT 符号的内存布局 RMT 硬件定义了自己的数据模式，称为 **RMT 符号**。下图展示了一个 RMT 符号的位字段：每个符号由两对两个值组成，每对中的第一个值是一个 15 位的值，表示信号持续时间，以 RMT 滴答计。每对中的第二个值是一个 1 位的值，表示信号的逻辑电平，即高电平或低电平。

RMT 发射器概述 RMT 发送通道 (TX Channel) 的数据路径和控制路径如下图所示：

驱动程序将用户数据编码为 RMT 数据格式，随后由 RMT 发射器根据编码生成波形。在将波形发送到 GPIO 管脚前，还可以调制高频载波信号。

RMT 接收器概述 RMT 接收通道 (RX Channel) 的数据路径和控制路径如下图所示：

RMT 接收器可以对输入信号采样，将其转换为 RMT 数据格式，并将数据存储在内存中。还可以向接收器提供输入信号的基本特征，使其识别信号停止条件，并过滤掉信号干扰和噪声。RMT 外设还支持从基准信号中解调出高频载波信号。

¹ 不同 ESP 芯片系列可能具有不同数量的 RMT 通道，详情请参阅 [TRM]。驱动程序对通道申请数量不做限制，但当硬件资源用尽时，驱动程序将返回错误。因此，每次进行资源分配时，请注意检查返回值。

图 21: RMT 符号结构 (L - 信号电平)

图 22: RMT 发射器概述

图 23: RMT 接收器概述

功能概述

下文将分节概述 RMT 的功能：

- **资源分配** - 介绍如何分配和正确配置 RMT 通道，以及如何回收闲置通道及其他资源。
- **载波调制与解调** - 介绍如何调制和解调用于 TX 和 RX 通道的载波信号。
- **注册事件回调** - 介绍如何注册用户提供的事件回调函数以接收 RMT 通道事件。
- **启用及禁用通道** - 介绍如何启用和禁用 RMT 通道。
- **发起 TX 事务** - 介绍发起 TX 通道事务的步骤。
- **发起 RX 事务** - 介绍发起 RX 通道事务的步骤。
- **多通道同时发送** - 介绍如何将多个通道收集到一个同步组中，以便同时启动发送。
- **RMT 编码器** - 介绍如何通过组合驱动程序提供的多个基本编码器来编写自定义编码器。
- **电源管理** - 介绍不同时钟源对功耗的影响。
- **IRAM 安全** - 介绍禁用 cache 对 RMT 驱动程序的影响，并提供应对方案。
- **线程安全** - 介绍由驱动程序认证为线程安全的 API。
- **Kconfig 选项** - 介绍 RMT 驱动程序支持的各种 Kconfig 选项。

资源分配 驱动程序中，`rmt_channel_handle_t` 用于表示 RMT 的 TX 和 RX 通道。驱动程序在内部管理可用的通道，并在收到请求时提供空闲通道。

安装 RMT TX 通道 要安装 RMT TX 通道，应预先提供配置结构体 `rmt_tx_channel_config_t`。以下列表介绍了配置结构体中的各个部分。

- `rmt_tx_channel_config_t::gpio_num` 设置发射器使用的 GPIO 编号。
- `rmt_tx_channel_config_t::clk_src` 选择 RMT 通道的时钟源。`rmt_clock_source_t` 中列出了可用的时钟源。注意，其他通道将使用同一所选时钟源，因此，应确保分配的任意 TX 或 RX 通道都享有相同的配置。有关不同时钟源对功耗的影响，请参阅 [电源管理](#)。
- `rmt_tx_channel_config_t::resolution_hz` 设置内部滴答计数器的分辨率。基于此 **滴答**，可以计算 RMT 信号的定时参数。
- 在启用 DMA 后端和未启用 DMA 后端的情况下，`rmt_tx_channel_config_t::mem_block_symbols` 字段含义稍有不同。
 - 若通过 `rmt_tx_channel_config_t::with_dma` 启用 DMA，则该字段可以控制内部 DMA 缓冲区大小。为实现更好的吞吐量、减少 CPU 开销，建议为字段设置一个较大的值，如 1024。
 - 如果未启用 DMA，则该字段控制通道专用内存块大小，至少为 48。
- `rmt_tx_channel_config_t::trans_queue_depth` 设置内部事务队列深度。队列越深，在待处理队列中可以准备的事务越多。
- `rmt_tx_channel_config_t::invert_out` 决定是否在将 RMT 信号发送到 GPIO 管脚前反转 RMT 信号。
- `rmt_tx_channel_config_t::with_dma` 为通道启用 DMA 后端。启用 DMA 后端可以释放 CPU 上的大部分通道工作负载，显著减轻 CPU 负担。但并非所有 ESP 芯片都支持 DMA 后端，在启用此选项前，请参阅 [\[TRM\]](#)。若所选芯片不支持 DMA 后端，可能会报告 `ESP_ERR_NOT_SUPPORTED` 错误。
- `rmt_tx_channel_config_t::io_loop_back` 启用通道所分配的 GPIO 上的输入和输出功能，将发送通道和接收通道绑定到同一个 GPIO 上，从而实现回环功能。
- `rmt_tx_channel_config_t::io_od_mode` 配置通道分配的 GPIO 为开漏模式 (open-drain)。当与 `rmt_tx_channel_config_t::io_loop_back` 结合使用时，可以实现双向总线，如 1-wire。
- `rmt_tx_channel_config_t::intr_priority` 设置中断的优先级。如果设置为 0，驱动将会使用一个中低优先级的中断（优先级可能为 1, 2 或 3），否则会使用 `rmt_tx_channel_config_t::intr_priority` 指定的优先级。请使用优先级序号 (1, 2, 3)，而不是 bitmask 的形式 ((1<<1), (1<<2), (1<<3))。请注意，中断优先级一旦设置，在 `rmt_del_channel()` 被调用之前不可再次修改。

将必要参数填充到结构体 `rmt_tx_channel_config_t` 后，可以调用 `rmt_new_tx_channel()` 来分配和初始化 TX 通道。如果函数运行正确，会返回 RMT 通道句柄；如果 RMT 资源池内缺少空闲通道，会返回 `ESP_ERR_NOT_FOUND` 错误；如果硬件不支持 DMA 后端等部分功能，则返回 `ESP_ERR_NOT_SUPPORTED` 错误。

```

rmt_channel_handle_t tx_chan = NULL;
rmt_tx_channel_config_t tx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT, // 选择时钟源
    .gpio_num = 0, // GPIO 编号
    .mem_block_symbols = 64, // 内存块大小, 即 64 * 4 = 256 字节
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz 滴答分辨率, 即 1 滴答 = 1 μs
    .trans_queue_depth = 4, // 设置后台等待处理的事务数量
    .flags.invert_out = false, // 不反转输出信号
    .flags.with_dma = false, // 不需要 DMA 后端
};
ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_chan));

```

安装 RMT RX 通道 要安装 RMT RX 通道, 应预先提供配置结构体 `rmt_rx_channel_config_t`。以下列表介绍了配置结构体中的各个部分。

- `rmt_rx_channel_config_t::gpio_num` 设置接收器使用的 GPIO 编号。
- `rmt_rx_channel_config_t::clk_src` 选择 RMT 通道的时钟源。`rmt_clock_source_t` 中列出了可用的时钟源。注意, 其他通道将使用同一所选时钟源, 因此, 应确保分配的任意 TX 或 RX 通道都享有相同的配置。有关不同时钟源对功耗的影响, 请参阅[电源管理](#)。
- `rmt_rx_channel_config_t::resolution_hz` 设置内部滴答计数器的分辨率。基于此滴答, 可以计算 RMT 信号的定时参数。
- 在启用 DMA 后端和未启用 DMA 后端的情况下, `rmt_rx_channel_config_t::mem_block_symbols` 字段含义稍有不同。
 - 若通过 `rmt_rx_channel_config_t::with_dma` 启用 DMA, 则该字段可以最大化控制内部 DMA 缓冲区大小。
 - 如果未启用 DMA, 则该字段控制通道专用内存块大小, 至少为 48。
- `rmt_rx_channel_config_t::invert_in` 在输入信号传递到 RMT 接收器前对其进行反转。该反转由 GPIO 交换矩阵完成, 而非 RMT 外设。
- `rmt_rx_channel_config_t::with_dma` 为通道启用 DMA 后端。启用 DMA 后端可以释放 CPU 上的大部分通道工作负载, 显著减轻 CPU 负担。但并非所有 ESP 芯片都支持 DMA 后端, 在启用此选项前, 请参阅[\[TRM\]](#)。若所选芯片不支持 DMA 后端, 可能会报告 `ESP_ERR_NOT_SUPPORTED` 错误。
- `rmt_rx_channel_config_t::io_loop_back` 启用通道所分配的 GPIO 上的输入和输出功能, 将发送通道和接收通道绑定到同一个 GPIO 上, 从而实现回环功能。
- `rmt_rx_channel_config_t::intr_priority` 设置中断的优先级。如果设置为 0, 驱动将会使用一个中低优先级的中断 (优先级可能为 1, 2 或 3), 否则会使用 `rmt_rx_channel_config_t::intr_priority` 指定的优先级。请使用优先级序号 (1, 2, 3), 而不是 bitmask 的形式 ((1<<1), (1<<2), (1<<3))。请注意, 中断优先级一旦设置, 在 `rmt_del_channel()` 被调用之前不可再次修改。

将必要参数填充到结构体 `rmt_rx_channel_config_t` 后, 可以调用 `rmt_new_rx_channel()` 来分配和初始化 RX 通道。如果函数运行正确, 会返回 RMT 通道句柄; 如果 RMT 资源池内缺少空闲通道, 会返回 `ESP_ERR_NOT_FOUND` 错误; 如果硬件不支持 DMA 后端等部分功能, 则返回 `ESP_ERR_NOT_SUPPORTED` 错误。

```

rmt_channel_handle_t rx_chan = NULL;
rmt_rx_channel_config_t rx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT, // 选择时钟源
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz 滴答分辨率, 即 1 滴答 = 1 μs
    .mem_block_symbols = 64, // 内存块大小, 即 64 * 4 = 256 字节
    .gpio_num = 2, // GPIO 编号
    .flags.invert_in = false, // 不反转输入信号
    .flags.with_dma = false, // 不需要 DMA 后端
};
ESP_ERROR_CHECK(rmt_new_rx_channel(&rx_chan_config, &rx_chan));

```

备注: 由于 GPIO 驱动程序中的软件限制, 当 TX 和 RX 通道都绑定到同一 GPIO 时, 请确保在 TX 通道之前初始化 RX 通道。如果先设置 TX 通道, 那么在 RX 通道设置期间, GPIO 控制信号将覆盖先前的

RMT TX 通道信号。

卸载 RMT 通道 如果不再需要之前安装的 RMT 通道，建议调用 `rmt_del_channel()` 回收资源，使底层软件与硬件重新用于其他功能。

载波调制与解调 RMT 发射器可以生成载波信号，并将其调制到消息信号上。载波信号的频率远高于消息信号。此外，仅支持配置载波信号的频率和占空比。RMT 接收器可以从输入信号中解调出载波信号。注意，并非所有 ESP 芯片都支持载波调制和解调功能，在配置载波前，请参阅 [TRM]。若所选芯片不支持载波调制和解调功能，可能会报告 `ESP_ERR_NOT_SUPPORTED` 错误。

载波相关配置位于 `rmt_carrier_config_t` 中，该配置中的各部分详情如下：

- `rmt_carrier_config_t::frequency_hz` 设置载波频率，单位为 Hz。
- `rmt_carrier_config_t::duty_cycle` 设置载波占空比。
- `rmt_carrier_config_t::polarity_active_low` 设置载波极性，即应用载波的电平。
- `rmt_carrier_config_t::always_on` 设置是否在数据发送完成后仍输出载波，该配置仅适用于 TX 通道。

备注： RX 通道的载波频率不应设置为理论值，建议为载波频率留出一定的容差。例如，以下代码片段的载波频率设置为 25 KHz，而非 TX 侧配置的 38 KHz。因为信号在空气中传播时会发生反射和折射，导致接收端接收的频率失真。

```
rmt_carrier_config_t tx_carrier_cfg = {
    .duty_cycle = 0.33,           // 载波占空比为 33%
    .frequency_hz = 38000,       // 38 KHz
    .flags.polarity_active_low = false, // 载波应调制到高电平
};
// 将载波调制到 TX 通道
ESP_ERROR_CHECK(rmt_apply_carrier(tx_chan, &tx_carrier_cfg));

rmt_carrier_config_t rx_carrier_cfg = {
    .duty_cycle = 0.33,           // 载波占空比为 33%
    .frequency_hz = 25000,       // 载波频率为 25
    ↪KHz, 应小于发射器的载波频率
    .flags.polarity_active_low = false, // 载波调制到高电平
};
// 从 RX 通道解调载波
ESP_ERROR_CHECK(rmt_apply_carrier(rx_chan, &rx_carrier_cfg));
```

注册事件回调 当 RMT 通道生成发送或接收完成等事件时，会通过中断告知 CPU。如果需要在发生特定事件时调用函数，可以为 TX 和 RX 通道分别调用 `rmt_tx_register_event_callbacks()` 和 `rmt_rx_register_event_callbacks()`，向 RMT 驱动程序的中断服务程序 (ISR) 注册事件回调。由于上述回调函数是在 ISR 中调用的，因此，这些函数不应涉及 block 操作。可以检查调用 API 的后缀，确保在函数中只调用了后缀为 ISR 的 FreeRTOS API。回调函数具有布尔返回值，指示回调是否解除了更高优先级任务的阻塞状态。

有关 TX 通道支持的事件回调，请参阅 `rmt_tx_event_callbacks_t`：

- `rmt_tx_event_callbacks_t::on_trans_done` 为“发送完成”的事件设置回调函数，函数原型声明为 `rmt_tx_done_callback_t`。

有关 RX 通道支持的事件回调，请参阅 `rmt_rx_event_callbacks_t`：

- `rmt_rx_event_callbacks_t::on_recv_done` 为“接收完成”的事件设置回调函数，函数原型声明为 `rmt_rx_done_callback_t`。

也可使用参数 `user_data`，在 `rmt_tx_register_event_callbacks()` 和 `rmt_rx_register_event_callbacks()` 中保存自定义上下文。用户数据将直接传递给每个回调函数。

备注：“receive-done”不等同于“receive-finished”。这个回调函数也可以在“partial-receive-done”时间发生的时候被调用。

在回调函数中可以获取驱动程序在 `edata` 中填充的特定事件数据。注意，`edata` 指针仅在回调的持续时间内有效。

有关 TX 完成事件数据的定义，请参阅 `rmt_tx_done_event_data_t`：

- `rmt_tx_done_event_data_t::num_symbols` 表示已发送的 RMT 符号数量，也反映了编码数据大小。注意，该值还考虑了由驱动程序附加的 EOF 符号，该符号标志着一次事务的结束。

有关 RX 完成事件数据的定义，请参阅 `rmt_rx_done_event_data_t`：

- `rmt_rx_done_event_data_t::received_symbols` 指向接收到的 RMT 符号，这些符号存储在 `rmt_receive()` 函数的 `buffer` 参数中，在回调函数返回前不应释放此接收缓冲区。如果你还启用了部分接收的功能，则这个用户缓冲区会被用作“二级缓冲区”，其中的内容可以被随后传入的数据覆盖。在这种情况下，如果你想要保存或者稍后处理一些数据，则需要将接收到的数据复制到其他位置。
- `rmt_rx_done_event_data_t::num_symbols` 表示接收到的 RMT 符号数量，该值不会超过 `rmt_receive()` 函数的 `buffer_size` 参数。如果 `buffer_size` 不足以容纳所有接收到的 RMT 符号，驱动程序将只保存缓冲区能够容纳的最大数量的符号，并丢弃或忽略多余的符号。
- `rmt_rx_done_event_data_t::is_last` 指示收到的数据包是否是当前的接收任务中的最后一个。这个标志在你使能 `rmt_receive_config_t::extra_flags::en_partial_rx` 部分接收功能时非常有用。

启用及禁用通道 在发送或接收 RMT 符号前，应预先调用 `rmt_enable()`。启用 TX 通道会启用特定中断，并使硬件准备发送事务。启用 RX 通道也会启用中断，但由于传入信号的特性尚不明确，接收器不会在此时启动，而是在 `rmt_receive()` 中启动。

相反，`rmt_disable()` 会禁用中断并清除队列中的中断，同时禁用发射器和接收器。

```
ESP_ERROR_CHECK(rmt_enable(tx_chan));
ESP_ERROR_CHECK(rmt_enable(rx_chan));
```

发起 TX 事务 RMT 是一种特殊的通信外设，无法像 SPI 和 I2C 那样发送原始字节流，只能以 `rmt_symbol_word_t` 格式发送数据。然而，硬件无法将用户数据转换为 RMT 符号，该转换只能通过 RMT 编码器在软件中完成。编码器将用户数据编码为 RMT 符号，随后写入 RMT 内存块或 DMA 缓冲区。有关创建 RMT 编码器的详细信息，请参阅 [RMT 编码器](#)。

获取编码器后，调用 `rmt_transmit()` 启动 TX 事务，该函数会接收少数位置参数，如通道句柄、编码器句柄和有效负载缓冲区。此外，还需要在 `rmt_transmit_config_t` 中提供专用于发送的配置，具体如下：

- `rmt_transmit_config_t::loop_count` 设置发送的循环次数。在发射器完成一轮发送后，如果该值未设置为零，则再次启动相同的发送程序。由于循环由硬件控制，RMT 通道可以在几乎不需要 CPU 干预的情况下，生成许多周期性序列。
 - 将 `rmt_transmit_config_t::loop_count` 设置为 -1，会启用无限循环发送机制，此时，除非手动调用 `rmt_disable()`，否则通道不会停止，也不会生成“完成发送”事件。
 - 将 `rmt_transmit_config_t::loop_count` 设置为正数，意味着迭代次数有限。此时，“完成发送”事件在指定的迭代次数完成后发生。

备注：注意，不是所有 ESP 芯片都支持 **循环发送** 功能，在配置此选项前，请参阅 [\[TRM\]](#)。若所选芯片不支持配置此选项，可能会报告 `ESP_ERR_NOT_SUPPORTED` 错误。

- `rmt_transmit_config_t::eot_level` 设置发射器完成工作时的输出电平，该设置同时适用于调用 `rmt_disable()` 停止发射器工作时的输出电平。
- `rmt_transmit_config_t::queue_nonblocking` 设置当传输队列满的时候该函数是否需要等待。如果该值设置为 `true` 那么当遇到队列满的时候，该函数会立即返回错误代码 `ESP_ERR_INVALID_STATE`。否则，函数会阻塞当前线程，直到传输队列有空档。

备注： 如果将 `rmt_transmit_config_t::loop_count` 设置为非零值，即启用循环功能，则传输的大小将受到限制。编码的 RMT 符号不应超过 RMT 硬件内存块容量，否则会出现类似 `encoding artifacts can't exceed hw memory block for loop transmission` 的报错信息。如需通过循环启动大型事务，请尝试以下任一方法：

- 增加 `rmt_tx_channel_config_t::mem_block_symbols`。若此时启用了 DMA 后端，该方法将失效。
- 自定义编码器，并在编码函数中构造一个无限循环，详情请参阅 [RMT 编码器](#)。

`rmt_transmit()` 会在其内部构建一个事务描述符，并将其发送到作业队列中，该队列通常会在 ISR 上下文中被调度。因此，在 `rmt_transmit()` 返回时，该事务可能尚未启动。注意，你不能在事务结束前就去回收或者修改 payload 中的内容。通过 `rmt_tx_register_event_callbacks()` 来注册事件回调，可以在事务完成的时候被通知。为确保完成所有挂起的事务，你还可以调用 `rmt_tx_wait_all_done()`。

多通道同时发送 在一些实时控制应用程序中，启动多个 TX 通道（例如使两个器械臂同时移动）时，应避免出现任何时间漂移。为此，RMT 驱动程序可以创建 **同步管理器** 帮助管理该过程。在驱动程序中，同步管理器为 `rmt_sync_manager_handle_t`。RMT 同步发送过程如下图所示：

图 24: RMT TX 同步发送

安装 RMT 同步管理器 要创建同步管理器，应预先在 `rmt_sync_manager_config_t` 中指定要管理的通道：

- `rmt_sync_manager_config_t::tx_channel_array` 指向要管理的 TX 通道数组。
- `rmt_sync_manager_config_t::array_size` 设置要管理的通道数量。

成功调用 `rmt_new_sync_manager()` 函数将返回管理器句柄，该函数也可能因为无效参数等错误而无法调用。在已经安装了同步管理器，且缺少硬件资源来创建另一个管理器时，该函数将报告 `ESP_ERR_NOT_FOUND` 错误。此外，如果硬件不支持同步管理器，将报告 `ESP_ERR_NOT_SUPPORTED` 错误。在使用同步管理器功能之前，请参阅 [TRM]。

发起同时发送 在调用 `rmt_sync_manager_config_t::tx_channel_array` 中所有通道上的 `rmt_transmit()` 前，任何受管理的 TX 通道都不会启动发送机制，而是处于待命状态。由于各

通道事务不同，TX 通道通常会在不同的时间完成相应事务，这可能导致无法同步。因此，在重新启动同时发送程序之前，应调用 `rmt_sync_reset()` 函数重新同步所有通道。

调用 `rmt_del_sync_manager()` 函数可以回收同步管理器，并使通道可以在将来独立启动发送程序。

```
rmt_channel_handle_t tx_channels[2] = {NULL}; // 声明两个通道
int tx_gpio_number[2] = {0, 2};
// 依次安装通道
for (int i = 0; i < 2; i++) {
    rmt_tx_channel_config_t tx_chan_config = {
        .clk_src = RMT_CLK_SRC_DEFAULT, // 选择时钟源
        .gpio_num = tx_gpio_number[i], // GPIO 编号
        .mem_block_symbols = 64, // 内存块大小，即 64 * 4 = 256 字节
        .resolution_hz = 1 * 1000 * 1000, // 1 MHz 分辨率
        .trans_queue_depth = 1, // 设置可以在后台挂起的事务数量
    };
    ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_channels[i]));
}
// 安装同步管理器
rmt_sync_manager_handle_t synchro = NULL;
rmt_sync_manager_config_t synchro_config = {
    .tx_channel_array = tx_channels,
    .array_size = sizeof(tx_channels) / sizeof(tx_channels[0]),
};
ESP_ERROR_CHECK(rmt_new_sync_manager(&synchro_config, &synchro));

ESP_ERROR_CHECK(rmt_transmit(tx_channels[0], led_strip_encoders[0], led_data, led_
↪num * 3, &transmit_config));
// 只有在调用 tx_channels[1] 的 rmt_transmit() 函数返回后，tx_channels[0]
↪才会开始发送数据。
ESP_ERROR_CHECK(rmt_transmit(tx_channels[1], led_strip_encoders[1], led_data, led_
↪num * 3, &transmit_config));
```

发起 RX 事务 如**启用及禁用通道**一节所述，仅调用 `rmt_enable()` 时，RX 通道无法接收 RMT 符号。为此，应在 `rmt_receive_config_t` 中指明传入信号的基本特征：

- `rmt_receive_config_t::signal_range_min_ns` 指定高电平或低电平有效脉冲的最小持续时间。如果脉冲宽度小于指定值，硬件会将其视作干扰信号并忽略。
- `rmt_receive_config_t::signal_range_max_ns` 指定高电平或低电平有效脉冲的最大持续时间。如果脉冲宽度大于指定值，接收器会将其视作**停止信号**，并立即生成接收完成事件。
- 如果传入的数据包很长，无法一次性保存在用户缓冲区中，可以通过将 `rmt_receive_config_t::extra_flags::en_partial_rx` 设置为 `true` 来开启部分接收功能。在这种情况下，当用户缓冲区快满的时候，驱动会多次调用 `rmt_rx_event_callbacks_t::on_recv_done` 回调函数来通知用户去处理已经收到的数据。你可以检查 `cpp.member::rmt_rx_done_event_data_t::is_last` 的值来了解当前事务是否已经结束。请注意，并不是所有 ESP 系列芯片都支持这个功能，它依赖硬件提供的“ping-pong 接收”或者“DMA 接收”的能力。

根据以上配置调用 `rmt_receive()` 后，RMT 接收器会启动 RX 机制。注意，以上配置均针对特定事务存在，也就是说，要开启新一轮的接收时，需要再次设置 `rmt_receive_config_t` 选项。接收器会将传入信号以 `rmt_symbol_word_t` 的格式保存在内部内存块或 DMA 缓冲区中。

由于内存块大小有限，RMT 接收器会交替提醒驱动程序将累积的符号复制到外部处理。

应在 `rmt_receive()` 函数的 `buffer` 参数中提供复制目标。如果由于缓冲区大小不足而导致缓冲区溢出，接收器仍可继续工作，但会丢弃溢出的符号，并报告此错误信息：`user buffer too small, received symbols truncated`。请注意 `buffer` 参数的生命周期，确保在接收器完成或停止工作前不会回收缓冲区。

当接收器完成工作，即接收到持续时间大于 `rmt_receive_config_t::signal_range_max_ns` 的信号时，驱动程序将停止接收器。如有需要，应再次调用 `rmt_receive()` 重新启动接收器。

在 `rmt_rx_event_callbacks_t::on_recv_done` 的回调中可以获取接收到的数据。要获取更多有关详情，请参阅注册事件回调。

```
static bool example_rmt_rx_done_callback(rmt_channel_handle_t channel, const rmt_
↳rx_done_event_data_t *edata, void *user_data)
{
    BaseType_t high_task_wakeup = pdFALSE;
    QueueHandle_t receive_queue = (QueueHandle_t)user_data;
    // 将接收到的 RMT 符号发送到解析任务的消息队列中
    xQueueSendFromISR(receive_queue, edata, &high_task_wakeup);
    // 返回是否唤醒了任何任务
    return high_task_wakeup == pdTRUE;
}

QueueHandle_t receive_queue = xQueueCreate(1, sizeof(rmt_rx_done_event_data_t));
rmt_rx_event_callbacks_t cbs = {
    .on_recv_done = example_rmt_rx_done_callback,
};
ESP_ERROR_CHECK(rmt_rx_register_event_callbacks(rx_channel, &cbs, receive_queue));

// 以下时间要求均基于 NEC 协议
rmt_receive_config_t receive_config = {
    .signal_range_min_ns = 1250, // NEC 信号的最短持续时间为 560 μs, 由于 1250_
↳ns < 560 μs, 有效信号不会视为噪声
    .signal_range_max_ns = 12000000, // NEC 信号的最长持续时间为 9000 μs, 由于_
↳12000000 ns > 9000 μs, 接收不会提前停止
};

rmt_symbol_word_t raw_symbols[64]; // 64 个符号应足够存储一个标准 NEC 帧的数据
// 准备开始接收
ESP_ERROR_CHECK(rmt_receive(rx_channel, raw_symbols, sizeof(raw_symbols), &receive_
↳config));
// 等待 RX 完成信号
rmt_rx_done_event_data_t rx_data;
xQueueReceive(receive_queue, &rx_data, portMAX_DELAY);
// 解析接收到的符号数据
example_parse_nec_frame(rx_data.received_symbols, rx_data.num_symbols);
```

RMT 编码器 RMT 编码器是 RMT TX 事务的一部分，用于在特定时间生成正确的 RMT 符号，并将其写入硬件内存或 DMA 缓冲区。对于编码函数，存在以下特殊限制条件：

- 由于目标 RMT 内存块无法一次性容纳所有数据，在单个事务中，须多次调用编码函数。为突破这一限制，可以采用 **交替**方式，将编码会话分成多个部分。为此，编码器需要 **记录其状态**，以便从上一部分编码结束之处继续编码。
- 编码函数在 ISR 上下文中运行。为加快编码会话，建议将编码函数放入 IRAM，这也有助于避免在编码过程中出现 cache 失效的情况。

为帮助用户更快速地上手 RMT 驱动程序，该程序默认提供了一些常用编码器，可以单独使用，也可以链式组合成新的编码器，有关原理请参阅 [组合模式](#)。驱动程序在 `rmt_encoder_t` 中定义了编码器接口，包含以下函数：

- `rmt_encoder_t::encode` 是编码器的基本函数，编码会话即在此处进行。
 - 在单个事务中，可能会多次调用 `rmt_encoder_t::encode` 函数，该函数会返回当前编码会话的状态。
 - 可能出现的编码状态已在 `rmt_encode_state_t` 列出。如果返回结果中包含 `RMT_ENCODING_COMPLETE`，表示当前编码器已完成编码。
 - 如果返回结果中包含 `RMT_ENCODING_MEM_FULL`，表示保存编码数据的空间不足，需要从当前会话中退出。
- `rmt_encoder_t::reset` 会将编码器重置为初始状态（编码器有其特定状态）。
 - 如果在未重置 RMT 发射器对应编码器的情况下，手动停止 RMT 发射器，随后的编码会话将报错。

- 该函数也会在 `rmt_disable()` 中隐式调用。
- `rmt_encoder_t::del` 可以释放编码器分配的资源。

拷贝编码器 调用 `rmt_new_copy_encoder()` 可以创建拷贝编码器，将 RMT 符号从用户空间复制到驱动程序层。拷贝编码器通常用于编码 `const` 数据，即初始化后在运行时不会发生更改的数据，如红外协议中的前导码。

调用 `rmt_new_copy_encoder()` 前，应预先提供配置结构体 `rmt_copy_encoder_config_t`。目前，该配置保留用作未来的扩展功能，暂无具体用途或设置项。

字节编码器 调用 `rmt_new_bytes_encoder()` 可以创建字节编码器，将用户空间的字节流动态转化成 RMT 符号。字节编码区通常用于编码动态数据，如红外协议中的地址和命令字段。

调用 `rmt_new_bytes_encoder()` 前，应预先提供配置结构体 `rmt_bytes_encoder_config_t`，具体配置如下：

- `rmt_bytes_encoder_config_t::bit0` 和 `rmt_bytes_encoder_config_t::bit1` 为必要项，用于告知编码器如何以 `rmt_symbol_word_t` 格式表示零位和一位。
- `rmt_bytes_encoder_config_t::msb_first` 设置各字节的位编码。如果设置为真，编码器将首先编码 **最高有效位**，否则将首先编码 **最低有效位**。

除驱动程序提供的原始编码器外，也可以将现有编码器链式组合成自定义编码器。常见编码器链如下图所示：

图 25: RMT 编码器链

自定义 NEC 协议的 RMT 编码器 本节将演示编写 NEC 编码器的流程。NEC 红外协议使用脉冲距离编码来发送消息位，每个脉冲突发的持续时间为 $562.5 \mu\text{s}$ ，逻辑位发送详见下文。注意，各字节的最低有效位会优先发送。

- 逻辑 0: $562.5 \mu\text{s}$ 的脉冲突发后有 $562.5 \mu\text{s}$ 的空闲时间，总发送时间为 1.125 ms
- 逻辑 1: $562.5 \mu\text{s}$ 的脉冲突发后有 1.6875 ms 的空闲时间，总发送时间为 2.25 ms

在遥控器上按下某个按键时，将按以下顺序发送有关信号：

- 9 ms 的引导脉冲发射，也称为 AGC 脉冲
- 4.5 ms 的空闲时间
- 接收设备的 8 位地址
- 地址的 8 位逻辑反码
- 8 位命令
- 命令的 8 位逻辑反码

图 26: 红外 NEC 帧

- 最后的 562.5 μ s 脉冲突发，表示消息发送结束

随后可以按相同顺序构建 NEC `rmt_encoder_t::encode` 函数，例如

```
// 红外 NEC 扫码表示法
typedef struct {
    uint16_t address;
    uint16_t command;
} ir_nec_scan_code_t;

// 通过组合原始编码器构建编码器
typedef struct {
    rmt_encoder_t base; // 基础类 "class" 声明了标准编码器接口
    rmt_encoder_t *copy_encoder; // 使用拷贝编码器来编码前导码和结束码
    rmt_encoder_t *bytes_encoder; // 使用字节编码器来编码地址和命令数据
    rmt_symbol_word_t nec_leading_symbol; // 使用 RMT 表示的 NEC 前导码
    rmt_symbol_word_t nec_ending_symbol; // 使用 RMT 表示的 NEC 结束码
    int state; // 记录当前编码状态,即所处编码阶段
} rmt_ir_nec_encoder_t;

static size_t rmt_encode_ir_nec(rmt_encoder_t *encoder, rmt_channel_handle_t
↪channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_
↪state)
{
    rmt_ir_nec_encoder_t *nec_encoder = __containerof(encoder, rmt_ir_nec_encoder_
↪t, base);
    rmt_encode_state_t session_state = RMT_ENCODING_RESET;
    rmt_encode_state_t state = RMT_ENCODING_RESET;
    size_t encoded_symbols = 0;
    ir_nec_scan_code_t *scan_code = (ir_nec_scan_code_t *)primary_data;
    rmt_encoder_handle_t copy_encoder = nec_encoder->copy_encoder;
    rmt_encoder_handle_t bytes_encoder = nec_encoder->bytes_encoder;
    switch (nec_encoder->state) {
        case 0: // 发送前导码
            encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_
↪encoder->nec_leading_symbol,
                                                    sizeof(rmt_symbol_word_t), &
↪session_state);
            if (session_state & RMT_ENCODING_COMPLETE) {
                nec_encoder->state = 1; //↵
↪只有在当前编码器完成工作时才能切换到下一个状态
            }
            if (session_state & RMT_ENCODING_MEM_FULL) {
                state |= RMT_ENCODING_MEM_FULL;
                goto out; //↵
↪如果没有足够的空间来存放其他编码相关的数据,程序会暂停当前操作,并跳转到指定位置继续执行。
            }
            // 继续执行
            case 1: // 发送地址
                encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_
↪code->address, sizeof(uint16_t), &session_state);
                if (session_state & RMT_ENCODING_COMPLETE) {
                    nec_encoder->state = 2; //↵
↪只有在当前编码器完成工作时才能切换到下一个状态
                }
    }
}

```

(下页继续)

```

    }
    if (session_state & RMT_ENCODING_MEM_FULL) {
        state |= RMT_ENCODING_MEM_FULL;
        goto out; //
    }
    // 继续执行
    case 2: // 发送命令
        encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_
    code->command, sizeof(uint16_t), &session_state);
        if (session_state & RMT_ENCODING_COMPLETE) {
            nec_encoder->state = 3; //
        }
        // 只有在当前编码器完成工作时才能切换到下一个状态
        if (session_state & RMT_ENCODING_MEM_FULL) {
            state |= RMT_ENCODING_MEM_FULL;
            goto out; //
        }
        // 继续执行
        case 3: // 发送结束码
            encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_
            encoder->nec_ending_symbol,
            sizeof(rmt_symbol_word_t), &
            session_state);
            if (session_state & RMT_ENCODING_COMPLETE) {
                nec_encoder->state = RMT_ENCODING_RESET; // 返回初始编码会话
                state |= RMT_ENCODING_COMPLETE; // 告知调用者 NEC 编码已完成
            }
            if (session_state & RMT_ENCODING_MEM_FULL) {
                state |= RMT_ENCODING_MEM_FULL;
                goto out; //
            }
        }
    }
out:
    *ret_state = state;
    return encoded_symbols;
}

```

如果没有足够的空间来存放其他编码相关的数据，程序会暂停当前操作，并跳转到指定位置继续执行。

如果没有足够的空间来存放其他编码相关的数据，程序会暂停当前操作，并跳转到指定位置继续执行。

如果没有足够的空间来存放其他编码相关的数据，程序会暂停当前操作，并跳转到指定位置继续执行。

完整示例代码存放在 `peripherals/rmt/ir_nec_transceiver` 目录下。以上代码片段使用了 `switch-case` 和一些 `goto` 语句实现了一个有限状态机，借助此模式可构建更复杂的红外协议。

电源管理 通过 `CONFIG_PM_ENABLE` 选项启用电源管理时，系统会在进入 Light-sleep 模式前调整 APB 频率。该操作可能改变 RMT 内部计数器的分辨率。

然而，驱动程序可以通过获取 `ESP_PM_APB_FREQ_MAX` 类型的电源管理锁，防止系统改变 APB 频率。每当驱动创建以 `RMT_CLK_SRC_APB` 作为时钟源的 RMT 通道时，都会在通过 `rmt_enable()` 启用通道后获取电源管理锁。反之，调用 `rmt_disable()` 时，驱动程序释放锁。这也意味着 `rmt_enable()` 和 `rmt_disable()` 应成对出现。

如果将通道时钟源设置为其他选项，如 `RMT_CLK_SRC_XTAL`，则驱动程序不会为其安装电源管理锁。对于低功耗应用程序来说，只要时钟源仍然可以提供足够的分辨率，不安装电源管理锁更为合适。

IRAM 安全 默认情况下，禁用 cache 时，写入/擦除主 flash 等原因将导致 RMT 中断延迟，事件回调函数也将延迟执行。在实时应用程序中，应避免此类情况。此外，当 RMT 事务依赖交替中断连续编码或复制 RMT 符号时，上述中断延迟将导致不可预测的结果。

因此，可以启用 Kconfig 选项 `CONFIG_RMT_ISR_IRAM_SAFE`，该选项：

1. 支持在禁用 cache 时启用所需中断

2. 支持将 ISR 使用的所有函数存放在 IRAM 中²
3. 支持将驱动程序实例存放在 DRAM 中，以防其意外映射到 PSRAM 中

启用该选项可以保证 cache 禁用时的中断运行，但会相应增加 IRAM 占用。

另外一个 Kconfig 选项 `CONFIG_RMT_RECV_FUNC_IN_IRAM` 可以将 `rmt_receive()` 函数放进内部的 IRAM 中，从而当 flash cache 被关闭的时候，这个函数也能够被使用。

线程安全 RMT 驱动程序会确保工厂函数 `rmt_new_tx_channel()`、`rmt_new_rx_channel()` 和 `rmt_new_sync_manager()` 的线程安全。使用时，可以直接从不同的 RTOS 任务中调用此类函数，无需额外锁保护。其他以 `rmt_channel_handle_t` 和 `rmt_sync_manager_handle_t` 作为第一个位置参数的函数均非线程安全，在没有设置互斥锁保护的任任务中，应避免从多个任务中调用这类函数。

以下函数允许在 ISR 上下文中使用：

- `rmt_receive()`

Kconfig 选项

- `CONFIG_RMT_ISR_IRAM_SAFE` 控制默认 ISR 处理程序能否在禁用 cache 的情况下工作。详情请参阅 [IRAM 安全](#)。
- `CONFIG_RMT_ENABLE_DEBUG_LOG` 用于启用调试日志输出，启用此选项将增加固件的二进制文件大小。
- `CONFIG_RMT_RECV_FUNC_IN_IRAM` 用于控制 RMT 接收函数被链接到系统存储的哪个位置 (IRAM 还是 Flash)。详情请参阅 [IRAM 安全](#)。

应用示例

- 基于 RMT 的 RGB LED 灯带自定义编码器： [peripherals/rmt/led_strip](#)
- RMT 红外 NEC 协议的编码与解码： [peripherals/rmt/ir_nec_transceiver](#)
- 队列中的 RMT 事务： [peripherals/rmt/musical_buzzer](#)
- 基于 RMT 的步进电机与 S 曲线算法： [peripherals/rmt/stepper_motor](#)
- 用于驱动 DShot ESC 的 RMT 无限循环： [peripherals/rmt/dshot_esc](#)
- 模拟 1-wire 协议的 RMT 实现（以 DS18B20 为例）： [peripherals/rmt/onewire](#)

FAQ

- RMT 为什么会发送比预期更多的数据？
RMT 的传输层编码是在 ISR 上下文中完成的，如果 RMT 编码耗时较长（例如，增加了过多的调试追踪信息），或者由于中断延迟和抢占导致编码工作被推迟执行，导致传输器在编码器更新内存数据之前就读取了老数据，致使传输器再次发送先前的数据。我们无法告诉硬件传输器自动等待新数据的更新，但是可以通过以下方法来缓解此问题：
 - 增加 `rmt_tx_channel_config_t::mem_block_symbols` 的值，步长为 48。
 - 将编码函数放置在 IRAM 中。
 - 如果所用芯片支持 `rmt_tx_channel_config_t::with_dma`，请启用该选项。
 - 将 RMT 驱动安装在另外一个 CPU 核上，避免和其他高中断频率的外设竞争同一个 CPU 资源。

- This header file can be included with:

² 注意，回调函数（如 `rmt_tx_event_callbacks_t::on_trans_done`）及回调函数所调用的函数也应位于 IRAM 中。

```
#include "driver/rmt_tx.h"
```

- This header file is a part of the API provided by the `esp_driver_rmt` component. To declare that your component depends on `esp_driver_rmt`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_rmt
```

or

```
PRIV_REQUIRES esp_driver_rmt
```

Functions

`esp_err_t rmt_new_tx_channel` (const `rmt_tx_channel_config_t` *config, `rmt_channel_handle_t` *ret_chan)

Create a RMT TX channel.

参数

- **config** -- [in] TX channel configurations
- **ret_chan** -- [out] Returned generic RMT channel handle

返回

- `ESP_OK`: Create RMT TX channel successfully
- `ESP_ERR_INVALID_ARG`: Create RMT TX channel failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create RMT TX channel failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create RMT TX channel failed because all RMT channels are used up and no more free one
- `ESP_ERR_NOT_SUPPORTED`: Create RMT TX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- `ESP_FAIL`: Create RMT TX channel failed because of other error

`esp_err_t rmt_transmit` (`rmt_channel_handle_t` tx_channel, `rmt_encoder_handle_t` encoder, const void *payload, size_t payload_bytes, const `rmt_transmit_config_t` *config)

Transmit data by RMT TX channel.

备注: This function constructs a transaction descriptor then pushes to a queue. The transaction will not start immediately if there's another one under processing. Based on the setting of `rmt_transmit_config_t::queue_nonblocking`, if there're too many transactions pending in the queue, this function can block until it has free slot, otherwise just return quickly.

备注: The payload data to be transmitted will be encoded into RMT symbols by the specific encoder.

备注: You CAN'T modify the payload during the transmission, it should be kept valid until the transmission is finished.

参数

- **tx_channel** -- [in] RMT TX channel that created by `rmt_new_tx_channel()`
- **encoder** -- [in] RMT encoder that created by various factory APIs like `rmt_new_bytes_encoder()`
- **payload** -- [in] The raw data to be encoded into RMT symbols
- **payload_bytes** -- [in] Size of the payload in bytes
- **config** -- [in] Transmission specific configuration

返回

- `ESP_OK`: Transmit data successfully
- `ESP_ERR_INVALID_ARG`: Transmit data failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Transmit data failed because channel is not enabled
- `ESP_ERR_NOT_SUPPORTED`: Transmit data failed because some feature is not supported by hardware, e.g. unsupported loop count

- **ESP_FAIL**: Transmit data failed because of other error

esp_err_t **rmt_tx_wait_all_done** (*rmt_channel_handle_t* tx_channel, int timeout_ms)

Wait for all pending TX transactions done.

备注: This function will block forever if the pending transaction can't be finished within a limited time (e.g. an infinite loop transaction). See also `rmt_disable()` for how to terminate a working channel.

参数

- **tx_channel** -- **[in]** RMT TX channel that created by `rmt_new_tx_channel()`
- **timeout_ms** -- **[in]** Wait timeout, in ms. Specially, -1 means to wait forever.

返回

- **ESP_OK**: Flush transactions successfully
- **ESP_ERR_INVALID_ARG**: Flush transactions failed because of invalid argument
- **ESP_ERR_TIMEOUT**: Flush transactions failed because of timeout
- **ESP_FAIL**: Flush transactions failed because of other error

esp_err_t **rmt_tx_register_event_callbacks** (*rmt_channel_handle_t* tx_channel, const *rmt_tx_event_callbacks_t* *cbs, void *user_data)

Set event callbacks for RMT TX channel.

备注: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

备注: When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

参数

- **tx_channel** -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()`
- **cbs** -- **[in]** Group of callback functions
- **user_data** -- **[in]** User data, which will be passed to callback functions directly

返回

- **ESP_OK**: Set event callbacks successfully
- **ESP_ERR_INVALID_ARG**: Set event callbacks failed because of invalid argument
- **ESP_FAIL**: Set event callbacks failed because of other error

esp_err_t **rmt_new_sync_manager** (const *rmt_sync_manager_config_t* *config, *rmt_sync_manager_handle_t* *ret_synchro)

Create a synchronization manager for multiple TX channels, so that the managed channel can start transmitting at the same time.

备注: All the channels to be managed should be enabled by `rmt_enable()` before put them into sync manager.

参数

- **config** -- **[in]** Synchronization manager configuration
- **ret_synchro** -- **[out]** Returned synchronization manager handle

返回

- **ESP_OK**: Create sync manager successfully

- ESP_ERR_INVALID_ARG: Create sync manager failed because of invalid argument
- ESP_ERR_NOT_SUPPORTED: Create sync manager failed because it is not supported by hardware
- ESP_ERR_INVALID_STATE: Create sync manager failed because not all channels are enabled
- ESP_ERR_NO_MEM: Create sync manager failed because out of memory
- ESP_ERR_NOT_FOUND: Create sync manager failed because all sync controllers are used up and no more free one
- ESP_FAIL: Create sync manager failed because of other error

esp_err_t **rmt_del_sync_manager** (*rmt_sync_manager_handle_t* synchro)

Delete synchronization manager.

参数 **synchro** -- **[in]** Synchronization manager handle returned from `rmt_new_sync_manager()`

返回

- ESP_OK: Delete the synchronization manager successfully
- ESP_ERR_INVALID_ARG: Delete the synchronization manager failed because of invalid argument
- ESP_FAIL: Delete the synchronization manager failed because of other error

esp_err_t **rmt_sync_reset** (*rmt_sync_manager_handle_t* synchro)

Reset synchronization manager.

参数 **synchro** -- **[in]** Synchronization manager handle returned from `rmt_new_sync_manager()`

返回

- ESP_OK: Reset the synchronization manager successfully
- ESP_ERR_INVALID_ARG: Reset the synchronization manager failed because of invalid argument
- ESP_FAIL: Reset the synchronization manager failed because of other error

Structures

struct **rmt_tx_event_callbacks_t**

Group of RMT TX callbacks.

备注: The callbacks are all running under ISR environment

备注: When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

rmt_tx_done_callback_t **on_trans_done**

Event callback, invoked when transmission is finished

struct **rmt_tx_channel_config_t**

RMT TX channel specific configuration.

Public Members

`gpio_num_t gpio_num`

GPIO number used by RMT TX channel. Set to -1 if unused

`rmt_clock_source_t clk_src`

Clock source of RMT TX channel, channels in the same group must use the same clock source

`uint32_t resolution_hz`

Channel clock resolution, in Hz

`size_t mem_block_symbols`

Size of memory block, in number of `rmt_symbol_word_t`, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value; In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

`size_t trans_queue_depth`

Depth of internal transfer queue, increase this value can support more transfers pending in the background

`int intr_priority`

RMT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

`uint32_t invert_out`

Whether to invert the RMT channel signal before output to GPIO pad

`uint32_t with_dma`

If set, the driver will allocate an RMT channel with DMA capability

`uint32_t io_loop_back`

The signal output from the GPIO will be fed to the input path as well

`uint32_t io_od_mode`

Configure the GPIO as open-drain mode

`struct rmt_tx_channel_config_t::[anonymous] flags`

TX channel config flags

`struct rmt_transmit_config_t`

RMT transmit specific configuration.

Public Members

`int loop_count`

Specify the times of transmission in a loop, -1 means transmitting in an infinite loop

`uint32_t eot_level`

Set the output level for the "End Of Transmission"

uint32_t **queue_nonblocking**

If set, when the transaction queue is full, driver will not block the thread but return directly

struct *rmt_transmit_config_t*::[anonymous] **flags**

Transmit specific config flags

struct **rmt_sync_manager_config_t**

Synchronous manager configuration.

Public Members

const *rmt_channel_handle_t* ***tx_channel_array**

Array of TX channels that are about to be managed by a synchronous controller

size_t **array_size**

Size of the tx_channel_array

Header File

- [components/esp_driver_rmt/include/driver/rmt_rx.h](#)
- This header file can be included with:

```
#include "driver/rmt_rx.h"
```

- This header file is a part of the API provided by the `esp_driver_rmt` component. To declare that your component depends on `esp_driver_rmt`, add the following to your CMakeLists.txt:

```
REQUIRES esp_driver_rmt
```

or

```
PRIV_REQUIRES esp_driver_rmt
```

Functions

esp_err_t **rmt_new_rx_channel** (const *rmt_rx_channel_config_t* *config, *rmt_channel_handle_t* *ret_chan)

Create a RMT RX channel.

参数

- **config** -- [in] RX channel configurations
- **ret_chan** -- [out] Returned generic RMT channel handle

返回

- ESP_OK: Create RMT RX channel successfully
- ESP_ERR_INVALID_ARG: Create RMT RX channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT RX channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create RMT RX channel failed because all RMT channels are used up and no more free one
- ESP_ERR_NOT_SUPPORTED: Create RMT RX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- ESP_FAIL: Create RMT RX channel failed because of other error

esp_err_t **rmt_receive** (*rmt_channel_handle_t* rx_channel, void *buffer, size_t buffer_size, const *rmt_receive_config_t* *config)

Initiate a receive job for RMT RX channel.

备注: This function is non-blocking, it initiates a new receive job and then returns. User should check the received data from the `on_recv_done` callback that registered by `rmt_rx_register_event_callbacks()`.

备注: This function can also be called in ISR context.

备注: If you want this function to work even when the flash cache is disabled, please enable the `CONFIG_RMT_RECV_FUNC_IN_IRAM` option.

参数

- **rx_channel** -- **[in]** RMT RX channel that created by `rmt_new_rx_channel()`
- **buffer** -- **[in]** The buffer to store the received RMT symbols
- **buffer_size** -- **[in]** size of the `buffer`, in bytes
- **config** -- **[in]** Receive specific configurations

返回

- `ESP_OK`: Initiate receive job successfully
- `ESP_ERR_INVALID_ARG`: Initiate receive job failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Initiate receive job failed because channel is not enabled
- `ESP_FAIL`: Initiate receive job failed because of other error

`esp_err_t rmt_rx_register_event_callbacks(rmt_channel_handle_t rx_channel, const rmt_rx_event_callbacks_t *cbs, void *user_data)`

Set callbacks for RMT RX channel.

备注: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

备注: When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

参数

- **rx_channel** -- **[in]** RMT generic channel that created by `rmt_new_rx_channel()`
- **cbs** -- **[in]** Group of callback functions
- **user_data** -- **[in]** User data, which will be passed to callback functions directly

返回

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_FAIL`: Set event callbacks failed because of other error

Structures

struct `rmt_rx_event_callbacks_t`

Group of RMT RX callbacks.

备注: The callbacks are all running under ISR environment

备注: When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

`rmt_rx_done_callback_t on_recv_done`

Event callback, invoked when the RMT channel reception is finished or partial data is received

struct `rmt_rx_channel_config_t`

RMT RX channel specific configuration.

Public Members

`gpio_num_t gpio_num`

GPIO number used by RMT RX channel. Set to -1 if unused

`rmt_clock_source_t clk_src`

Clock source of RMT RX channel, channels in the same group must use the same clock source

`uint32_t resolution_hz`

Channel clock resolution, in Hz

`size_t mem_block_symbols`

Size of memory block, in number of `rmt_symbol_word_t`, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value (e.g. 1024); In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

`int intr_priority`

RMT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

`uint32_t invert_in`

Whether to invert the incoming RMT channel signal

`uint32_t with_dma`

If set, the driver will allocate an RMT channel with DMA capability

`uint32_t io_loop_back`

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct `rmt_rx_channel_config_t::[anonymous] flags`

RX channel config flags

struct `rmt_receive_config_t`

RMT receive specific configuration.

Public Members

uint32_t **signal_range_min_ns**

A pulse whose width is smaller than this threshold will be treated as glitch and ignored

uint32_t **signal_range_max_ns**

RMT will stop receiving if one symbol level has kept more than `signal_range_max_ns`

struct *rmt_receive_config_t::extra_flags* **flags**

Receive specific config flags

struct **extra_flags**

Receive specific flags.

Public Members

uint32_t **en_partial_rx**

Set this flag if the incoming data is very long, and the driver can only receive the data piece by piece, because the user buffer is not sufficient to save all the data.

Header File

- [components/esp_driver_rmt/include/driver/rmt_common.h](#)
- This header file can be included with:

```
#include "driver/rmt_common.h"
```

- This header file is a part of the API provided by the `esp_driver_rmt` component. To declare that your component depends on `esp_driver_rmt`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_rmt
```

or

```
PRIV_REQUIRES esp_driver_rmt
```

Functions

esp_err_t **rmt_del_channel** (*rmt_channel_handle_t* channel)

Delete an RMT channel.

参数 **channel** -- [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

返回

- ESP_OK: Delete RMT channel successfully
- ESP_ERR_INVALID_ARG: Delete RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete RMT channel failed because it is still in working
- ESP_FAIL: Delete RMT channel failed because of other error

esp_err_t **rmt_apply_carrier** (*rmt_channel_handle_t* channel, const *rmt_carrier_config_t* *config)

Apply modulation feature for TX channel or demodulation feature for RX channel.

参数

- **channel** -- [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`
- **config** -- [in] Carrier configuration. Specially, a NULL config means to disable the carrier modulation or demodulation feature

返回

- ESP_OK: Apply carrier configuration successfully
- ESP_ERR_INVALID_ARG: Apply carrier configuration failed because of invalid argument
- ESP_FAIL: Apply carrier configuration failed because of other error

`esp_err_t rmt_enable(rmt_channel_handle_t channel)`

Enable the RMT channel.

备注: This function will acquire a PM lock that might be installed during channel allocation

参数 `channel` -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

返回

- ESP_OK: Enable RMT channel successfully
- ESP_ERR_INVALID_ARG: Enable RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable RMT channel failed because it's enabled already
- ESP_FAIL: Enable RMT channel failed because of other error

`esp_err_t rmt_disable(rmt_channel_handle_t channel)`

Disable the RMT channel.

备注: This function will release a PM lock that might be installed during channel allocation

参数 `channel` -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

返回

- ESP_OK: Disable RMT channel successfully
- ESP_ERR_INVALID_ARG: Disable RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable RMT channel failed because it's not enabled yet
- ESP_FAIL: Disable RMT channel failed because of other error

Structures

struct `rmt_carrier_config_t`

RMT carrier wave configuration (for either modulation or demodulation)

Public Members

uint32_t `frequency_hz`

Carrier wave frequency, in Hz, 0 means disabling the carrier

float `duty_cycle`

Carrier wave duty cycle (0~100%)

uint32_t `polarity_active_low`

Specify the polarity of carrier, by default it's modulated to base signal's high level

uint32_t `always_on`

If set, the carrier can always exist even there's not transfer undergoing

```
struct rmt_carrier_config_t::[anonymous] flags
    Carrier config flags
```

Header File

- `components/esp_driver_rmt/include/driver/rmt_encoder.h`
- This header file can be included with:

```
#include "driver/rmt_encoder.h"
```

- This header file is a part of the API provided by the `esp_driver_rmt` component. To declare that your component depends on `esp_driver_rmt`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_rmt
```

or

```
PRIV_REQUIRES esp_driver_rmt
```

Functions

`esp_err_t rmt_new_bytes_encoder` (const *rmt_bytes_encoder_config_t* *config, *rmt_encoder_handle_t* *ret_encoder)

Create RMT bytes encoder, which can encode byte stream into RMT symbols.

参数

- **config** -- [in] Bytes encoder configuration
- **ret_encoder** -- [out] Returned encoder handle

返回

- ESP_OK: Create RMT bytes encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT bytes encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT bytes encoder failed because out of memory
- ESP_FAIL: Create RMT bytes encoder failed because of other error

`esp_err_t rmt_bytes_encoder_update_config` (*rmt_encoder_handle_t* bytes_encoder, const *rmt_bytes_encoder_config_t* *config)

Update the configuration of the bytes encoder.

备注: The configurations of the bytes encoder is also set up by `rmt_new_bytes_encoder()`. This function is used to update the configuration of the bytes encoder at runtime.

参数

- **bytes_encoder** -- [in] Bytes encoder handle, created by e.g `rmt_new_bytes_encoder()`
- **config** -- [in] Bytes encoder configuration

返回

- ESP_OK: Update RMT bytes encoder successfully
- ESP_ERR_INVALID_ARG: Update RMT bytes encoder failed because of invalid argument
- ESP_FAIL: Update RMT bytes encoder failed because of other error

`esp_err_t rmt_new_copy_encoder` (const *rmt_copy_encoder_config_t* *config, *rmt_encoder_handle_t* *ret_encoder)

Create RMT copy encoder, which copies the given RMT symbols into RMT memory.

参数

- **config** -- [in] Copy encoder configuration

• **ret_encoder** -- [out] Returned encoder handle

返回

- ESP_OK: Create RMT copy encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT copy encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT copy encoder failed because out of memory
- ESP_FAIL: Create RMT copy encoder failed because of other error

esp_err_t **rmt_new_simple_encoder** (const *rmt_simple_encoder_config_t* *config, *rmt_encoder_handle_t* *ret_encoder)

Create RMT simple callback encoder, which uses a callback to convert incoming data into RMT symbols.

参数

- **config** -- [in] Simple callback encoder configuration
- **ret_encoder** -- [out] Returned encoder handle

返回

- ESP_OK: Create RMT simple callback encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT simple callback encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT simple callback encoder failed because out of memory
- ESP_FAIL: Create RMT simple callback encoder failed because of other error

esp_err_t **rmt_del_encoder** (*rmt_encoder_handle_t* encoder)

Delete RMT encoder.

参数 **encoder** -- [in] RMT encoder handle, created by e.g *rmt_new_bytes_encoder* ()

返回

- ESP_OK: Delete RMT encoder successfully
- ESP_ERR_INVALID_ARG: Delete RMT encoder failed because of invalid argument
- ESP_FAIL: Delete RMT encoder failed because of other error

esp_err_t **rmt_encoder_reset** (*rmt_encoder_handle_t* encoder)

Reset RMT encoder.

参数 **encoder** -- [in] RMT encoder handle, created by e.g *rmt_new_bytes_encoder* ()

返回

- ESP_OK: Reset RMT encoder successfully
- ESP_ERR_INVALID_ARG: Reset RMT encoder failed because of invalid argument
- ESP_FAIL: Reset RMT encoder failed because of other error

void ***rmt_alloc_encoder_mem** (size_t size)

A helper function to allocate a proper memory for RMT encoder.

参数 **size** -- Size of memory to be allocated

返回 Pointer to the allocated memory if the allocation is successful, NULL otherwise

Structures

struct **rmt_encoder_t**

Interface of RMT encoder.

Public Members

size_t (***encode**)(*rmt_encoder_t* *encoder, *rmt_channel_handle_t* tx_channel, const void *primary_data, size_t data_size, *rmt_encode_state_t* *ret_state)

Encode the user data into RMT symbols and write into RMT memory.

备注: The encoding function will also be called from an ISR context, thus the function must not call any blocking API.

备注: It's recommended to put this function implementation in the IRAM, to achieve a high performance and less interrupt latency.

Param encoder [in] Encoder handle
Param tx_channel [in] RMT TX channel handle, returned from `rmt_new_tx_channel()`
Param primary_data [in] App data to be encoded into RMT symbols
Param data_size [in] Size of `primary_data`, in bytes
Param ret_state [out] Returned current encoder's state
Return Number of RMT symbols that the primary data has been encoded into

`esp_err_t (*reset)(rmt_encoder_t *encoder)`

Reset encoding state.

Param encoder [in] Encoder handle
Return

- ESP_OK: reset encoder successfully
- ESP_FAIL: reset encoder failed

`esp_err_t (*del)(rmt_encoder_t *encoder)`

Delete encoder object.

Param encoder [in] Encoder handle
Return

- ESP_OK: delete encoder successfully
- ESP_FAIL: delete encoder failed

struct **rmt_bytes_encoder_config_t**

Bytes encoder configuration.

Public Members

`rmt_symbol_word_t bit0`

How to represent BIT0 in RMT symbol

`rmt_symbol_word_t bit1`

How to represent BIT1 in RMT symbol

`uint32_t msb_first`

Whether to encode MSB bit first

struct `rmt_bytes_encoder_config_t::[anonymous] flags`

Encoder config flag

struct **rmt_copy_encoder_config_t**

Copy encoder configuration.

struct **rmt_simple_encoder_config_t**

Simple callback encoder configuration.

Public Members

rmt_encode_simple_cb_t **callback**

Callback to call for encoding data into RMT items

void ***arg**

Opaque user-supplied argument for callback

size_t **min_chunk_size**

Minimum amount of free space, in RMT symbols, the encoder needs in order to guarantee it always returns non-zero. Defaults to 64 if zero / not given.

Type Definitions

```
typedef size_t (rmt_encode_simple_cb_t)(const void *data, size_t data_size, size_t symbols_written, size_t symbols_free, rmt_symbol_word_t *symbols, bool *done, void *arg)
```

Callback for simple callback encoder.

This will get called to encode the data stream of given length (as passed to `rmt_transmit` by the user) into symbols to be sent by the hardware.

The callback will be initially called with `symbol_pos=0`. If the callback encodes `N` symbols and finishes, the next callback will always be with `symbols_written=N`. If the callback then encodes `M` symbols, the next callback will always be with `symbol_pos=N+M`, etc. The only exception is when the encoder is reset (e.g. to begin a new transaction) in which case `symbol_pos` will always restart at 0.

If the amount of free space in the symbol buffer (as indicated by `symbols_free`) is too low, the function can return 0 as result and the RMT will call the function again once there is more space available. Note that the callback should eventually return non-0 if called with free space of *rmt_simple_encoder_config_t:min_chunk_size* or more. It is acceptable to return 0 for a given free space `N`, then on the next call (possibly with a larger free buffer space) return less or more than `N` symbols.

When the transaction is done (all `data_size` data is encoded), the callback can indicate this by setting `*done` to true. This can either happen on the last callback call that returns an amount of symbols encoded, or on a callback that returns zero. In either case, the callback will not be called again for this transaction.

Param data [in] Data pointer, as passed to `rmt_transmit()`

Param data_size [in] Size of the data, as passed to `rmt_transmit()`

Param symbols_written [in] Current position in encoded stream, in symbols

Param symbols_free [in] The maximum amount of symbols that can be written into the `symbols` buffer

Param symbols [out] Symbols to be sent to the RMT hardware

Param done [out] Setting this to true marks this transaction as finished

Param arg Opaque argument

Return Amount of symbols encoded in this callback round. 0 if more space is needed.

Enumerations

enum **rmt_encode_state_t**

RMT encoding state.

Values:

enumerator **RMT_ENCODING_RESET**

The encoding session is in reset state

enumerator **RMT_ENCODING_COMPLETE**

The encoding session is finished, the caller can continue with subsequent encoding

enumerator **RMT_ENCODING_MEM_FULL**

The encoding artifact memory is full, the caller should return from current encoding session

Header File

- [components/esp_driver_rmt/include/driver/rmt_types.h](#)
- This header file can be included with:

```
#include "driver/rmt_types.h"
```

- This header file is a part of the API provided by the `esp_driver_rmt` component. To declare that your component depends on `esp_driver_rmt`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_rmt
```

or

```
PRIV_REQUIRES esp_driver_rmt
```

Structures

struct **rmt_tx_done_event_data_t**

Type of RMT TX done event data.

Public Members

size_t **num_symbols**

The number of transmitted RMT symbols, including one EOF symbol, which is appended by the driver to mark the end of a transmission. For a loop transmission, this value only counts for one round.

struct **rmt_rx_done_event_data_t**

Type of RMT RX done event data.

Public Members

rmt_symbol_word_t ***received_symbols**

Point to the received RMT symbols

size_t **num_symbols**

The number of received RMT symbols

uint32_t **is_last**

Indicating if the current received data are the last part of the transaction

struct *rmt_rx_done_event_data_t*::[anonymous] **flags**

Extra flags

Type Definitions

```
typedef struct rmt_channel_t *rmt_channel_handle_t
```

Type of RMT channel handle.

```
typedef struct rmt_sync_manager_t *rmt_sync_manager_handle_t
```

Type of RMT synchronization manager handle.

```
typedef struct rmt_encoder_t *rmt_encoder_handle_t
```

Type of RMT encoder handle.

```
typedef bool (*rmt_tx_done_callback_t)(rmt_channel_handle_t tx_chan, const rmt_tx_done_event_data_t *edata, void *user_ctx)
```

Prototype of RMT event callback.

Param tx_chan [in] RMT channel handle, created from `rmt_new_tx_channel()`

Param edata [in] Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

Param user_ctx [in] User registered context, passed from `rmt_tx_register_event_callbacks()`

Return Whether a high priority task has been waken up by this callback function

```
typedef bool (*rmt_rx_done_callback_t)(rmt_channel_handle_t rx_chan, const rmt_rx_done_event_data_t *edata, void *user_ctx)
```

Prototype of RMT event callback.

Param rx_chan [in] RMT channel handle, created from `rmt_new_rx_channel()`

Param edata [in] Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

Param user_ctx [in] User registered context, passed from `rmt_rx_register_event_callbacks()`

Return Whether a high priority task has been waken up by this function

2.5.24 SD Pull-up Requirements

Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products needs to be adjusted to provide the pull-ups required in the SD bus.

SD pull-up requirements apply to cases where ESP32-P4 uses the SPI or SDMMC controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines of the SD bus must be pulled up by 10 kOhm resistors. SD cards and SDIO devices should also have pull-ups on all above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent them from entering a wrong state.

This document has the following structure:

- [Overview of compatibility](#) between the default pull states on pins of Espressif's products and the states required by the SD bus
- [Solutions](#) - ideas on how to resolve compatibility issues
- [Related information](#) - other relevant information

Overview of Compatibility

This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.

Systems on a Chip (SoCs) ESP32-P4 SDMMC host controller allows using any of GPIOs for any of SD interface signals. However, it is recommended to avoid using strapping GPIOs, GPIOs with internal weak pull-downs and GPIOs commonly used for other purposes to prevent conflicts:

Systems in Packages (SIP)

Modules

Development Boards

Solutions

No Pull-ups If you use a development board without pull-ups, you can do the following:

- If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif's development boards with pull-ups, go to [Development Boards](#).
- Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.

Related Information

2.5.25 SDMMC 主机驱动

概述

ESP32-P4 的 SDMMC 主机外设共有两个卡槽，用于插入 SD 卡、连接 SDIO 设备或连接 eMMC 芯片，每个卡槽均可单独使用。

卡槽 SDMMC_HOST_SLOT_0 和 SDMMC_HOST_SLOT_1 都支持 1、4、8 线的 SD 接口，这些卡槽通过 GPIO 交换矩阵连接到 ESP32-P4 的 GPIO，即每个 SD 卡信号都可以使用任意 GPIO 连接。

- 卡槽 SDMMC_HOST_SLOT_1 通过 GPIO 矩阵连接。这意味着任何 GPIO 都可以用于每个 SD 卡信号。它适用于非 UHS-I 用途。
- 卡槽 SDMMC_HOST_SLOT_0 专用于 UHS-I 模式，驱动程序中尚不支持该模式。

目前 SDMMC 主机需要为 IO 电平提供外部电压参考。如果您自行购买 ESP32P4 芯片并计划使用 SDMMC 外设，请参阅:ref:'wr-ctrl'。

支持的速率模式

SDMMC 主机驱动支持以下速率模式：

- 默认速率 (20 MHz)：对于 SD 卡，支持 1 线或 4 线传输；对于 3.3 V eMMC，支持 1 线、4 线或 8 线传输。
- 高速模式 (40 MHz)：对于 SD 卡，支持 1 线或 4 线传输；对于 3.3 V eMMC，支持 1 线、4 线或 8 线传输。
- 高速 DDR 模式 (40 MHz)：对于 3.3 V eMMC，支持 4 线传输。

当前尚不支持的速率模式：

- 高速 DDR 模式：不支持 8 线 eMMC 传输
- UHS-I 1.8 V 模式：不支持 4 线 SD 卡传输

使用 SDMMC 主机驱动

在大多数应用程序中，只有下列函数会被直接调用：

- `sdmmc_host_init()`
- `sdmmc_host_init_slot()`
- `sdmmc_host_deinit()`

其他函数将通过 `sdmmc_host_t` 结构体中的函数指针由 SD/MMC 协议层调用，例如：

- `sdmmc_host_set_bus_width()`
- `sdmmc_host_set_card_clk()`
- `sdmmc_host_do_transaction()`

配置总线宽度和频率

使用 `sdmmc_host_t` 和 `sdmmc_slot_config_t` 的默认初始化配置，即 `SDMMC_HOST_DEFAULT` 和 `SDMMC_SLOT_CONFIG_DEFAULT` 时，SDMMC 主机驱动会尝试以当前卡所支持的最大总线宽度进行通信（SD 卡为 4 线，eMMC 为 8 线），并使用 20 MHz 的通信频率。

在支持 40 MHz 频率通信的设计中，可以调整 `sdmmc_host_t` 结构体中的 `max_freq_khz` 字段，提升总线频率：

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

如需选择标准速率以外的特定频率，请根据所使用的 SD 接口（SDMMC 或 SDSPI）确定适当频率范围，并选择其中的任意值。然而，实际的时钟频率会由底层驱动程序计算，可能与你所需的值不同。

使用 SDMMC 接口时，`max_freq_khz` 即频率上限，因此最终的频率值应始终低于该上限。而使用 SDSPI 接口时，驱动程序会提供最接近的适配频率，因此该值可以大于、等于或小于 `max_freq_khz`。

请配置 `sdmmc_slot_config_t` 的 `width` 字段，配置总线宽度。例如，配置 1 线模式的代码如下：

```
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```

配置 GPIO

通过配置结构体 `sdmmc_slot_config_t`，ESP32-P4 的 SDMMC 主机可以根据需要，为每个信号配置任意的 GPIO 管脚。

例如，使用以下代码，可以将 GPIO 1-6 分别用于 CLK、CMD、D0-D3 信号：

```
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.clk = GPIO_NUM_1;
slot.cmd = GPIO_NUM_2;
slot.d0 = GPIO_NUM_3;
slot.d1 = GPIO_NUM_4;
slot.d2 = GPIO_NUM_5;
slot.d3 = GPIO_NUM_6;
```

也可以配置 CD 和 WP 管脚。与配置其他信号的方法类似，你只需配置相同结构体的 `cd` 和 `wp` 参数：

```
slot.cd = GPIO_NUM_7;
slot.wp = GPIO_NUM_8;
```

`SDMMC_SLOT_CONFIG_DEFAULT` 将 CD 和 WP 管脚都配置为 `GPIO_NUM_NC`，表明默认情况下不会使用这两个管脚。

通过上述方式初始化 `sdmmc_slot_config_t` 结构体后，即可在调用 `sdmmc_host_init_slot()` 或其他任意高层函数（如 `esp_vfs_fat_sdmmc_mount()`）时使用该结构体。

配置供电和参考电压

ESP32-P4 SDMMC 主机需要为 IO 电平提供外部电压参考，以支持高速设备，驱动器将动态配置电压参考。您可以使用片上可编程 LDO 作为从机电源和电压参考，也可以提供正确的外部电源。

- 要使用片上 LDO，请确保 VDDPST_5(sd_vref) 引脚连接到所选的片上 LD 通道，并调用:cpp:func:'sd_pwr_ctrl_new_on_chip_ldo' 分配所选的 LDO 通道，然后将'pwr_ctr_handle' 传递给:cpp:class:'sdmmc_host_t::pwr_ctl_handle'。
- 要使用外部电源，请确保 VDDPST_5(sd_vref) 引脚已连接，然后按照:cpp:class:'sd_pwr_ctrl_drv_t' 构造外部电源控制结构体，并将其传递给:cpp:class:'sdmmc_host_t::pwr_ctr_handle'。

eMMC 芯片的 DDR 模式

默认情况下，如果满足以下条件，将使用 DDR 模式：

- 在 sdmmc_host_t 结构体中将 SDMMC 主机频率配置为 SDMMC_FREQ_HIGHSPEED，且
- eMMC 芯片在其 CSD 寄存器中报告支持 DDR 模式

DDR 模式对信号完整性要求更高。如果要在保持 SDMMC_FREQ_HIGHSPEED 频率的同时禁用 DDR 模式，请在 sdmmc_host_t 结构体的 sdmmc_host_t::flags 字段中清除 SDMMC_HOST_FLAG_DDR 位：

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
host.flags &= ~SDMMC_HOST_FLAG_DDR;
```

Functions

esp_err_t sdmmc_host_init (void)

Initialize SDMMC host peripheral.

备注： This function is not thread safe

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdmmc_host_init was already called
- ESP_ERR_NO_MEM if memory can not be allocated

esp_err_t **sdmmc_host_init_slot** (int slot, const *sdmmc_slot_config_t* *slot_config)

Initialize given slot of SDMMC peripheral.

On the ESP32, SDMMC peripheral has two slots:

- Slot 0: 8-bit wide, maps to HS1_* signals in PIN MUX
- Slot 1: 4-bit wide, maps to HS2_* signals in PIN MUX

Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

备注: This function is not thread safe

参数

- **slot** -- slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **slot_config** -- additional configuration for the slot

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if host has not been initialized using `sdmmc_host_init`

esp_err_t **sdmmc_host_set_bus_width** (int slot, size_t width)

Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. SD_APP_SET_BUS_WIDTH)

备注: This function is not thread safe

参数

- **slot** -- slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **width** -- bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if slot number or width is not valid

size_t **sdmmc_host_get_slot_width** (int slot)

Get bus width configured in `sdmmc_host_init_slot` to be used for data transfer.

参数 **slot** -- slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

返回 configured bus width of the specified slot.

esp_err_t **sdmmc_host_set_card_clk** (int slot, uint32_t freq_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

备注: This function is not thread safe

参数

- **slot** -- slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **freq_khz** -- card clock frequency, in kHz

返回

- ESP_OK on success
- other error codes may be returned in the future

esp_err_t **sdmmc_host_set_bus_ddr_mode** (int slot, bool ddr_enabled)

Enable or disable DDR mode of SD interface.

参数

- **slot** -- slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **ddr_enabled** -- enable or disable DDR mode

返回

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if DDR mode is not supported on this slot

esp_err_t **sdmmc_host_set_cclk_always_on** (int slot, bool cclk_always_on)

Enable or disable always-on card clock. When `cclk_always_on` is false, the host controller is allowed to shut down the card clock between the commands. When `cclk_always_on` is true, the clock is generated even if no command is in progress.

参数

- **slot** -- slot number
- **cclk_always_on** -- enable or disable always-on clock

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the slot number is invalid

esp_err_t **sdmmc_host_do_transaction** (int slot, sdmmc_command_t *cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

Attention Data buffer passed in `cmdinfo->data` must be in DMA capable memory and aligned to 4 byte boundary. If it's behind the cache, both `cmdinfo->data` and `cmdinfo->buflen` need to be aligned to cache line boundary.

备注: This function is not thread safe w.r.t. `init/deinit` functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdmmc_host_do_transaction` as long as other `sdmmc_host_*` functions are not called.

参数

- **slot** -- slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **cmdinfo** -- pointer to structure describing command and data to transfer

返回

- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response
- ESP_ERR_INVALID_SIZE if the size of data transfer is not valid in SD protocol
- ESP_ERR_INVALID_ARG if the data buffer is not in DMA capable memory

esp_err_t **sdmmc_host_io_int_enable** (int slot)

Enable IO interrupts.

This function configures the host to accept SDIO interrupts.

参数 **slot** -- slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

返回 returns ESP_OK, other errors possible in the future

esp_err_t **sdmmc_host_io_int_wait** (int slot, TickType_t timeout_ticks)

Block until an SDIO interrupt is received, or timeout occurs.

参数

- **slot** -- slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

- **timeout_ticks** -- number of RTOS ticks to wait for the interrupt
- 返回
- ESP_OK on success (interrupt received)
 - ESP_ERR_TIMEOUT if the interrupt did not occur within timeout_ticks

esp_err_t **sdmmc_host_deinit** (void)

Disable SDMMC host and release allocated resources.

备注: This function is not thread safe

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdmmc_host_init function has not been called

esp_err_t **sdmmc_host_get_real_freq** (int slot, int *real_freq_khz)

Provides a real frequency used for an SD card installed on specific slot of SD/MMC host controller.

This function calculates real working frequency given by current SD/MMC host controller setup for required slot: it reads associated host and card dividers from corresponding SDMMC registers, calculates respective frequency and stores the value into the 'real_freq_khz' parameter

参数

- **slot** -- slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **real_freq_khz** -- [out] output parameter for the result frequency (in kHz)

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG on real_freq_khz == NULL or invalid slot number used

esp_err_t **sdmmc_host_set_input_delay** (int slot, sdmmc_delay_phase_t delay_phase)

set input delay

- This API sets delay when the SDMMC Host samples the signal from the SD Slave.
- This API will check if the given `delay_phase` is valid or not.
- This API will print out the delay time, in picosecond (ps)

备注: ESP32 doesn't support this feature, you will get an ESP_ERR_NOT_SUPPORTED

参数

- **slot** -- slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **delay_phase** -- delay phase, this API will convert the phase into picoseconds and print it out

返回

- ESP_OK: ON success.
- ESP_ERR_INVALID_ARG: Invalid argument.
- ESP_ERR_NOT_SUPPORTED: ESP32 doesn't support this feature.

esp_err_t **sdmmc_host_get_dma_info** (int slot, esp_dma_mem_info_t *dma_mem_info)

Get the DMA memory information for the host driver.

参数

- **slot** -- [in] slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **dma_mem_info** -- [out] DMA memory information structure

返回

- ESP_OK: ON success.
- ESP_ERR_INVALID_ARG: Invalid argument.

Structures

struct **sdmmc_slot_config_t**

Extra configuration for SDMMC peripheral slot

Public Members

gpio_num_t clk

GPIO number of CLK signal.

gpio_num_t cmd

GPIO number of CMD signal.

gpio_num_t d0

GPIO number of D0 signal.

gpio_num_t d1

GPIO number of D1 signal.

gpio_num_t d2

GPIO number of D2 signal.

gpio_num_t d3

GPIO number of D3 signal.

gpio_num_t d4

GPIO number of D4 signal. Ignored in 1- or 4- line mode.

gpio_num_t d5

GPIO number of D5 signal. Ignored in 1- or 4- line mode.

gpio_num_t d6

GPIO number of D6 signal. Ignored in 1- or 4- line mode.

gpio_num_t d7

GPIO number of D7 signal. Ignored in 1- or 4- line mode.

gpio_num_t gpio_cd

GPIO number of card detect signal.

gpio_num_t cd

GPIO number of card detect signal; shorter name.

gpio_num_t gpio_wp

GPIO number of write protect signal.

gpio_num_t wp

GPIO number of write protect signal; shorter name.

`uint8_t width`

Bus width used by the slot (might be less than the max width supported)

`uint32_t flags`

Features used by this slot.

Macros

`SDMMC_SLOT_FLAG_INTERNAL_PULLUP`

Enable internal pullups on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.

`SDMMC_SLOT_FLAG_WP_ACTIVE_HIGH`

GPIO write protect polarity. 0 means "active low", i.e. card is protected when the GPIO is low; 1 means "active high", i.e. card is protected when GPIO is high.

2.5.26 SD SPI 主机驱动程序

概述

SD SPI 主机驱动程序支持使用 SPI 主控驱动程序与一或多张 SD 卡通信, SPI 主控驱动程序则利用 SPI 主机实现功能。每张 SD 卡都通过一个 SD SPI 设备访问, 相应设备以 SD SPI 设备句柄 `sdspi_dev_handle_t` 表示。调用 `sdspi_host_init_device()` 将设备连接到 SPI 总线上时会返回所需 SPI 设备句柄。注意, 在使用 SPI 总线前, 需要先通过 `spi_bus_initialize()` 初始化总线。

SD SPI 主机驱动程序基于 [SPI 主机驱动程序](#) 实现。借助 SPI 主控驱动程序, SD 卡及其他 SPI 设备可以共享同一 SPI 总线。SPI 主机驱动程序将处理来自不同任务的独占访问。

SD SPI 驱动程序使用受软件控制的 CS 信号。

使用方法

首先, 使用宏 `SDSPI_DEVICE_CONFIG_DEFAULT` 初始化结构体 `sdspi_device_config_t`, 该结构体用于初始化 SD SPI 设备。该宏还会填充默认的管脚映射, 与 SDMMC 主机驱动的管脚映射相同。随后根据需要, 修改结构体中的主机和管脚配置。然后调用 `sdspi_host_init_device` 初始化 SD SPI 设备, 并将其连接到所属的总线上。

接着, 使用宏 `SDSPI_HOST_DEFAULT` 初始化结构体 `sdmmc_host_t`, 该结构体用于存储上层 (SD/SDIO/MMC 驱动) 的状态和配置信息。将结构体中的 `slot` 参数设置为从 `sdspi_host_init_device` 返回的 SD SPI 设备的 SD SPI 句柄。使用 `sdmmc_host_t` 调用 `sdmmc_card_init`, 检测并初始化 SD 卡。

初始化完成后, 即可使用 SD/SDIO/MMC 驱动函数访问 SD 卡。

其他细节

通常, 大多数应用程序仅使用驱动程序的以下 API 函数:

- `sdspi_host_init()`
- `sdspi_host_init_device()`
- `sdspi_host_remove_device()`
- `sdspi_host_deinit()`

对于其他函数，大多由协议层的 SD/SDIO/MMC 驱动程序通过 `sdmhc_host_t` 结构体中的函数指针使用。更多详情，请参阅 [SD/SDIO/MMC 驱动程序](#)。

备注： 由于 SPI 驱动程序的限制，SD 卡在通过 SPI 总线与主设备进行数据传输和通信时，速度不超过 `SDMMC_FREQ_DEFAULT`。

警告： 在 SD 卡之间以及其他 SPI 设备间共享 SPI 总线时，存在部分限制，详情请参阅 [SD 卡与其他 SPI 设备共享 SPI 总线](#)。

相关文档

SD 卡与其他 SPI 设备共享 SPI 总线

SD 卡支持 SPI 模式，使其能够作为 SPI 设备通信，但使用时需注意其限制。

其他设备的管脚负载 向同一总线添加设备会增加管脚的整体负载，包括交流负载（管脚电容）和直流负载（上拉电阻）。

交流负载 在通信速率不超过 50 MHz 的情况下，专为高速通信设计的 SD 卡采用小型管脚电容（交流负载小）。但在同一 SPI 总线上连接其他设备后，会增加管脚的交流负载。

管脚交流负载过高时，可能无法实现电平快速切换。通过使用示波器，你可以观察到管脚状态变化的边缘变得更加平滑，即边缘变化率更低。当 SD 卡连接到交流负载较高的总线时，可能无法满足 SD 卡建立时间 (setup) 的时序要求。高交流负载甚至可能导致 SD 卡和其他 SPI 设备无法正确解析主机发出的时钟信号，影响通信稳定性。

如果连接的其他设备的工作频率与 SD 卡工作频率不同，上述问题可能会更加明显。这是因为其他设备可能具有更大的管脚电容。管脚容量越大，响应时间越长，SD 总线可工作的最高频率越低。

你可以尝试以下测试，判断管脚交流负载是否过重：

术语

- **启动边沿 (launch edge)**: 数据开始切换的时钟边沿；
- **锁存边沿 (latch edge)**: 数据接收侧应进行数据采样的时钟边沿，对 SD 卡来说是上升沿。

1. 使用示波器观察时钟，并比较数据线与时钟。

- 如果时钟不够快，例如上升/下降沿长于时钟周期的 1/4，表明时钟偏斜过大。
- 如果在时钟锁存边沿之前数据线不稳定，表明数据线负载过大。

借助逻辑分析仪，也可以观察到数据与时钟启动沿相比，延迟较大。但比起用示波器，用逻辑分析仪观察到的现象可能不太明显。

2. 尝试使用较低的时钟频率。

如果设备可以在较低的通信频率下正常工作，而在较高的通信频率下出现问题，说明管脚交流负载过大。

如果管脚的交流负载过大，你可以选择使用其他管脚负载更低但通信速度更快的设备，或降低时钟速度。

直流负载 SD 卡所需的上拉电阻通常在 10 kΩ 至 50 kΩ 之间，注意对某些 SPI 设备来说，这可能是过强的上拉电阻。

请查阅设备的规格说明书，了解其直流输出电流。此直流输出电流应大于 700 μA，否则可能无法正确读取设备输出。

初始化顺序

备注：如果在执行以下步骤时遇到任何问题，请首先确保时序正确。如前文所述，你可以尝试降低时钟速度，例如将 SD 卡的 `SDMMC_FREQ_PROBING` 设置为 400 kHz，排除管脚交流负载的影响。

在同一 SPI 总线上与其他 SPI 设备一起使用 SD 卡时，由于 SD 卡启动流程的限制，应遵循以下初始化顺序。有关详情，请参阅 [storage/sd_card](#)。

1. 通过 `spi_bus_initialize()` 正确初始化总线。
2. 将除 SD 卡外所有设备的 CS 线置为空闲状态（默认为高电平），避免在后续步骤中与 SD 卡发生冲突。
这可以通过以下任一方式实现：
 1. 调用 `spi_bus_add_device()` 将设备连接到 SPI 总线，该函数将初始化用作 CS 的 GPIO 管脚到空闲电平：默认为高电平。
 2. 在添加新设备前，初始化需要拉高的 CS 管脚 GPIO。
 3. 在 ESP 的 GPIO 未初始化前，依靠内部/外部上拉电阻拉高所有 CS 管脚（**不推荐**）。请确保上拉电阻拥有足够强度，且没有其他下拉电阻影响拉高。例如，应启用内部下拉电阻。
3. 调用 `esp_vfs_fat_sdspi_mount()` 将卡挂载到文件系统。
此步骤将使 SD 卡进入 SPI 模式，**应该**在同一总线上的所有其他 SPI 通信前完成。否则，SD 卡会保持在 SD 模式，即使在未选中其 CS 线的情况下，SD 卡也可能随机响应总线上的任何 SPI 通信。如果你想测试这种行为，请注意，一旦 SD 卡置于 SPI 模式，在下次上电前，也就是断电后重新上电之前，SD 卡将不会返回 SD 模式
4. 此时，即可与其他 SPI 设备自由通信。

API 参考

Header File

- `components/esp_driver_sdspi/include/driver/sdspi_host.h`
- This header file can be included with:

```
#include "driver/sdspi_host.h"
```

- This header file is a part of the API provided by the `esp_driver_sdspi` component. To declare that your component depends on `esp_driver_sdspi`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_sdspi
```

or

```
PRIV_REQUIRES esp_driver_sdspi
```

Functions

`esp_err_t sdspi_host_init` (void)

Initialize SD SPI driver.

备注： This function is not thread safe

返回

- `ESP_OK` on success
- other error codes may be returned in future versions

`esp_err_t sdspi_host_init_device` (const `sdspi_device_config_t` *dev_config, `sdspi_dev_handle_t` *out_handle)

Attach and initialize an SD SPI device on the specific SPI bus.

备注： This function is not thread safe

备注: Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

备注: The SDIO over `sdspi` needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

参数

- **dev_config** -- pointer to device configuration structure
- **out_handle** -- Output of the handle to the `sdspi` device.

返回

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if `sdspi_host_init_device` has invalid arguments
- `ESP_ERR_NO_MEM` if memory can not be allocated
- other errors from the underlying `spi_master` and `gpio` drivers

esp_err_t **sdspi_host_remove_device** (*sdspi_dev_handle_t* handle)

Remove an SD SPI device.

参数 **handle** -- Handle of the SD SPI device

返回 Always `ESP_OK`

esp_err_t **sdspi_host_do_transaction** (*sdspi_dev_handle_t* handle, `sdmmc_command_t *cmdinfo`)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

备注: This function is not thread safe w.r.t. `init/deinit` functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdspi_host_do_transaction` as long as other `sdspi_host_*` functions are not called.

参数

- **handle** -- Handle of the `sdspi` device
- **cmdinfo** -- pointer to structure describing command and data to transfer

返回

- `ESP_OK` on success
- `ESP_ERR_TIMEOUT` if response or data transfer has timed out
- `ESP_ERR_INVALID_CRC` if response or data transfer CRC check has failed
- `ESP_ERR_INVALID_RESPONSE` if the card has sent an invalid response

esp_err_t **sdspi_host_set_card_clk** (*sdspi_dev_handle_t* host, `uint32_t` freq_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

备注: This function is not thread safe

参数

- **host** -- Handle of the `sdspi` device
- **freq_khz** -- card clock frequency, in kHz

返回

- `ESP_OK` on success
- other error codes may be returned in the future

esp_err_t **sdspi_host_get_real_freq** (*sdspi_dev_handle_t* handle, int *real_freq_khz)

Calculate working frequency for specific device.

参数

- **handle** -- SDSPI device handle
- **real_freq_khz** -- [out] output parameter to hold the calculated frequency (in kHz)

返回

- ESP_ERR_INVALID_ARG : handle is NULL or invalid or real_freq_khz parameter is NULL
- ESP_OK : Success

esp_err_t **sdspi_host_deinit** (void)

Release resources allocated using sdspi_host_init.

备注: This function is not thread safe

返回

- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdspi_host_init function has not been called

esp_err_t **sdspi_host_io_int_enable** (*sdspi_dev_handle_t* handle)

Enable SDIO interrupt.

参数 **handle** -- Handle of the sdspi device

返回

- ESP_OK on success

esp_err_t **sdspi_host_io_int_wait** (*sdspi_dev_handle_t* handle, TickType_t timeout_ticks)

Wait for SDIO interrupt until timeout.

参数

- **handle** -- Handle of the sdspi device
- **timeout_ticks** -- Ticks to wait before timeout.

返回

- ESP_OK on success

esp_err_t **sdspi_host_get_dma_info** (int slot, esp_dma_mem_info_t *dma_mem_info)

Get the DMA memory information for the host driver.

参数

- **slot** -- [in] Not used
- **dma_mem_info** -- [out] DMA memory information structure

返回

- ESP_OK: ON success.
- ESP_ERR_INVALID_ARG: Invalid argument.

Structures

struct **sdspi_device_config_t**

Extra configuration for SD SPI device.

Public Members

spi_host_device_t **host_id**

SPI host to use, SPIx_HOST (see spi_types.h).

`gpio_num_t gpio_cs`

GPIO number of CS signal.

`gpio_num_t gpio_cd`

GPIO number of card detect signal.

`gpio_num_t gpio_wp`

GPIO number of write protect signal.

`gpio_num_t gpio_int`

GPIO number of interrupt line (input) for SDIO card.

`bool gpio_wp_polarity`

GPIO write protect polarity 0 means "active low", i.e. card is protected when the GPIO is low; 1 means "active high", i.e. card is protected when GPIO is high.

Macros

`SDSPI_DEFAULT_HOST`

`SDSPI_DEFAULT_DMA`

`SDSPI_HOST_DEFAULT ()`

Default `sdmmc_host_t` structure initializer for SD over SPI driver.

Uses SPI mode and max frequency set to 20MHz

'slot' should be set to an `sdspi` device initialized by `sdspi_host_init_device ()`.

`SDSPI_SLOT_NO_CS`

indicates that card select line is not used

`SDSPI_SLOT_NO_CD`

indicates that card detect line is not used

`SDSPI_SLOT_NO_WP`

indicates that write protect line is not used

`SDSPI_SLOT_NO_INT`

indicates that interrupt line is not used

`SDSPI_IO_ACTIVE_LOW`

`SDSPI_DEVICE_CONFIG_DEFAULT ()`

Macro defining default configuration of SD SPI device.

Type Definitions

typedef int `sdspi_dev_handle_t`

Handle representing an SD SPI device.

2.5.27 Sigma-Delta 调制器 (SDM)

简介

ESP32-P4 具备二阶 Sigma-Delta 调制器，可以为多个通道生成独立的脉冲密度调制 (PDM) 脉冲。请参阅技术参考手册，查看可用的硬件通道数量。¹

Sigma-Delta 调制器可以将模拟电压信号转换为脉冲频率或脉冲密度，该过程称为脉冲密度调制 (PDM) (请参阅 [维基百科上有关 Sigma-Delta 调制的介绍](#))。

与 I2S 外设中的 PDM 模式和和数模转换器 (DAC) 相比，SDM 中的 PDM 主要有以下特点：

1. SDM 没有时钟信号，类似于 PDM 的 DAC 模式；
2. SDM 没有 DMA 支持，无法持续改变其输出密度。如果需要改变 SDM 的输出密度，可以在定时器的回调函数中进行操作；
3. 基于以上两点，不同于 DAC，要还原模拟波形，还必须使用外部的有源或无源低通滤波器，详情请参阅[转换为模拟信号 \(可选\)](#)。

Sigma-Delta 调制通道通常应用于以下场景：

- LED 调光
- 使用有源 RC 低通滤波器，实现简单的数模转换（8 位分辨率）
- 结合半桥或全桥回路，以及 LC 低通滤波器，实现 D 级功率放大

功能概述

下文将分节概述安装和操作 SDM 通道的一般步骤：

- [资源分配](#) - 介绍如何初始化和配置 SDM 通道，以及在通道完成任务后如何回收相关资源。
- [启用和禁用通道](#) - 介绍如何启用和禁用 SDM 通道。
- [设置脉冲密度](#) - 介绍如何设置 PDM 脉冲的等效占空比。
- [电源管理](#) - 介绍不同时钟源对功耗的影响。
- [IRAM 安全](#) - 介绍禁用 cache 时仍可使用的功能。
- [线程安全](#) - 介绍由驱动程序认证为线程安全的 API。
- [Kconfig 选项](#) - 介绍 SDM 驱动程序支持的各种 Kconfig 选项，这些选项可以给驱动程序的行为造成不同影响。

资源分配 在 ESP-IDF 中，SDM 通道的信息和属性通过特定的数据结构进行管理和访问，该数据结构表示为 `sdm_channel_handle_t`。每个通道都可以输出由硬件生成的二进制信号，且这些信号都经过 Sigma-Delta 调制。所有可用通道均存放在资源池中，由驱动程序管理，无需手动将固定通道分配给 GPIO。

要安装 SDM 通道，请调用 `sdm_new_channel()` 获取通道句柄。通道的具体配置信息由结构体 `sdm_config_t` 传递。

- `sdm_config_t::gpio_num` 设置 PDM 脉冲输出的 GPIO 管脚号。
- `sdm_config_t::clk_src` 选择 SDM 模块的时钟源。注意，所有通道选择的时钟源应保持一致。
- `sdm_config_t::sample_rate_hz` 设置 SDM 模块的采样率。
- `sdm_config_t::invert_out` 设置是否反转输出信号。
- `sdm_config_t::io_loop_back` 通过 GPIO 矩阵外设，启用 GPIO 的输入和输出功能。注意，该字段仅供调试使用。

函数 `sdm_new_channel()` 可能因为各种原因失败，如内存不足、参数无效等。当缺少空闲通道（即所有的硬件 SDM 通道均在使用中）时，将返回 `ESP_ERR_NOT_FOUND`。

¹ 不同的 ESP 芯片系列可能具有不同数量的 SDM 通道，请参阅 ESP32-P4 技术参考手册中的 [GPIO 和 IOMUX](#) 章节，了解更多详情。驱动程序对通道申请数量不做限制，但当硬件资源用尽时，驱动程序将返回错误。因此，每次进行通道分配（如调用 `sdm_new_channel()`）时，请注意检查返回值。

SDM 通道完成任务后，请调用 `sdm_del_channel()` 回收相应资源，以便底层硬件通道用于其他目的。在删除 SDM 通道句柄前，请通过 `sdm_channel_disable()` 禁用要删除的通道，或确保该通道尚未由 `sdm_channel_enable()` 启用，再继续删除操作。

创建采样率为 1 MHz 的 SDM 通道

```
sdm_channel_handle_t chan = NULL;
sdm_config_t config = {
    .clk_src = SDM_CLK_SRC_DEFAULT,
    .sample_rate_hz = 1 * 1000 * 1000,
    .gpio_num = 0,
};
ESP_ERROR_CHECK(sdm_new_channel(&config, &chan));
```

启用和禁用通道 在对 SDM 通道进行进一步的 IO 控制之前，需要先调用 `sdm_channel_enable()` 启用通道。在内部，该函数实现了以下操作：

- 将通道状态从 **init** 切换到 **enable**
- 如果选择了特定时钟源（如 APB 锁），则会获取合适的电源管理锁。要了解更多信息，请参阅 [电源管理](#)。

调用 `sdm_channel_disable()` 则执行相反操作，即将通道恢复到 **init** 状态，并释放电源管理锁。

设置脉冲密度 在 PDM 中，脉冲密度决定了低通滤波器转换后的输出模拟电压，该模拟电压可以通过公式 $V_{out} = VDD_{IO} / 256 * duty + VDD_{IO} / 2$ 计算。使用函数 `sdm_channel_set_pulse_density()` 时，需要传入一个名为 `density` 的参数。这个参数是一个整数值，范围在 -128 到 127 之间，表示一个 8 位有符号整数。根据 `density` 参数的不同取值，输出信号的占空比也会相应改变。例如，如果将 `density` 参数设置为零，输出信号的占空比约为 50%。

电源管理 启用电源管理（即启用 `CONFIG_PM_ENABLE`）时，在进入 Light-sleep 模式前，系统会调整 APB 频率，这可能会改变 Sigma-Delta 调制器的采样率。

但是，通过获取类型为 `ESP_PM_APB_FREQ_MAX` 的电源管理锁，驱动程序可以防止系统改变 APB 频率。每当驱动程序创建 SDM 通道，且该通道选择 `SDM_CLK_SRC_APB` 作为其时钟源时，在通过 `sdm_channel_enable()` 启用通道的过程中，驱动程序会确保获取类型为 `ESP_PM_APB_FREQ_MAX` 的电源管理锁。反之，调用 `sdm_channel_disable()` 禁用通道时，驱动程序释放该锁。

IRAM 安全 Kconfig 选项 `CONFIG_SDM_CTRL_FUNC_IN_IRAM` 支持将常用的 IO 控制函数存放在 IRAM 中，以保证在禁用 cache 时可以正常使用函数。IO 控制函数如下所示：

- `sdm_channel_set_pulse_density()`

线程安全 驱动程序会确保工厂函数 `sdm_new_channel()` 的线程安全，使用时，可以直接从不同的 RTOS 任务中调用此类函数，无需额外锁保护。

驱动程序设置了临界区，以防函数同时在任务和 ISR 中调用。因此，以下函数支持在 ISR 上下文运行：

- `sdm_channel_set_pulse_density()`

其他以 `sdm_channel_handle_t` 作为第一个位置参数的函数均非线程安全，因此应避免从多个任务中调用这类函数。

Kconfig 选项

- `CONFIG_SDM_CTRL_FUNC_IN_IRAM` 控制 SDM 通道控制函数的存放位置（IRAM 或 flash）。更多信息请参阅 [IRAM 安全](#)。
- `CONFIG_SDM_ENABLE_DEBUG_LOG` 用于启用调试日志输出。启用此选项将增加固件的二进制文件大小。

转换为模拟信号 (可选)

一般而言，Sigma-Delta 信号连接到 LED 用来调节明暗时，无需在信号和 LED 之间添加滤波器，因为人眼本身对光强变化有低通滤波作用。但是，如果你想测量实际电压，或观察模拟波形，就需要设计一个模拟低通滤波器。此外，建议使用有源滤波器，相较于无源滤波器，有源滤波器在处理信号时具有更强的抗干扰性，且损失的电压较少。

请参阅如下示例 [Sallen-Key 拓扑低通滤波器](#)，了解滤波器的相关知识。

图 27: Sallen-Key 拓扑低通滤波器

应用示例

- 使用 Sigma-Delta 调制的 100 Hz 正弦波：[peripherals/sigma_delta/sdm_dac](#)。
- 使用 Sigma-Delta 调制、并由 GPIO 驱动的 LED：[peripherals/sigma_delta/sdm_led](#)。

API 参考

Header File

- [components/esp_driver_sdm/include/driver/sdm.h](#)
- This header file can be included with:

```
#include "driver/sdm.h"
```

- This header file is a part of the API provided by the `esp_driver_sdm` component. To declare that your component depends on `esp_driver_sdm`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_sdm
```

or

```
PRIV_REQUIRES esp_driver_sdm
```

Functions

esp_err_t **sdm_new_channel** (const *sdm_config_t* *config, *sdm_channel_handle_t* *ret_chan)

Create a new Sigma Delta channel.

参数

- **config** -- [in] SDM configuration
- **ret_chan** -- [out] Returned SDM channel handle

返回

- ESP_OK: Create SDM channel successfully
- ESP_ERR_INVALID_ARG: Create SDM channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create SDM channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create SDM channel failed because all channels are used up and no more free one
- ESP_FAIL: Create SDM channel failed because of other error

esp_err_t **sdm_del_channel** (*sdm_channel_handle_t* chan)

Delete the Sigma Delta channel.

参数 **chan** -- [in] SDM channel created by `sdm_new_channel`

返回

- ESP_OK: Delete the SDM channel successfully
- ESP_ERR_INVALID_ARG: Delete the SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete the SDM channel failed because the channel is not in init state
- ESP_FAIL: Delete the SDM channel failed because of other error

esp_err_t **sdm_channel_enable** (*sdm_channel_handle_t* chan)

Enable the Sigma Delta channel.

备注: This function will transit the channel state from init to enable.

备注: This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the *sdm_config_t*, while `CONFIG_PM_ENABLE` is enabled.

参数 **chan** -- [in] SDM channel created by `sdm_new_channel`

返回

- ESP_OK: Enable SDM channel successfully
- ESP_ERR_INVALID_ARG: Enable SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable SDM channel failed because the channel is already enabled
- ESP_FAIL: Enable SDM channel failed because of other error

esp_err_t **sdm_channel_disable** (*sdm_channel_handle_t* chan)

Disable the Sigma Delta channel.

备注: This function will do the opposite work to the `sdm_channel_enable()`

参数 **chan** -- [in] SDM channel created by `sdm_new_channel`

返回

- ESP_OK: Disable SDM channel successfully
- ESP_ERR_INVALID_ARG: Disable SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable SDM channel failed because the channel is not enabled yet
- ESP_FAIL: Disable SDM channel failed because of other error

esp_err_t **sdm_channel_set_pulse_density** (*sdm_channel_handle_t* chan, int8_t density)

Set the pulse density of the PDM output signal.

备注: The raw output signal requires a low-pass filter to restore it into analog voltage, the restored analog output voltage could be $V_{out} = VDD_{IO} / 256 * density + VDD_{IO} / 2$

备注: This function is allowed to run within ISR context

备注: This function will be placed into IRAM if CONFIG_SDM_CTRL_FUNC_IN_IRAM is on, so that it's allowed to be executed when Cache is disabled

参数

- **chan** -- [in] SDM channel created by `sdm_new_channel`
- **density** -- [in] Quantized pulse density of the PDM output signal, ranges from -128 to 127. But the range of [-90, 90] can provide a better randomness.

返回

- ESP_OK: Set pulse density successfully
- ESP_ERR_INVALID_ARG: Set pulse density failed because of invalid argument
- ESP_FAIL: Set pulse density failed because of other error

esp_err_t **sdm_channel_set_duty** (*sdm_channel_handle_t* chan, int8_t duty)

The alias function of `sdm_channel_set_pulse_density`, it decides the pulse density of the output signal.

备注: `sdm_channel_set_pulse_density` has a more appropriate name compare this alias function, suggest to turn to `sdm_channel_set_pulse_density` instead

参数

- **chan** -- [in] SDM channel created by `sdm_new_channel`
- **duty** -- [in] Actually it's the quantized pulse density of the PDM output signal

返回

- ESP_OK: Set duty cycle successfully
- ESP_ERR_INVALID_ARG: Set duty cycle failed because of invalid argument
- ESP_FAIL: Set duty cycle failed because of other error

Structures

struct **sdm_config_t**

Sigma Delta channel configuration.

Public Members

int **gpio_num**

GPIO number

sdm_clock_source_t **clk_src**

Clock source

uint32_t **sample_rate_hz**

Over sample rate in Hz, it determines the frequency of the carrier pulses

uint32_t **invert_out**

Whether to invert the output signal

uint32_t **io_loop_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct *sdm_config_t*::[anonymous] **flags**

Extra flags

Type Definitions

typedef struct sdm_channel_t ***sdm_channel_handle_t**

Type of Sigma Delta channel handle.

Header File

- [components/hal/include/hal/sdm_types.h](#)
- This header file can be included with:

```
#include "hal/sdm_types.h"
```

Type Definitions

typedef *soc_periph_sdm_clk_src_t* **sdm_clock_source_t**

2.5.28 SPI flash API

概述

spi_flash 组件提供外部 flash 数据读取、写入、擦除和内存映射相关的 API 函数。

关于更多高层次的用于访问分区（分区表定义于[分区表](#)）的 API 函数，参见[分区 API](#)。

备注：访问主 flash 芯片时，建议使用上述 *esp_partition_** API 函数，而非低层级的 *esp_flash_** API 函数。分区表 API 函数根据存储在分区表中的数据，进行边界检查并计算在 flash 中的正确偏移量。不过，仍支持使用 *esp_flash_** 函数直接访问外部（额外）的 SPI flash 芯片。

与 ESP-IDF v4.0 之前的 API 不同，这一版 *esp_flash_** API 功能并不局限于主 SPI flash 芯片（即运行程序的 SPI flash 芯片）。通过使用不同的芯片指针，可以访问连接到 SPI0/1 或 SPI2 总线的外部 flash 芯片。

备注：大多数 *esp_flash_** API 使用 SPI1，SPI2 等外设而非通过 SPI0 上的 cache。这使得它们不仅能访问主 flash，也能访问外部 flash。

而由于 cache 的限制，所有经过 cache 的操作都只能对主 flash 进行。这些操作的地址同样受到 cache 能力的限制。Cache 无法访问外部 flash 或者高于它能力的地址段。这些 cache 操作包括：mmap、加密读写、执行代码或者访问在 flash 中的变量。

备注: ESP-IDF v4.0 之后的 flash API 不再是原子的。因此，如果读操作执行过程中发生写操作，且读操作和写操作的 flash 地址出现重叠，读操作返回的数据可能会包含旧数据和新数据（新数据为写操作更新产生的数据）。

备注: 仅有主 flash 芯片支持加密操作，外接（经 SPI1 使用其他不同片选访问，或经其它 SPI 总线访问）的 flash 芯片则不支持加密操作。硬件的限制也决定了仅有主 flash 支持从 cache 当中读取。

flash 功能支持情况

支持的 flash 列表 不同厂家的 flash 特性有不同的操作方式，因此需要特殊的驱动支持。当前驱动支持大多数厂家 flash 24 位地址范围内的快速/慢速读，以及二线模式 (DIO/DOOUT)，因为他们不需要任何厂家的自定义命令。

当前驱动支持以下厂家/型号的 flash 的四线模式 (QIO/QOUT):

1. ISSI
2. GD
3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA

备注: 只有 ESP32-P4 支持上述某个 flash 时，芯片的驱动才默认支持这款 flash。可使用 menuconfig 中的 Component config > SPI flash driver > Auto-detect flash chips 选项来使能/禁用某个 flash。

flash 可选的功能

Optional Features for Flash Some features are not supported on all ESP chips and Flash chips. You can check the list below for more information.

- *Auto Suspend & Resume*
- *Flash unique ID*
- *High Performance Mode of QSPI Flash Chips*
- *32-bit Address Support of QSPI Flash Chips*
- *OPI Flash Support*

备注: When Flash optional features listed in this page are used, aside from the capability of ESP chips, and ESP-IDF version you are using, you will also need to make sure these features are supported by flash chips used.

- If you are using an official Espressif modules/SiP. Some of the modules/SiPs always support the feature, in this case you can see these features listed in the datasheet. Otherwise please contact [Espressif's business team](#) to know if we can supply such products for you.
 - If you are making your own modules with your own bought flash chips, and you need features listed above. Please contact your vendor if they support the those features, and make sure that the chips can be supplied continuously.
-

注意: This document only shows that ESP-IDF code has supported the features of those flash chips. It is not a list of stable flash chips certified by Espressif. If you build your own hardware from flash chips with your own brought flash chips (even with flash listed in this page), you need to validate the reliability of flash chips yourself.

Auto Suspend & Resume This feature is only supported on ESP32-S3, ESP32-C2, ESP32-C3, ESP32-C6, ESP32-H2 for now.

The support for ESP32-P4 may be added in the future.

Flash Unique ID This feature is supported on all Espressif chips.

Unique ID is not flash id, which means flash has 64-Bit unique ID for each device. The instruction to read the unique ID (4Bh) accesses a factory-set read-only 64-bit number that is unique to each flash device. This ID number helps you to recognize each single device. Not all flash vendors support this feature. If you try to read the unique ID on a chip which does not have this feature, the behavior is not determined. The support list is as follows.

List of Flash chips that support this feature:

1. ISSI
2. GD
3. TH
4. FM
5. Winbond
6. XMC
7. BOYA

High Performance Mode of QSPI Flash Chips This feature is only supported on ESP32-S3 for now.

The support for ESP32-S2, ESP32-C3, ESP32-C6, ESP32-H2, ESP32-P4 may be added in the future.

备注: This section is provided for QSPI flash chips. Octal flash used on ESP-chips support High performance mode by default so far, please refer to the [OPI Flash Support](#) for the list of supported octal flash chips.

32-bit Address Support of QSPI Flash Chips This feature is supported on all Espressif chips (see restrictions to application below).

备注: This section is provided for QSPI flash chips. The 32-bit address support of Octal Flash chips are considered as part of the Octal flash support. Please refer to the [OPI Flash Support](#) for the list of supported octal flash chips.

Most NOR flash chips used by Espressif chips use 24-bits address, which can cover 16 MBytes memory. However, for larger memory (usually equal to or larger than 32 MBytes), flash uses a 32-bits address to address memory region higher than 16 MBytes. Unfortunately, 32-bits address chips have vendor-specific commands, so we need to support the chips one by one.

List of Flash chips that support this feature:

1. W25Q256
2. GD25Q256

Restrictions

重要: Over 16 MBytes space on flash mentioned above can be only used for data saving, like file system.

Mapping data/instructions to 32-bit physical address space (so as to be accessed by the CPU) needs the support of MMU. However ESP32-P4 doesn't support this feature. Only ESP32-S3 supports this up to now.

OPI Flash Support This feature is only supported on ESP32-S3 for now.

OPI flash means that the flash chip supports octal peripheral interface, which has octal I/O pins. Different octal flash has different configurations and different commands. Hence, it is necessary to carefully check the support list.

有一些功能可能不是所有的 flash 芯片都支持，或不是所有的 ESP 芯片都支持。这些功能包括：

- 32 比特地址的 flash 支持 - 通常意味着拥有大于 16 MB 内存空间的大容量 flash 需要更长的地址去访问。
- flash 的私有 ID (unique ID) - 表示 flash 支持它自己的 64-bit 独有 ID。

如果想使用这些功能，则需保证 ESP32-P4 支持这些功能，且产品里所使用的 flash 芯片也要支持这些功能。请参阅 [Optional Features for Flash](#)，查看更多信息。

也可以自定义 flash 芯片驱动。请参阅 [Overriding Default Chip Drivers](#)，查看详细信息。

警告： Customizing SPI Flash Chip Drivers is considered an "expert" feature. Users should only do so at their own risk. (See the notes below)

Overriding Default Chip Drivers During the SPI Flash driver's initialization (i.e., `esp_flash_init()`), there is a chip detection step during which the driver iterates through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the ESP-IDF, thus are updated in together with each ESP-IDF version. However ESP-IDF also allows users to customize their own chip drivers.

Users should note the following when customizing chip drivers:

1. You may need to rely on some non-public ESP-IDF functions, which have slight possibility to change between ESP-IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some ESP-IDF bug fixes to other chip drivers are not automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.
4. If you update to a newer ESP-IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise the driver will only search for the drivers in custom list you provided.

Steps For Creating Custom Chip Drivers and Overriding the ESP-IDF Default Driver List

1. Enable the `CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST` config option. This prevents compilation and linking of the Default Chip Driver List (`default_registered_chips`) provided by ESP-IDF. Instead, the linker searches for the structure of the same name (`default_registered_chips`) that must be provided by the user.
2. Add a new component in your project, e.g., `custom_chip_driver`.
3. Copy the necessary chip driver files from the `spi_flash` component in ESP-IDF. This may include:
 - `spi_flash_chip_drivers.c` (to provide the `default_registered_chips` structure)
 - Any of the `spi_flash_chip_*.c` files that matches your own flash model best
 - `CMakeLists.txt` and `linker.lf` files

Modify the files above properly. Including:

- Change the `default_registered_chips` variable to non-static and remove the `#ifdef` logic around it.
- Update `linker.lf` file to rename the fragment header and the library name to match the new component.
- If reusing other drivers, some header names need prefixing with `spi_flash/` when included from outside `spi_flash` component.

备注：

- When writing your own flash chip driver, you can set your flash chip capabilities through `spi_flash_chip_***(vendor)_get_caps` and points the function pointer `get_chip_caps` for protection to the `spi_flash_chip_***_get_caps` function. The steps are as follows.
 - Please check whether your flash chip have the capabilities listed in `spi_flash_caps_t` by checking the flash datasheet.
 - Write a function named `spi_flash_chip_***(vendor)_get_caps`. Take the example below as a reference. (if the flash support suspend and read unique id).
 - Points the pointer `get_chip_caps` (in `spi_flash_chip_t`) to the function mentioned above.

```
spi_flash_caps_t spi_flash_chip_***(vendor)_get_caps(esp_flash_t *chip)
{
    spi_flash_caps_t caps_flags = 0;
    // 32-bit-address flash is not supported
    flash_suspend is supported
    caps_flags |= SPI_FLASH_CHIP_CAP_SUSPEND;
    // flash read unique id.
    caps_flags |= SPI_FLASH_CHIP_CAP_UNIQUE_ID;
    return caps_flags;
}
```

```
const spi_flash_chip_t esp_flash_chip_eon = {
    // Other function pointers
    .get_chip_caps = spi_flash_chip_eon_get_caps,
};
```

- You also can see how to implement this in the example [storage/custom_flash_driver](#).

- Write a new `CMakeLists.txt` file for the `custom_chip_driver` component, including an additional line to add a linker dependency from `spi_flash` to `custom_chip_driver`:

```
idf_component_register(SRCS "spi_flash_chip_drivers.c"
                      "spi_flash_chip_mychip.c" # modify as needed
                      REQUIRES hal
                      PRIV_REQUIRES spi_flash
                      LDFRAGMENTS linker.lf)
idf_component_add_link_dependency(FROM spi_flash)
```

- An example of this component `CMakeLists.txt` can be found in [storage/custom_flash_driver/components/custom_chip_driver/CMakeLists.txt](#)
- The `linker.lf` is used to put every chip driver that you are going to use whilst cache is disabled into internal RAM. See [链接器脚本生成机制](#) for more details. Make sure this file covers all the source files that you add.
 - Build your project, and you will see the new flash driver is used.

Example See also [storage/custom_flash_driver](#).

初始化 flash 设备

在使用 `esp_flash_*` API 之前，需要在 SPI 总线上初始化芯片，步骤如下：

- 调用 `spi_bus_initialize()` 初始化 SPI 总线。此函数将初始化总线上设备间共享的资源，如 I/O、DMA、中断等。
- 调用 `spi_bus_add_flash_device()` 将 flash 设备连接到总线上。然后分配内存，填充 `esp_flash_t` 结构体，同时初始化 CS I/O。
- 调用 `esp_flash_init()` 与芯片进行通信。后续操作会依据芯片类型不同而有差异。

备注：当前，已支持多个 flash 芯片连接到同一总线。

SPI flash 访问 API

如下所示为处理 flash 中数据的函数集:

- `esp_flash_read()`: 将数据从 flash 读取到 RAM;
- `esp_flash_write()`: 将数据从 RAM 写入到 flash;
- `esp_flash_erase_region()`: 擦除 flash 中指定区域的数据;
- `esp_flash_erase_chip()`: 擦除整个 flash;
- `esp_flash_get_chip_size()`: 返回 `menuconfig` 中设置的 flash 芯片容量 (以字节为单位)。

一般来说, 请尽量避免对主 SPI flash 芯片直接使用原始 SPI flash 函数。如需对主 SPI flash 芯片进行操作, 请使用分区专用函数。

SPI flash 容量

SPI flash 容量由引导加载程序镜像头部 (烧录偏移量为 0x1000) 的一个字段进行配置。

默认情况下, 引导程序被写入 flash 时, `esptool.py` 会自动检测 SPI flash 容量, 同时使用正确容量更新引导程序的头部。也可以在工程配置中设置 `CONFIG_ESPTOOLPY_FLASHSIZE`, 生成固定的 flash 容量。

如需在运行时覆盖已配置的 flash 容量, 请配置 `g_rom_flashchip` 结构中的 `chip_size`。 `esp_flash_*` 函数使用此容量 (于软件和 ROM 中) 进行边界检查。

SPI1 flash 并发约束

SPI1 flash 并发约束

指令/数据 cache (用以执行固件) 与 SPI1 外设 (由像 SPI flash 驱动一样的驱动程序控制) 共享 SPI0/1 总线。因此, SPI1 外设上的操作会对整个系统造成显著的影响。这类操作包括调用 SPI flash API 或者 SPI1 总线上的其他驱动、任何 flash 操作 (如读取、写入、擦除) 或是由其他用户定义的 SPI 操作 (对主 flash 或是其他 SPI 从机)。

在 ESP32-P4 上, 启用配置选项 `CONFIG_SPIRAM_XIP_FROM_PSRAM` (默认禁用) 后将允许 flash/PSRAM 的 cache 访问和 SPI1 的操作并发执行。请参阅在 *PSRAM 中执行代码*, 查看详细信息。

禁用该选项时, 在读取/写入/擦除 flash 期间, 必须禁用 cache。使用驱动访问 SPI1 的相关约束参见 *禁用 cache 时*。这些约束会带来更多的 IRAM/DRAM 消耗。

禁用 cache 时 此时, 在 flash 擦写操作中, 所有的 CPU 都只能执行 IRAM 中的代码, 而且必须从 DRAM 中读取数据。如果使用本文档中的 API 函数, 上述限制将自动生效且透明 (无需额外关注), 但这些限制可能会影响系统中的其他任务的性能。

备注: 启用 `CONFIG_SPIRAM_XIP_FROM_PSRAM` 选项后, 不会禁用 cache。

为避免意外读取 flash cache, 一个 CPU 在启动 flash 写入或擦除操作时, 另一个 CPU 将阻塞。在 flash 操作完成前, 会禁用所有在 CPU 上非 IRAM 安全的中断。

另请参阅 *OS 函数* 和 *SPI 总线锁*。

除 SPI0/1 以外, SPI 总线上的其他 flash 芯片则不受这种限制。

请参阅 *应用程序内存分布*, 查看内部 RAM (如 IRAM、DRAM) 和 flash cache 的区别。

IRAM 安全中断处理程序 如果需要在 flash 操作期间运行中断处理程序 (比如低延迟操作), 请在 *注册中断处理程序* 时设置 `ESP_INTR_FLAG_IRAM`。

请确保中断处理程序访问的所有数据和函数 (包括其调用的数据和函数) 都存储在 IRAM 或 DRAM 中。参见 *如何将代码放入 IRAM*。

在未将函数或符号正确放入 IRAM/DRAM 的情况下，在 flash 操作期间，中断处理程序从 flash cache 中读取数据时，会导致程序崩溃。这可能是由于代码未正确放入 IRAM，产生了非法指令异常，也可能是因为常数未正确放入 DRAM，读取到了垃圾数据。

备注：在 ISRs 中处理字符串时，不建议使用 `printf` 和其他输出函数。为了方便调试，在从 ISRs 中获取数据时，请使用 `ESP_DRAM_LOGE()` 和类似的宏。请确保 TAG 和格式字符串都放置于 DRAM 中。

非 IRAM 安全中断处理程序 如果在注册时没有设置 `ESP_INTR_FLAG_IRAM` 标志，当禁用 cache 时，将不会执行中断处理程序。一旦 cache 恢复，非 IRAM 安全的中断将重新启用，中断处理程序随即再次正常运行。这意味着，只要禁用了 cache，就不会发生相应的硬件事件。

当 DMA 也可以访问 Flash 中的数据时 当 DMA 正在从 Flash 中读取数据时，来自 SPI1 的擦/写操作优先级会更高，如果 Flash 的 auto-suspend 功能没有开启，将会导致 DMA 读到错误的数。建议在擦写 Flash 之前先停止 DMA 对 Flash 的访问。如果 DMA 不可以停止，比如 LCD 需要持续刷新保存在 Flash 中的图像数据，建议将此类数据拷贝到 PSRAM 或者内部的 SRAM 中。

在 PSRAM 中执行代码 启用 `CONFIG_SPIRAM_XIP_FROM_PSRAM` 选项后，flash 中 `.text` 部分的数据（用于指令）和 flash 中 `.rodata` 部分的数据（用于只读数据）将被放入 PSRAM。

相应的虚拟内存地址将被映射到 PSRAM。

如果同时启用以上两个选项，则在 SPI1 flash 操作期间 cache 不会被禁用，无需确保 ISR、ISR 回调及相关数据放置在内部 RAM 中。

注意：指令/数据 cache（用以执行固件）与 SPI1 外设（由像 SPI flash 驱动一样的驱动程序控制）共享 SPI0/1 总线。因此，在 SPI1 总线上调用 SPI flash API（包括访问主 flash）会对整个系统造成显著的影响。请参阅 [SPI1 flash 并发约束](#)，查看详细信息。

SPI flash 加密

SPI flash 内容支持加密，并在硬件层进行透明解密。

请参阅 [flash 加密](#)，查看详细信息。

内存映射 API

ESP32-P4 的内存硬件可以将 flash 部分区域映射到指令地址空间和数据地址空间。此映射仅用于读操作，不能通过写入 flash 映射的存储区域来改变 flash 中的内容。

flash 在 64 KB 页进行映射。内存映射硬件既可将 flash 映射到数据地址空间，也能映射到指令地址空间。请查看技术参考手册，了解内存映射硬件的详细信息及有关限制。

请注意，有些页被用于将应用程序映射到内存中，因此实际可用的页会少于硬件提供的总数。

启用 [flash 加密](#) 时，使用内存映射区域从 flash 读取数据是解密 flash 的唯一方法，解密需在硬件层进行。

内存映射 API 在 `spi_flash_mmap.h` 和 `esp_partition.h` 中声明：

- `spi_flash_mmap()`：将 flash 物理地址区域映射到 CPU 指令空间或数据空间；
- `spi_flash_munmap()`：取消上述区域的映射；
- `esp_partition_mmap()`：将分区的一部分映射至 CPU 指令空间或数据空间；

`spi_flash_mmap()` 和 `esp_partition_mmap()` 的区别如下：

- `spi_flash_mmap()`：需要给定一个 64 KB 对齐的物理地址；

- `esp_partition_mmap()`: 给定分区内任意偏移量即可, 此函数根据需要将返回的指针调整至指向映射内存。

内存映射以页为单位, 即使传递给 `esp_partition_mmap` 的是一个分区, 分区外的数据也是可以读取到的, 不会受到分区边界的影响。

备注: 由于 `mmap` 是由 `cache` 支持的, 因此, `mmap` 也仅能用在主 `flash` 上。

SPI flash 实现

`esp_flash_t` 结构体包含芯片数据和该 API 的三个重要部分:

1. 主机驱动, 为访问芯片提供硬件支持;
2. 芯片驱动, 为不同芯片提供兼容性服务;
3. OS 函数, 在不同阶段 (一级或二级 Boot 或者应用程序阶段) 为部分 OS 函数 (如锁、延迟) 提供支持。

主机驱动 主机驱动依赖 `hal/include/hal` 文件夹下 `spi_flash_types.h` 定义的 `spi_flash_host_driver_t` 接口。该接口提供了一些常用的函数, 用于与芯片通信。

在 SPI HAL 文件中, 有些函数是基于现有的 ESP32-P4 `memory-spi` 来实现的。但是, 由于 ESP32-P4 的速度限制, HAL 层无法提供某些读命令的高速实现 (所以这些命令根本没有在 HAL 的文件中被实现)。`memspi_host_driver.h` 和 `.c` 文件使用 HAL 提供的 `common_command` 函数实现上述读命令的高速版本, 并将所有它实现的以及 HAL 函数封装为 `spi_flash_host_driver_t` 供更上层调用。

仅通过 GPIO, 也可实现自己的主机驱动。只要实现了 `spi_flash_host_driver_t` 中所有函数, 不管底层硬件是什么, `esp_flash` API 都可以访问 `flash`。

芯片驱动 芯片驱动在 `spi_flash_chip_driver.h` 中进行定义, 并将主机驱动提供的基本函数进行封装以供 API 层使用。

有些操作需在执行前先发送命令, 或在执行后读取状态, 因此有些芯片需要不同的命令或值以及通信方式。

`generic chip` 芯片代表了常见的 `flash` 芯片, 其他芯片驱动可以在这种通用芯片的基础上进行开发。

芯片驱动依赖主机驱动。

OS 函数

SPI 特性

SPI 主机

SPI 总线锁 为了多路复用来自 SPI 主机、SPI flash 等不同驱动的设备, 每个 SPI 总线上都配有 SPI 总线锁。驱动程序可以通过对锁实施仲裁, 将设备连接到总线上。

每个总线锁都已初始化并注册了后台服务 (BG)。设备应在 BG 禁用后, 再在总线上进行传输。

- SPI1 总线的后台服务为高速缓存。在设备操作开始前, 总线锁可以禁用高速缓存, 并在设备释放锁后将其再次启用。高速缓存处于禁用状态时, 让出当前任务的执行权毫无意义, 因此, 该情况下 SPI1 总线上的任何设备都无法使用 ISR。
SPI 主机驱动程序暂不支持 SPI1 总线。只有 SPI flash 驱动程序可以连接到该总线。
- 对于其他总线, 驱动程序可以将 ISR 注册为后台服务。若设备任务要求独占总线, 则总线锁将阻塞该任务, 同时禁用 ISR, 随即解除对该任务的阻塞。任务释放锁后, 如果 ISR 中还有待处理的事务, 则锁将尝试重新启用 ISR。

OS 函数层目前支持访问锁和延迟的方法。

锁（见 [SPI 总线锁](#)）用于解决同一 SPI 总线上的设备访问和 SPI flash 芯片访问之间的冲突。例如：

1. 经 SPI1 总线访问 flash 芯片时，应当禁用 cache（平时用于获取代码和 PSRAM 数据）。
2. 经其他总线访问 flash 芯片时，应当禁用 flash 上 SPI 主驱动器注册的 ISR 以避免冲突。
3. SPI 主驱动器上某些没有 CS 线或者 CS 线受软件（如 SDSPI）控制的设备需要在一段时间内独占总线。

延时则用于某些长时操作，需要主机处于等待状态或执行轮询。

顶层 API 将芯片驱动和 OS 函数封装成一个完整的组件，并提供参数检查。

使用 OS 函数还可以在在一定程度上避免在擦除大块 flash 区域时出现看门狗超时的情况。在这段时间内，CPU 将被 flash 擦除任务占用，从而阻止其他任务的执行，包括为看门狗定时器 (WDT) 供电的空闲任务。若已选中配置选项 `CONFIG_ESP_TASK_WDT_PANIC`，并且 flash 操作时间长于看门狗的超时时间，系统将重新启动。

不过，由于不同的 flash 芯片擦除时间不同，flash 驱动几乎无法兼容，很难完全规避超时的风险，这一点需要格外注意。请遵照以下指南：

1. 建议启用 `CONFIG_SPI_FLASH_YIELD_DURING_ERASE` 选项，允许调度器在擦除 flash 时进行重新调度。此外，还可以使用下列参数。
 - 在 `menuconfig` 中增加 `CONFIG_SPI_FLASH_ERASE_YIELD_TICKS` 或减少 `CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS` 的时间。
 - 在 `menuconfig` 中增加 `CONFIG_ESP_TASK_WDT_TIMEOUT_S` 的时间，以设置更长的看门狗超时周期。然而，看门狗超时周期拉长后，可能无法再检测到以前可检测到的超时。
1. 请注意，在进行长时间的 SPI flash 操作时，启用 `CONFIG_ESP_TASK_WDT_PANIC` 选项将会在超时触发紧急处理程序。不过，启用该选项也可以帮助处理应用程序中的意外异常，请根据实际情况决定是否启用这个选项。
2. 在开发过程中，请根据项目对擦除 flash 的具体要求和时间限制，谨慎进行 flash 操作。在配置 flash 擦除超时周期时，请在实际产品要求的基础上留出合理的冗余时间，从而提高产品的可靠性。

实现细节

必须确保操作期间，两个 CPU 均未从 flash 运行代码，实现细节如下：

- 单核模式下，SDK 在执行 flash 操作前将禁用中断或调度算法。
- 双核模式下，SDK 需确保两个 CPU 均未运行 flash 代码。

如果有 SPI flash API 在 CPU A (PRO 或 APP) 上调用，它使用 `esp_ipc_call` API 在 CPU B 上运行 `spi_flash_op_block_func` 函数。`esp_ipc_call` API 会在 CPU B 上唤醒一个高优先级任务，即运行 `spi_flash_op_block_func` 函数。运行该函数将禁用 CPU B 上的 cache，并使用 `s_flash_op_can_start` 旗帜来标志 cache 已禁用。然后，CPU A 上的任务也会禁用 cache 并继续执行 flash 操作。

执行 flash 操作时，CPU A 和 CPU B 仍然可以执行中断操作。默认中断代码均存储于 RAM 中，如果新添加了中断分配 API，则应添加一个标志位以请求在 flash 操作期间禁用该新分配的中断。

flash 操作完成后，CPU A 上的函数将设置另一标志位，即 `s_flash_op_complete`，用以通知 CPU B 上的任务可以重新启用 cache 并释放 CPU。接着，CPU A 上的函数也重新启用 cache，并将控制权返还给调用者。

另外，所有 API 函数均受互斥量 `s_flash_op_mutex` 保护。

在单核环境中（启用 `CONFIG_FREERTOS_UNICORE`），需要禁用上述两个 cache，以防发生 CPU 间通信。

SPI Flash API ESP-IDF Version vs Chip-ROM Version There is a set of SPI Flash drivers in Chip-ROM which you can use by enabling `CONFIG_SPI_FLASH_ROM_IMPL`. Most of the ESP-IDF SPI Flash driver code are in internal RAM, therefore enabling this option frees some internal RAM usage. Note if you enable this option, this means some SPI Flash driver features and bugfixes that are done in ESP-IDF might not be included in the Chip-ROM version.

Feature Supported by ESP-IDF but Not in Chip-ROM

- Octal Flash chip support. See *OPI Flash Support* for details.
- 32-bit-address support for GD25Q256. Note this feature is an optional feature, please do read *32-bit Address Support of QSPI Flash Chips* for details.
- TH Flash chip support.
- Kconfig option `CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED`.
- `CONFIG_SPI_FLASH_VERIFY_WRITE`, enabling this option helps you detect bad writing.
- `CONFIG_SPI_FLASH_LOG_FAILED_WRITE`, enabling this option prints the bad writing.
- `CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE`, enabling this option checks if you are writing zero to one.
- `CONFIG_SPI_FLASH_DANGEROUS_WRITE`, enabling this option checks for flash programming to certain protected regions like bootloader, partition table or application itself.
- `CONFIG_SPI_FLASH_ENABLE_COUNTERS`, enabling this option to collect performance data for ESP-IDF SPI Flash driver APIs.
- `CONFIG_SPI_FLASH_AUTO_SUSPEND`, enabling this option to automatically suspend / resume a long Flash operation when short Flash operation happens. Note this feature is an optional feature, please do read *Auto Suspend & Resume* for more limitations.

Bugfixes Introduced in ESP-IDF but Not in Chip-ROM

- Detected Flash physical size correctly, for larger than 256MBit Flash chips. (Commit ID: b4964279d44f73cce7cfd5cf684567fbdfd6fd9e)

SPI flash API 参考

Header File

- `components/spi_flash/include/esp_flash_spi_init.h`
- This header file can be included with:

```
#include "esp_flash_spi_init.h"
```

- This header file is a part of the API provided by the `spi_flash` component. To declare that your component depends on `spi_flash`, add the following to your `CMakeLists.txt`:

```
REQUIRES spi_flash
```

or

```
PRIV_REQUIRES spi_flash
```

Functions

`esp_err_t spi_bus_add_flash_device(esp_flash_t **out_chip, const esp_flash_spi_device_config_t *config)`

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

参数

- **out_chip** -- Pointer to hold the initialized chip.
- **config** -- Configuration of the chips to initialize.

返回

- ESP_ERR_INVALID_ARG: out_chip is NULL, or some field in the config is invalid.
- ESP_ERR_NO_MEM: failed to allocate memory for the chip structures.
- ESP_OK: success.

esp_err_t **spi_bus_remove_flash_device** (*esp_flash_t* *chip)

Remove a SPI Flash device from the SPI bus.

参数 chip -- The flash device to remove.

返回

- ESP_ERR_INVALID_ARG: The chip is invalid.
- ESP_OK: success.

Structures

struct **esp_flash_spi_device_config_t**

Configurations for the SPI Flash to init.

Public Members

spi_host_device_t **host_id**

Bus to use.

int **cs_io_num**

GPIO pin to output the CS signal.

esp_flash_io_mode_t **io_mode**

IO mode to read from the Flash.

enum *esp_flash_speed_s* **speed**

Speed of the Flash clock. Replaced by freq_mhz.

int **input_delay_ns**

Input delay of the data pins, in ns. Set to 0 if unknown.

int **cs_id**

CS line ID, ignored when not host_id is not SPI1_HOST, or CONFIG_SPI_FLASH_SHARE_SPI1_BUS is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

int **freq_mhz**

The frequency of flash chip(MHZ)

Functions

esp_err_t **esp_flash_init** (*esp_flash_t* *chip)

Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

备注: Only the `host` and `read_mode` fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.

备注: If the `chip->drv` pointer is NULL, `chip` `chip_drv` will be auto-detected based on its manufacturer & product IDs. See `esp_flash_registered_flash_drivers` pointer for details of this process.

参数 `chip` -- Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

返回 ESP_OK on success, or a flash error code if initialisation fails.

bool **esp_flash_chip_driver_initialized** (const *esp_flash_t* *chip)

Check if appropriate chip driver is set.

参数 `chip` -- Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

返回 true if set, otherwise false.

esp_err_t **esp_flash_read_id** (*esp_flash_t* *chip, uint32_t *out_id)

Read flash ID via the common "RDID" SPI flash command.

ID is a 24-bit value. Lower 16 bits of 'id' are the chip ID, upper 8 bits are the manufacturer ID.

参数

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **out_id** -- [out] Pointer to receive ID value.

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_size** (*esp_flash_t* *chip, uint32_t *out_size)

Detect flash size based on flash ID.

备注: 1. Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn't follow this convention, the size may be incorrectly detected.

- The `out_size` returned only stands for The `out_size` stands for the size in the binary image header. If you want to get the real size of the chip, please call `esp_flash_get_physical_size` instead.
-

参数

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **out_size** -- [out] Detected size in bytes, standing for the size in the binary image header.

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_physical_size** (*esp_flash_t* *chip, uint32_t *flash_size)

Detect flash size based on flash ID.

备注: Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn't follow this convention, the size may be incorrectly detected.

参数

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **flash_size** -- [out] Detected size in bytes.

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_read_unique_chip_id** (*esp_flash_t* *chip, uint64_t *out_id)

Read flash unique ID via the common "RDUID" SPI flash command.

ID is a 64-bit value.

备注: This is an optional feature, which is not supported on all flash chips. READ PROGRAMMING GUIDE FIRST!

参数

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`.
- **out_id** -- [out] Pointer to receive unique ID value.

返回

- ESP_OK on success, or a flash error code if operation failed.
- ESP_ERR_NOT_SUPPORTED if the chip doesn't support read id.

esp_err_t **esp_flash_erase_chip** (*esp_flash_t* *chip)

Erase flash chip contents.

参数 **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`

返回

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- ESP_ERR_NOT_ALLOWED if a read-only partition is present.
- Other flash error code if operation failed.

esp_err_t **esp_flash_erase_region** (*esp_flash_t* *chip, uint32_t start, uint32_t len)

Erase a region of the flash chip.

Sector size is specified in `chip->drv->sector_size` field (typically 4096 bytes.) ESP_ERR_INVALID_ARG will be returned if the start & length are not a multiple of this size.

Erase is performed using block (multi-sector) erases where possible (block size is specified in `chip->drv->block_erase_size` field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

参数

- **chip** -- Pointer to identify flash chip. If NULL, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`
- **start** -- Address to start erasing flash. Must be sector aligned.

- **len** -- Length of region to erase. Must also be sector aligned.

返回

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- ESP_ERR_NOT_ALLOWED if the address range (start –start + len) overlaps with a read-only partition address space
- Other flash error code if operation failed.

esp_err_t **esp_flash_get_chip_write_protect** (*esp_flash_t* *chip, bool *write_protected)

Read if the entire chip is write protected.

备注: A correct result for this flag depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

参数

- **chip** -- Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
- **write_protected** -- [out] Pointer to boolean, set to the value of the write protect flag.

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_set_chip_write_protect** (*esp_flash_t* *chip, bool write_protect)

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

备注: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

参数

- **chip** -- Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
- **write_protect** -- Boolean value for the write protect flag

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_protectable_regions** (const *esp_flash_t* *chip, const *esp_flash_region_t* **out_regions, uint32_t *out_num_regions)

Read the list of individually protectable regions of this SPI flash chip.

备注: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

参数

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **out_regions** -- [out] Pointer to receive a pointer to the array of protectable regions of the chip.
- **out_num_regions** -- [out] Pointer to an integer receiving the count of protectable regions in the array returned in 'regions'.

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_get_protected_region** (*esp_flash_t* *chip, const *esp_flash_region_t* *region, bool *out_protected)

Detect if a region of the SPI flash chip is protected.

备注: It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

备注: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

参数

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **region** -- Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`.
- **out_protected** -- **[out]** Pointer to a flag which is set based on the protected status for this region.

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_set_protected_region** (*esp_flash_t* *chip, const *esp_flash_region_t* *region, bool protect)

Update the protected status for a region of the SPI flash chip.

备注: It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

备注: Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the 'chip->drv' field).

参数

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **region** -- Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`.
- **protect** -- Write protection flag to set.

返回 ESP_OK on success, or a flash error code if operation failed.

esp_err_t **esp_flash_read** (*esp_flash_t* *chip, void *buffer, uint32_t address, uint32_t length)

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

备注: If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

参数

- **chip** -- Pointer to identify flash chip. If NULL, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`

- **buffer** -- Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- **address** -- Address on flash to read from. Must be less than chip->size field.
- **length** -- Length (in bytes) of data to read.

返回

- ESP_OK: success
- ESP_ERR_NO_MEM: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

esp_err_t **esp_flash_write** (*esp_flash_t* *chip, const void *buffer, uint32_t address, uint32_t length)

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

参数

- **chip** -- Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
- **address** -- Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** -- Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- **length** -- Length (in bytes) of data to write.

返回

- ESP_OK on success
- ESP_FAIL, bad write, this will be detected only when CONFIG_SPI_FLASH_VERIFY_WRITE is enabled
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- ESP_ERR_NOT_ALLOWED if the address range (address –address + length) overlaps with a read-only partition address space
- Other flash error code if operation failed.

esp_err_t **esp_flash_write_encrypted** (*esp_flash_t* *chip, uint32_t address, const void *buffer, uint32_t length)

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

备注: Both address & length must be 16 byte aligned, as this is the encryption block size

参数

- **chip** -- Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- **address** -- Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** -- Pointer to a buffer with the data to write.
- **length** -- Length (in bytes) of data to write. 16 byte aligned.

返回

- ESP_OK: on success
- ESP_FAIL: bad write, this will be detected only when CONFIG_SPI_FLASH_VERIFY_WRITE is enabled
- ESP_ERR_NOT_SUPPORTED: encrypted write not supported for this chip.
- ESP_ERR_INVALID_ARG: Either the address, buffer or length is invalid.
- ESP_ERR_NOT_ALLOWED if the address range (address –address + length) overlaps with a read-only partition address space

esp_err_t **esp_flash_read_encrypted** (*esp_flash_t* *chip, uint32_t address, void *out_buffer, uint32_t length)

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

参数

- **chip** -- Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- **address** -- Address on flash to read from.
- **out_buffer** -- Pointer to a buffer for the data to read to.
- **length** -- Length (in bytes) of data to read.

返回

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted read not supported for this chip.

static inline bool **esp_flash_is_quad_mode** (const *esp_flash_t* *chip)

Returns true if chip is configured for Quad I/O or Quad Fast Read.

参数 chip -- Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

返回 true if flash works in quad mode, otherwise false

Structures

struct **esp_flash_region_t**

Structure for describing a region of flash.

Public Members

uint32_t **offset**

Start address of this region.

uint32_t **size**

Size of the region.

struct **esp_flash_os_functions_t**

OS-level integration hooks for accessing flash chips inside a running OS.

It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

esp_err_t (***start**)(void *arg)

Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to 'end').

esp_err_t (***end**)(void *arg)

Called after completing any flash operation.

esp_err_t (***region_protected**)(void *arg, size_t start_addr, size_t size)

Called before any erase/write operations to check whether the region is limited by the OS

esp_err_t (***delay_us**)(void *arg, uint32_t us)

Delay for at least 'us' microseconds. Called in between 'start' and 'end'.

void (***get_temp_buffer**)(void *arg, size_t request_size, size_t *out_size)

Called for get temp buffer when buffer from application cannot be directly read into/write from.

void (***release_temp_buffer**)(void *arg, void *temp_buf)

Called for release temp buffer.

esp_err_t (***check_yield**)(void *arg, uint32_t chip_status, uint32_t *out_request)

Yield to other tasks. Called during erase operations.

Return ESP_OK means yield needs to be called (got an event to handle), while ESP_ERR_TIMEOUT means skip yield.

esp_err_t (***yield**)(void *arg, uint32_t *out_status)

Yield to other tasks. Called during erase operations.

int64_t (***get_system_time**)(void *arg)

Called for get system time.

void (***set_flash_op_status**)(uint32_t op_status)

Call to set flash operation status

struct **esp_flash_t**

Structure to describe a SPI flash chip connected to the system.

Structure must be initialized before use (passed to `esp_flash_init()`). It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

spi_flash_host_inst_t ***host**

Pointer to hardware-specific "host_driver" structure. Must be initialized before used.

const *spi_flash_chip_t* ***chip_drv**

Pointer to chip-model-specific "adapter" structure. If NULL, will be detected during initialisation.

const *esp_flash_os_functions_t* ***os_func**

Pointer to os-specific hook structure. Call `esp_flash_init_os_functions()` to setup this field, after the host is properly initialized.

void ***os_func_data**

Pointer to argument for os-specific hooks. Left NULL and will be initialized with `os_func`.

esp_flash_io_mode_t **read_mode**

Configured SPI flash read mode. Set before `esp_flash_init` is called.

uint32_t size

Size of SPI flash in bytes. If 0, size will be detected during initialisation. Note: this stands for the size in the binary image header. If you want to get the flash physical size, please call `esp_flash_get_physical_size`.

uint32_t chip_id

Detected chip id.

uint32_t busy

This flag is used to verify chip's status.

uint32_t hpm_dummy_ena

This flag is used to verify whether flash works under HPM status.

uint32_t reserved_flags

reserved.

Macros**SPI_FLASH_YIELD_REQ_YIELD****SPI_FLASH_YIELD_REQ_SUSPEND****SPI_FLASH_YIELD_STA_RESUME****SPI_FLASH_OS_IS_ERASING_STATUS_FLAG****Type Definitions**

typedef struct *spi_flash_chip_t* **spi_flash_chip_t**

Header File

- `components/spi_flash/include/spi_flash_mmap.h`
- This header file can be included with:

```
#include "spi_flash_mmap.h"
```

- This header file is a part of the API provided by the `spi_flash` component. To declare that your component depends on `spi_flash`, add the following to your `CMakeLists.txt`:

```
REQUIRES spi_flash
```

or

```
PRIV_REQUIRES spi_flash
```

Functions

esp_err_t **spi_flash_mmap** (*size_t* src_addr, *size_t* size, *spi_flash_mmap_memory_t* memory, const void **out_ptr, *spi_flash_mmap_handle_t* *out_handle)

Map region of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the requested region of flash memory into the address space. It may reuse MMU pages which already provide the required mapping.

As with any allocator, if mmap/munmap are heavily used then the address space may become fragmented. To troubleshoot issues with page allocation, use `spi_flash_mmap_dump()` function.

参数

- **src_addr** -- Physical address in flash where requested region starts. This address *must* be aligned to 64kB boundary (`SPI_FLASH_MMU_PAGE_SIZE`)
- **size** -- Size of region to be mapped. This size will be rounded up to a 64kB boundary
- **memory** -- Address space where the region should be mapped (data or instruction)
- **out_ptr** -- [out] Output, pointer to the mapped memory region
- **out_handle** -- [out] Output, handle which should be used for `spi_flash_munmap` call

返回 ESP_OK on success, ESP_ERR_NO_MEM if pages can not be allocated

`esp_err_t spi_flash_mmap_pages` (const int *pages, size_t page_count, *spi_flash_mmap_memory_t* memory, const void **out_ptr, *spi_flash_mmap_handle_t* *out_handle)

Map sequences of pages of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the indicated pages of flash memory contiguously into address space. In this respect, it works in a similar way as `spi_flash_mmap()` but it allows mapping a (maybe non-contiguous) set of pages into a contiguous region of memory.

参数

- **pages** -- An array of numbers indicating the 64kB pages in flash to be mapped contiguously into memory. These indicate the indexes of the 64kB pages, not the byte-size addresses as used in other functions. Array must be located in internal memory.
- **page_count** -- Number of entries in the pages array
- **memory** -- Address space where the region should be mapped (instruction or data)
- **out_ptr** -- [out] Output, pointer to the mapped memory region
- **out_handle** -- [out] Output, handle which should be used for `spi_flash_munmap` call

返回

- ESP_OK on success
- ESP_ERR_NO_MEM if pages can not be allocated
- ESP_ERR_INVALID_ARG if pagecount is zero or pages array is not in internal memory

void `spi_flash_munmap` (*spi_flash_mmap_handle_t* handle)

Release region previously obtained using `spi_flash_mmap`.

备注: Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

参数 **handle** -- Handle obtained from `spi_flash_mmap`

void `spi_flash_mmap_dump` (void)

Display information about mapped regions.

This function lists handles obtained using `spi_flash_mmap`, along with range of pages allocated to each handle. It also lists all non-zero entries of MMU table and corresponding reference counts.

uint32_t `spi_flash_mmap_get_free_pages` (*spi_flash_mmap_memory_t* memory)

get free pages number which can be mmap

This function will return number of free pages available in mmu table. This could be useful before calling actual `spi_flash_mmap` (maps flash range to DCache or ICache memory) to check if there is sufficient space available for mapping.

参数 **memory** -- memory type of MMU table free page

返回 number of free pages which can be mmaped

size_t **spi_flash_cache2phys** (const void *cached)

Given a memory address where flash is mapped, return the corresponding physical flash offset.

Cache address does not have been assigned via `spi_flash_mmap()`, any address in memory mapped flash space can be looked up.

参数 **cached** -- Pointer to flashed cached memory.

返回

- **SPI_FLASH_CACHE2PHYS_FAIL** If cache address is outside flash cache region, or the address is not mapped.
- Otherwise, returns physical offset in flash

const void ***spi_flash_phys2cache** (size_t phys_offs, *spi_flash_mmap_memory_t* memory)

Given a physical offset in flash, return the address where it is mapped in the memory space.

Physical address does not have to have been assigned via `spi_flash_mmap()`, any address in flash can be looked up.

备注: Only the first matching cache address is returned. If MMU flash cache table is configured so multiple entries point to the same physical address, there may be more than one cache address corresponding to that physical address. It is also possible for a single physical address to be mapped to both the IROM and DROM regions.

备注: This function doesn't impose any alignment constraints, but if memory argument is `SPI_FLASH_MMAP_INST` and `phys_offs` is not 4-byte aligned, then reading from the returned pointer will result in a crash.

参数

- **phys_offs** -- Physical offset in flash memory to look up.
- **memory** -- Address space type to look up a flash cache address mapping for (instruction or data)

返回

- NULL if the physical address is invalid or not mapped to flash cache of the specified memory type.
- Cached memory address (in IROM or DROM space) corresponding to `phys_offs`.

Macros

ESP_ERR_FLASH_OP_FAIL

This file contains `spi_flash_mmap_xx` APIs, mainly for doing memory mapping to an SPI0-connected external Flash, as well as some helper functions to convert between virtual and physical address

ESP_ERR_FLASH_OP_TIMEOUT

SPI_FLASH_SEC_SIZE

SPI Flash sector size

SPI_FLASH_MMU_PAGE_SIZE

Flash cache MMU mapping page size

SPI_FLASH_CACHE2PHYS_FAIL

Type Definitions

typedef uint32_t **spi_flash_mmap_handle_t**

Opaque handle for memory region obtained from spi_flash_mmap.

Enumerations

enum **spi_flash_mmap_memory_t**

Enumeration which specifies memory space requested in an mmap call.

Values:

enumerator **SPI_FLASH_MMAP_DATA**

map to data memory, allows byte-aligned access

enumerator **SPI_FLASH_MMAP_INST**

map to instruction memory, allows only 4-byte-aligned access

Header File

- [components/hal/include/hal/spi_flash_types.h](#)
- This header file can be included with:

```
#include "hal/spi_flash_types.h"
```

Structures

struct **spi_flash_trans_t**

Definition of a common transaction. Also holds the return value.

Public Members

uint8_t **reserved**

Reserved, must be 0.

uint8_t **mosi_len**

Output data length, in bytes.

uint8_t **miso_len**

Input data length, in bytes.

uint8_t **address_bitlen**

Length of address in bits, set to 0 if command does not need an address.

uint32_t **address**

Address to perform operation on.

const uint8_t ***mosi_data**

Output data to solve.

uint8_t ***miso_data**

[out] Input data from slave, little endian

uint32_t **flags**

Flags for this transaction. Set to 0 for now.

uint16_t **command**

Command to send.

uint8_t **dummy_bitlen**

Basic dummy bits to use.

uint32_t **io_mode**

Flash working mode when `SPI_FLASH_IGNORE_BASEIO` is specified.

struct **spi_flash_sus_cmd_conf**

Configuration structure for the flash chip suspend feature.

Public Members

uint32_t **sus_mask**

SUS/SUS1/SUS2 bit in flash register.

uint32_t **cmd_rdsr**

Read flash status register(2) command.

uint32_t **sus_cmd**

Flash suspend command.

uint32_t **res_cmd**

Flash resume command.

uint32_t **reserved**

Reserved, set to 0.

struct **spi_flash_encryption_t**

Structure for flash encryption operations.

Public Members

void (***flash_encryption_enable**)(void)

Enable the flash encryption.

void (***flash_encryption_disable**)(void)

Disable the flash encryption.

void (***flash_encryption_data_prepare**)(uint32_t address, const uint32_t *buffer, uint32_t size)

Prepare flash encryption before operation.

备注: address and buffer must be 8-word aligned.

Param address The destination address in flash for the write operation.

Param buffer Data for programming

Param size Size to program.

void (***flash_encryption_done**)(void)

flash data encryption operation is done.

void (***flash_encryption_destroy**)(void)

Destroy encrypted result

bool (***flash_encryption_check**)(uint32_t address, uint32_t length)

Check if is qualified to encrypt the buffer

Param address the address of written flash partition.

Param length Buffer size.

struct **spi_flash_host_inst_t**

SPI Flash Host driver instance

Public Members

const struct *spi_flash_host_driver_s* ***driver**

Pointer to the implementation function table.

struct **spi_flash_host_driver_s**

Host driver configuration and context structure.

Public Members

esp_err_t (***dev_config**)(*spi_flash_host_inst_t* *host)

Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously

esp_err_t (***common_command**)(*spi_flash_host_inst_t* *host, *spi_flash_trans_t* *t)

Send an user-defined spi transaction to the device.

esp_err_t (***read_id**)(*spi_flash_host_inst_t* *host, uint32_t *id)

Read flash ID.

void (***erase_chip**)(*spi_flash_host_inst_t* *host)

Erase whole flash chip.

void (***erase_sector**)(*spi_flash_host_inst_t* *host, uint32_t start_address)

Erase a specific sector by its start address.

void (***erase_block**)(*spi_flash_host_inst_t* *host, uint32_t start_address)

Erase a specific block by its start address.

esp_err_t (***read_status**)(*spi_flash_host_inst_t* *host, uint8_t *out_sr)

Read the status of the flash chip.

esp_err_t (***set_write_protect**)(*spi_flash_host_inst_t* *host, bool wp)

Disable write protection.

void (***program_page**)(*spi_flash_host_inst_t* *host, const void *buffer, uint32_t address, uint32_t length)

Program a page of the flash. Check `max_write_bytes` for the maximum allowed writing length.

bool (***supports_direct_write**)(*spi_flash_host_inst_t* *host, const void *p)

Check whether the SPI host supports direct write.

When cache is disabled, SPI1 doesn't support directly write when buffer isn't internal.

int (***write_data_slicer**)(*spi_flash_host_inst_t* *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)

Slicer for write data. The `program_page` should be called iteratively with the return value of this function.

Param address Beginning flash address to write

Param len Length request to write

Param align_addr Output of the aligned address to write to

Param page_size Physical page size of the flash chip

Return Length that can be actually written in one `program_page` call

esp_err_t (***read**)(*spi_flash_host_inst_t* *host, void *buffer, uint32_t address, uint32_t read_len)

Read data from the flash. Check `max_read_bytes` for the maximum allowed reading length.

bool (***supports_direct_read**)(*spi_flash_host_inst_t* *host, const void *p)

Check whether the SPI host supports direct read.

When cache is disabled, SPI1 doesn't support directly read when the given buffer isn't internal.

int (***read_data_slicer**)(*spi_flash_host_inst_t* *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)

Slicer for read data. The `read` should be called iteratively with the return value of this function.

Param address Beginning flash address to read

Param len Length request to read

Param align_addr Output of the aligned address to read

Param page_size Physical page size of the flash chip

Return Length that can be actually read in one `read` call

uint32_t (***host_status**)(*spi_flash_host_inst_t* *host)

Check the host status, 0:busy, 1:idle, 2:suspended.

esp_err_t (***configure_host_io_mode**)(*spi_flash_host_inst_t* *host, uint32_t command, uint32_t addr_bitlen, int dummy_bitlen_base, *esp_flash_io_mode_t* io_mode)

Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

void (***poll_cmd_done**)(*spi_flash_host_inst_t* *host)

Internal use, poll the HW until the last operation is done.

esp_err_t (***flush_cache**)(*spi_flash_host_inst_t* *host, uint32_t addr, uint32_t size)

For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

void (***check_suspend**)(*spi_flash_host_inst_t* *host)

Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

void (***resume**)(*spi_flash_host_inst_t* *host)

Resume flash from suspend manually

void (***suspend**)(*spi_flash_host_inst_t* *host)

Set flash in suspend status manually

esp_err_t (***sus_setup**)(*spi_flash_host_inst_t* *host, const *spi_flash_sus_cmd_conf* *sus_conf)

Suspend feature setup for setting cmd and status register mask.

Macros

SPI_FLASH_TRANS_FLAG_CMD16

Send command of 16 bits.

SPI_FLASH_TRANS_FLAG_IGNORE_BASEIO

Not applying the basic io mode configuration for this transaction.

SPI_FLASH_TRANS_FLAG_BYTE_SWAP

Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

SPI_FLASH_TRANS_FLAG_PE_CMD

Indicates that this transaction is to erase/program flash chip.

SPI_FLASH_CONFIG_CONF_BITS

OR the io_mode with this mask, to enable the dummy output feature or replace the first several dummy bits into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)

SPI_FLASH_OPI_FLAG

A flag for flash work in opi mode, the io mode below are opi, above are SPI/QSPI mode. DO NOT use this value in any API.

SPI_FLASH_READ_MODE_MIN

Slowest io mode supported by ESP32, currently SlowRd.

Type Definitions

typedef enum *esp_flash_speed_s* **esp_flash_speed_t**

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLASH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

typedef struct *spi_flash_host_driver_s* **spi_flash_host_driver_t**

Enumerations

enum **esp_flash_speed_s**

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLASH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

Values:

enumerator **ESP_FLASH_5MHZ**

The flash runs under 5MHz.

enumerator **ESP_FLASH_10MHZ**

The flash runs under 10MHz.

enumerator **ESP_FLASH_20MHZ**

The flash runs under 20MHz.

enumerator **ESP_FLASH_26MHZ**

The flash runs under 26MHz.

enumerator **ESP_FLASH_40MHZ**

The flash runs under 40MHz.

enumerator **ESP_FLASH_80MHZ**

The flash runs under 80MHz.

enumerator **ESP_FLASH_120MHZ**

The flash runs under 120MHz, 120MHZ can only be used by main flash after timing tuning in system. Do not use this directly in any API.

enumerator **ESP_FLASH_SPEED_MAX**

The maximum frequency supported by the host is `ESP_FLASH_SPEED_MAX-1`.

enum **esp_flash_io_mode_t**

Mode used for reading from SPI flash.

Values:

enumerator **SPI_FLASH_SLOWRD**

Data read using single I/O, some limits on speed.

enumerator **SPI_FLASH_FASTRD**

Data read using single I/O, no limit on speed.

enumerator **SPI_FLASH_DOUT**

Data read using dual I/O.

enumerator **SPI_FLASH_DIO**

Both address & data transferred using dual I/O.

enumerator **SPI_FLASH_QOUT**

Data read using quad I/O.

enumerator **SPI_FLASH_QIO**

Both address & data transferred using quad I/O.

enumerator **SPI_FLASH_OPI_STR**

Only support on OPI flash, flash read and write under STR mode.

enumerator **SPI_FLASH_OPI_DTR**

Only support on OPI flash, flash read and write under DTR mode.

enumerator **SPI_FLASH_READ_MODE_MAX**

The fastest io mode supported by the host is `ESP_FLASH_READ_MODE_MAX-1`.

Header File

- [components/hal/include/hal/esp_flash_err.h](#)
- This header file can be included with:

```
#include "hal/esp_flash_err.h"
```

Macros

ESP_ERR_FLASH_NOT_INITIALISED

`esp_flash_chip_t` structure not correctly initialised by `esp_flash_init()`.

ESP_ERR_FLASH_UNSUPPORTED_HOST

Requested operation isn't supported via this host SPI bus (`chip->spi` field).

ESP_ERR_FLASH_UNSUPPORTED_CHIP

Requested operation isn't supported by this model of SPI flash chip.

ESP_ERR_FLASH_PROTECTED

Write operation failed due to chip's write protection being enabled.

Enumerations

enum **[anonymous]**

Values:

enumerator **ESP_ERR_FLASH_SIZE_NOT_MATCH**

The chip doesn't have enough space for the current partition table.

enumerator **ESP_ERR_FLASH_NO_RESPONSE**

Chip did not respond to the command, or timed out.

Header File

```

or

```
PRIV_REQUIRES bootloader_support
```

Functions

bool **esp_flash_encryption_enabled** (void)

Is flash encryption currently enabled in hardware?

Flash encryption is enabled if the `FLASH_CRYPT_CNT` efuse has an odd number of bits set.

返回 true if flash encryption is enabled.

esp_err_t **esp_flash_encrypt_check_and_update** (void)

bool **esp_flash_encrypt_state** (void)

Returns the Flash Encryption state and prints it.

返回 True - Flash Encryption is enabled False - Flash Encryption is not enabled

bool **esp_flash_encrypt_initialized_once** (void)

Checks if the first initialization was done.

If the first initialization was done then FLASH_CRYPT_CNT != 0

返回 true - the first initialization was done false - the first initialization was NOT done

esp_err_t **esp_flash_encrypt_init** (void)

The first initialization of Flash Encryption key and related eFuses.

返回 ESP_OK if all operations succeeded

esp_err_t **esp_flash_encrypt_contents** (void)

Encrypts flash content.

返回 ESP_OK if all operations succeeded

esp_err_t **esp_flash_encrypt_enable** (void)

Activates Flash encryption on the chip.

It burns FLASH_CRYPT_CNT eFuse based on the CONFIG_SECURE_FLASH_ENCRYPTION_MODE_RELEASE option.

返回 ESP_OK if all operations succeeded

bool **esp_flash_encrypt_is_write_protected** (bool print_error)

Returns True if the write protection of FLASH_CRYPT_CNT is set.

参数 **print_error** -- Print error if it is write protected

返回 true - if FLASH_CRYPT_CNT is write protected

esp_err_t **esp_flash_encrypt_region** (uint32_t src_addr, size_t data_length)

Encrypt-in-place a block of flash sectors.

备注: This function resets RTC_WDT between operations with sectors.

参数

- **src_addr** -- Source offset in flash. Should be multiple of 4096 bytes.
- **data_length** -- Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

返回 ESP_OK if all operations succeeded, ESP_ERR_FLASH_OP_FAIL if SPI flash fails, ESP_ERR_FLASH_OP_TIMEOUT if flash times out.

void **esp_flash_write_protect_crypt_cnt** (void)

Write protect FLASH_CRYPT_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

备注: On ESP32 V3 only, write protecting FLASH_CRYPT_CNT will also prevent disabling UART Download Mode. If both are wanted, call esp_efuse_disable_rom_download_mode() before calling this function.

esp_flash_enc_mode_t **esp_get_flash_encryption_mode** (void)

Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

返回

void **esp_flash_encryption_init_checks** (void)

Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn't match the project config in any way

备注: This function is called automatically during app startup, it doesn't need to be called from the app.

bool **esp_flash_encryption_cfg_verify_release_mode** (void)

Returns the verification status for all physical security features of flash encryption in release mode.

If the device has flash encryption feature configured in the release mode, then it is highly recommended to call this API in the application startup code. This API verifies the sanity of the eFuse configuration against the release (production) mode of the flash encryption feature.

返回

- True - all eFuses are configured correctly
- False - not all eFuses are configured correctly.

void **esp_flash_encryption_set_release_mode** (void)

Switches Flash Encryption from "Development" to "Release".

If already in "Release" mode, the function will do nothing. If flash encryption efuse is not enabled yet then abort. It burns:

- "disable encrypt in dl mode"
- set FLASH_CRYPT_CNT efuse to max

Enumerations

enum **esp_flash_enc_mode_t**

Values:

enumerator **ESP_FLASH_ENC_MODE_DISABLED**

enumerator **ESP_FLASH_ENC_MODE_DEVELOPMENT**

enumerator **ESP_FLASH_ENC_MODE_RELEASE**

2.5.29 SPI 主机驱动程序

SPI 主机驱动程序是一个软件程序，用于在 ESP32-P4 的通用 SPI (GP-SPI) 外设工作在主控模式时，对其进行控制。

有关 GP-SPI 硬件相关信息，请参考 [ESP32-P4 技术参考手册 > SPI 控制器 \[PDF\]](#)。

术语

下表为 SPI 主机驱动的相关术语。

术语	定义
主机 (Host)	ESP32-P4 内置的 SPI 控制器外设。用作 SPI 主机，在总线上发起 SPI 传输。
设备 (Device)	SPI 从机设备。一条 SPI 总线与一或多个设备连接。每个设备共享 MOSI、MISO 和 SCLK 信号，但只有当主机向设备的专属 CS 线发出信号时，设备才会在总线上处于激活状态。
总线 (Bus)	信号总线，由连接到同一主机的所有设备共用。一般来说，每条总线包括以下线：MISO、MOSI、SCLK、一条或多条 CS 线，以及可选的 QUADWP 和 QUADHD。因此，除每个设备都有单独的 CS 线外，所有设备都连接在相同的线下。多个设备也可以菊花链的方式共享一条 CS 线。
MOSI	主机输出，从机输入，也写作 D。数据从主机发送至设备。在 Octal/OPI 模式下也表示为 data0 信号。
MISO	主机输入，从机输出，也写作 Q。数据从设备发送至主机。在 Octal/OPI 模式下也表示为 data1 信号。
SCLK	串行时钟。由主机产生的振荡信号，使数据位的传输保持同步。
CS	片选。允许主机选择连接到总线上的单个设备，以便发送或接收数据。
QUADWP	写保护信号。只用于 4 位 (qio/qout) 传输。在 Octal/OPI 模式下也表示为 data2 信号。
QUADHD	保持信号。只用于 4 位 (qio/qout) 传输。在 Octal/OPI 模式下也表示为 data3 信号。
DATA4	在 Octal/OPI 模式下表示为 data4 信号。
DATA5	在 Octal/OPI 模式下表示为 data5 信号。
DATA6	在 Octal/OPI 模式下表示为 data6 信号。
DATA7	在 Octal/OPI 模式下表示为 data7 信号。
断言 (Assertion)	指激活一条线路的操作。
去断言 (De-assertion)	指将线路恢复到非活动状态（回到空闲状态）的操作。
传输事务 (Transaction)	即主机断言设备的 CS 线，向设备发送数据/从设备读取数据，接着去断言 CS 线的过程。传输事务为原子操作，不可打断。
发射沿 (Launch Edge)	源寄存器将信号发射到线路上的时钟边沿。
锁存沿 (Latch Edge)	目的寄存器锁存信号的时钟边沿。

主机驱动特性

SPI 主机驱动程序负责管理主机与设备间的通信，具有以下特性：

- 支持多线程环境使用
- 读写数据过程中 DMA 透明传输
- 同一信号总线上不同设备的数据可自动时分复用，请参阅 [SPI 总线锁](#)。

警告： SPI 主机驱动允许总线上连接多个设备（共享单个 ESP32-P4 SPI 外设）。每个设备仅由一个任务访问时，驱动程序线程安全。反之，若多个任务尝试访问同一 SPI 设备，则驱动程序 **非线程安全**。此时，建议执行以下任一操作：

- 重构应用程序，确保每个 SPI 外设在同一时间仅由一个任务访问。使用 `spi_bus_config_t::isr_cpu_id` 将 SPI ISR 注册到与 SPI 外设相关任务相同的内核，以确保线程安全。
- 使用 `xSemaphoreCreateMutex` 为共享设备添加互斥锁。

SPI 传输事务

SPI 总线传输事务由五个阶段构成，详见下表（任意阶段均可跳过）。

阶段名称	描述
命令阶段 (Command)	在此阶段，主机向总线发送命令字段，长度为 0-16 位。
地址阶段 (Address)	在此阶段，主机向总线发送地址字段，长度为 0-32 位。
Dummy 阶段	此阶段可自行配置，用于适配时序要求。
写入阶段 (Write)	此阶段主机向设备传输数据，这些数据在紧随命令阶段（可选）和地址阶段（可选）之后。从电平的角度来看，数据与命令没有区别。
读取阶段 (Read)	此阶段主机读取设备数据。

传输事务属性由总线配置结构体 `spi_bus_config_t`、设备配置结构体 `spi_device_interface_config_t` 和传输事务配置结构体 `spi_transaction_t` 共同决定。

一个 SPI 主机可以发送全双工传输事务，此时读取和写入阶段同步进行。传输事务总长度取决于以下结构体成员长度总和：

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

而 `spi_transaction_t::rxlength` 则决定了接收到的数据包长度。

在半双工传输事务中，读取和写入阶段独立进行（一次一个方向）。写入和读取阶段的长度由 `spi_transaction_t::length` 和 `spi_transaction_t::rxlength` 分别决定。

并非每个 SPI 设备都要求命令和/或地址，因此命令阶段和地址阶段为可选项。这反映在设备的配置中：如果 `spi_device_interface_config_t::command_bits` 和/或 `spi_device_interface_config_t::address_bits` 被设置为零，则不会唤起命令或地址阶段。

并非每个传输事务都需要写入和读取数据，因此读取和写入阶段也是可选项。如果将 `spi_transaction_t::rx_buffer` 设置为 NULL，且未设置 `SPI_TRANS_USE_RXDATA`，读取阶段将被跳过。如果将 `spi_transaction_t::tx_buffer` 设置为 NULL，且未设置 `SPI_TRANS_USE_TXDATA`，写入阶段将被跳过。

主机驱动程序支持两种类型的传输事务：中断传输事务和轮询传输事务。用户可以选择在不同设备上使用不同的传输事务类型。若设备需要同时使用两种传输事务类型，请参阅[向同一设备发送混合传输事务的注意事项](#)。

中断传输事务 中断传输事务将阻塞传输事务程序，直至传输事务完成，以使 CPU 运行其他任务程序。

应用任务中可以将多个传输事务加入到队列中，驱动程序将在中断服务程序 (ISR) 中自动逐一发送队列中的数据。在所有传输事务完成以前，任务可切换到其他程序中。

轮询传输事务 轮询传输事务不依赖于中断，程序将不断轮询 SPI 主机的状态位，直到传输事务完成。

所有执行中断传输事务的任务都可能被队列阻塞。在此情况下，用户需要等待 ISR 和传输事务传输完成。轮询传输事务节省了原本用于队列处理和上下文切换的时间，减少了传输事务持续时间。传输事务类型的缺点是在这些事务进行期间，CPU 将被占用而处于忙碌状态。

传输事务完成后，`spi_device_polling_end()` 程序需要至少 1 μ s 的时间来解除阻塞其他任务。此处强烈建议调用函数 `spi_device_acquire_bus()` 和 `spi_device_release_bus()` 来打包一系列轮询传输事务以避免开销。详情请参阅[获取总线](#)。

传输线模式配置 ESP32-P4 支持的线路模式如下。要使用这些模式，请在结构体 `spi_transaction_t` 中设置 flags，如传输事务标志信号一栏所示。要检查相应的 IO 管脚是否被设置，请在 `spi_bus_config_t` 中设置 flags，如总线 IO 设置标志信号一栏所示。

模式	命令位宽	地址位宽	数据位宽	传输事务标志信号	总线 IO 设置标志信号
普通 SPI 模式	1	1	1	0	0
双线输出模式	1	1	2	SPI_TRANS_MODE_2WIRE	SPI_COM-MON_BUSFLAG_DUAL
双线 I/O 模式	1	2	2	SPI_TRANS_MODE_2WIRE SPI_TRANS_MULTILINE_CMD	SPI_COM-MON_BUSFLAG_DUAL
四线输出模式	1	1	4	SPI_TRANS_MODE_4WIRE	SPI_COM-MON_BUSFLAG_QUAD
四线 I/O 模式	1	4	4	SPI_TRANS_MODE_4WIRE SPI_TRANS_MULTILINE_CMD	SPI_COM-MON_BUSFLAG_QUAD
八线输出模式	1	1	8	SPI_TRANS_MODE_8WIRE	SPI_COM-MON_BUSFLAG_OCTAL
OPI 模式	8	8	8	SPI_TRANS_MODE_8WIRE SPI_TRANS_MULTILINE_CMD SPI_TRANS_MULTILINE_ADDR	SPI_COM-MON_BUSFLAG_OCTAL

命令阶段和地址阶段 在命令阶段和地址阶段，`spi_transaction_t::cmd` 和 `spi_transaction_t::addr` 将被发送到总线，该过程中无数据读取。命令阶段和地址阶段的默认长度通过调用 `spi_bus_add_device()` 在 `spi_device_interface_config_t` 中设置。如果 `spi_transaction_t::flags` 中的标志信号 `SPI_TRANS_VARIABLE_CMD` 和 `SPI_TRANS_VARIABLE_ADDR` 未设置，则驱动程序将在设备初始化期间自动将这些阶段的长度设置为默认值。

如需更改命令阶段和地址阶段的长度，可通过以下步骤实现：声明结构体 `spi_transaction_ext_t`，在 `spi_transaction_ext_t::base` 中设置标志信号 `SPI_TRANS_VARIABLE_CMD` 和/或 `SPI_TRANS_VARIABLE_ADDR`，随后按正常步骤完成余下配置。这样一来，各阶段的长度将等于结构体 `spi_transaction_ext_t` 中设置的 `spi_transaction_ext_t::command_bits` 和 `spi_transaction_ext_t::address_bits` 长度。

如果需要命令阶段和地址阶段的线数与数据阶段保持一致，则应在结构体 `spi_transaction_t` 中将 `SPI_TRANS_MULTILINE_CMD` 和/或 `SPI_TRANS_MULTILINE_ADDR` 设置进该结构体的 `flags` 成员变量。请参阅 [传输线模式配置](#)。

写入和读取阶段 一般而言，需要传输到设备或由设备读取的数据将由 `spi_transaction_t::rx_buffer` 和 `spi_transaction_t::tx_buffer` 指向的内存块中读取或写入。如果传输时启用了 DMA，则缓冲区应：

1. 申请支持 DMA 的内存。具体操作请参阅 [支持 DMA 的内存](#)。
2. 32 位对齐（从 32 位边界开始，长度为 4 字节的倍数）。

若未满足以上要求，传输事务效率将受到临时缓冲区分配和复制的影响。

如果使用多条数据线传输，请在结构体 `spi_device_interface_config_t` 中的 `flags` 设置 `SPI_DEVICE_HALFDUPLEX` 标志信号。结构体 `spi_transaction_t` 中的 `flags` 应按照 [传输线模式配置](#) 中的描述设置。

备注： 不支持同时具有读取和写入阶段的半双工传输事务。请使用全双工模式。

获取总线 若需连续发送专门的 SPI 传输事务以提高效率，可采用获取总线的方式。获取总线后，与其他设备间的传输事务（包括轮询传输事务或中断传输事务）将处于待处理状态，直到总线被释放。要获取和释放总线，请调用函数 `spi_device_acquire_bus()` 和 `spi_device_release_bus()`。

使用驱动程序

- 通过调用函数 `spi_bus_initialize()` 初始化 SPI 总线。确保在结构体 `spi_bus_config_t` 中设置正确的 I/O 管脚。不需要的信号设置为 -1。
- 通过调用函数 `spi_bus_add_device()` 注册连接到总线的设备。确保用参数 `dev_config` 配置设备可能需要的任何时序要求。完成上述操作后可获得设备句柄，以便在向设备发送传输事务时使用。
- 要与设备交互，请在 一个或多个 `spi_transaction_t` 结构体中填充所需的传输事务参数，随后使用轮询传输事务或中断传输事务发送这些结构体：
 - **中断传输事务** 调用函数 `spi_device_queue_trans()` 将传输事务添加到队列中，随后使用函数 `spi_device_get_trans_result()` 查询结果，或将所有请求输入 `spi_device_transmit()` 实现同步处理。
 - **轮询传输事务** 调用函数 `spi_device_polling_transmit()` 发送轮询传输事务。若有插入内容的需要，也可使用 `spi_device_polling_start()` 和 `spi_device_polling_end()` 发送传输事务。
- (可选) 若要向设备发送背对背传输事务，请在发送传输事务前调用函数 `spi_device_acquire_bus()`，并在发送传输事务后调用函数 `spi_device_release_bus()`。
- (可选) 要从总线上移除特定设备，请以设备句柄为参数调用函数 `spi_bus_remove_device()`。
- (可选) 要复位 (或重置) 总线，请确保总线上未连接其他设备，并调用函数 `spi_bus_free()`。

SPI 主机驱动程序的示例代码存放在 ESP-IDF 示例项目的 `peripherals/spi_master` 目录下。

传输数据小于 32 位的传输事务 当传输事务数据等于或小于 32 位时，为数据分配一个缓冲区将是次优的选择。实际上，数据可以直接存储于传输事务结构体中。对已传输的数据，可通过调用函数 `spi_transaction_t::tx_data` 并在传输时设置 `SPI_TRANS_USE_TXDATA` 标志信号来实现。对已接收的数据，可通过调用函数 `spi_transaction_t::rx_data` 并设置 `SPI_TRANS_USE_RXDATA` 来实现。在这两种情况下，请勿修改 `spi_transaction_t::tx_buffer` 或 `spi_transaction_t::rx_buffer`，因为它们与 `spi_transaction_t::tx_data` 和 `spi_transaction_t::rx_data` 的内存位置相同。

非 `uint8_t` 的整数传输事务 SPI 主机逐字节地将数据读入和写入内存。默认情况下，数据优先以最高有效位 (MSB) 发送，极少数情况下会优先使用最低有效位 (LSB)。如果需要发送一个小于 8 位的值，这些位应以 MSB 优先的方式写入内存。

例如，如果需要发送 `0b00010`，则应将其写成 `uint8_t` 变量，读取长度设置为 5 位。此时，设备仍然会收到 8 位数据，并另有 3 个“随机”位，所以读取过程必须准确。

此外，ESP32-P4 属于小端芯片，即 `uint16_t` 和 `uint32_t` 变量的最低有效位存储在最小的地址。因此，如果 `uint16_t` 存储在内存中，则首先发送位 [7:0]，其次是位 [15:8]。

在某些情况下，要传输的数据大小与 `uint8_t` 数组不同，可使用以下宏将数据转换为可由 SPI 驱动直接发送的格式：

- 需传输的数据，使用 `SPI_SWAP_DATA_TX`
- 接收到的数据，使用 `SPI_SWAP_DATA_RX`

向同一设备发送混合传输事务的注意事项 为避免代码过于复杂，请一次只向单个设备发送一种类型的传输事务 (中断或轮询)。如有需要，可交替发送中断传输事务和轮询传输事务，详见下文。

所有的轮询传输事务和中断传输事务完成后，方可发送轮询传输事务。

由于未完成的轮询传输事务将阻塞其他传输事务，请务必在 `spi_device_polling_start()` 之后调用函数 `spi_device_polling_end()` 以允许其他事务或其他设备使用总线。如果在轮询过程中无需切换到其他任务，可调用函数 `spi_device_polling_transmit()` 启动传输事务，则该传输事务将自动结束。

ISR 会干扰飞行中的轮询传输事务，以适应中断传输事务。在调用 `spi_device_polling_start()` 前，需确保所有发送到 ISR 的中断传输事务已经完成。为此可持续调用 `spi_device_get_trans_result()`，直至全部传输事务返回。

为更好地控制函数的调用顺序，只在单个任务中向同一设备发送混合传输事务。

GPIO 矩阵与 IO_MUX 管脚 芯片的大多数外围信号都与之专用的 IO_MUX 管脚连接，但这些信号也可以通过较不直接的 GPIO 矩阵路由到任何其他可用的管脚。只要有一个信号是通过 GPIO 矩阵路由的，那么所有的信号都将通过它路由。

当 SPI 主机被设置为 80 MHz 或更低的频率时，通过 GPIO 矩阵路由 SPI 管脚的行为将与通过 IOMUX 路由相同。

SPI 总线的 IO_MUX 管脚如下表所示。

管脚名称	GPIO 编号 (SPI2)
CS0 ¹	7
SCLK	9
MISO	10
MOSI	8
QUADWP	11
QUADHD	6

传输速度的影响因素

传输速度主要有以下三个限制因素

- 传输事务间隔时间
- SPI 时钟频率
- 缓存缺失的 SPI 函数，包括回调

影响大传输事务传输速度的主要参数是时钟频率。而多个小传输事务的传输速度主要由传输事务间隔时长决定。

传输事务持续时间 传输事务持续时间包括设置 SPI 外设寄存器，将数据复制到 FIFO 或设置 DMA 链接，以及 SPI 传输事务时间。

中断传输事务允许附加额外的开销，以适应 FreeRTOS 队列的成本以及任务与 ISR 切换所需的时间。

对于 **中断传输事务**，CPU 可以在传输事务进行过程中切换到其他任务，这能够节约 CPU 时间，会延长传输事务持续时间，请参阅 [中断传输事务](#)。对于 **轮询传输事务**，它不会阻塞任务，但允许在传输事务进行时轮询。详情请参阅 [轮询传输事务](#)。

如果 DMA 被启用，每个传输事务设置链接列表需要约 2 μ s。当主机传输数据时，它会自动从链接列表中读取数据。如果不启用 DMA，CPU 必须自己从 FIFO 中写入和读取每个字节。这一过程时长通常不到 2 μ s，但写入和读取的传输事务长度都被限制在 64 字节。

单个字节数据的典型传输事务持续时间如下。

- 使用 DMA 的中断传输事务：N/A μ s。
- 使用 CPU 的中断传输事务：N/A μ s。
- 使用 DMA 的轮询传输事务：N/A μ s。
- 使用 CPU 的轮询传输事务：N/A μ s。

请注意，以上数据测试时，`CONFIG_SPI_MASTER_ISR_IN_IRAM` 选项处于启用状态，SPI 传输事务相关的代码放置在 IRAM 中。若关闭此选项（例如为了节省 IRAM），可能影响传输事务持续时间。

SPI 时钟频率 GPSPi 外设的时钟源可以通过设置 `spi_device_handle_t::cfg::clock_source` 选择，可用的时钟源请参阅 [spi_clock_source_t](#)。

默认情况下，驱动程序将把 `spi_device_handle_t::cfg::clock_source` 设置为 `SPI_CLK_SRC_DEFAULT`。这往往代表 GPSPi 时钟源中的最高频率，在不同的芯片中这一数值会有所不同。

¹ 只有连接到总线的第一台设备可以使用 CS0 管脚。

设备的实际时钟频率可能不完全等于所设置的数字，驱动会将其重新计算为与硬件兼容的最接近的数字，并且不超过时钟源的时钟频率。调用函数 `spi_device_get_actual_freq()` 以了解驱动计算的实际频率。

写入或读取阶段的理论最大传输速度可根据下表计算：

写入/读取阶段的线宽	速度 (Bps)
1-Line	$SPI \text{ 频率} / 8$
2-Line	$SPI \text{ 频率} / 4$
4-Line	$SPI \text{ 频率} / 2$
8-Line	$SPI \text{ 频率}$

其他阶段（命令阶段、地址阶段、Dummy 阶段）的传输速度计算与此类似。

缓存缺失 默认配置只将 ISR 置于 IRAM 中。其他 SPI 相关功能，包括驱动本身和回调都可能发生缓存缺失，需等待代码从 flash 中读取。为避免缓存缺失，可参考 `CONFIG_SPI_MASTER_IN_IRAM`，将整个 SPI 驱动置入 IRAM，并将整个回调及其 callee 函数一起置入 IRAM。

备注： SPI 驱动是基于 FreeRTOS 的 API 实现的，在使用 `CONFIG_SPI_MASTER_IN_IRAM` 时，不得启用 `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`。

单个中断传输事务传输 n 字节的总成本为 $20+8n/F_{spi}[\text{MHz}] [\mu\text{s}]$ ，故传输速度为 $n/(20+8n/F_{spi})$ 。8 MHz 时钟速度的传输速度见下表。

频率 (MHz)	传输事务间隔 (μs)	传输事务长度 (bytes)	传输时长 (μs)	传输速度 (KBps)
8	25	1	26	38.5
8	25	8	33	242.4
8	25	16	41	490.2
8	25	64	89	719.1
8	25	128	153	836.6

传输事务长度较短时将提高传输事务间隔成本，因此应尽可能将几个短传输事务压缩成一个传输事务，以提升传输速度。

注意，ISR 在 flash 操作期间默认处于禁用状态。要在 flash 操作期间继续发送传输事务，请启用 `CONFIG_SPI_MASTER_ISR_IN_IRAM`，并在 `spi_bus_config_t::intr_flags` 中设置 `ESP_INTR_FLAG_IRAM`。此时，flash 操作前列队的传输事务将由 ISR 并行处理。此外，每个设备的回调和它们的 callee 函数都应该在 IRAM 中，避免回调因缓存丢失而崩溃。详情请参阅 [IRAM 安全中断处理程序](#)。

应用示例

查看使用 SPI 主机驱动程序在半双工模式下读取/写入 AT93C46D EEPROM（8 位模式）的示例代码，请前往 ESP-IDF 示例的 `peripherals/spi_master/hd_eeprom` 目录。

查看使用 SPI 主机驱动程序在全双工模式下驱动 LCD 屏幕（如 ST7789V 或 ILI9341）的示例代码，请前往 ESP-IDF 示例的 `peripherals/spi_master/lcd` 目录。

API 参考 - SPI Common

Header File

- `components/hal/include/hal/spi_types.h`
- This header file can be included with:

```
#include "hal/spi_types.h"
```

Structures

struct **spi_line_mode_t**

Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.

Public Members

uint8_t **cmd_lines**

The line width of command phase, e.g. 2-line-cmd-phase.

uint8_t **addr_lines**

The line width of address phase, e.g. 1-line-addr-phase.

uint8_t **data_lines**

The line width of data phase, e.g. 4-line-data-phase.

Type Definitions

typedef *soc_periph_spi_clk_src_t* **spi_clock_source_t**

Type of SPI clock source.

Enumerations

enum **spi_host_device_t**

Enum with the three SPI peripherals that are software-accessible in it.

Values:

enumerator **SPI1_HOST**

SPI1.

enumerator **SPI2_HOST**

SPI2.

enumerator **SPI3_HOST**

SPI3.

enumerator **SPI_HOST_MAX**

invalid host value

enum **spi_event_t**

SPI Events.

Values:

enumerator **SPI_EV_BUF_TX**

The buffer has sent data to master.

enumerator **SPI_EV_BUF_RX**

The buffer has received data from master.

enumerator **SPI_EV_SEND_DMA_READY**

Slave has loaded its TX data buffer to the hardware (DMA).

enumerator **SPI_EV_SEND**

Master has received certain number of the data, the number is determined by Master.

enumerator **SPI_EV_RECV_DMA_READY**

Slave has loaded its RX data buffer to the hardware (DMA).

enumerator **SPI_EV_RECV**

Slave has received certain number of data from master, the number is determined by Master.

enumerator **SPI_EV_CMD9**

Received CMD9 from master.

enumerator **SPI_EV_CMDA**

Received CMDA from master.

enumerator **SPI_EV_TRANS**

A transaction has done.

enum **spi_command_t**

SPI command.

Values:

enumerator **SPI_CMD_HD_WRBUF**

enumerator **SPI_CMD_HD_RDBUF**

enumerator **SPI_CMD_HD_WRDMA**

enumerator **SPI_CMD_HD_RDDMA**

enumerator **SPI_CMD_HD_SEG_END**

enumerator **SPI_CMD_HD_EN_QPI**

enumerator **SPI_CMD_HD_WR_END**

enumerator **SPI_CMD_HD_INT0**

enumerator **SPI_CMD_HD_INT1**

enumerator **SPI_CMD_HD_INT2**

Header File

- `components/esp_driver_spi/include/driver/spi_common.h`
- This header file can be included with:

```
#include "driver/spi_common.h"
```

- This header file is a part of the API provided by the `esp_driver_spi` component. To declare that your component depends on `esp_driver_spi`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_spi
```

or

```
PRIV_REQUIRES esp_driver_spi
```

Functions

`esp_err_t spi_bus_initialize` (*spi_host_device_t* host_id, const *spi_bus_config_t* *bus_config, *spi_dma_chan_t* dma_chan)

Initialize a SPI bus.

警告: SPI0/1 is not supported

警告: If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

警告: The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

参数

- **host_id** -- SPI peripheral that controls this bus
- **bus_config** -- Pointer to a *spi_bus_config_t* struct specifying how the host should be initialized
- **dma_chan** -- - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
 - Selecting `SPI_DMA_DISABLED` limits the size of transactions.
 - Set to `SPI_DMA_DISABLED` if only the SPI flash uses this bus.
 - Set to `SPI_DMA_CH_AUTO` to let the driver to allocate the DMA channel.

返回

- `ESP_ERR_INVALID_ARG` if configuration is invalid
- `ESP_ERR_INVALID_STATE` if host already is in use
- `ESP_ERR_NOT_FOUND` if there is no available DMA channel
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

`esp_err_t spi_bus_free` (*spi_host_device_t* host_id)

Free a SPI bus.

警告: In order for this to succeed, all devices have to be removed first.

参数 **host_id** -- SPI peripheral to free

返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid

- ESP_ERR_INVALID_STATE if bus hasn't been initialized before, or not all devices on the bus are freed
- ESP_OK on success

Structures

struct **spi_bus_config_t**

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used. On ESP32, using GPIO matrix will bring about 25ns of input delay, which may cause incorrect read for >40MHz speeds.

备注: Be advised that the slave driver does not use the quadwp/quadhd lines and fields in *spi_bus_config_t* referring to these lines will be ignored and can thus safely be left uninitialized.

Public Members

int **mosi_io_num**

GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.

int **data0_io_num**

GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

int **miso_io_num**

GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.

int **data1_io_num**

GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.

int **sclk_io_num**

GPIO pin for SPI Clock signal, or -1 if not used.

int **quadwp_io_num**

GPIO pin for WP (Write Protect) signal, or -1 if not used.

int **data2_io_num**

GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

int **quadhd_io_num**

GPIO pin for HD (Hold) signal, or -1 if not used.

int **data3_io_num**

GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.

int **data4_io_num**

GPIO pin for spi data4 signal in octal mode, or -1 if not used.

int **data5_io_num**

GPIO pin for spi data5 signal in octal mode, or -1 if not used.

int **data6_io_num**

GPIO pin for spi data6 signal in octal mode, or -1 if not used.

int **data7_io_num**

GPIO pin for spi data7 signal in octal mode, or -1 if not used.

int **max_transfer_sz**

Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to `SOC_SPI_MAXIMUM_BUFFER_SIZE` if DMA is disabled.

uint32_t **flags**

Abilities of bus to be checked by the driver. Or-ed value of `SPICOMMON_BUSFLAG_*` flags.

esp_intr_cpu_affinity_t **isr_cpu_id**

Select cpu core to register SPI ISR.

int **intr_flags**

Interrupt flag for the bus to set the priority, and IRAM attribute, see `esp_intr_alloc.h`. Note that the `EDGE`, `INTRDISABLED` attribute are ignored by the driver. Note that if `ESP_INTR_FLAG_IRAM` is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

Macros

SPI_MAX_DMA_LEN

SPI_SWAP_DATA_TX (DATA, LEN)

Transform unsigned integer of length ≤ 32 bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points `tx_buffer` to `&data`.

参数

- **DATA** -- Data to be sent, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** -- Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

SPI_SWAP_DATA_RX (DATA, LEN)

Transform received data of length ≤ 32 bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
```

参数

- **DATA** -- Data to be rearranged, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** -- Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

SPICOMMON_BUSFLAG_SLAVE

Initialize I/O in slave mode.

SPICOMMON_BUSFLAG_MASTER

Initialize I/O in master mode.

SPICOMMON_BUSFLAG_IOMUX_PINS

Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

SPICOMMON_BUSFLAG_GPIO_PINS

Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

SPICOMMON_BUSFLAG_SCLK

Check existing of SCLK pin. Or indicates CLK line initialized.

SPICOMMON_BUSFLAG_MISO

Check existing of MISO pin. Or indicates MISO line initialized.

SPICOMMON_BUSFLAG_MOSI

Check existing of MOSI pin. Or indicates MOSI line initialized.

SPICOMMON_BUSFLAG_DUAL

Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

SPICOMMON_BUSFLAG_WPHD

Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

SPICOMMON_BUSFLAG_QUAD

Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

SPICOMMON_BUSFLAG_IO4_IO7

Check existing of IO4~IO7 pins. Or indicates IO4~IO7 pins initialized.

SPICOMMON_BUSFLAG_OCTAL

Check existing of MOSI/MISO/WP/HD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

SPICOMMON_BUSFLAG_NATIVE_PINS**Type Definitions**

```
typedef spi_common_dma_t spi_dma_chan_t
```

Enumerations

```
enum spi_common_dma_t
```

SPI DMA channels.

Values:

enumerator **SPI_DMA_DISABLED**

Do not enable DMA for SPI.

enumerator **SPI_DMA_CH_AUTO**

Enable DMA, channel is automatically selected by driver.

API 参考 - SPI Master

Header File

- [components/esp_driver_spi/include/driver/spi_master.h](#)
- This header file can be included with:

```
#include "driver/spi_master.h"
```

- This header file is a part of the API provided by the `esp_driver_spi` component. To declare that your component depends on `esp_driver_spi`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_spi
```

or

```
PRIV_REQUIRES esp_driver_spi
```

Functions

`esp_err_t spi_bus_add_device` (*spi_host_device_t* host_id, const *spi_device_interface_config_t* *dev_config, *spi_device_handle_t* *handle)

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

There's no notable delay on chips other than ESP32.

备注: On ESP32, due to the delay of GPIO matrix, the maximum frequency SPI Master can correctly samples the slave's output is lower than the case using IOMUX. Typical maximum frequency communicating with an ideal slave without data output delay: 80MHz (IOMUX pins) and 26MHz (GPIO matrix pins). With the help of extra dummy cycles in half-duplex mode, the delay can be compensated by setting `input_delay_ns` in `dev_config` structure correctly.

参数

- **host_id** -- SPI peripheral to allocate device on
- **dev_config** -- SPI interface protocol config for the device
- **handle** -- Pointer to variable to hold the device handle

返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid or configuration combination is not supported (e.g. `dev_config->post_cb` isn't set while flag `SPI_DEVICE_NO_RETURN_RESULT` is enabled)
- `ESP_ERR_INVALID_STATE` if selected clock source is unavailable or spi bus not initialized
- `ESP_ERR_NOT_FOUND` if host doesn't have any free CS slots
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

esp_err_t **spi_bus_remove_device** (*spi_device_handle_t* handle)

Remove a device from the SPI bus.

参数 **handle** -- Device handle to free

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if device already is freed
- ESP_OK on success

esp_err_t **spi_device_queue_trans** (*spi_device_handle_t* handle, *spi_transaction_t* *trans_desc, TickType_t ticks_to_wait)

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

备注: Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

参数

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans_desc** -- Description of transaction to execute
- **ticks_to_wait** -- Ticks to wait until there's room in the queue; use `portMAX_DELAY` to never time out.

返回

- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first) or set flag `SPI_TRANS_DMA_BUFFER_ALIGN_MANUAL` but tx or rx buffer not DMA-capable, or `addr&len` not align to cache line size
- ESP_ERR_TIMEOUT if there was no room in the queue before `ticks_to_wait` expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

esp_err_t **spi_device_get_trans_result** (*spi_device_handle_t* handle, *spi_transaction_t* **trans_desc, TickType_t ticks_to_wait)

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or reuse the buffers.

参数

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans_desc** -- Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
- **ticks_to_wait** -- Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if flag `SPI_DEVICE_NO_RETURN_RESULT` is set
- ESP_ERR_TIMEOUT if there was no completed transaction before `ticks_to_wait` expired
- ESP_OK on success

esp_err_t **spi_device_transmit** (*spi_device_handle_t* handle, *spi_transaction_t* *trans_desc)

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or `polling_start/transmit` that hasn't been finalized.

备注: This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

参数

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans_desc** -- Description of transaction to execute

返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

`esp_err_t spi_device_polling_start` (`spi_device_handle_t` handle, `spi_transaction_t` *trans_desc, TickType_t ticks_to_wait)

Immediately start a polling transaction.

备注: Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

参数

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans_desc** -- Description of transaction to execute
- **ticks_to_wait** -- Ticks to wait until there's room in the queue; currently only `portMAX_DELAY` is supported.

返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first) or set flag `SPI_TRANS_DMA_BUFFER_ALIGN_MANUAL` but tx or rx buffer not DMA-capable, or `addr&len` not align to cache line size
- `ESP_ERR_TIMEOUT` if the device cannot get control of the bus before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished
- `ESP_OK` on success

`esp_err_t spi_device_polling_end` (`spi_device_handle_t` handle, TickType_t ticks_to_wait)

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

参数

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **ticks_to_wait** -- Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the transaction cannot finish before `ticks_to_wait` expired
- `ESP_OK` on success

`esp_err_t spi_device_polling_transmit` (`spi_device_handle_t` handle, `spi_transaction_t` *trans_desc)

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn't been finalized.

备注: This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

参数

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans_desc** -- Description of transaction to execute

返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the device cannot get control of the bus
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions of same device are not finished
- `ESP_OK` on success

`esp_err_t spi_device_acquire_bus` (`spi_device_handle_t` device, `TickType_t` wait)

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

备注: The function will wait until all the existing transactions have been sent.

参数

- **device** -- The device to occupy the bus.
- **wait** -- Time to wait before the the bus is occupied by the device. Currently MUST set to `portMAX_DELAY`.

返回

- `ESP_ERR_INVALID_ARG` : `wait` is not set to `portMAX_DELAY`.
- `ESP_OK` : Success.

void `spi_device_release_bus` (`spi_device_handle_t` dev)

Release the SPI bus occupied by the device. All other devices can start sending transactions.

参数 **dev** -- The device to release the bus.

`esp_err_t spi_device_get_actual_freq` (`spi_device_handle_t` handle, int *freq_khz)

Calculate working frequency for specific device.

参数

- **handle** -- SPI device handle
- **freq_khz** -- [out] output parameter to hold calculated frequency in kHz

返回

- `ESP_ERR_INVALID_ARG` : `handle` or `freq_khz` parameter is NULL
- `ESP_OK` : Success

int `spi_get_actual_clock` (int fapb, int hz, int duty_cycle)

Calculate the working frequency that is most close to desired frequency.

参数

- **fapb** -- The frequency of apb clock, should be `APB_CLK_FREQ`.
- **hz** -- Desired working frequency
- **duty_cycle** -- Duty cycle of the spi clock

返回 Actual working frequency that most fit.

void `spi_get_timing` (bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)

Calculate the timing settings of specified frequency and settings.

备注: If `**dummy_o*` is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

参数

- **gpio_is_used** -- True if using GPIO matrix, or False if iomux pins are used.
- **input_delay_ns** -- Input delay from SCLK launch edge to MISO data valid.
- **eff_clk** -- Effective clock frequency (in Hz) from `spi_get_actual_clock()`.
- **dummy_o** -- Address of dummy bits used output. Set to NULL if not needed.
- **cycles_remain_o** -- Address of cycles remaining (after dummy bits are used) output.
 - -1 If too many cycles remaining, suggest to compensate half a clock.
 - 0 If no remaining cycles or dummy bits are not used.
 - positive value: cycles suggest to compensate.

int **spi_get_freq_limit** (bool gpio_is_used, int input_delay_ns)

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

参数

- **gpio_is_used** -- True if using GPIO matrix, or False if native pins are used.
- **input_delay_ns** -- Input delay from SCLK launch edge to MISO data valid.

返回 Frequency limit of current configurations.

esp_err_t **spi_bus_get_max_transaction_len** (*spi_host_device_t* host_id, size_t *max_bytes)

Get max length (in bytes) of one transaction.

参数

- **host_id** -- SPI peripheral
- **max_bytes** -- [out] Max length of one transaction, in bytes

返回

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument

Structures

struct **spi_device_interface_config_t**

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

Public Members

uint8_t **command_bits**

Default amount of bits in command phase (0-16), used when `SPI_TRANS_VARIABLE_CMD` is not used, otherwise ignored.

uint8_t **address_bits**

Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.

uint8_t **dummy_bits**

Amount of dummy bits to insert between address and data phase.

uint8_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)

- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

spi_clock_source_t **clock_source**

Select SPI clock source, `SPI_CLK_SRC_DEFAULT` by default.

`uint16_t` **duty_cycle_pos**

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

`uint16_t` **cs_ena_pretrans**

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

`uint8_t` **cs_ena_posttrans**

Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

`int` **clock_speed_hz**

SPI clock speed in Hz. Derived from `clock_source`.

`int` **input_delay_ns**

Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it's suggest to have the right value.

`int` **spics_io_num**

CS GPIO pin for this device, or -1 if not used.

`uint32_t` **flags**

Bitwise OR of `SPI_DEVICE_*` flags.

`int` **queue_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using `spi_device_queue_trans` but not yet finished using `spi_device_get_trans_result`) at the same time.

transaction_cb_t **pre_cb**

Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

transaction_cb_t **post_cb**

Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

`struct` **spi_transaction_t**

This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

Public Members

uint32_t flags

Bitwise OR of SPI_TRANS_* flags.

uint16_t cmd

Command data, of which the length is set in the `command_bits` of *spi_device_interface_config_t*.

NOTE: this field, used to be "command" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

Example: write 0x0123 and `command_bits=12` to send command 0x12, 0x3_ (in previous version, you may have to write 0x3_12).

uint64_t addr

Address data, of which the length is set in the `address_bits` of *spi_device_interface_config_t*.

NOTE: this field, used to be "address" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

Example: write 0x123400 and `address_bits=24` to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

size_t length

Total data length, in bits.

size_t rxlength

Total data length received, should be not greater than `length` in full-duplex mode (0 defaults this to the value of `length`).

void *user

User-defined variable. Can be used to store eg transaction ID.

const void *tx_buffer

Pointer to transmit buffer, or NULL for no MOSI phase.

uint8_t tx_data[4]

If SPI_TRANS_USE_TXDATA is set, data set here is sent directly from this variable.

void *rx_buffer

Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8_t rx_data[4]

If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.

struct spi_transaction_ext_t

This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI_TRANS_VARIABLE_CMD_ADR to use the bit length here.

Public Members

struct *spi_transaction_t* **base**

Transaction data, so that pointer to *spi_transaction_t* can be converted into *spi_transaction_ext_t*.

uint8_t **command_bits**

The command length in this transaction, in bits.

uint8_t **address_bits**

The address length in this transaction, in bits.

uint8_t **dummy_bits**

The dummy length in this transaction, in bits.

Macros

SPI_MASTER_FREQ_8M

SPI common used frequency (in Hz)

备注: SPI peripheral only has an integer divider, and the default clock source can be different on other targets, so the actual frequency may be slightly different from the desired frequency. 8MHz

SPI_MASTER_FREQ_9M

8.89MHz

SPI_MASTER_FREQ_10M

10MHz

SPI_MASTER_FREQ_11M

11.43MHz

SPI_MASTER_FREQ_13M

13.33MHz

SPI_MASTER_FREQ_16M

16MHz

SPI_MASTER_FREQ_20M

20MHz

SPI_MASTER_FREQ_26M

26.67MHz

SPI_MASTER_FREQ_40M

40MHz

SPI_MASTER_FREQ_80M

80MHz

SPI_DEVICE_TXBIT_LSBFIRST

Transmit command/address/data LSB first instead of the default MSB first.

SPI_DEVICE_RXBIT_LSBFIRST

Receive data LSB first instead of the default MSB first.

SPI_DEVICE_BIT_LSBFIRST

Transmit and receive LSB first.

SPI_DEVICE_3WIRE

Use MOSI (=spid) for both sending and receiving data.

SPI_DEVICE_POSITIVE_CS

Make CS positive during a transaction instead of negative.

SPI_DEVICE_HALFDUPLEX

Transmit data before receiving it, instead of simultaneously.

SPI_DEVICE_CLK_AS_CS

Output clock on CS line if CS is active.

SPI_DEVICE_NO_DUMMY

There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you're going to work with output only, or read without dummy bits at your own risk.

SPI_DEVICE_DDRCLK**SPI_DEVICE_NO_RETURN_RESULT**

Don't return the descriptor to the host on completion (use `post_cb` to notify instead)

SPI_TRANS_MODE_DIO

Transmit/receive data in 2-bit mode.

SPI_TRANS_MODE_QIO

Transmit/receive data in 4-bit mode.

SPI_TRANS_USE_RXDATA

Receive into `rx_data` member of *`spi_transaction_t`* instead into memory at `rx_buffer`.

SPI_TRANS_USE_TXDATA

Transmit `tx_data` member of *`spi_transaction_t`* instead of data at `tx_buffer`. Do not set `tx_buffer` when using this.

SPI_TRANS_MODE_DIOQIO_ADDR

Also transmit address in mode selected by `SPI_MODE_DIO/SPI_MODE_QIO`.

SPI_TRANS_VARIABLE_CMD

Use the `command_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

SPI_TRANS_VARIABLE_ADDR

Use the `address_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

SPI_TRANS_VARIABLE_DUMMY

Use the `dummy_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

SPI_TRANS_CS_KEEP_ACTIVE

Keep CS active after data transfer.

SPI_TRANS_MULTILINE_CMD

The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

SPI_TRANS_MODE_OCT

Transmit/receive data in 8-bit mode.

SPI_TRANS_MULTILINE_ADDR

The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

SPI_TRANS_DMA_BUFFER_ALIGN_MANUAL

By default driver will automatically re-alloc dma buffer if it doesn't meet hardware alignment or `dma_capable` requirements, this flag is for you to disable this feature, you will need to take care of the alignment otherwise driver will return you error `ESP_ERR_INVALID_ARG`.

Type Definitions

```
typedef void (*transaction_cb_t)(spi_transaction_t *trans)
```

```
typedef struct spi_device_t *spi_device_handle_t
```

Handle for a device on a SPI bus.

2.5.30 SPI 从机驱动程序

SPI 从机驱动程序控制在 ESP32-P4 中作为从机的 GP-SPI 外设。

有关 GP-SPI 硬件相关信息，请参考 [ESP32-P4 技术参考手册 > SPI 控制器 \[PDF\]](#)。

术语

下表为 SPI 从机驱动的相关术语。

术语	定义
主机 (Host)	ESP32-P4 外部的 SPI 控制器外设。用作 SPI 主机，在总线上发起 SPI 传输。
从机设备 (Device)	SPI 从机设备（通用 SPI 控制器）。每个从机设备共享 MOSI、MISO 和 SCLK 信号，但只有当主机向从机设备的专属 CS 线发出信号时，从机设备才会在总线上处于激活状态。
总线 (Bus)	信号总线，由连接到同一主机的所有从机设备共用。一般来说，一条总线包括以下线路：MISO、MOSI、SCLK、一条或多条 CS 线，以及可选的 QUADWP 和 QUADHD。每个从机设备都有单独的 CS 线，除此之外，所有从机设备都连接在相同的线路下。如果以菊花链的方式连接，几个从机设备也可以共享一条 CS 线。
MISO	主机输入，从机输出，也写作 Q。数据从从机设备发送至主机。
MOSI	主机输出，从机输入，也写作 D。数据从主机发送至从机设备。
SCLK	串行时钟。由主机产生的振荡信号，使数据位的传输保持同步。
CS	片选。允许主机选择连接到总线上的单个从机设备，以便发送或接收数据。
QUADWP	写保护信号。只用于 4 位 (qio/qout) 传输。
QUADHD	保持信号。只用于 4 位 (qio/qout) 传输。
断言 (Assertion)	指激活一条线的操作。反之，将线路恢复到非活动状态（回到空闲状态）的操作则称为 去断言 。
传输事务 (Transaction)	即主机断言从机设备的 CS 线，向从机设备传输数据，接着去断言 CS 线的过程。传输事务为原子操作，不可打断。
发射沿 (Launch Edge)	源寄存器将信号 发射 到线路上的时钟边沿。
锁存沿 (Latch Edge)	目的寄存器 锁存 信号的时钟边沿。

驱动程序的功能

SPI 从机驱动程序允许将 SPI 外设作为全双工设备使用。驱动程序可以发送/接收长度不超过 64 字节的传输事务，或者利用 DMA 来发送/接收更长的传输事务。然而，存在一些与 DMA 有关的 **已知问题**。

SPI 从机驱动程序支持将 SPI ISR 注册至指定 CPU 内核。如果多个任务同时尝试访问一个 SPI 设备，建议重构应用程序，以使每个 SPI 外设一次只由一个任务访问。此外，请使用 `spi_bus_config_t::isr_cpu_id` 将 SPI ISR 注册至与 SPI 外设相关任务相同的内核，确保线程安全。

SPI 传输事务

主机断言 CS 线并在 SCLK 线上发出时钟脉冲时，一次全双工 SPI 传输事务就此开始。每个时钟脉冲都意味着通过 MOSI 线从主机转移一个数据位到从机设备上，并同时通过 MISO 线返回一个数据位。传输事务结束后，主机去断言 CS 线。

传输事务的属性由作为从机设备的 SPI 外设的配置结构体 `spi_slave_interface_config_t` 和传输事务配置结构体 `spi_slave_transaction_t` 决定。

由于并非每次传输事务都需要写入和读取数据，可以选择配置 `spi_transaction_t` 为仅 TX、仅 RX 或同时 TX 和 RX 传输事务。如果将 `spi_slave_transaction_t::rx_buffer` 设置为 NULL，读取阶段将被跳过。与之类似，如果将 `spi_slave_transaction_t::tx_buffer` 设置为 NULL，则写入阶段将被跳过。

备注：主机应在从机设备准备好接收数据之后再进行传输事务。建议使用另外一个 GPIO 管脚作为握手信号来同步设备。更多细节，请参阅 [传输事务间隔](#)。

使用驱动程序

- 调用函数 `spi_slave_initialize()`，将 SPI 外设初始化为从机设备。请确保在 `bus_config` 中设置正确的 I/O 管脚，并将未使用的信号设置为 -1。
 - 传输事务开始前，需用要求的事务参数填充一个或多个 `spi_slave_transaction_t` 结构体。可以通过调用函数 `spi_slave_queue_trans()` 来将所有传输事务排进队列，并在稍后使用函数 `spi_slave_get_trans_result()` 查询结果；也可以将所有请求输入 `spi_slave_transmit()` 中单独处理。主机上的传输事务完成前，后两个函数将被阻塞，以便发送并接收队列中的数据。
- (可选) 如需卸载 SPI 从机驱动程序，请调用 `spi_slave_free()`。

传输事务数据和主/从机长度不匹配

通常，通过从机设备进行传输的数据会被读取或写入到由 `spi_slave_transaction_t::rx_buffer` 和 `spi_slave_transaction_t::tx_buffer` 指示的大块内存中。可以配置 SPI 驱动程序，使用 DMA 进行传输。在这种情况下，则必须使用 `pvPortMallocCaps(size, MALLOC_CAP_DMA)` 将缓存区分配到具备 DMA 功能的内存中。

驱动程序可以读取或写入缓存区的数据量取决于 `spi_slave_transaction_t::length`，但其并不会定义一次 SPI 传输的实际长度。传输事务的长度由主机的时钟线和 CS 线决定，且只有在传输事务完成后，才能从 `spi_slave_transaction_t::trans_len` 中读取实际长度。

如果传输长度超过缓存区长度，则只有在 `spi_slave_transaction_t::length` 中指定的初始比特数会被发送和接收。此时，`spi_slave_transaction_t::trans_len` 被设置为 `spi_slave_transaction_t::length` 而非实际传输事务长度。若需满足实际传输事务长度的要求，请将 `spi_slave_transaction_t::length` 设置为大于 `spi_slave_transaction_t::trans_len` 预期最大值的值。如果传输长度短于缓存区长度，则只传输与缓存区长度相等的数据。

GPIO 交换矩阵和 IO_MUX

ESP32-P4 的大多数外设信号都直接连接到其专用的 IO_MUX 管脚。不过，也可以使用 GPIO 交换矩阵，将信号路由到任何可用的其他管脚。如果通过 GPIO 交换矩阵路由了至少一个信号，则所有信号都将通过 GPIO 交换矩阵路由。

当 SPI 主机频率配置为 80 MHz 或更低时，则通过 GPIO 交换矩阵或 IO_MUX 路由 SPI 管脚效果相同。

下表列出了 SPI 总线的 IO_MUX 管脚。

管脚名称	GPIO 编号 (SPI2)
CS0	7
SCLK	9
MISO	10
MOSI	8
QUADWP	11
QUADHD	6

速度与时钟

传输事务间隔 ESP32-P4 的 SPI 从机外设是由 CPU 控制的通用从机设备。与专用的从机相比，在内嵌 CPU 的 SPI 从机设备中，预定义寄存器的数量有限，所有的传输事务都必须由 CPU 处理。也就是说，传输和响应并不是实时的，且可能存在明显的延迟。

解决方案为，首先使用函数 `spi_slave_queue_trans()`，然后使用 `spi_slave_get_trans_result()`，来代替 `spi_slave_transmit()`。由此一来，可使从机设备的响应速度提高一倍。

也可以配置一个 GPIO 管脚，当从机设备开始新一次传输事务前，它将通过该管脚向主机发出信号。示例代码存放在 `peripherals/spi_slave` 目录下。

时钟频率要求 SPI 从机的工作频率最高可达 60 MHz。如果时钟频率过快或占空比不足 50%，数据就无法被正确识别或接收。

限制条件和已知问题

1. 若启用了 DMA，则 RX 缓冲区应该以字对齐（从 32 位边界开始，字节长度为 4 的倍数）。否则，DMA 可能无法正确写入或无法实现边界对齐。若此项条件不满足，驱动程序将会报错。此外，主机写入字节长度应为 4 的倍数。长度不符合的数据将被丢弃。

应用示例

从机设备/主机通信的示例代码存放在 ESP-IDF 示例项目的 `peripherals/spi_slave` 目录下。

API 参考

Header File

- `components/esp_driver_spi/include/driver/spi_slave.h`
- This header file can be included with:

```
#include "driver/spi_slave.h"
```

- This header file is a part of the API provided by the `esp_driver_spi` component. To declare that your component depends on `esp_driver_spi`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_spi
```

or

```
PRIV_REQUIRES esp_driver_spi
```

Functions

`esp_err_t spi_slave_initialize` (`spi_host_device_t` host, const `spi_bus_config_t` *bus_config, const `spi_slave_interface_config_t` *slave_config, `spi_dma_chan_t` dma_chan)

Initialize a SPI bus as a slave interface.

警告: SPI0/1 is not supported

警告: If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

警告: The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

参数

- **host** -- SPI peripheral to use as a SPI slave interface
- **bus_config** -- Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized

- **slave_config** -- Pointer to a *spi_slave_interface_config_t* struct specifying the details for the slave interface
- **dma_chan** -- - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
 - Selecting SPI_DMA_DISABLED limits the size of transactions.
 - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
 - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

返回

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

esp_err_t **spi_slave_free** (*spi_host_device_t* host)

Free a SPI bus claimed as a SPI slave interface.

参数 **host** -- SPI peripheral to free

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

esp_err_t **spi_slave_queue_trans** (*spi_host_device_t* host, const *spi_slave_transaction_t* *trans_desc, TickType_t ticks_to_wait)

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via *spi_slave_initialize*.) This function may block if the queue is full (depending on the *ticks_to_wait* parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in *trans_desc* to the SPI slave driver; the application is not to access this memory until *spi_slave_queue_trans* is called to hand ownership back to the application.

备注: On esp32, if trans length not WORD aligned, the rx buffer last word memory will still overwritten by DMA HW

参数

- **host** -- SPI peripheral that is acting as a slave
- **trans_desc** -- Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait** -- Ticks to wait until there's room in the queue; use port-MAX_DELAY to never time out.

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if set flag SPI_SLAVE_TRANS_DMA_BUFFER_ALIGN_AUTO but there is no free memory
- ESP_ERR_INVALID_STATE if sync data between Cache and memory failed
- ESP_OK on success

esp_err_t **spi_slave_get_trans_result** (*spi_host_device_t* host, *spi_slave_transaction_t* **trans_desc, TickType_t ticks_to_wait)

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or reuse the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

参数

- **host** -- SPI peripheral to that is acting as a slave
- **trans_desc** -- **[out]** Pointer to variable able to contain a pointer to the description of the transaction that is executed
- **ticks_to_wait** -- Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_SUPPORTED` if flag `SPI_SLAVE_NO_RETURN_RESULT` is set
- `ESP_OK` on success

esp_err_t **spi_slave_transmit** (*spi_host_device_t* host, *spi_slave_transaction_t* *trans_desc, TickType_t ticks_to_wait)

Do a SPI transaction.

Essentially does the same as `spi_slave_queue_trans` followed by `spi_slave_get_trans_result`. Do not use this when there is still a transaction queued that hasn't been finalized using `spi_slave_get_trans_result`.

参数

- **host** -- SPI peripheral to that is acting as a slave
- **trans_desc** -- Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait** -- Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

返回

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

Structures

struct **spi_slave_interface_config_t**

This is a configuration for a SPI host acting as a slave device.

Public Members

int **spics_io_num**

CS GPIO pin for this device.

uint32_t **flags**

Bitwise OR of `SPI_SLAVE_*` flags.

int **queue_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using `spi_slave_queue_trans` but not yet finished using `spi_slave_get_trans_result`) at the same time.

uint8_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)

- 2: (1, 0)
- 3: (1, 1)

slave_transaction_cb_t **post_setup_cb**

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

slave_transaction_cb_t **post_trans_cb**

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

struct **spi_slave_transaction_t**

This structure describes one SPI transaction

Public Members

uint32_t flags

Bitwise OR of `SPI_SLAVE_TRANS_*` flags.

size_t length

Total data length, in bits.

size_t trans_len

Transaction data length, in bits.

const void *tx_buffer

Pointer to transmit buffer, or NULL for no MOSI phase.

void *rx_buffer

Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (`rx_buffer%4==0`), and has length of a multiple of 4 bytes.

void *user

User-defined variable. Can be used to store eg transaction ID.

Macros

SPI_SLAVE_TXBIT_LSBFIRST

Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE_RXBIT_LSBFIRST

Receive data LSB first instead of the default MSB first.

SPI_SLAVE_BIT_LSBFIRST

Transmit and receive LSB first.

SPI_SLAVE_NO_RETURN_RESULT

Don't return the descriptor to the host on completion (use `post_trans_cb` to notify instead)

SPI_SLAVE_TRANS_DMA_BUFFER_ALIGN_AUTO

Automatically re-malloc dma buffer if user buffer doesn't meet hardware alignment or `dma_capable`, this process may loss some memory and performance.

Type Definitions

```
typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)
```

2.5.31 SPI 从机半双工模式

简介

半双工 (HD) 模式是 ESP SPI 从机外设提供了一种特殊模式。比起全双工 (FD) 模式 (用于 GPSPI 事务, 详情请参阅 [SPI 从机驱动程序](#)), 在半双工模式下, 硬件会提供更多服务。这些服务减轻了 CPU 负载, 提高了 SPI 从机的响应速度。然而, 通信格式由硬件确定, 始终为半双工模式, 即在同一时刻只能进行单向数据传输, 半双工模式因此得名。

当进行 SPI 事务时, 根据事务的 **命令阶段**, 可以将事务分为不同的类型。每个事务可能包含以下阶段: 命令、地址、dummy、数据。命令阶段是必需的, 其他阶段存在与否则取决于命令的需求。在命令、地址、dummy 阶段, 总线的控制权始终由主设备 (通常是主机) 控制, 数据阶段的方向则取决于命令。数据阶段可以是输入阶段, 即主设备将数据写入从设备 (例如, 主机向从机发送数据); 也可以是输出阶段, 即主设备从从设备读取数据 (例如, 主机从从机接收数据)。

协议 有关主设备与 SPI 从机通信的详细信息, 请参阅 [ESP SPI 从机 HD \(半双工\) 模式协议](#)。

通过不同类型的事务, 从设备为主设备提供以下服务:

- 一个 DMA 通道, 支持主设备向从设备写入大量数据。
- 一个 DMA 通道, 支持主设备从从设备读取大量数据。
- 一些通用寄存器, 由主设备和从设备共享。
- 一些通用中断, 用于主设备打断从设备的软件执行。

术语

- 事务 (transaction)
- 通道 (channel)
- 发送 (sending)
- 接收 (receiving)
- 数据描述符 (data descriptor)

驱动程序特性

- 支持主设备以分段方式读写事务
- 支持发送数据队列和接收数据队列

驱动程序使用

从机初始化 调用 `spi_slave_hd_init()` 初始化 SPI 总线、外设和驱动程序。在初始化之后，SPI 从机将独占使用 SPI 外设和总线上的管脚。这意味着在反初始化前，其他设备无法使用这些资源。因此，为了确保其他设备可以正确利用 SPI 资源并进行正常通信，从机的大部分配置应在其初始化过程中完成。

结构体 `spi_bus_config_t` 指定了总线的初始化方式，结构体 `spi_slave_hd_slot_config_t` 指定了 SPI 从机驱动程序的运行方式。

从机反初始化 (可选) 调用 `spi_slave_hd_deinit()` 卸载驱动程序。该反初始化函数会释放相关资源，包括管脚、SPI 外设、驱动程序所用内存、中断源等。

通过 DMA 通道发送/接收数据 要通过 DMA 通道向主设备发送数据，应用程序需要先将数据正确地封装在 `spi_slave_hd_data_t` 描述符结构体中，然后再将数据描述符和通道参数 `SPI_SLAVE_CHAN_TX` 传递给 `spi_slave_hd_queue_trans()`。数据描述符的指针存储在队列中，一旦接收到主设备的 `Rd_DMA` 命令，就会按照调用 `spi_slave_hd_queue_trans()` 时数据进入队列的顺序，依次将数据发送给主设备。

应用程序需要检查数据发送的结果。为此，应用程序可以调用 `spi_slave_hd_get_trans_res()`，并将通道参数设置为 `SPI_SLAVE_CHAN_TX`。该函数将阻塞程序，直到主设备发起的 `Rd_DMA` 命令事务成功完成或超时。函数中的参数 `out_trans` 将输出刚刚完成的数据描述符的指针，从而提供有关已完成的发送操作的信息。

通过 DMA 通道从主设备接收数据的操作与发送数据类似。应用程序需要使用正确的数据描述符调用 `spi_slave_hd_queue_trans()`，并将通道参数设置为 `SPI_SLAVE_CHAN_RX`。随后，应用程序调用 `spi_slave_hd_get_trans_res()` 获取接收 `buffer` 的描述符，然后处理接收 `buffer` 中的数据。

备注： 驱动程序本身并没有用于发送或接收数据的内部 `buffer`。应用程序需要通过数据描述符为驱动程序提供 `buffer`，从而向主设备发送数据，或接收来自主设备的数据。

在使用 `spi_slave_hd_queue_trans()` 将数据描述符成功发送到驱动程序的内部队列后、并由 `spi_slave_hd_get_trans_res()` 返回前，应用程序需要正确地维护数据描述符以及它所指向的 `buffer`。在此期间，根据需要，硬件和驱动程序可以随时读取或写入 `buffer` 和描述符。

注意，在使用该驱动程序进行数据传输时，可以根据实际需要提前终止数据传输，而不需要等待整个 `buffer` 填满或者完全发送完毕。例如，在分段事务模式下，无论发送/接收 `buffer` 是否已使用完（已满），主设备都需要发送 `CMD7` 终止 `Wr_DMA` 事务，或发送 `CMD8` 以分段方式终止 `Rd_DMA` 事务。

以自定义用户参数使用数据描述符 在某些情况下，发送包函数和回收包函数可能会分散在不同位置。发送包函数用于发送数据描述符，回收包函数用于处理返回的数据描述符。在回收包函数中获取返回的数据描述符时，可能需要一些额外信息，帮助处理数据传输完成后返回给应用程序的描述符。例如，多次发送相同数据时，你可能想知道返回的描述符来自哪一轮发送。

为此，可以通过强制类型转换，将数据描述符中的 `arg` 设置为变量，提供事务信息；或者将其指向一个包含处理发送/接收数据所需的所有信息的结构体。在回收包函数处理返回的描述符时，即可使用这个额外信息。

使用回调函数

备注： 这些回调函数在 `ISR` 中调用，因此需要迅速处理所需操作，并尽快返回，确保系统正常运行。因此，在编写 `ISR` 的代码时，需要十分谨慎。

由于中断处理过程是与主程序并发执行的，长时间的延迟或阻塞操作可能会导致系统响应变慢，或导致不可预测的行为。因此，在编写回调函数时，应避免使用可能引起延迟或阻塞的操作，例如等待、睡眠、资源锁等。

在初始化 SPI 从机半双工驱动程序时，会传递结构体 `spi_slave_hd_slot_config_t` 中的 `spi_slave_hd_callback_config_t`，为任意事件设置回调函数。

每个不为 `NULL` 的回调函数都将使能对应的中断，所以回调函数会在对应的中断事件触发时立即调用。对于不感兴趣的事件，则无需为其提供回调函数。

配置结构体中的 `arg` 可以给回调函数传递部分上下文信息，或在使用相同的回调函数处理多个 SPI 从机外设时，指明特定的 SPI 从机实例。通过强制类型转换，可以将 `arg` 设置为表示 SPI 从机实例的变量，或者将其指向某个上下文结构体变量。所有回调函数都会使用在初始化回调函数时设置的 `arg` 参数。

配置结构体中的 `event` 和 `awoken` 参数也可以给回调函数传递上下文信息。

- 参数 `event` 向回调函数传递当前事件信息。`spi_slave_hd_event_t` 包含事件类型和刚刚处理完的数据描述符等信息，此时，通常会使用 *data argument*。
- 参数 `awoken` 是一个输出参数，用于告知 ISR，在回调函数后已有其他操作唤醒任务，ISR 应调用 `portYIELD_FROM_ISR()` 调度这些任务。只需将 `awoken` 参数传递给可能解除任务阻塞的 FreeRTOS API，ISR 即可接收 `awoken` 的返回值。

写入/读取共享寄存器 调用 `spi_slave_hd_write_buffer()` 写入共享 `buffer`，调用 `spi_slave_hd_read_buffer()` 读取共享 `buffer`。

备注：在 ESP32-P4 上，应用程序以字为单位读取/写入共享寄存器，但主机以字节为单位读取/写入共享寄存器。这样一来，就无法确保从主机读取的四个连续字节是来自从机应用程序写入的同一个字。同时，如果从机在主机写入字节时读取了一个字，可能会得到这样的字：主机刚刚写入它的一半，另一半尚未写入。

通过两次读取同个字，并对两次读取的值做比较，主机可以确保读取的字处于非过渡态。

对从机而言，要确保读取的字处于非过渡态则更为困难，因为主机写入四个字的过程可能会非常长，达到 32 个 SPI 时钟周期。为此，可以在写入的字的最后一个（最大地址）字节中添加一些冗余校验码 (CRC)，确保在写入含有 CRC 的字节时，即代表整个字完全写入。

从软件读取/写入和从主机读取/写入可能存在冲突，在多核心系统中尤为如此。因此，建议在数据传输过程中，一个字只在一个方向上使用，即要么只由主机写入，要么只由从机写入。

接收来自主机的通用中断 当主机发送 `CMD8`、`CMD9` 或 `CMDA` 时，从机会触发相应的动作。目前，`CMD8` 固定用于指示 `Rd_DMA` 段的终止。要接收通用中断，可以在从机初始化时为 `CMD9` 和 `CMDA` 注册回调函数，详情请参阅 [使用回调函数](#)。

应用示例

查看从机设备/主机通信的示例代码，请前往 ESP-IDF 示例的 `peripherals/spi_slave_hd` 目录。

API 参考

Header File

- `components/esp_driver_spi/include/driver/spi_slave_hd.h`
- This header file can be included with:

```
#include "driver/spi_slave_hd.h"
```

- This header file is a part of the API provided by the `esp_driver_spi` component. To declare that your component depends on `esp_driver_spi`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_spi
```

or

```
PRIV_REQUIRES esp_driver_spi
```

Functions

esp_err_t **spi_slave_hd_init** (*spi_host_device_t* host_id, const *spi_bus_config_t* *bus_config, const *spi_slave_hd_slot_config_t* *config)

Initialize the SPI Slave HD driver.

参数

- **host_id** -- The host to use
- **bus_config** -- Bus configuration for the bus used
- **config** -- Configuration for the SPI Slave HD driver

返回

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: invalid argument given
- ESP_ERR_INVALID_STATE: function called in invalid state, may be some resources are already in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM: memory allocation failed
- or other return value from *esp_intr_alloc*

esp_err_t **spi_slave_hd_deinit** (*spi_host_device_t* host_id)

Deinitialize the SPI Slave HD driver.

参数 **host_id** -- The host to deinitialize the driver

返回

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: if the host_id is not correct

esp_err_t **spi_slave_hd_queue_trans** (*spi_host_device_t* host_id, *spi_slave_chan_t* chan, *spi_slave_hd_data_t* *trans, TickType_t timeout)

Queue transactions (segment mode)

参数

- **host_id** -- Host to queue the transaction
- **chan** -- SPI_SLAVE_CHAN_TX or SPI_SLAVE_CHAN_RX
- **trans** -- Transaction descriptors
- **timeout** -- Timeout before the data is queued

返回

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: The input argument is invalid. Can be the following reason:
 - The buffer given is not DMA capable
 - The length of data is invalid (not larger than 0, or exceed the max transfer length)
 - The transaction direction is invalid
- ESP_ERR_TIMEOUT: Cannot queue the data before timeout. Master is still processing previous transaction.
- ESP_ERR_INVALID_STATE: Function called in invalid state. This API should be called under segment mode.

esp_err_t **spi_slave_hd_get_trans_res** (*spi_host_device_t* host_id, *spi_slave_chan_t* chan, *spi_slave_hd_data_t* **out_trans, TickType_t timeout)

Get the result of a data transaction (segment mode)

备注: This API should be called successfully the same times as the *spi_slave_hd_queue_trans*.

参数

- **host_id** -- Host to queue the transaction
- **chan** -- Channel to get the result, SPI_SLAVE_CHAN_TX or SPI_SLAVE_CHAN_RX
- **out_trans** -- **[out]** Pointer to the transaction descriptor (*spi_slave_hd_data_t*) passed to the driver before. Hardware has finished this transaction. Member *trans_len* indicates the actual number of bytes of received data, it's meaningless for TX.
- **timeout** -- Timeout before the result is got

返回

- **ESP_OK**: on success
- **ESP_ERR_INVALID_ARG**: Function is not valid
- **ESP_ERR_TIMEOUT**: There's no transaction done before timeout
- **ESP_ERR_INVALID_STATE**: Function called in invalid state. This API should be called under segment mode.

void **spi_slave_hd_read_buffer** (*spi_host_device_t* host_id, int addr, uint8_t *out_data, size_t len)

Read the shared registers.

参数

- **host_id** -- Host to read the shared registers
- **addr** -- Address of register to read, 0 to SOC_SPI_MAXIMUM_BUFFER_SIZE-1
- **out_data** -- **[out]** Output buffer to store the read data
- **len** -- Length to read, not larger than SOC_SPI_MAXIMUM_BUFFER_SIZE-addr

void **spi_slave_hd_write_buffer** (*spi_host_device_t* host_id, int addr, uint8_t *data, size_t len)

Write the shared registers.

参数

- **host_id** -- Host to write the shared registers
- **addr** -- Address of register to write, 0 to SOC_SPI_MAXIMUM_BUFFER_SIZE-1
- **data** -- Buffer holding the data to write
- **len** -- Length to write, SOC_SPI_MAXIMUM_BUFFER_SIZE-addr

esp_err_t **spi_slave_hd_append_trans** (*spi_host_device_t* host_id, *spi_slave_chan_t* chan, *spi_slave_hd_data_t* *trans, TickType_t timeout)

Load transactions (append mode)

备注: In this mode, user transaction descriptors will be appended to the DMA and the DMA will keep processing the data without stopping

参数

- **host_id** -- Host to load transactions
- **chan** -- SPI_SLAVE_CHAN_TX or SPI_SLAVE_CHAN_RX
- **trans** -- Transaction descriptor
- **timeout** -- Timeout before the transaction is loaded

返回

- **ESP_OK**: on success
- **ESP_ERR_INVALID_ARG**: The input argument is invalid. Can be the following reason:
 - The buffer given is not DMA capable
 - The length of data is invalid (not larger than 0, or exceed the max transfer length)
 - The transaction direction is invalid
- **ESP_ERR_TIMEOUT**: Master is still processing previous transaction. There is no available transaction for slave to load
- **ESP_ERR_INVALID_STATE**: Function called in invalid state. This API should be called under append mode.

esp_err_t **spi_slave_hd_get_append_trans_res** (*spi_host_device_t* host_id, *spi_slave_chan_t* chan, *spi_slave_hd_data_t* **out_trans, TickType_t timeout)

Get the result of a data transaction (append mode)

备注: This API should be called the same times as the `spi_slave_hd_append_trans`

参数

- **host_id** -- Host to load the transaction
- **chan** -- SPI_SLAVE_CHAN_TX or SPI_SLAVE_CHAN_RX
- **out_trans** -- [out] Pointer to the transaction descriptor (*spi_slave_hd_data_t*) passed to the driver before. Hardware has finished this transaction. Member `trans_len` indicates the actual number of bytes of received data, it's meaningless for TX.
- **timeout** -- Timeout before the result is got

返回

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: Function is not valid
- ESP_ERR_TIMEOUT: There's no transaction done before timeout
- ESP_ERR_INVALID_STATE: Function called in invalid state. This API should be called under append mode.

Structures

struct **spi_slave_hd_data_t**

Descriptor of data to send/receive.

Public Members

uint8_t ***data**

Buffer to send, must be DMA capable.

size_t **len**

Len of data to send/receive. For receiving the buffer length should be multiples of 4 bytes, otherwise the extra part will be truncated.

size_t **trans_len**

For RX direction, it indicates the data actually received. For TX direction, it is meaningless.

uint32_t **flags**

Bitwise OR of SPI_SLAVE_HD_TRANS_* flags.

void ***arg**

Extra argument indicating this data.

struct **spi_slave_hd_event_t**

Information of SPI Slave HD event.

Public Members

spi_event_t **event**

Event type.

spi_slave_hd_data_t ***trans**

Corresponding transaction for SPI_EV_SEND and SPI_EV_RECV events.

struct **spi_slave_hd_callback_config_t**

Callback configuration structure for SPI Slave HD.

Public Members

slave_cb_t **cb_buffer_tx**

Callback when master reads from shared buffer.

slave_cb_t **cb_buffer_rx**

Callback when master writes to shared buffer.

slave_cb_t **cb_send_dma_ready**

Callback when TX data buffer is loaded to the hardware (DMA)

slave_cb_t **cb_sent**

Callback when data are sent.

slave_cb_t **cb_recv_dma_ready**

Callback when RX data buffer is loaded to the hardware (DMA)

slave_cb_t **cb_recv**

Callback when data are received.

slave_cb_t **cb_cmd9**

Callback when CMD9 received.

slave_cb_t **cb_cmdA**

Callback when CMDA received.

void ***arg**

Argument indicating this SPI Slave HD peripheral instance.

struct **spi_slave_hd_slot_config_t**

Configuration structure for the SPI Slave HD driver.

Public Members

uint8_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

uint32_t **spics_io_num**

CS GPIO pin for this device.

uint32_t **flags**

Bitwise OR of SPI_SLAVE_HD_* flags.

uint32_t **command_bits**

command field bits, multiples of 8 and at least 8.

uint32_t **address_bits**

address field bits, multiples of 8 and at least 8.

uint32_t **dummy_bits**

dummy field bits, multiples of 8 and at least 8.

uint32_t **queue_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using `spi_slave_hd_queue_trans` but not yet finished using `spi_slave_hd_get_trans_result`) at the same time.

spi_dma_chan_t **dma_chan**

DMA channel to used.

spi_slave_hd_callback_config_t **cb_config**

Callback configuration.

Macros

SPI_SLAVE_HD_TRANS_DMA_BUFFER_ALIGN_AUTO

Automatically re-malloc dma buffer if user buffer doesn't meet hardware alignment or `dma_capable`, this process may lose some memory and performance.

SPI_SLAVE_HD_TXBIT_LSBFIRST

Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE_HD_RXBIT_LSBFIRST

Receive data LSB first instead of the default MSB first.

SPI_SLAVE_HD_BIT_LSBFIRST

Transmit and receive LSB first.

SPI_SLAVE_HD_APPEND_MODE

Adopt DMA append mode for transactions. In this mode, users can load(append) DMA descriptors without stopping the DMA.

Type Definitions

typedef bool (***slave_cb_t**)(void *arg, *spi_slave_hd_event_t* *event, BaseType_t *awoken)

Callback for SPI Slave HD.

Enumerations

enum **spi_slave_chan_t**

Channel of SPI Slave HD to do data transaction.

Values:

enumerator **SPI_SLAVE_CHAN_TX**

The output channel (RDDMA)

enumerator **SPI_SLAVE_CHAN_RX**

The input channel (WRDMA)

2.5.32 JPEG Encoder and Decoder

Introduction

JPEG is a commonly used method of lossy compression for digital images, particularly for those images produced by digital photography. The degree of compression can be adjusted, allowing a selectable tradeoff between storage size and image quality. JPEG typically achieves 10:1 compression with little perceptible loss in image quality.

JPEG codec on ESP32-P4 is an image codec, which is based on the JPEG baseline standard, for compressing and decompressing images to reduce the bandwidth required to transmit images or the space required to store images, making it possible to process large-resolution images. But please note, at one time, the codec engine can only work as either encoder or decoder.

Functional Overview

This document covers the following sections:

- *Resource Allocation* - covers how to allocate JPEG resources with properly set of configurations. It also covers how to recycle the resources when they finished working.
- *Finite State Machine* - covers JPEG workflow. Introduce how jpeg driver uses internal resources and its software process.
- *JPEG Decoder Engine* - covers behavior of JPEG decoder engine. Introduce how to use decoder engine functions to decode an image (from jpg format to raw format).
- *JPEG Encoder Engine* - covers behavior of JPEG encoder engine. Introduce how to use encoder engine functions to encode an image (from raw format to jpg format).
- *Performance Overview* - covers encoder and decoder performance.
- *Pixel Storage Layout for Different Color Formats* - covers color space order overview required in this JPEG decoder and encoder.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Power Management* - describes how jpeg driver would be affected by power consumption.
- *Kconfig Options* - lists the supported Kconfig options that can bring different effects to the driver.

Resource Allocation

Install JPEG decoder engine JPEG decoder engine requires the configuration that specified by `jpeg_decode_engine_cfg_t`.

If the configurations in `jpeg_decode_engine_cfg_t` is specified, users can call `jpeg_new_decoder_engine()` to allocate and initialize a JPEG decoder engine. This function will return an JPEG decoder handle if it runs correctly. You can take following code as reference.

```
jpeg_decoder_handle_t decoder_engine;

jpeg_decode_engine_cfg_t decode_eng_cfg = {
    .intr_priority = 0,
    .timeout_ms = 40,
};

ESP_ERROR_CHECK(jpeg_new_decoder_engine(&decode_eng_cfg, &decoder_engine));
```

Uninstall JPEG decoder engine If a previously installed JPEG engine is no longer needed, it's recommended to recycle the resource by calling `jpeg_del_decoder_engine()`, so that the underlying hardware is released.

```
ESP_ERROR_CHECK(jpeg_del_decoder_engine(decoder_engine));
```

Install JPEG encoder engine The JPEG encoder engine requires the configuration specified by `jpeg_encode_engine_cfg_t`.

If the configurations in `jpeg_encode_engine_cfg_t` is specified, users can call `jpeg_new_encoder_engine()` to allocate and initialize a JPEG encoder engine. This function will return an JPEG encoder handle if it runs correctly. You can take following code as reference.

```
jpeg_encoder_handle_t encoder_engine;

jpeg_encode_engine_cfg_t encode_eng_cfg = {
    .intr_priority = 0,
    .timeout_ms = 40,
};

ESP_ERROR_CHECK(jpeg_new_encoder_engine(&encode_eng_cfg, &encoder_engine));
```

Uninstall JPEG encoder engine If a previously installed JPEG engine is no longer needed, it's recommended to recycle the resource by calling `jpeg_del_encoder_engine()`, so that the underlying hardware is released.

```
ESP_ERROR_CHECK(jpeg_del_encoder_engine(encoder_engine));
```

Finite State Machine The JPEG driver usage of hardware resources and its process workflow are shown in the following graph:

JPEG Decoder Engine After installing the JPEG decoder driver by `jpeg_new_decoder_engine()`, ESP32-P4 is ready to decode JPEG pictures by `jpeg_decoder_process()`. `jpeg_decoder_process()` is flexible for decoding different types of pictures by a configurable parameter called `jpeg_decode_cfg_t`.

Moreover, our jpeg decoder api provides a helper function which helps you get the basic information of your given image. Calling `jpeg_decoder_get_info()` would return the picture information structure called `jpeg_decoder_get_info()`. If you already know the picture basic information, this functions is unnecessary to be called.

The format conversions supported by this driver are listed in the table below:

Format of the already compressed image	Format after decompressing
YUV444	RGB565
	RGB888
	YUV444
YUV422	RGB565
	RGB888
	YUV444
	YUV422
YUV420	RGB565
	RGB888
	YUV444
	YUV420
GRAY	GRAY

Overall, You can take following code as reference, the code is going to decode a 1080*1920 picture.

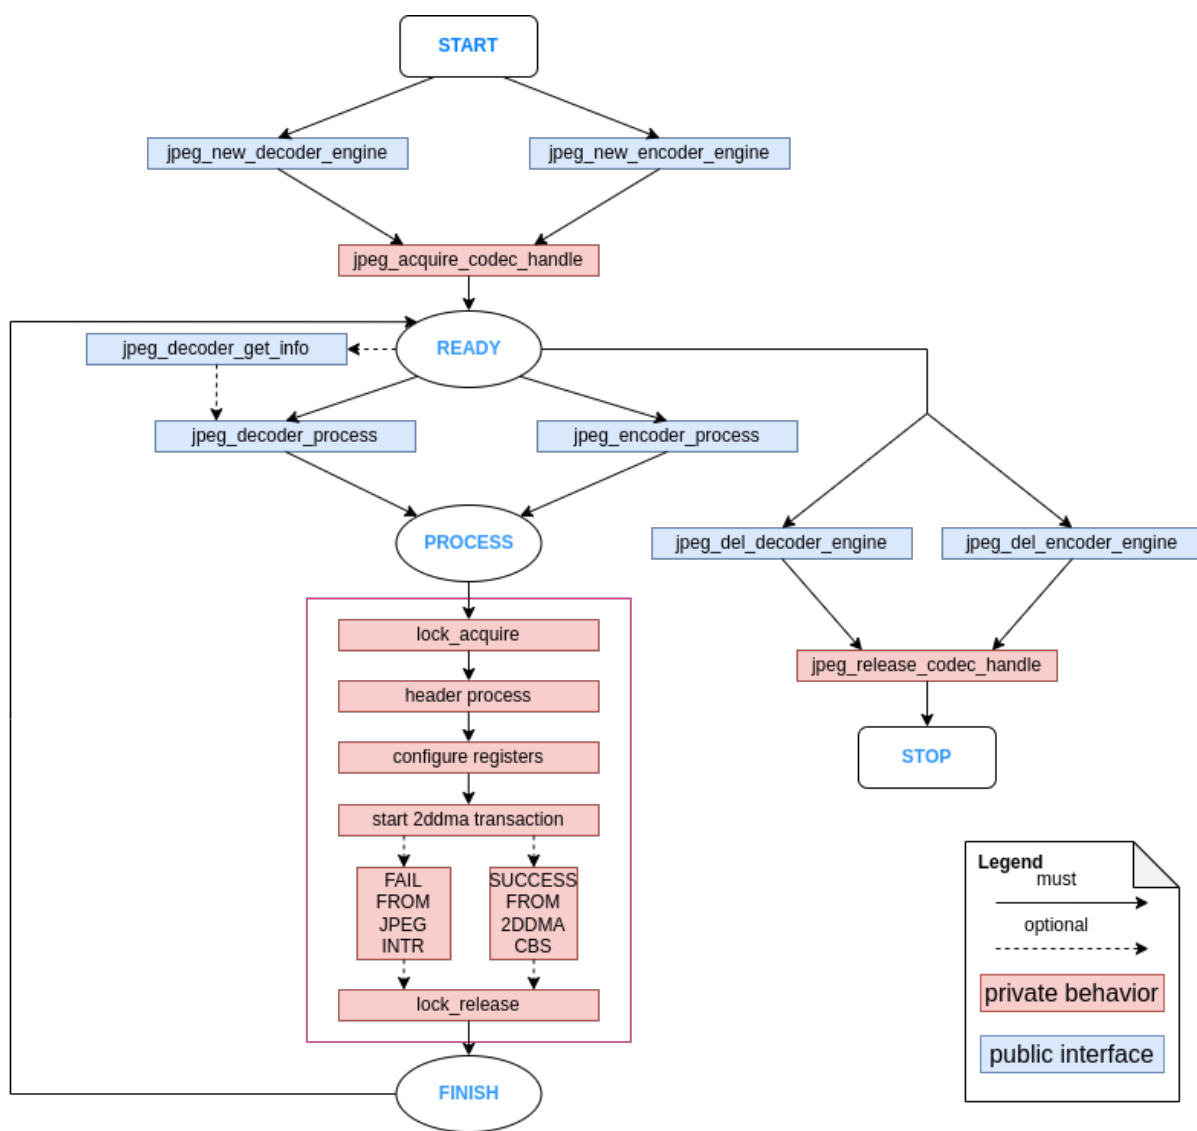

图 28: JPEG finite state machine

```

jpeg_decode_cfg_t decode_cfg_rgb = {
    .output_format = JPEG_DECODE_OUT_FORMAT_RGB888,
    .rgb_order = JPEG_DEC_RGB_ELEMENT_ORDER_BGR,
};

size_t tx_buffer_size;
size_t rx_buffer_size;

jpeg_decode_memory_alloc_cfg_t rx_mem_cfg = {
    .buffer_direction = JPEG_DEC_ALLOC_OUTPUT_BUFFER,
};

jpeg_decode_memory_alloc_cfg_t tx_mem_cfg = {
    .buffer_direction = JPEG_DEC_ALLOC_INPUT_BUFFER,
};

uint8_t *bit_stream = (uint8_t*)jpeg_alloc_decoder_mem(jpeg_size, &tx_mem_cfg, &tx_
↪buffer_size);
uint8_t *out_buf = (uint8_t*)jpeg_alloc_decoder_mem(1920 * 1088 * 3, &rx_mem_cfg, &
↪rx_buffer_size);

jpeg_decode_picture_info_t header_info;
ESP_ERROR_CHECK(jpeg_decoder_get_info(bit_stream, bit_stream_size, &header_info));
uint32_t out_size = 0;
ESP_ERROR_CHECK(jpeg_decoder_process(decoder_engine, &decode_cfg_rgb, bit_stream, ↪
↪bit_stream_size, out_buf, &out_size));

```

There are some Tips that can help you use this driver more accurately:

1. In above code, you should make sure the *bit_stream* and *out_buf* should be aligned by certain rules. We provide a helper function *jpeg_alloc_decoder_mem()* to help you malloc a buffer which is aligned in both size and address.
2. The content of *bit_stream* buffer should not be changed until *jpeg_decoder_process()* returns.
3. The width and height of output picture would be 16 bytes aligned if original picture is formatted by YUV420 or YUV422. For example, if the input picture is 1080*1920, the output picture will be 1088*1920. That is the restriction of jpeg protocol. Please provide sufficient output buffer memory.

JPEG Encoder Engine After installing the JPEG encoder driver by *jpeg_new_encoder_engine()*, ESP32-P4 is ready to decode JPEG pictures by *jpeg_encoder_process()*. *jpeg_encoder_process()* is flexible for decoding different types of pictures by a configurable parameter called *jpeg_encode_cfg_t*.

The format conversions supported by this driver are listed in the table below:

Format of Original Image	Down sampling method
RGB565/RGB888	YUV444
	YUV422
	YUV420
GRAY	GRAY
YUV422	YUV422

Below is the example of code that encodes a 1080*1920 picture:

```

int raw_size_1080p = 0; /* Your raw image size */
jpeg_encode_cfg_t enc_config = {
    .src_type = JPEG_ENCODE_IN_FORMAT_RGB888,
    .sub_sample = JPEG_DOWN_SAMPLING_YUV422,
    .image_quality = 80,
    .width = 1920,
    .height = 1080,

```

(下页继续)

```

};

uint8_t *raw_buf_1080p = (uint8_t*)jpeg_alloc_encoder_mem(raw_size_1080p);
if (raw_buf_1080p == NULL) {
    ESP_LOGE(TAG, "alloc 1080p tx buffer error");
    return;
}
uint8_t *jpg_buf_1080p = (uint8_t*)jpeg_alloc_encoder_mem(raw_size_1080p / 10); //↵
↵Assume that compression ratio of 10 to 1
if (jpg_buf_1080p == NULL) {
    ESP_LOGE(TAG, "alloc jpg_buf_1080p error");
    return;
}

ESP_ERROR_CHECK(jpeg_encoder_process(jpeg_handle, &enc_config, raw_buf_1080p, raw_
↵size_1080p, jpg_buf_1080p, &jpg_size_1080p));

```

There are some Tips that can help you use this driver more accurately:

1. In above code, you should make sure the *raw_buf_1080p* and *jpg_buf_1080p* should aligned by calling *jpeg_alloc_encoder_mem()*.
2. The content of *raw_buf_1080p* buffer should not be changed until *jpeg_encoder_process()* returns.
3. The compression ratio depends on the chosen *image_quality* and the content of the image itself. Generally, a higher *image_quality* value obviously results in better image quality but a smaller compression ratio. As for the image content, it is hard to give any specific guidelines, so this question is out of the scope of this document. Generally, the baseline JPEG compression ratio can vary from 40:1 to 10:1. Please take the actual situation into account.

Performance Overview This section provides some measurements of the decoder and encoder performance. The data presented in the tables below gives the average values of decoding or encoding a randomly chosen picture fragments for 50 times. All tests were performed at a CPU frequency of 360MHz and a SPIRAM clock frequency of 200MHz. Only JPEG related code is run in this test, no other modules are involved (e.g. USB Camera, etc.).

Both decoder and encoder are not cause too much CPU involvement. Only header parse causes CPU source. Calculations related to JPEG compression, such as DCT, quantization, huffman encoding/decoding, etc., are done entirely in hardware.

JPEG decoder performance

JPEG Size		Pixel Format		Performance(fps)
Height	Width	in(Format of the already compressed image)	out(Format after decompressing)	
1080	1920	YUV422	RGB888/RGB565	48
720	1280	YUV422	RGB888/RGB565	109
480	800	YUV422	RGB888/RGB565	253
480	640	YUV422	RGB888/RGB565	307
480	320	YUV422	RGB888/RGB565	571
720	1280	GRAY	GRAY	161
480	800	YUV444	YUV444	129
480	800	YUV422	YUV444/YUV422	190
480	800	YUV420	YUV444/YUV420	253

JPEG encoder performance

JPEG Size		Pixel Format		Performance(fps)
Height	Width	in(Format of Original Image)	out(Down sampling method)	
1080	1920	RGB888	YUV422	26
1080	1920	RGB565	YUV422	36
1080	1920	RGB565	YUV420	40
1080	1920	RGB565	YUV444	24
1080	1920	RGB888	YUV422	26
720	1280	RGB565	YUV420	88
720	1280	RGB565	YUV444	55
720	1280	RGB565	YUV422	81
480	800	RGB888	YUV420	142
480	640	RGB888	YUV420	174
480	320	RGB888	YUV420	315
720	1280	GRAY	GRAY	163
480	800	YUV422	YUV422	146

Pixel Storage Layout for Different Color Formats The encoder and decoder described in this guide use the same uncompressed raw image formats (RGB, YUV). Therefore, the encoder and decoder are not discussed separately in this section. The pixel layout of the following formats applies to the input direction of the encoder and the output direction of the decoder (if supported). The specific pixel layout is shown in the following figure:

RGB888 In the following picture, each small block means one bit.

图 29: RGB888 pixel order

For RGB888, the order can be changed via `jpeg_decode_cfg_t::rgb_order` sets the pixel to *RGB* order.

图 30: RGB888 pixel big endian order

RGB565 In the following picture, each small block means one bit.

图 31: RGB565 pixel order

For RGB565, the order can be changed via `jpeg_decode_cfg_t::rgb_order` sets the pixel to *RGB* order.

YUV444 In the following picture, each small block means one byte.

YUV422 In the following picture, each small block means one byte.

YUV420 In the following picture, each small block means one byte.

Thread Safety The factory function `jpeg_new_decoder_engine()`, `jpeg_decoder_get_info()`, `jpeg_decoder_process()`, and `jpeg_del_decoder_engine()` are guaranteed to be thread safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks.

图 32: RGB565 pixel big endian order

图 33: YUV444 pixel order

Power Management When power management is enabled (i.e., `CONFIG_PM_ENABLE` is set), the system needs to adjust or stop the source clock of JPEG to enter Light-sleep, thus potentially changing the JPEG decoder or encoder process. This might lead to unexpected behavior in hardware calculation. To prevent such issues, entering light sleep is disabled for the time when JPEG encoder or decoder is working.

Whenever the user is decoding or encoding via JPEG (i.e., calling `jpeg_encoder_process()` or `jpeg_decoder_process()`), the driver guarantees that the power management lock is acquired by setting it to `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`. Once the encoding or decoding is finished, the driver releases the lock and the system can enter light sleep.

Kconfig Options

- `CONFIG_JPEG_ENABLE_DEBUG_LOG` is used to enable the debug log at the cost of increased firmware binary size.

Maintainers' Notes

The JPEG driver usage of hardware resources and its process workflow are shown in the following graph:

Application Examples

- JPEG decoder application example: [peripherals/jpeg/jpeg_decode](#).
- JPEG encoder application example: [peripherals/jpeg/jpeg_encode](#).

PRIV_REQUIRES esp_driver_jpeg

Functions

esp_err_t **jpeg_new_decoder_engine** (const *jpeg_decode_engine_cfg_t* *dec_eng_cfg, *jpeg_decoder_handle_t* *ret_decoder)

Acquire a JPEG decode engine with the specified configuration.

This function acquires a JPEG decode engine with the specified configuration. The configuration parameters are provided through the *dec_eng_cfg* structure, and the resulting JPEG decoder handle is returned through the *ret_decoder* pointer.

参数

- **dec_eng_cfg** -- [in] Pointer to the JPEG decode engine configuration.
- **ret_decoder** -- [out] Pointer to a variable that will receive the JPEG decoder handle.

返回

- ESP_OK: JPEG decoder initialized successfully.
- ESP_ERR_INVALID_ARG: JPEG decoder initialization failed because of invalid argument.
- ESP_ERR_NO_MEM: Create JPEG decoder failed because of out of memory.

esp_err_t **jpeg_decoder_get_info** (const uint8_t *bit_stream, uint32_t stream_size, *jpeg_decode_picture_info_t* *picture_info)

Helper function for getting information about a JPEG image.

This function analyzes the provided JPEG image data and retrieves information about the image, such as its width, height. The image data is specified by the *bit_stream* pointer and the *stream_size* parameter. The resulting image information is returned through the *picture_info* structure.

备注: This function doesn't depend on any jpeg hardware, it helps user to know jpeg information from jpeg header. For example, user can get picture width and height via this function and malloc a reasonable size buffer for jpeg engine process.

参数

- **bit_stream** -- [in] Pointer to the buffer containing the JPEG image data.
- **stream_size** -- [in] Size of the JPEG image data in bytes. Note that parse beginning partial of picture also works, but the beginning partial should be enough given.
- **picture_info** -- [out] Pointer to the structure that will receive the image information.

返回

- ESP_OK: JPEG decoder get jpg image header successfully.
- ESP_ERR_INVALID_ARG: JPEG decoder get header info failed because of invalid argument.

esp_err_t **jpeg_decoder_process** (*jpeg_decoder_handle_t* decoder_engine, const *jpeg_decode_cfg_t* *decode_cfg, const uint8_t *bit_stream, uint32_t stream_size, uint8_t *decode_outbuf, uint32_t outbuf_size, uint32_t *out_size)

Process a JPEG image with the specified decoder instance.

This function processes the provided JPEG image data using the specified JPEG decoder instance. The input JPEG image data is specified by the *bit_stream* pointer and the *stream_size* parameter. The resulting decoded image data is written to the *decode_outbuf* buffer, and the length of the output image data is returned through the *out_size* pointer.

备注: 1.Please make sure that the content of *bit_stream* pointer cannot be modified until this function returns. 2.Please note that the output size of image is always the multiple of 16 depends on protocol of JPEG.

参数

- **decoder_engine** -- [in] Handle of the JPEG decoder instance to use for processing.
- **decode_cfg** -- [in] Config structure of decoder.
- **bit_stream** -- [in] Pointer to the buffer containing the input JPEG image data.
- **stream_size** -- [in] Size of the input JPEG image data in bytes.
- **decode_outbuf** -- [in] Pointer to the buffer that will receive the decoded image data.
- **outbuf_size** -- [in] The size of `decode_outbuf`
- **out_size** -- [out] Pointer to a variable that will receive the length of the output image data.

返回

- ESP_OK: JPEG decoder process successfully.
- ESP_ERR_INVALID_ARG: JPEG decoder process failed because of invalid argument.

esp_err_t **jpeg_del_decoder_engine** (*jpeg_decoder_handle_t* decoder_engine)

Release resources used by a JPEG decoder instance.

This function releases the resources used by the specified JPEG decoder instance. The decoder instance is specified by the `decoder_engine` parameter.

参数 **decoder_engine** -- Handle of the JPEG decoder instance to release resources for.

返回

- ESP_OK: Delete JPEG decoder successfully.
- ESP_ERR_INVALID_ARG: Delete JPEG decoder failed because of invalid argument.

void ***jpeg_alloc_decoder_mem** (size_t size, const *jpeg_decode_memory_alloc_cfg_t* *mem_cfg, size_t *allocated_size)

A helper function to allocate memory space for JPEG decoder.

参数

- **size** -- [in] The size of memory to allocate.
- **mem_cfg** -- [in] Memory configuration for memory allocation
- **allocated_size** -- [out] Actual allocated buffer size.

返回 Pointer to the allocated memory space, or NULL if allocation fails.

Structures

struct **jpeg_decode_cfg_t**

Configuration parameters for a JPEG decoder image process.

Public Members

jpeg_dec_output_format_t **output_format**

JPEG decoder output format

jpeg_dec_rgb_element_order_t **rgb_order**

JPEG decoder output order

jpeg_yuv_rgb_conv_std_t **conv_std**

JPEG decoder yuv->rgb standard

struct **jpeg_decode_engine_cfg_t**

Configuration parameters for the JPEG decoder engine.

Public Members

int **intr_priority**

JPEG interrupt priority, if set to 0, driver will select the default priority (1,2,3).

int **timeout_ms**

JPEG timeout threshold for handling a picture, should larger than valid decode time in ms. For example, for 30fps decode, this value must larger than 34. -1 means wait forever

struct **jpeg_decode_picture_info_t**

Structure for jpeg decode header.

Public Members

uint32_t **width**

Number of pixels in the horizontal direction

uint32_t **height**

Number of pixels in the vertical direction

[*jpeg_down_sampling_type_t*](#) **sample_method**

compressed JPEG picture sampling method

struct **jpeg_decode_memory_alloc_cfg_t**

JPEG decoder memory allocation config.

Public Members

[*jpeg_dec_buffer_alloc_direction_t*](#) **buffer_direction**

Buffer direction for jpeg decoder memory allocation

Header File

- [components/esp_driver_jpeg/include/driver/jpeg_encode.h](#)
- This header file can be included with:

```
#include "driver/jpeg_encode.h"
```

- This header file is a part of the API provided by the `esp_driver_jpeg` component. To declare that your component depends on `esp_driver_jpeg`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_jpeg
```

or

```
PRIV_REQUIRES esp_driver_jpeg
```

Functions

[*esp_err_t*](#) **jpeg_new_encoder_engine** (const [*jpeg_encode_engine_cfg_t*](#) *enc_eng_cfg,
[*jpeg_encoder_handle_t*](#) *ret_encoder)

Allocate JPEG encoder.

参数

- **enc_eng_cfg** -- **[in]** config for jpeg encoder
- **ret_encoder** -- **[out]** handle for jpeg encoder

返回

- ESP_OK: JPEG encoder initialized successfully.
- ESP_ERR_INVALID_ARG: JPEG encoder initialization failed because of invalid argument.
- ESP_ERR_NO_MEM: Create JPEG encoder failed because of out of memory.

esp_err_t **jpeg_encoder_process** (*jpeg_encoder_handle_t* encoder_engine, const *jpeg_encode_cfg_t* *encode_cfg, const uint8_t *encode_inbuf, uint32_t inbuf_size, uint8_t *encode_outbuf, uint32_t outbuf_size, uint32_t *out_size)

Process encoding of JPEG data using the specified encoder engine.

This function processes the encoding of JPEG data using the provided encoder engine and configuration. It takes an input buffer containing the raw image data, performs encoding based on the configuration settings, and outputs the compressed bitstream.

参数

- **encoder_engine** -- **[in]** Handle to the JPEG encoder engine to be used for encoding.
- **encode_cfg** -- **[in]** Pointer to the configuration structure for the JPEG encoding process.
- **encode_inbuf** -- **[in]** Pointer to the input buffer containing the raw image data.
- **inbuf_size** -- **[in]** Size of the input buffer in bytes.
- **encode_outbuf** -- **[in]** Pointer to the output buffer where the compressed bitstream will be stored.
- **outbuf_size** -- **[in]** The size of output buffer.
- **out_size** -- **[out]** Pointer to a variable where the size of the output bitstream will be stored.

返回

- ESP_OK: JPEG encoder process successfully.
- ESP_ERR_INVALID_ARG: JPEG encoder process failed because of invalid argument.
- ESP_ERR_TIMEOUT: JPEG encoder process timeout.

esp_err_t **jpeg_del_encoder_engine** (*jpeg_encoder_handle_t* encoder_engine)

Release resources used by a JPEG encoder instance.

This function releases the resources used by the specified JPEG encoder instance. The encoder instance is specified by the `encoder_engine` parameter.

参数 **encoder_engine** -- **[in]** Handle of the JPEG encoder instance to release resources for.

返回

- ESP_OK: Delete JPEG encoder successfully.
- ESP_ERR_INVALID_ARG: Delete JPEG encoder failed because of invalid argument.

void ***jpeg_alloc_encoder_mem** (size_t size, const *jpeg_encode_memory_alloc_cfg_t* *mem_cfg, size_t *allocated_size)

A helper function to allocate memory space for JPEG encoder.

参数

- **size** -- **[in]** The size of memory to allocate.
- **mem_cfg** -- **[in]** Memory configuration for memory allocation
- **allocated_size** -- **[out]** Actual allocated buffer size.

返回 Pointer to the allocated memory space, or NULL if allocation fails.

Structures

struct **jpeg_encode_cfg_t**

JPEG encoder configure structure.

Public Members

uint32_t **height**

Number of pixels in the horizontal direction

uint32_t **width**

Number of pixels in the vertical direction

jpeg_enc_input_format_t **src_type**

Source type of raw image to be encoded, see *jpeg_enc_src_type_t*

jpeg_down_sampling_type_t **sub_sample**

JPEG subsampling method

uint32_t **image_quality**

JPEG compressing quality, value from 1-100, higher value means higher quality

struct **jpeg_encode_engine_cfg_t**

Configuration parameters for the JPEG encode engine.

Public Members

int **intr_priority**

JPEG interrupt priority, if set to 0, driver will select the default priority (1,2,3).

int **timeout_ms**

JPEG timeout threshold for handling a picture, should larger than valid encode time in ms. For example, for 30fps encode, this value must larger than 34. -1 means wait forever

struct **jpeg_encode_memory_alloc_cfg_t**

JPEG encoder memory allocation config.

Public Members

jpeg_enc_buffer_alloc_direction_t **buffer_direction**

Buffer direction for jpeg encoder memory allocation

Type Definitions

typedef struct jpeg_decoder_t ***jpeg_decoder_handle_t**

Type of jpeg decoder handle.

typedef struct jpeg_encoder_t ***jpeg_encoder_handle_t**

Type of jpeg encoder handle.

Enumerations

enum **jpeg_dec_output_format_t**

Enumeration for jpeg output format.

Values:

enumerator **JPEG_DECODE_OUT_FORMAT_RGB888**

output RGB888 format

enumerator **JPEG_DECODE_OUT_FORMAT_RGB565**

output RGB565 format

enumerator **JPEG_DECODE_OUT_FORMAT_GRAY**

output the gray picture

enumerator **JPEG_DECODE_OUT_FORMAT_YUV444**

output yuv444 format

enumerator **JPEG_DECODE_OUT_FORMAT_YUV422**

output yuv422 format

enumerator **JPEG_DECODE_OUT_FORMAT_YUV420**

output yuv420 format

enum **jpeg_yuv_rgb_conv_std_t**

Enumeration for YUV and RGB conversion standard.

Values:

enumerator **JPEG_YUV_RGB_CONV_STD_BT601**

BT601

enumerator **JPEG_YUV_RGB_CONV_STD_BT709**

BT709

enum **jpeg_dec_rgb_element_order_t**

Enumeration for jpeg big/small endian output.

Values:

enumerator **JPEG_DEC_RGB_ELEMENT_ORDER_BGR**

Output the color component in small endian

enumerator **JPEG_DEC_RGB_ELEMENT_ORDER_RGB**

Output the color component in big endian

enum **jpeg_dec_buffer_alloc_direction_t**

Enumeration for jpeg decoder alloc buffer direction.

Values:

enumerator **JPEG_DEC_ALLOC_INPUT_BUFFER**

Alloc the picture input buffer, (compressed format in decoder)

enumerator **JPEG_DEC_ALLOC_OUTPUT_BUFFER**

Alloc the picture output buffer, (decompressed format in decoder)

enum **jpeg_enc_input_format_t**

Enumeration for jpeg input format.

Values:

enumerator **JPEG_ENCODE_IN_FORMAT_RGB888**

input RGB888 format

enumerator **JPEG_ENCODE_IN_FORMAT_RGB565**

input RGB565 format

enumerator **JPEG_ENCODE_IN_FORMAT_GRAY**

input GRAY format

enumerator **JPEG_ENCODE_IN_FORMAT_YUV422**

input YUV422 format

enum **jpeg_enc_buffer_alloc_direction_t**

Enumeration for jpeg encoder alloc buffer direction.

Values:

enumerator **JPEG_ENC_ALLOC_INPUT_BUFFER**

Alloc the picture input buffer, (decompressed format in encoder)

enumerator **JPEG_ENC_ALLOC_OUTPUT_BUFFER**

Alloc the picture output buffer, (compressed format in encoder)

Header File

- [components/hal/include/hal/jpeg_types.h](#)
- This header file can be included with:

```
#include "hal/jpeg_types.h"
```

Unions

union **jpeg_huffman_table_info_t**

#include <jpeg_types.h> Structure for huffman information.

Public Members

uint8_t **id**

Huffman table id.

uint8_t **type**

Huffman table type.

struct *jpeg_huffman_table_info_t*::[anonymous] [**anonymous**]

uint8_t **info**

Information of huffman table.

Structures

struct **jpeg_component_factor_t**

Structure for recording factor of component.

Public Members

uint32_t **horizontal**

horizontal factor

uint32_t **vertical**

vertical factor

Enumerations

enum **jpeg_codec_mode_t**

Enum for JPEG codec working mode.

Values:

enumerator **JPEG_CODEC_ENCODER**

Encode mode.

enumerator **JPEG_CODEC_DECODER**

Decode mode.

enum **jpeg_sample_mode_t**

Enum for JPEG sampling mode.

Values:

enumerator **JPEG_SAMPLE_MODE_YUV444**

sample in YUV444

enumerator **JPEG_SAMPLE_MODE_YUV422**

sample in YUV422

enumerator **JPEG_SAMPLE_MODE_YUV420**

sample in YUV420

enum **jpeg_down_sampling_type_t**

Enumeration for jpeg decoder sample methods.

Values:

enumerator **JPEG_DOWN_SAMPLING_YUV444**

Sample by YUV444

enumerator **JPEG_DOWN_SAMPLING_YUV422**

Sample by YUV422

enumerator **JPEG_DOWN_SAMPLING_YUV420**

Sample by YUV420

enumerator **JPEG_DOWN_SAMPLING_GRAY**

Sample the gray picture

enum **jpeg_enc_src_type_t**

JPEG encoder source formats.

Values:

enumerator **JPEG_ENC_SRC_RGB888**

JPEG encoder source RGB888

enumerator **JPEG_ENC_SRC_YUV422**

JPEG encoder source YUV422

enumerator **JPEG_ENC_SRC_RGB565**

JPEG encoder source RGB565

enumerator **JPEG_ENC_SRC_GRAY**

JPEG encoder source GRAY

2.5.33 温度传感器

简介

ESP32-P4 内置传感器，用于测量芯片内部的温度。该温度传感器模组包含一个 8 位 Sigma-Delta 模拟-数字转换器 (ADC) 和一个数字-模拟转换器 (DAC)，可以补偿测量结果，减少温度测量的误差。

由于硬件限制，温度传感器存在预定义的测量范围及其对应误差，详见下表：

预定义测量范围 (°C)	测量误差 (°C)
50 ~ 125	< 3
20 ~ 100	< 2
-10 ~ 80	< 1
-30 ~ 50	< 2
-40 ~ 20	< 3

备注： 温度传感器主要用于测量芯片内部的温度变化。芯片内部温度通常高于环境温度，并且受到微控制器的时钟频率或 I/O 负载、外部散热环境等因素影响。

功能概述

下文将分节概述温度传感器的功能：

- **资源分配** - 介绍了部分参数，设置这些参数可以获取温度传感器句柄；还介绍了在温度传感器完成工作后如何回收资源。
- **启用及禁用温度传感器** - 介绍如何启用及禁用温度传感器。
- **获取测量的温度值** - 介绍如何获取实时温度值。
- **安装温度阈值回调函数** - 介绍如何注册温度阈值回调函数。
- **电源管理** - 介绍更改功耗模式（如 Light-sleep 模式）对温度传感器造成的影响。
- **IRAM 安全** - 介绍在禁用 cache 时如何提高温度传感器的性能。
- **线程安全** - 介绍如何使驱动程序具备线程安全性。
- **ETM 事件和任务** - 介绍哪些事件和任务可以连接到 ETM 通道。

资源分配 ESP32-P4 只有一个内置温度传感器硬件。`temperature_sensor_handle_t` 表示温度传感器模块，该变量也是不同函数之间的纽带。通过使用相同的 `temperature_sensor_handle_t` 变量，可以在不同的函数调用中访问和修改温度传感器属性，以控制和管理温度传感器。该变量会作为温度 API 的参数，携带有关硬件和配置的信息，你只需创建类型为 `temperature_sensor_handle_t` 的指针，并将其传递给所需 API。

请在安装内置温度传感器模块前评估测量环境的温度范围。例如，如果在室内测量，环境温度可能在 10 °C ~ 30 °C；如果在灯泡中测量，环境温度则可能在 60 °C ~ 110 °C。在环境温度范围的基础上，请根据以下值定义配置结构体 `temperature_sensor_config_t`，再安装内置温度传感器：

- `range_min`：所测量温度范围的最小值。
- `range_max`：所测量温度范围的最大值。

设置好温度范围后，将配置结构体传递给 `temperature_sensor_install()`，该函数将创建温度传感器模块并返回句柄。

如前文所述，不同测量范围对应不同测量误差。然而你无需自行比对测量误差，乐鑫提供了一个内部机制，可以根据所给温度范围选择最小误差。

温度传感器使用完毕后，请调用 `temperature_sensor_uninstall()` 释放相应资源。

创建温度传感器句柄

- 第 1 步：评估测量范围。本示例的温度范围为 20 °C ~ 50 °C。
- 第 2 步：配置测量范围，获取温度传感器句柄。

```
temperature_sensor_handle_t temp_handle = NULL;
temperature_sensor_config_t temp_sensor_config = TEMPERATURE_SENSOR_CONFIG_
↳DEFAULT(20, 50);
ESP_ERROR_CHECK(temperature_sensor_install(&temp_sensor_config, &temp_handle));
```

启用及禁用温度传感器

1. 调用 `temperature_sensor_enable()` 启用温度传感器。此时，内部温度传感器回路开始工作，驱动程序从初始化状态转为启用状态。
2. 调用 `temperature_sensor_disable()` 禁用温度传感器。

获取测量的温度值 通过 `temperature_sensor_enable()` 启用温度传感器后，可以调用 `temperature_sensor_get_celsius()` 获取当前测量的温度值。

```
// 启用温度传感器
ESP_ERROR_CHECK(temperature_sensor_enable(temp_handle));
// 获取传输的传感器数据
float tsens_out;
ESP_ERROR_CHECK(temperature_sensor_get_celsius(temp_handle, &tsens_out));
printf("Temperature in %f °C\n", tsens_out);
// 温度传感器使用完毕后，禁用温度传感器，节约功耗
ESP_ERROR_CHECK(temperature_sensor_disable(temp_handle));
```

安装温度阈值回调函数 ESP32-P4 支持自动触发温度传感器，持续监测内部温度，内部温度达到给定阈值时将触发中断。因此，可以安装中断回调函数执行所需操作，如报警、重启等。下文介绍了如何准备阈值回调函数。

- 函数 `temperature_sensor_event_callbacks_t::on_threshold` 在中断服务程序 (ISR) 的上下文中调用，请确保该函数不会涉及 `block` 操作。为此，可以检查调用 API 的后缀，确保仅从函数内调用具有 ISR 后缀的 FreeRTOS API 等。函数原型在 `temperature_thres_cb_t` 中声明。

通过参数 `user_arg` 可以将自定义上下文保存到 `temperature_sensor_register_callbacks()` 中，用户数据将直接传递给回调函数。

```
IRAM_ATTR static bool temp_sensor_monitor_cbs(temperature_sensor_handle_t tsens,
↳const temperature_sensor_threshold_event_data_t *edata, void *user_data)
{
    ESP_DRAM_LOGI("tsens", "Temperature value is higher or lower than threshold,
↳value is %d\n...\n\n", edata->celsius_value);
    return false;
```

(下页继续)

```

}

// 配置回调函数
temperature_sensor_abs_threshold_config_t threshold_cfg = {
    .high_threshold = 50,
    .low_threshold = -10,
};
// 设置监控阈值
temperature_sensor_set_absolute_threshold(temp_sensor, &threshold_cfg);
// 注册中断回调函数
temperature_sensor_event_callbacks_t cbs = {
    .on_threshold = temp_sensor_monitor_cbs,
};
// 安装温度回调函数
temperature_sensor_register_callbacks(temp_sensor, &cbs, NULL);

```

电源管理 由于温度传感器不使用 APB 时钟，无论是否激活 `CONFIG_PM_ENABLE` 启用电源管理，温度传感器仍可以继续工作。

IRAM 安全 默认情况下，禁用 cache 时，写入/擦除 flash 等原因将导致温度传感器中断延迟，事件回调函数也将延迟执行。在实时应用程序中，应避免此类情况。

因此，可以启用 Kconfig 选项 `CONFIG_TEMP_SENSOR_ISR_IRAM_SAFE`，该选项：

1. 支持在禁用 cache 时启用所需中断
2. 支持将 ISR 使用的所有函数存放在 IRAM 中

启用该选项可以保证 cache 禁用时的中断运行，但会占用更多的 IRAM。

线程安全 温度传感器中并未添加任何确保线程安全的额外保护，因为温度传感器通常只在一个任务中调用。如果要在不同任务中使用该驱动程序，请设置额外的锁进行保护。

ETM 事件和任务 温度传感器能够生成事件，这些事件可以与 `doc:ETM` [模块](#) 进行交互。`temperature_sensor_etm_event_type_t` 中列出了所有支持的事件。可以调用 `temperature_sensor_new_etm_event` 来获取相应的 ETM 事件句柄。`temperature_sensor_etm_task_type_t` 中列出了所有支持的任务。可以调用 `temperature_sensor_new_etm_task` 来获取相应的 ETM 任务句柄。

备注：

- 对于 `temperature_sensor_etm_event_type_t::event_type` 的 `TEMPERATURE_SENSOR_EVENT_OVER_LIMIT` 取决于首先设置的阈值类型。如果是通过 `temperature_sensor_set_absolute_threshold()` 设置了绝对阈值，那么 `TEMPERATURE_SENSOR_EVENT_OVER_LIMIT` 将指代绝对阈值。同样，如果是通过 `temperature_sensor_set_delta_threshold()` 设置了增量阈值，那么 `TEMPERATURE_SENSOR_EVENT_OVER_LIMIT` 将指代增量阈值。

有关如何将事件和任务连接到 ETM 通道的详细信息，请参阅 `doc:ETM` [文档](#)。

意外情况

1. 从芯片获取的温度值通常与环境温度不同，因为温度传感器内置于芯片，从某种程度来说，温度传感器测量的是芯片内的温度。

2. 安装温度传感器失败时，如果驱动程序打印的错误信息为 `the boundary you gave cannot meet the range of internal temperature sensor`，说明内置温度传感器温度测量范围的限制影响了安装过程，该错误通常由以下几种不正确的 `temperature_sensor_config_t` 配置造成：

- (1) 超出温度测量范围，如 200 °C ~ 300 °C。
- (2) 超过了预定义测量范围的界限，如 40 °C ~ 110 °C。

应用示例

- 读取温度传感器测量值：[peripherals/temperature_sensor/temp_sensor](#)。
- 监测温度传感器测量值：[peripherals/temperature_sensor/temp_sensor_monitor](#)。

API 参考

Header File

- [components/esp_driver_tsens/include/driver/temperature_sensor.h](#)
- This header file can be included with:

```
#include "driver/temperature_sensor.h"
```

- This header file is a part of the API provided by the `esp_driver_tsens` component. To declare that your component depends on `esp_driver_tsens`, add the following to your CMakeLists.txt:

```
REQUIRES esp_driver_tsens
```

or

```
PRIV_REQUIRES esp_driver_tsens
```

Functions

`esp_err_t temperature_sensor_install` (`const temperature_sensor_config_t *tsens_config`,
`temperature_sensor_handle_t *ret_tsens`)

Install temperature sensor driver.

参数

- `tsens_config` -- Pointer to config structure.
- `ret_tsens` -- Return the pointer of temperature sensor handle.

返回

- ESP_OK if succeed

`esp_err_t temperature_sensor_uninstall` (`temperature_sensor_handle_t tsens`)

Uninstall the temperature sensor driver.

参数 `tsens` -- The handle created by `temperature_sensor_install()`.

返回

- ESP_OK if succeed.

`esp_err_t temperature_sensor_enable` (`temperature_sensor_handle_t tsens`)

Enable the temperature sensor.

参数 `tsens` -- The handle created by `temperature_sensor_install()`.

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE if temperature sensor is enabled already.

`esp_err_t temperature_sensor_disable` (`temperature_sensor_handle_t tsens`)

Disable temperature sensor.

参数 **tsens** -- The handle created by `temperature_sensor_install()`.

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE if temperature sensor is not enabled yet.

esp_err_t **temperature_sensor_get_celsius** (*temperature_sensor_handle_t* tsens, float *out_celsius)

Read temperature sensor data that is converted to degrees Celsius.

备注: Should not be called from interrupt.

参数

- **tsens** -- The handle created by `temperature_sensor_install()`.
- **out_celsius** -- The measure output value.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG invalid arguments
- ESP_ERR_INVALID_STATE Temperature sensor is not enabled yet.
- ESP_FAIL Parse the sensor data into ambient temperature failed (e.g. out of the range).

esp_err_t **temperature_sensor_set_absolute_threshold** (*temperature_sensor_handle_t* tsens, const *temperature_sensor_abs_threshold_config_t* *abs_cfg)

Set temperature sensor absolute mode automatic monitor.

备注: This function should not be called with `temperature_sensor_set_delta_threshold`.

参数

- **tsens** -- The handle created by `temperature_sensor_install()`.
- **abs_cfg** -- Configuration of temperature sensor absolute mode interrupt, see `temperature_sensor_abs_threshold_config_t`.

返回

- ESP_OK: Set absolute threshold successfully.
- ESP_ERR_INVALID_STATE: Set absolute threshold failed because of wrong state.
- ESP_ERR_INVALID_ARG: Set absolute threshold failed because of invalid argument.

esp_err_t **temperature_sensor_set_delta_threshold** (*temperature_sensor_handle_t* tsens, const *temperature_sensor_delta_threshold_config_t* *delta_cfg)

Set temperature sensor differential mode automatic monitor.

备注: This function should not be called with `temperature_sensor_set_absolute_threshold`

参数

- **tsens** -- The handle created by `temperature_sensor_install()`.
- **delta_cfg** -- Configuration of temperature sensor delta mode interrupt, see `temperature_sensor_delta_threshold_config_t`.

返回

- ESP_OK: Set differential value threshold successfully.
- ESP_ERR_INVALID_STATE: Set absolute threshold failed because of wrong state.
- ESP_ERR_INVALID_ARG: Set differential value threshold failed because of invalid argument.

```
esp_err_t temperature_sensor_register_callbacks (temperature_sensor_handle_t tsens, const
                                                temperature_sensor_event_callbacks_t *cbs,
                                                void *user_arg)
```

Install temperature sensor interrupt callback. Temperature sensor interrupt will be enabled at same time.

参数

- **tsens** -- The handle created by `temperature_sensor_install()`.
- **cbs** -- Pointer to the group of temperature sensor interrupt callbacks.
- **user_arg** -- Callback argument.

返回

- **ESP_OK**: Set event callbacks successfully
- **ESP_ERR_INVALID_ARG**: Set event callbacks failed because of invalid argument
- **ESP_FAIL**: Set event callbacks failed because of other error

Structures

```
struct temperature_sensor_config_t
```

Configuration of measurement range for the temperature sensor.

备注: If you see the log the boundary you gave cannot meet the range of internal temperature sensor. You may need to refer to predefined range listed [doc api-reference/peripherals/Temperature sensor](#).

Public Members

```
int range_min
```

the minimum value of the temperature you want to test

```
int range_max
```

the maximum value of the temperature you want to test

```
temperature_sensor_clk_src_t clk_src
```

the clock source of the temperature sensor.

```
struct temperature_sensor_threshold_event_data_t
```

Temperature sensor event data.

Public Members

```
int celsius_value
```

Celsius value in interrupt callback.

```
temperature_val_intr_condition_t intr_condition
```

Can be used to judge temperature sensor interrupts in which reason

```
struct temperature_sensor_event_callbacks_t
```

Group of temperature sensor callback functions, all of them will be run in ISR.

Public Members

temperature_thres_cb_t **on_threshold**

Temperature value interrupt callback

struct **temperature_sensor_abs_threshold_config_t**

Config options for temperature value absolute interrupt.

Public Members

float **high_threshold**

High threshold value(Celsius). Interrupt will be triggered if temperature value is higher than this value

float **low_threshold**

Low threshold value(Celsius). Interrupt will be triggered if temperature value is lower than this value

struct **temperature_sensor_delta_threshold_config_t**

Config options for temperature value delta interrupt.

Public Members

float **increase_delta**

Interrupt will be triggered if the temperature increment of two consecutive samplings if larger than *increase_delta*

float **decrease_delta**

Interrupt will be triggered if the temperature decrement of two consecutive samplings if smaller than *decrease_delta*

Macros

TEMPERATURE_SENSOR_CONFIG_DEFAULT (min, max)

temperature_sensor_config_t default constructor

Type Definitions

typedef struct temperature_sensor_obj_t ***temperature_sensor_handle_t**

Type of temperature sensor driver handle.

typedef bool (***temperature_thres_cb_t**)(*temperature_sensor_handle_t* tsens, const *temperature_sensor_threshold_event_data_t* *edata, void *user_data)

Callback for temperature sensor threshold interrupt.

Param tsens [in] The handle created by *temperature_sensor_install()*.

Param edata [in] temperature sensor event data, fed by driver.

Param user_data [in] User data, set in *temperature_sensor_register_callbacks()*.

Return Whether a high priority task has been waken up by this function.

Enumerations

enum **temperature_val_intr_condition_t**

Enum for temperature sensor interrupt condition.

Values:

enumerator **TEMPERATURE_VAL_HIGHER_THAN_HIGH_THRESHOLD**

temperature sensor value is higher than high threshold

enumerator **TEMPERATURE_VAL_LOWER_THAN_LOW_THRESHOLD**

temperature sensor value is lower than low threshold

Header File

- [components/hal/include/hal/temperature_sensor_types.h](#)
- This header file can be included with:

```
#include "hal/temperature_sensor_types.h"
```

Type Definitions

typedef *soc_periph_temperature_sensor_clk_src_t* **temperature_sensor_clk_src_t**

temperature sensor clock source

Enumerations

enum **temperature_sensor_etm_event_type_t**

temperature sensor event types enum

Values:

enumerator **TEMPERATURE_SENSOR_EVENT_OVER_LIMIT**

Temperature sensor over limit event

enumerator **TEMPERATURE_SENSOR_EVENT_MAX**

Maximum number of temperature sensor events

enum **temperature_sensor_etm_task_type_t**

temperature sensor task types enum

Values:

enumerator **TEMPERATURE_SENSOR_TASK_START**

Temperature sensor start task

enumerator **TEMPERATURE_SENSOR_TASK_STOP**

Temperature sensor stop task

enumerator **TEMPERATURE_SENSOR_TASK_MAX**

Maximum number of temperature sensor tasks

Header File

- `components/esp_driver_tsens/include/driver/temperature_sensor_etm.h`
- This header file can be included with:

```
#include "driver/temperature_sensor_etm.h"
```

- This header file is a part of the API provided by the `esp_driver_tsens` component. To declare that your component depends on `esp_driver_tsens`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_tsens
```

or

```
PRIV_REQUIRES esp_driver_tsens
```

Functions

`esp_err_t temperature_sensor_new_etm_event` (*temperature_sensor_handle_t* tsens, const *temperature_sensor_etm_event_config_t* *config, *esp_etm_event_handle_t* *out_event)

Get the ETM event for Temperature Sensor.

备注: The created ETM event object can be deleted later by calling `esp_etm_del_event`

参数

- **tsens** -- **[in]** Temperature Sensor handle, allocated by `temperature_sensor_install()`
- **config** -- **[in]** Temperature Sensor ETM event configuration
- **out_event** -- **[out]** Returned ETM event handle

返回

- `ESP_OK`: Get ETM event successfully
- `ESP_ERR_INVALID_ARG`: Get ETM event failed because of invalid argument
- `ESP_FAIL`: Get ETM event failed because of other error

`esp_err_t temperature_sensor_new_etm_task` (*temperature_sensor_handle_t* tsens, const *temperature_sensor_etm_task_config_t* *config, *esp_etm_task_handle_t* *out_task)

Get the ETM task for Temperature Sensor.

备注: The created ETM task object can be deleted later by calling `esp_etm_del_task`

参数

- **tsens** -- **[in]** Temperature Sensor, allocated by `temperature_sensor_install()`
- **config** -- **[in]** Temperature Sensor ETM task configuration
- **out_task** -- **[out]** Returned ETM task handle

返回

- `ESP_OK`: Get ETM task successfully
- `ESP_ERR_INVALID_ARG`: Get ETM task failed because of invalid argument
- `ESP_FAIL`: Get ETM task failed because of other error

Structures

struct `temperature_sensor_etm_event_config_t`

Temperature Sensor ETM event configuration.

Public Members`temperature_sensor_etm_event_type_t event_type`

Temperature Sensor ETM event type

struct `temperature_sensor_etm_task_config_t`

Temperature Sensor ETM task configuration.

Public Members`temperature_sensor_etm_task_type_t task_type`

Temperature Sensor ETM task type

2.5.34 电容式触摸传感器**概述**

触摸传感器系统由保护覆盖层、触摸电极、绝缘基板和走线组成，保护覆盖层位于最上层，绝缘基板上设有电极及走线。触摸覆盖层将引起电容变化，根据电容变化，可以判断此次触摸是否为有效触摸行为。

触摸传感器可以以矩阵或滑条等方式组合使用，从而覆盖更大触感区域及更多触点。触摸传感由软件或专用硬件计时器发起，由有限状态机 (FSM) 硬件控制。

如需了解触摸传感器设计、操作及其控制寄存器等相关信息，请参考《ESP32-P4 技术参考手册》(PDF) 中“片上传感器与模拟信号处理”章节。

请参考 [触摸传感器应用方案简介](#)，查看触摸传感器设计详情和固件开发指南。

电容式触摸传感器版本概览

硬件版本	芯片	主要特征
V1	ESP32	第一代触摸传感器，触摸时读数变小
V2	ESP32-S2	第二代触摸传感器，触摸时读数变大新增防水防潮、接近感应、睡眠唤醒功能
	ESP32-S3	第二代触摸传感器，新增接近感应测量完成中断
V3	ESP32-P4	第三代触摸传感器，新增跳频扫描

触摸通道概览

通道	CH0	CH1	CH2	CH3	CH4	CH5	CH6	CH7	CH8	CH9	CH10	CH11	CH12	CH13	CH14
GPIO	IO2	IO3	IO4	IO5	IO6	IO7	IO8	IO9	IO10	IO11	IO12	IO13	IO14	IO15	未引出

驱动中的术语介绍

- **触摸传感器控制器**：触摸传感器驱动中的控制器，负责触摸传感器的配置和管理。
- **触摸传感器通道**：具体的一路触摸传感器采样通道。一个触摸传感器模块具有多个通道，一般连接到触摸板上，用于测量该触摸板电容的变化。驱动中把对一个通道的采样称为测量，而对所有注册通道的测量称为一次扫描。
- **触摸传感器采样配置**：触摸传感器采样配置是驱动中对采样有关的硬件配置的统称。采样配置负责触摸传感器通道的采样，其配置决定了触摸通道的充放电次数、充放电频率、测量间隔等。ESP32-P4 仅支持一套采样配置，不支持跳频采样。

文件结构

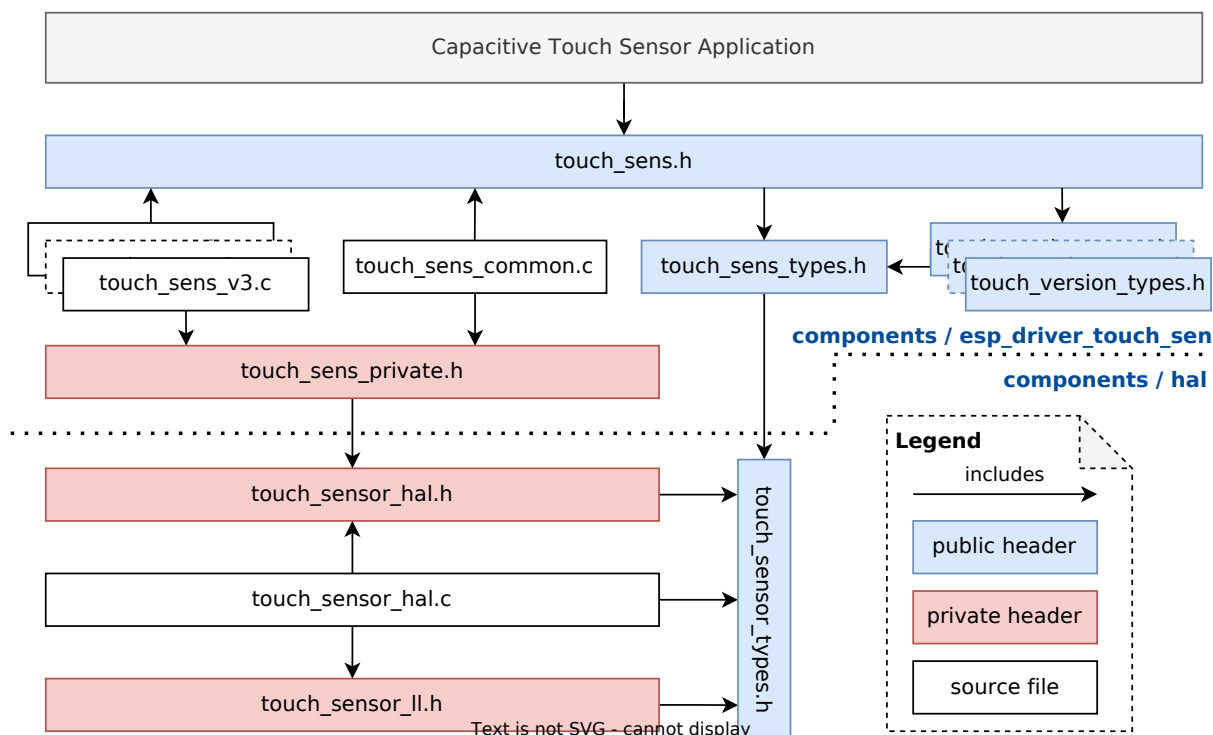

图 37: 触摸传感器驱动文件结构图

驱动状态机

下图为触摸传感器驱动的状态机，描述了调用不同函数后驱动的运行状态，以及状态变迁的约束。

上图为触摸传感器驱动的状态机，描述了调用不同函数后状态的变换关系。其中 <other_configurations> 部分为可选的配置项，包括对触摸驱动控制器和触摸通道的重新配置、回调函数注册等。

备注： `touch_channel_read_data()` 可在获取触摸通道句柄后（即 INIT 后）任意状态调用，但请注意读数值的有效性。

功能介绍

ESP32-P4 的电容式触摸传感器驱动提供的 API 按功能主要可分为：

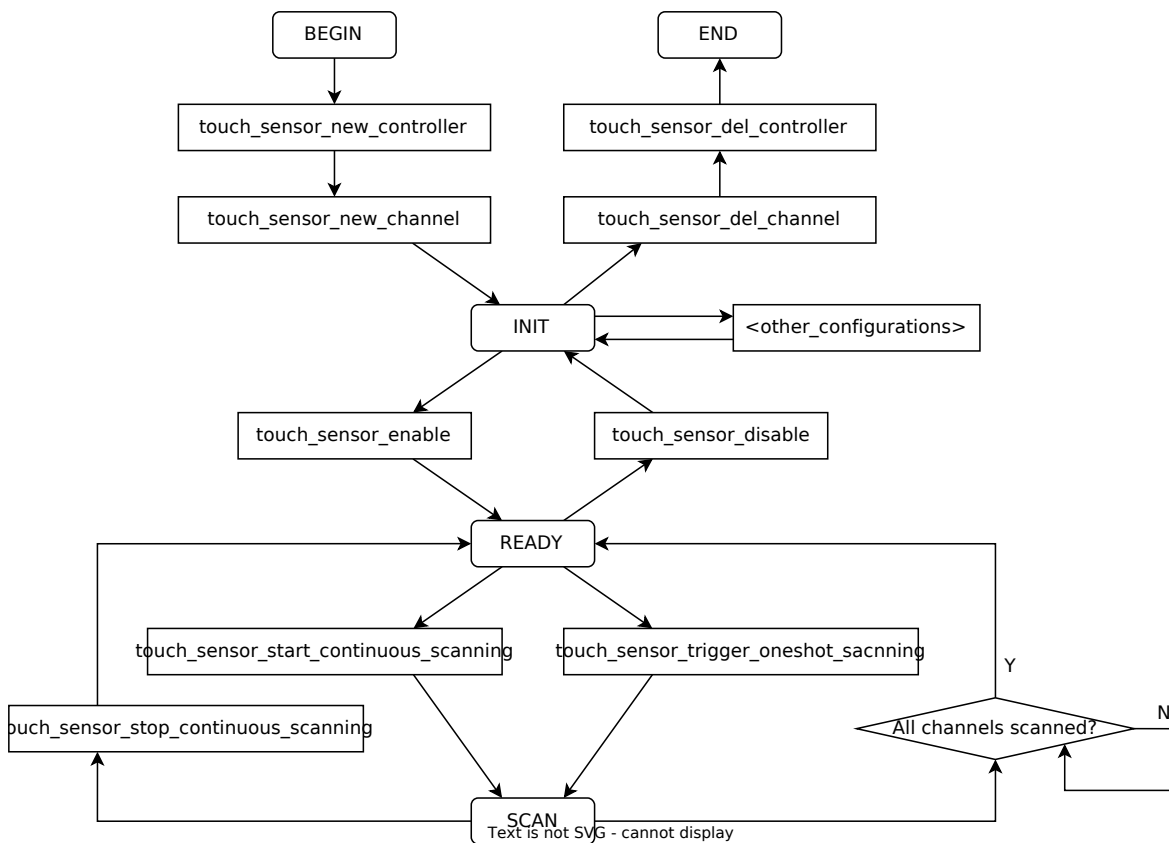

图 38: 触摸传感器驱动状态机示意图

- 触摸传感器控制器管理
- 触摸传感器通道管理
- 滤波器配置
- 回调函数
- 启用和禁用
- 连续扫描
- 单次扫描
- 基线值配置
- 测量值读数
- 防水防潮配置
- 接近感应配置
- 睡眠唤醒配置

触摸传感器控制器管理 触摸传感器驱动通过触摸传感器控制器句柄 `touch_sensor_handle_t` 控制。调用 `touch_sensor_new_controller()` 函数即可初始化触摸传感器控制器并得到控制器句柄。

```

// 有些芯片支持多套采样配置，这里以一套为例
#define SAMPLE_NUM 1
touch_sensor_handle_t sens_handle = NULL;
// 采样配置
touch_sensor_sample_config_t sample_cfg[SAMPLE_NUM] = {
    // 指定采样配置或通过 `TOUCH_SENSOR_Vn_DEFAULT_SAMPLE_CONFIG` 使用默认采样配置
    // ...
};
// 默认控制器配置
touch_sensor_config_t touch_cfg = TOUCH_SENSOR_DEFAULT_BASIC_CONFIG(SAMPLE_NUM, ↵
↵sample_cfg);
// 申请一个新的触摸传感器控制器句柄
  
```

(下页继续)

(续上页)

```
ESP_ERROR_CHECK(touch_sensor_new_controller(&touch_cfg, &sens_handle));
```

删除触摸传感器驱动控制器时需调用 `touch_sensor_del_controller()` 函数，从而释放该控制器所占用的软硬件资源。注意，需要将基于该控制器申请的其他资源销毁或释放后才能删除该控制器。如该控制器下仍有触摸通道未被删除，则无法直接删除。

```
ESP_ERROR_CHECK(touch_sensor_del_controller(sens_handle));
```

在触摸传感器驱动控制器初始化后，且未启用触摸传感器时，可调用 `touch_sensor_reconfig_controller()` 函数对该控制器进行重新配置。

```
touch_sensor_config_t touch_cfg = {
    // 控制器的新配置
    // ...
};
ESP_ERROR_CHECK(touch_sensor_reconfig_controller(sens_handle, &touch_cfg));
```

触摸传感器通道管理 一个触摸传感器具有多个测量通道，每个触摸传感器通道由句柄 `touch_channel_handle_t` 控制。调用 `touch_sensor_new_channel()` 函数即可初始化触摸传感器通道并得到通道句柄。

```
// ...
touch_channel_config_t chan_cfg = {
    // 触摸通道配置
    // ...
};
touch_channel_handle_t chan_handle = NULL;
int chan_id = 0;
// 申请一个新的触摸通道句柄
ESP_ERROR_CHECK(touch_sensor_new_channel(sens_handle, chan_id, &chan_cfg, &chan_
↪handle));
```

删除触摸传感器通道时需调用 `touch_sensor_del_channel()` 函数，从而释放该通道所占用的软硬件资源。

```
ESP_ERROR_CHECK(touch_sensor_del_channel(chan_handle));
```

在触摸传感器驱动通道初始化后，且未启用触摸传感器时，可调用 `touch_sensor_reconfig_channel()` 函数对该通道进行重新配置。

```
touch_channel_config_t chan_cfg = {
    // 触摸通道新配置
    // ...
};
ESP_ERROR_CHECK(touch_sensor_reconfig_channel(chan_handle, &chan_cfg));
```

滤波器配置 触摸传感器可以通过配置滤波器来提升不同场景下的数据稳定性。调用 `touch_sensor_config_filter()` 并指定 `touch_sensor_filter_config_t` 来配置基线值和读数值的滤波策略和更新方式，配置后对所有启用的触摸通道都生效。

若需要注销滤波器，可再次调用 `touch_sensor_config_filter()` 并将第二个参数（即 `touch_sensor_filter_config_t` 的配置结构体指针）设为 NULL 来注销滤波器功能。

```
// ...
touch_sensor_filter_config_t filter_config = {
    // 滤波器配置
    // ...
};
```

(下页继续)

```
// 注册滤波器
ESP_ERROR_CHECK(touch_sensor_config_filter(sens_handle, &filter_config));
// ...
// 注销滤波器
ESP_ERROR_CHECK(touch_sensor_config_filter(sens_handle, NULL));
```

回调函数 通过调用 `touch_sensor_register_callbacks()` 注册各类触摸传感器事件回调函数，当触摸传感器通道触发如触摸 `on_active`、释放 `on_inactive` 等事件时，就会调用对应的回调函数通知上层应用，以便对触摸事件进行处理。

例如，测量值超出当前的测量通道的基线值 + 触发阈值，则该通道将被触发，并调用 `on_active` 事件的回调函数，通知应用层该触摸通道被触发。同理，若处于触发状态的通道测量值小于基线值 + 触发阈值，则该通道将回到未触发状态，并调用 `on_inactive` 事件的回调函数，通知应用层该触摸通道被释放。

备注： 为保证触发和释放事件的稳定性，触摸传感器可配置触发阈值的迟滞比较裕量和去抖动计数来避免短时间内由噪声和读数抖动引起的反复触发和释放

具体可注册的回调时间请参考 `touch_event_callbacks_t`。

```
touch_event_callbacks_t callbacks = {
    .on_active = example_touch_on_active_cb,
    // 其他回调函数
    // ...
};
// 注册回调函数
ESP_ERROR_CHECK(touch_sensor_register_callbacks(sens_handle, &callbacks, NULL));

// 通过把相应回调设为 NULL 以注销回调函数
callbacks.on_active = NULL;
// 其他需要注销的回调函数
// ...
ESP_ERROR_CHECK(touch_sensor_register_callbacks(sens_handle, &callbacks, NULL));
```

启用和禁用 配置完成触摸传感器控制器以及通道后，可调用 `touch_sensor_enable()` 函数启用该控制器，启用后控制器处于就绪状态，会对注册的通道上电，可以开始扫描并采集触摸数据。注意，控制器启用后无法更新配置，只能进行扫描采样和读数操作。若要更新配置，需先调用 `touch_sensor_disable()` 函数禁用控制器，方可重新配置控制器、通道等。

```
// 启用触摸传感器
ESP_ERROR_CHECK(touch_sensor_enable(sens_handle));
// ...
// 禁用触摸传感器
ESP_ERROR_CHECK(touch_sensor_disable(sens_handle));
```

连续扫描 在控制器启用后，调用 `touch_sensor_start_continuous_scanning()` 函数可开始对所有已注册的触摸通道进行连续扫描，每次扫描都会更新对应通道的测量值。调用 `touch_sensor_stop_continuous_scanning()` 函数后则停止扫描。

```
// 开始连续扫描
ESP_ERROR_CHECK(touch_sensor_start_continuous_scanning(sens_handle));
// ...
// 停止连续扫描
ESP_ERROR_CHECK(touch_sensor_stop_continuous_scanning(sens_handle));
```

单次扫描 在控制器启用后，调用 `touch_sensor_trigger_oneshot_scanning()` 函数可触发一次对所有已注册的触摸通道的扫描。注意，单次扫描为阻塞函数，调用后会保持阻塞直到扫描结束后返回。此外在开始连续扫描后，无法再触发单次扫描。

```
// 触发单次扫描，并设置超时时间为 1000ms
ESP_ERROR_CHECK(touch_sensor_trigger_oneshot_scanning(sens_handle, 1000));
```

基线值配置 一般情况下，不需要额外设置触摸传感器的基线值，若有必要强制复位基线值到当前平滑值，可调用 `touch_channel_config_benchmark()`。

```
touch_chan_benchmark_config_t benchmark_cfg = {
    // 基线操作
    // ...
};
ESP_ERROR_CHECK(touch_channel_config_benchmark(chan_handle, &benchmark_cfg));
```

测量值读数 调用 `touch_channel_read_data()` 可读取每个通道不同种类的数据，例如基线值、经过滤波后的平滑值等。支持的数据类型请参考 `touch_chan_data_type_t`。

ESP32-P4 支持通过配置多套采样配置来实现跳频采样，`touch_channel_read_data()` 可一次性读出一个通道所有采样配置的测量值。根据配置的 `touch_sensor_config_t::sample_cfg_num` 采样配置数量，第三个参数 (`*data`) 数据指针传入数组长度大于等于采样配置数量的数组指针即可，该函数会将所指定通道的所有采样配置的测量值存入该数组中。

```
#define SAMPLE_NUM 1 // 以一套采样配置为例
uint32_t smooth_data[SAMPLE_NUM] = {};
// 读取滤波后的平滑数据
ESP_ERROR_CHECK(touch_channel_read_data(chan_handle, TOUCH_CHAN_DATA_TYPE_SMOOTH, &smooth_data));
```

防水防潮配置 ESP32-P4 支持防水防潮功能。可通过调用 `touch_sensor_config_waterproof()` 并配置 `touch_waterproof_config_t` 来注册防水防潮功能。防水防潮功能主要包含两部分：

- 遇水（浸没）保护功能：`touch_waterproof_config_t::guard_chan` 用于指定用于遇水保护功能的触摸通道，该通道在 PCB 上一般设计成环形，其他普通触摸通道布局在该环形保护圈内，当电路板大面积浸水时，该环形保护通道会被触发，并停止其他触摸通道的扫描，由此防止其他普通通道的误触发；
- 防潮（水滴）屏蔽功能：`touch_waterproof_config_t::shield_chan` 用于指定防潮屏蔽功能的触摸通道，该通道在 PCB 上一般设计成网格状铺铜。防潮屏蔽通道将与当前测量通道进行同步充放电，当有小水珠覆盖时，通过配置适当的 `touch_waterproof_config_t::shield_drv` 来提高因水滴造成的电耦合强度，从而识别水滴造成的误触。在实际应用中识别到水滴造成的误触后可适当增加触摸通道触发的阈值来实现通道在水滴覆盖下的正常触发，从而实现防潮功能。

若需要注销防水防潮功能，可再次调用 `touch_sensor_config_waterproof()` 并将第二个参数（即 `touch_waterproof_config_t` 的配置结构体指针）设为 `NULL` 来注销防水防潮功能。

```
touch_waterproof_config_t waterproof_cfg = {
    // 防水防潮配置
    // ...
};
// 注册防水防潮功能
ESP_ERROR_CHECK(touch_sensor_config_waterproof(sens_handle, &waterproof_cfg));
// ...
// 注销防水防潮功能
ESP_ERROR_CHECK(touch_sensor_config_waterproof(sens_handle, NULL));
```

接近感应配置 ESP32-P4 支持接近感应功能。可通过调用 `touch_sensor_config_proximity_sensing()` 并配置 `touch_proximity_config_t` 来注册接近感应功能。

由于接近感应引起的电容变化远小于物理触摸，PCB 上常用较大面积的铺铜来增大触摸通道的感应面积，另外需要在硬件上对接近感应通道进行多轮扫描并在驱动中进行累加来提高测量灵敏度。接近感应的灵敏度由测量轮数 `touch_proximity_config_t::scan_times` 以及单次测量的充放电次数 `touch_proximity_config_t::charge_times` 决定。测量轮数以及充放电次数越高，灵敏度越高，但是过高的灵敏度容易导致误触发，请选择适当的灵敏度来保证触发的稳定性。

接近感应通道多次测量的累加值也可通过 `touch_channel_read_data()` 获取，数据类型 `touch_chan_data_type_t` 为 `TOUCH_CHAN_DATA_TYPE_PROXIMITY`。

若需要注销接近感应功能，可再次调用 `touch_sensor_config_proximity_sensing()` 并将第二个参数（即 `touch_proximity_config_t` 的配置结构体指针）设为 `NULL` 来注销接近感应功能。

```
touch_proximity_config_t prox_cfg = {
    // 接近感应配置
    // ...
};
// 注册接近感应功能
ESP_ERROR_CHECK(touch_sensor_config_proximity_sensing(sens_handle, &prox_cfg));
// ...
// 注销接近感应功能
ESP_ERROR_CHECK(touch_sensor_config_proximity_sensing(sens_handle, NULL));
```

睡眠唤醒配置 ESP32-P4 支持触摸传感器将芯片从浅睡眠或深睡眠状态中唤醒。可通过调用 `touch_sensor_config_sleep_wakeup()` 并配置 `touch_sleep_config_t` 来注册接近感应功能。

注册触摸传感器的睡眠唤醒功能后，处于睡眠状态下的芯片仍将保持对触摸传感器的采样，这将会导致芯片睡眠后的功耗增加，可通过减少充放电次数、增加采样间隔等方式来降低功耗。

另外，请注意在主核睡眠期间的采样、唤醒等操作均由硬件完成，本驱动由于运行在主核上，无法提供读数、配置等功能。

- 浅睡眠状态唤醒：通过指定 `slp_wakeup_lvl` 为 `TOUCH_LIGHT_SLEEP_WAKEUP` 即可启用触摸传感器浅睡眠唤醒功能。注意任何已注册的触摸传感器通道都会在浅睡眠状态下保持采样并支持唤醒浅睡眠。
- 深睡眠状态唤醒：启用触摸传感器深睡眠唤醒功能除了指定 `slp_wakeup_lvl` 为 `TOUCH_DEEP_SLEEP_WAKEUP` 外，还需要指定深睡眠唤醒通道 `deep_slp_chan`，注意只有该指定的通道才会在深睡眠状态下保持采样以及唤醒，以此降低在深睡眠状态下的功耗。此外，若需要在深度睡眠下使用另一套低功耗的配置来进一步降低功耗，可以通过 `deep_slp_sens_cfg` 额外指定一套低功耗配置，在进入深睡眠前，驱动会应用这套配置，从深睡眠状态唤醒后，则会重新配置到之前的配置。请注意当 `slp_wakeup_lvl` 配置为 `TOUCH_DEEP_SLEEP_WAKEUP` 后，触摸传感器不仅能唤醒深睡眠状态，还能唤醒浅睡眠状态。

若需要注销睡眠唤醒功能，可再次调用 `touch_sensor_config_sleep_wakeup()` 并将第二个参数（即 `touch_sleep_config_t` 的配置结构体指针）设为 `NULL` 来注销睡眠唤醒功能。

```
touch_sleep_config_t light_slp_cfg = {
    .slp_wakeup_lvl = TOUCH_LIGHT_SLEEP_WAKEUP,
};
// 注册浅睡眠唤醒功能
ESP_ERROR_CHECK(touch_sensor_config_sleep_wakeup(sens_handle, &light_slp_cfg));
// ...
// 注销睡眠唤醒功能
ESP_ERROR_CHECK(touch_sensor_config_sleep_wakeup(sens_handle, NULL));
touch_sleep_config_t deep_slp_cfg = {
    .slp_wakeup_lvl = TOUCH_DEEP_SLEEP_WAKEUP,
    .deep_slp_chan = dslp_chan_handle,
    // 其他深睡眠唤醒配置
    // ...
};
```

(下页继续)

```
};
// 注册深睡眠唤醒功能
ESP_ERROR_CHECK(touch_sensor_config_sleep_wakeup(sens_handle, &deep_slp_cfg));
```

应用示例

- 触摸传感器基础例程: [peripherals/touch_sensor/touch_sensor_v3](#).

REQUIRES esp_driver_touch_sens
```

or

```
PRIV_REQUIRES esp_driver_touch_sens
```

Functions

***esp_err_t* touch_sensor_new_controller** (const *touch_sensor_config_t* *sens_cfg, *touch_sensor_handle_t* *ret_sens_handle)

Allocate a new touch sensor controller.

备注: The touch sensor driver will be in INIT state after this function is called successfully.

参数

- **sens_cfg** -- [in] Touch sensor controller configurations
- **ret_sens_handle** -- [out] The return handle of the touch controller instance

返回

- `ESP_OK` On success
- `ESP_ERR_NO_MEM` No memory for the touch sensor controller
- `ESP_ERR_INVALID_ARG` Invalid argument or NULL pointer
- `ESP_ERR_INVALID_STATE` The touch sensor controller is already allocated

***esp_err_t* touch_sensor_del_controller** (*touch_sensor_handle_t* sens_handle)

Delete the touch sensor controller.

备注: This function can be called when the touch sensor controller is NOT enabled (i.e. INIT state).

参数 **sens_handle** -- [in] Touch sensor controller handle

返回

- `ESP_OK` On success
- `ESP_ERR_INVALID_ARG` Invalid argument or NULL pointer
- `ESP_ERR_INVALID_STATE` Controller not disabled or still some touch channels not deleted

esp_err_t **touch_sensor_new_channel** (*touch_sensor_handle_t* sens_handle, int chan_id, const *touch_channel_config_t* *chan_cfg, *touch_channel_handle_t* *ret_chan_handle)

Allocate a new touch channel from the touch sensor controller.

备注: This function can be called when the touch sensor controller is NOT enabled (i.e. INIT state).

参数

- **sens_handle** -- [in] Touch sensor controller handle
- **chan_id** -- [in] Touch channel index
- **chan_cfg** -- [in] Touch channel configurations
- **ret_chan_handle** -- [out] The return handle of the touch channel instance

返回

- ESP_OK On success
- ESP_ERR_NO_MEM No memory for the touch sensor channel
- ESP_ERR_INVALID_ARG Invalid argument or NULL pointer
- ESP_ERR_INVALID_STATE The touch sensor controller has not disabled or this channel has been allocated

esp_err_t **touch_sensor_del_channel** (*touch_channel_handle_t* chan_handle)

Delete the touch channel.

备注: This function can be called when the touch sensor controller is NOT enabled (i.e. INIT state).

参数 **chan_handle** -- [in] Touch channel handle

返回

- ESP_OK On success
- ESP_ERR_INVALID_ARG Invalid argument or NULL pointer
- ESP_ERR_INVALID_STATE The touch sensor controller has not disabled

esp_err_t **touch_sensor_reconfig_controller** (*touch_sensor_handle_t* sens_handle, const *touch_sensor_config_t* *sens_cfg)

Re-configure the touch sensor controller.

备注: This function can be called when the touch sensor controller is NOT enabled (i.e. INIT state).

备注: The re-configuration only applies to the touch controller, so it requires the controller handle that allocated from `touch_sensor_new_controller`, meanwhile, it won't affect the touch channels, no matter the channels are allocated or not.

参数

- **sens_handle** -- [in] Touch sensor controller handle
- **sens_cfg** -- [in] Touch sensor controller configurations

返回

- ESP_OK On success
- ESP_ERR_INVALID_ARG Invalid argument or NULL pointer
- ESP_ERR_INVALID_STATE The touch sensor controller has not disabled

esp_err_t **touch_sensor_reconfig_channel** (*touch_channel_handle_t* chan_handle, const *touch_channel_config_t* *chan_cfg)

Re-configure the touch channel.

备注: This function can be called when the touch sensor controller is NOT enabled (i.e. INIT state).

备注: The re-configuration only applies to a particular touch channel, so it requires the channel handle that allocated from `touch_sensor_new_channel`

参数

- **chan_handle** -- [in] Touch channel handle
- **chan_cfg** -- [in] Touch channel configurations

返回

- ESP_OK On success
- ESP_ERR_INVALID_ARG Invalid argument or NULL pointer
- ESP_ERR_INVALID_STATE The touch sensor controller has not disabled

esp_err_t **touch_sensor_config_filter** (*touch_sensor_handle_t* sens_handle, const *touch_sensor_filter_config_t* *filter_cfg)

Configure the touch sensor filter.

备注: This function is allowed to be called after the touch sensor is enabled

参数

- **sens_handle** -- [in] Touch sensor controller handle
- **filter_cfg** -- [in] Filter configurations, set NULL to disable the filter

返回

- ESP_OK: Configure the filter success
- ESP_ERR_INVALID_ARG: The sensor handle is NULL

esp_err_t **touch_sensor_enable** (*touch_sensor_handle_t* sens_handle)

Enable the touch sensor controller.

备注: This function can be called when the touch sensor controller is NOT enabled (i.e. INIT state). And the touch sensor driver will be in ENABLED state after this function is called successfully.

备注: Enable the touch sensor will power on the registered touch channels

参数 **sens_handle** -- [in] Touch sensor controller handle

返回

- ESP_OK On success
- ESP_ERR_INVALID_ARG Invalid argument or NULL pointer
- ESP_ERR_INVALID_STATE The touch sensor controller has already enabled

esp_err_t **touch_sensor_disable** (*touch_sensor_handle_t* sens_handle)

Disable the touch sensor controller.

备注: This function can only be called after the touch sensor controller is enabled (i.e. ENABLED state). And the touch sensor driver will be in INIT state after this function is called successfully.

备注: Disable the touch sensor will power off the registered touch channels

参数 `sens_handle` -- [in] Touch sensor controller handle

返回

- ESP_OK On success
- ESP_ERR_INVALID_ARG Invalid argument or NULL pointer
- ESP_ERR_INVALID_STATE The touch sensor controller has already disabled

esp_err_t **touch_sensor_start_continuous_scanning** (*touch_sensor_handle_t* sens_handle)

Start the scanning of the registered touch channels continuously.

备注: This function can only be called after the touch sensor controller is enabled (i.e. ENABLED state). And the touch sensor driver will be in SCANNING state after this function is called successfully. And it can also be called in ISR/callback context.

备注: The hardware FSM (Finite-State Machine) of touch sensor will be driven by its hardware timer continuously and repeatedly. i.e., the registered channels will be scanned one by one repeatedly.

参数 `sens_handle` -- [in] Touch sensor controller handle

返回

- ESP_OK On success
- ESP_ERR_INVALID_ARG Invalid argument or NULL pointer
- ESP_ERR_INVALID_STATE The touch sensor controller is not enabled or the continuous scanning has started

esp_err_t **touch_sensor_stop_continuous_scanning** (*touch_sensor_handle_t* sens_handle)

Stop the continuous scanning of the registered touch channels immediately.

备注: This function can only be called after the continuous scanning started (i.e. SCANNING state). And the touch sensor driver will be in ENABLED state after this function is called successfully. And it can also be called in ISR/callback context.

备注: Stop the hardware timer and reset the FSM (Finite-State Machine) of the touch sensor controller

参数 `sens_handle` -- [in] Touch sensor controller handle

返回

- ESP_OK On success
- ESP_ERR_INVALID_ARG Invalid argument or NULL pointer
- ESP_ERR_INVALID_STATE The continuous scanning has stopped

esp_err_t **touch_sensor_trigger_onehot_scanning** (*touch_sensor_handle_t* sens_handle, int timeout_ms)

Trigger an oneshot scanning for all the registered channels.

备注: This function can only be called after the touch sensor controller is enabled (i.e. ENABLED state). And the touch sensor driver will be in SCANNING state after this function is called successfully, and then switch back to ENABLED state after the scanning is done or timeout.

备注: The block time of this function depends on various factors, In common practice, recommend to set the timeout to several seconds or wait forever, because oneshot scanning can't last for so long.

参数

- **sens_handle** -- **[in]** Touch sensor controller handle
- **timeout_ms** -- **[in]** Set a positive value or zero means scan timeout in milliseconds Set a negative value means wait forever until finished scanning

返回

- ESP_OK On success
- ESP_ERR_TIMEOUT Timeout to finish the oneshot scanning
- ESP_ERR_INVALID_ARG Invalid argument
- ESP_ERR_INVALID_STATE The touch sensor controller is not enabled or the continuous scanning has started

esp_err_t **touch_sensor_register_callbacks** (*touch_sensor_handle_t* sens_handle, const *touch_event_callbacks_t* *callbacks, void *user_ctx)

Register the touch sensor callbacks.

备注: This function can be called when the touch sensor controller is NOT enabled (i.e. INIT state).

参数

- **sens_handle** -- **[in]** Touch sensor controller handle
- **callbacks** -- **[in]** Callback functions
- **user_ctx** -- **[in]** User context that will be passed to the callback functions

返回

- ESP_OK On success
- ESP_ERR_INVALID_ARG NULL pointer
- ESP_ERR_INVALID_STATE Touch sensor controller has not disabled

esp_err_t **touch_channel_config_benchmark** (*touch_channel_handle_t* chan_handle, const *touch_chan_benchmark_config_t* *benchmark_cfg)

Configure the touch sensor benchmark for all the registered channels.

备注: This function can be called no matter the touch sensor controller is enabled or not (i.e. ENABLED or SCANNING state). And it can also be called in ISR/callback context.

参数

- **chan_handle** -- **[in]** Touch channel handle
- **benchmark_cfg** -- **[in]** The benchmark configurations

返回

- ESP_OK On success
- ESP_ERR_INVALID_ARG NULL pointer

esp_err_t **touch_channel_read_data** (*touch_channel_handle_t* chan_handle, *touch_chan_data_type_t* type, uint32_t *data)

Read the touch channel data according to the types.

备注: This function can be called no matter the touch sensor controller is enabled or not (i.e. ENABLED or SCANNING state). And it can also be called in ISR/callback context.

备注: Specially, TOUCH_CHAN_DATA_TYPE_PROXIMITY data type will be read from the cached data in the driver, because the proximity data need to be accumulated in several scan times that specified by `touch_proximity_config_t::scan_times`. For other data types, the data are read from the hardware registers directly (not cached in the driver). The channel data in the register will be updated once the measurement of this channels is done, And keep locked until the next measurement is done.

参数

- **chan_handle** -- [in] Touch channel handle
- **type** -- [in] Specify the data type to read
- **data** -- [out] The data array pointer. If the target supports multiple sample configurations (SOC_TOUCH_SAMPLE_CFG_NUM), the array length should be equal to the frequency hopping number that specified in `touch_sensor_config_t::sample_cfg_num`, otherwise the array length should be 1.

返回

- ESP_OK On success
- ESP_ERR_INVALID_ARG Invalid argument or NULL pointer

`esp_err_t touch_sensor_config_waterproof` (`touch_sensor_handle_t` sens_handle, const `touch_waterproof_config_t` *wp_cfg)

Configure the touch sensor water proof channels.

备注: Once waterproof is enabled, the other touch channels won't be updated unless the shield channels is activated.

参数

- **sens_handle** -- [in] Touch sensor controller handle
- **wp_cfg** -- [in] Water proof channel configurations, set NULL to disable the water proof function

返回

- ESP_OK: Configure the water proof success
- ESP_ERR_INVALID_ARG: The sensor handle is NULL
- ESP_ERR_INVALID_STATE: The touch sensor is enabled

`esp_err_t touch_sensor_config_proximity_sensing` (`touch_sensor_handle_t` sens_handle, const `touch_proximity_config_t` *prox_cfg)

Configure the touch sensor proximity sensing channels.

参数

- **sens_handle** -- [in] Touch sensor controller handle
- **prox_cfg** -- [in] Proximity channels configurations, set NULL to disable the proximity sensing

返回

- ESP_OK: Configure the proximity channel success
- ESP_ERR_INVALID_ARG: The sensor handle is NULL
- ESP_ERR_INVALID_STATE: The touch sensor is enabled

`esp_err_t touch_sensor_config_sleep_wakeup` (`touch_sensor_handle_t` sens_handle, const `touch_sleep_config_t` *sleep_cfg)

Configure the touch sensor to wake-up the chip from sleep.

备注: Call this function to enable/disable the touch sensor wake-up the chip from deep/light sleep To only enable the touch sensor wake-up the chip from light sleep, set the

`touch_sleep_config_t::deep_slp_chan` to NULL. During the light sleep, all enabled touch channels will keep working, and any one of them can wake-up the chip from light sleep. To enable the touch sensor wake-up the chip from both light and deep sleep, set the `touch_sleep_config_t::deep_slp_chan` to an enabled channel. During the deep sleep, only this specified channels can work and wake-up the chip from the deep sleep, and other enabled channels can only wake-up the chip from light sleep.

参数

- **sens_handle** -- [in] Touch sensor controller handle
- **sleep_cfg** -- [in] Sleep wake-up configurations, set NULL to disable the touch sensor wake-up the chip from sleep

返回

- ESP_OK: Configure the sleep channel success
- ESP_ERR_INVALID_ARG: The sensor handle is NULL
- ESP_ERR_INVALID_STATE: The touch sensor is enabled

Structures

struct **touch_sensor_sample_config_t**

Sample configurations of the touch sensor.

Public Members

uint32_t **div_num**

Division of the touch output pulse, $\text{touch_out_pulse} / \text{div_num} = \text{charge_times}$

uint32_t **charge_times**

The charge and discharge times of this sample configuration, the read data are positive correlation to the `charge_times`

uint8_t **rc_filter_res**

The resistance of the RC filter of this sample configuration, range [0, 3], while 0 = 0K, 1 = 1.5K, 2 = 3K, 3 = 4.5K

uint8_t **rc_filter_cap**

The capacitance of the RC filter of this sample configuration, range [0, 127], while 0 = 0pF, 1 = 20pF, ..., 127 = 2.54pF

uint8_t **low_drv**

Low speed touch driver, only effective when high speed driver is disabled

uint8_t **high_drv**

High speed touch driver

uint8_t **bias_volt**

The Internal LDO voltage, which decide the bias voltage of the sample wave, range [0,15]

bool **bypass_shield_output**

Whether to bypass the shield output, enable when the charging/discharging rate greater than 10MHz

struct **touch_sensor_config_t**

Configurations of the touch sensor controller.

Public Members

uint32_t **power_on_wait_us**

The waiting time between the channels power on and able to measure, to ensure the data stability

float **meas_interval_us**

Measurement interval of each channels

uint32_t **max_meas_time_us**

The maximum time of measuring one channel, if the time exceeds this value, the timeout interrupt will be triggered. Set to '0' to ignore the measurement time limitation, otherwise please set a proper time considering the configurations of this sample configurations below.

touch_out_mode_t **output_mode**

Touch channel counting mode of the binarized touch output

uint32_t **sample_cfg_num**

The sample configuration number that used for sampling

touch_sensor_sample_config_t ***sample_cfg**

The array of this sample configuration configurations, the length should be specified in *touch_sensor_config_t::sample_cfg_num*

struct **touch_channel_config_t**

Configurations of the touch sensor channel.

Public Members

uint32_t **active_thresh**[TOUCH_SAMPLE_CFG_NUM]

The active threshold of each sample configuration, while the touch channel smooth value minus benchmark value exceed this threshold, will be regarded as activated

struct **touch_sensor_filter_config_t**

Configurations of the touch sensor filter.

Public Members

touch_benchmark_filter_mode_t **filter_mode**

Benchmark filter mode. IIR filter and Jitter filter can be selected, TOUCH_BM_IIR_FILTER_16 is recommended

uint32_t **jitter_step**

Jitter filter step size, only takes effect when the *filter_mode* is TOUCH_BM_JITTER_FILTER. Range: [0 ~ 15]

int **denoise_lvl**

The denoise level, which determines the noise bouncing range that won't trigger benchmark update. Range: [0 ~ 4]. The greater the *denoise_lvl* is, more noise resistance will be. Specially, 0 stands for no denoise Typically, recommend to set this field to 1.

struct *touch_sensor_filter_config_t*::[anonymous] **benchmark**

Benchmark configuration.

Benchmark filter

touch_smooth_filter_mode_t **smooth_filter**

Smooth data IIR filter mode

uint32_t **active_hysteresis**

The hysteresis threshold to judge whether the touch channel is active. If the channel data exceed the '*touch_channel_config_t::active_thresh* + active_hysteresis' the channel will be activated. If the channel data is below to '*touch_channel_config_t::active_thresh* - active_hysteresis' the channel will be inactivated.

uint32_t **debounce_cnt**

The debounce count of the touch channel. Only when the channel data exceed the *touch_channel_config_t::active_thresh* + active_hysteresis for debounce_cnt times the channel will be activated. And only if the channel data is below to the *touch_channel_config_t::active_thresh* - active_hysteresis for debounce_cnt times, the channel will be inactivated. (The unit of debounce_cnt is the tick of the slow clock source)

struct *touch_sensor_filter_config_t*::[anonymous] **data**

Data configuration.

Channel data filter

struct **touch_sleep_config_t**

Configure the touch sensor sleep function.

Public Members

touch_sleep_wakeup_level_t **slp_wakeup_lvl**

The sleep level that can be woke up by touch sensor.

touch_channel_handle_t **deep_slp_chan**

The touch channel handle that supposed to work in the deep sleep. It can wake up the chip from deep sleep when this channel is activated. Only effective when the *touch_sleep_config_t::slp_wakeup_lvl* is TOUCH_DEEP_SLEEP_WAKEUP

uint32_t **deep_slp_thresh**[TOUCH_SAMPLE_CFG_NUM]

The active threshold of the deep sleep channel during deep sleep, while the sleep channel exceed this threshold, it will be regarded as activated. Only effective when the *touch_sleep_config_t::slp_wakeup_lvl* is TOUCH_DEEP_SLEEP_WAKEUP

touch_sensor_config_dslp_t ***deep_slp_sens_cfg**

Specify the touch sensor configuration during the deep sleep. Note that these configurations will no take effect immediately, they will be set automatically while the chip prepare to enter sleep. Set NULL to not change the configurations before entering sleep. The sleep configuration mainly aims at lower down the charging and measuring times, so that to save power consumption during the sleep. Only effective when the *touch_sleep_config_t::slp_wakeup_lvl* is TOUCH_DEEP_SLEEP_WAKEUP

struct **touch_waterproof_config_t**

Configure the touch sensor waterproof function.

Public Members

touch_channel_handle_t **guard_chan**

The guard channel of that used for immersion detect. Set NULL if you don't need the guard channel. Typically, the guard channel is a ring that surrounds the touch panels, it is used to detect the large area that covered by water. While large area of water covers the touch panel, the guard channel will be activated.

touch_channel_handle_t **shield_chan**

The shield channel that used for water droplets shield, can't be NULL. Typically, the shield channel uses grid layout which covers the touch area, it is used to shield the influence of water droplets covering both the touch panel and the shield channel. The shield channel will be paralleled to the current measuring channel (except the guard channel) to reduce the influence of water droplets.

uint32_t **shield_drv**

The shield channel driver, which controls the drive capability of shield channel, range: 0 ~ 7 The larger the parasitic capacitance on the shielding channel, the higher the drive capability needs to be set.

uint32_t **immersion_proof**

Enable to protect the touch sensor pad when immersion detected. It will temporary disable the touch scanning if the guard channel triggered, and enable again if guard channel released. So that to avoid the fake touch when the touch panel is immersed in water.

struct *touch_waterproof_config_t*::[anonymous] **flags**

Flags of the water proof function

struct **touch_proximity_config_t**

Configure the touch sensor proximity function.

Public Members

touch_channel_handle_t **proximity_chan**[TOUCH_PROXIMITY_CHAN_NUM]

The touch channel handles that will be configured as proximity sensing channels

uint32_t **scan_times**

The total scan times of EACH sample configuration, all sample configurations share a same *scan_times*. The measurement result of each scanning will be accumulated together to get the final result.

uint32_t **charge_times**[TOUCH_SAMPLE_CFG_NUM]

The charge times of EACH scanning, different sample configurations can set different *charge_times*. The measurement result of each scanning is positive correlation to the *charge_times*, please set a proper value in case of the final accumulated result overflow.

struct **touch_base_event_data_t**

Base event structure used in touch event queue.

Public Members*touch_channel_handle_t* **chan**

the current triggered touch channel handle

int **chan_id**

the current triggered touch channel number

uint32_t **status_mask**

the current channel triggered status. For the bits in the status mask, if the bit is set, the corresponding channel is active if the bit is cleared, the corresponding channel is inactive

struct **touch_event_callbacks_t**

Touch sensor callbacks.

备注: Set NULL for the used callbacks.

Public Membersbool (***on_active**)(*touch_sensor_handle_t* sens_handle, const *touch_active_event_data_t* *event, void *user_ctx)

Touch sensor on active event callback. Callback when any touch channel is activated.

Param sens_handle [in] Touch sensor controller handle, created from `touch_sensor_new_controller()`**Param event [in]** Touch sensor active event data**Param user_ctx [in]** User registered context, passed from `touch_sensor_register_callbacks()`**Return** Whether a high priority task has been waken up by this callback functionbool (***on_inactive**)(*touch_sensor_handle_t* sens_handle, const *touch_inactive_event_data_t* *event, void *user_ctx)

Touch sensor on inactive event callback. Callback when any touch channel is inactivated.

Param sens_handle [in] Touch sensor controller handle, created from `touch_sensor_new_controller()`**Param event [in]** Touch sensor inactive event data**Param user_ctx [in]** User registered context, passed from `touch_sensor_register_callbacks()`**Return** Whether a high priority task has been waken up by this callback functionbool (***on_measure_done**)(*touch_sensor_handle_t* sens_handle, const *touch_meas_done_event_data_t* *event, void *user_ctx)

Touch sensor on measure done event callback. Callback when the measurement of all the sample configurations on the current touch channel is done.

Param sens_handle [in] Touch sensor controller handle, created from `touch_sensor_new_controller()`**Param event [in]** Touch sensor measure done event data**Param user_ctx [in]** User registered context, passed from `touch_sensor_register_callbacks()`**Return** Whether a high priority task has been waken up by this callback function

```
bool (*on_scan_done)(touch_sensor_handle_t sens_handle, const touch_scan_done_event_data_t *event, void *user_ctx)
```

Touch sensor on scan done event callback. Callback when finished scanning all the registered touch channels.

Param sens_handle [in] Touch sensor controller handle, created from `touch_sensor_new_controller()`

Param event [in] Touch sensor scan done event data

Param user_ctx [in] User registered context, passed from `touch_sensor_register_callbacks()`

Return Whether a high priority task has been waken up by this callback function

```
bool (*on_timeout)(touch_sensor_handle_t sens_handle, const touch_timeout_event_data_t *event, void *user_ctx)
```

Touch sensor on measurement timeout event callback. Callback when measure the current touch channel timeout.

Param sens_handle [in] Touch sensor controller handle, created from `touch_sensor_new_controller()`

Param event [in] Touch sensor timeout event data

Param user_ctx [in] User registered context, passed from `touch_sensor_register_callbacks()`

Return Whether a high priority task has been waken up by this callback function

```
bool (*on_proximity_meas_done)(touch_sensor_handle_t sens_handle, const touch_prox_done_event_data_t *event, void *user_ctx)
```

Touch sensor on proximity sensing measurement done event callback. Callback when proximity sensing measurement of the current channel is done.

Param sens_handle [in] Touch sensor controller handle, created from `touch_sensor_new_controller()`

Param event [in] Touch sensor proximity sensing measure done event data

Param user_ctx [in] User registered context, passed from `touch_sensor_register_callbacks()`

Return Whether a high priority task has been waken up by this callback function

```
struct touch_chan_benchmark_config_t
```

Touch sensor benchmark configurations, to set or reset the benchmark of the channel.

Public Members

```
bool do_reset
```

Whether to reset the benchmark to the channel's latest smooth data

Macros

```
TOUCH_MIN_CHAN_ID
```

This file is only applicable to the touch hardware version3 Version 3 includes ESP32-P4.

The minimum available channel id of the touch pad

```
TOUCH_MAX_CHAN_ID
```

The maximum available channel id of the touch pad

TOUCH_SENSOR_DEFAULT_BASIC_CONFIG (sample_cfg_number, sample_cfg_array)

Helper macro to the default configurations of the touch sensor controller.

TOUCH_SENSOR_V3_DEFAULT_SAMPLE_CONFIG (_div_num, coarse_freq_tune, fine_freq_tune)

Helper macro to the default sample configurations.

备注: This default configuration uses `sample frequency = clock frequency / 1`

TOUCH_SENSOR_DEFAULT_FILTER_CONFIG ()

Type Definitions

typedef *touch_sensor_config_t* **touch_sensor_config_dslp_t**

Touch sensor configuration during the deep sleep.

备注: Currently it is the same as the normal controller configuration. The deep sleep configuration only takes effect when the chip entered sleep, so that to update a more power efficient configuration.

typedef *touch_base_event_data_t* **touch_meas_done_event_data_t**

Measure done event data.

备注: Currently same as base event data

typedef *touch_base_event_data_t* **touch_scan_done_event_data_t**

Scan done event data.

备注: Currently same as base event data

typedef *touch_base_event_data_t* **touch_active_event_data_t**

Active event data.

备注: Currently same as base event data

typedef *touch_base_event_data_t* **touch_inactive_event_data_t**

Inactive event data.

备注: Currently same as base event data

typedef *touch_base_event_data_t* **touch_prox_done_event_data_t**

Proximity sensing measure done event data.

备注: Currently same as base event data

typedef *touch_base_event_data_t* **touch_timeout_event_data_t**
Timeout event data.

备注: Currently same as base event data

Enumerations

enum **touch_chan_data_type_t**

The data type of the touch channel.

Values:

enumerator **TOUCH_CHAN_DATA_TYPE_SMOOTH**

The smooth data of the touch channel

enumerator **TOUCH_CHAN_DATA_TYPE_BENCHMARK**

The benchmark of the touch channel

enumerator **TOUCH_CHAN_DATA_TYPE_PROXIMITY**

The proximity data of the proximity channel

enum **touch_sleep_wakeup_level_t**

The chip sleep level that allows the touch sensor to wake-up.

Values:

enumerator **TOUCH_LIGHT_SLEEP_WAKEUP**

Only enable the touch sensor to wake up the chip from light sleep

enumerator **TOUCH_DEEP_SLEEP_WAKEUP**

Enable the touch sensor to wake up the chip from deep sleep or light sleep

enum **touch_chan_shield_cap_t**

Touch sensor shield channel drive capability level.

Values:

enumerator **TOUCH_SHIELD_CAP_40PF**

The max equivalent capacitance in shield channel is 40pf

enumerator **TOUCH_SHIELD_CAP_80PF**

The max equivalent capacitance in shield channel is 80pf

enumerator **TOUCH_SHIELD_CAP_120PF**

The max equivalent capacitance in shield channel is 120pf

enumerator **TOUCH_SHIELD_CAP_160PF**

The max equivalent capacitance in shield channel is 160pf

enumerator **TOUCH_SHIELD_CAP_200PF**

The max equivalent capacitance in shield channel is 200pf

enumerator **TOUCH_SHIELD_CAP_240PF**

The max equivalent capacitance in shield channel is 240pf

enumerator **TOUCH_SHIELD_CAP_280PF**

The max equivalent capacitance in shield channel is 280pf

enumerator **TOUCH_SHIELD_CAP_320PF**

The max equivalent capacitance in shield channel is 320pf

enum **touch_benchmark_filter_mode_t**

Touch channel Infinite Impulse Response (IIR) filter or Jitter filter for benchmark.

备注: Recommended filter coefficient selection is IIR_16.

Values:

enumerator **TOUCH_BM_IIR_FILTER_4**

IIR Filter for benchmark, $1/4$ raw_value + $3/4$ benchmark

enumerator **TOUCH_BM_IIR_FILTER_8**

IIR Filter for benchmark, $1/8$ raw_value + $7/8$ benchmark

enumerator **TOUCH_BM_IIR_FILTER_16**

IIR Filter for benchmark, $1/16$ raw_value + $15/16$ benchmark (typical)

enumerator **TOUCH_BM_IIR_FILTER_32**

IIR Filter for benchmark, $1/32$ raw_value + $31/32$ benchmark

enumerator **TOUCH_BM_IIR_FILTER_64**

IIR Filter for benchmark, $1/64$ raw_value + $63/64$ benchmark

enumerator **TOUCH_BM_IIR_FILTER_128**

IIR Filter for benchmark, $1/128$ raw_value + $127/128$ benchmark

enumerator **TOUCH_BM_JITTER_FILTER**

Jitter Filter for benchmark, raw value +/- jitter_step

enum **touch_smooth_filter_mode_t**

Touch channel Infinite Impulse Response (IIR) filter for smooth data.

Values:

enumerator **TOUCH_SMOOTH_NO_FILTER**

No filter adopted for smooth data, smooth data equals raw data

enumerator **TOUCH_SMOOTH_IIR_FILTER_2**

IIR filter adopted for smooth data, smooth data equals 1/2 raw data + 1/2 last smooth data (typical)

enumerator **TOUCH_SMOOTH_IIR_FILTER_4**

IIR filter adopted for smooth data, smooth data equals 1/4 raw data + 3/4 last smooth data

enumerator **TOUCH_SMOOTH_IIR_FILTER_8**

IIR filter adopted for smooth data, smooth data equals 1/8 raw data + 7/8 last smooth data

enum **touch_intr_event_t**

Interrupt events.

Values:

enumerator **TOUCH_INTR_EVENT_ACTIVE**

Touch channel active event

enumerator **TOUCH_INTR_EVENT_INACTIVE**

Touch channel inactive event

enumerator **TOUCH_INTR_EVENT_MEASURE_DONE**

Touch channel measure done event

enumerator **TOUCH_INTR_EVENT_SCAN_DONE**

All touch channels scan done event

enumerator **TOUCH_INTR_EVENT_TIMEOUT**

Touch channel measurement timeout event

enumerator **TOUCH_INTR_EVENT_PROXIMITY_DONE**

Proximity channel measurement done event

2.5.35 Two-Wire Automotive Interface (TWAI)

Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32-P4 contains 3 TWAI controller(s) that can be configured to communicate on a TWAI bus via an external transceiver.

警告: The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

Sections

- [Two-Wire Automotive Interface \(TWAI\)](#)

- [Overview](#)
- [TWAI Protocol Summary](#)
- [Signals Lines and Transceiver](#)
- [API Naming Conventions](#)
- [Driver Configuration](#)
- [Driver Operation](#)
- [Examples](#)
- [API Reference](#)

TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

Multi-master: Any node on the bus can initiate the transfer of a message.

Multi-cast: When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

Asynchronous: The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

Error Detection and Signaling: Every node constantly monitors the bus. When any node detects an error, it signals the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This results in an error detection being propagated to all nodes on the bus.

Message Priorities: Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

TWAI Messages TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as **Extended Frame** and **Standard Frame** which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

Error States and Counters The TWAI protocol implements a feature known as "fault confinement" where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the **Transmit Error Counter (TEC)** and the **Receive Error Counter (REC)**. The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node's **error state**, namely **Error Active**, **Error Passive**, and **Bus-Off**.

Error Active: A node is Error Active when **both TEC and REC are less than 128** and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an **Active Error Flag** over the bus.

Error Passive: A node is Error Passive when **either the TEC or REC becomes greater than or equal to 128**. Error Passive nodes are still able to take part in bus communications, but will instead transmit a **Passive Error Flag** upon detection of an error.

Bus-Off: A node becomes Bus-Off when the **TEC becomes greater than or equal to 256**. A Bus-Off node is unable influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

Signals Lines and Transceiver

The TWAI controller does not contain a integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, **an external transceiver is required**. The type of external transceiver used should depend on the application's physical layer specification (e.g., using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller's interface consists of 4 signal lines known as **TX, RX, BUS-OFF, and CLKOUT**. These four signal lines can be routed through the GPIO Matrix to the ESP32-P4's GPIO pads.

图 39: Signal lines of the TWAI controller

TX and RX: The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0 V), and a recessive bit as a high logic level (3.3 V).

BUS-OFF: The BUS-OFF signal line is **optional** and is set to a low logic level (0 V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3 V) otherwise.

CLKOUT: The CLKOUT signal line is **optional** and outputs a prescaled version of the controller's source clock.

备注: An external transceiver **must internally loopback the TX to RX** such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

API Naming Conventions

备注: The TWAI driver provides two sets of API. One is handle-free and is widely used in IDF versions earlier than v5.2, but it can only support one TWAI hardware controller. The other set is with handles, and the function name is usually suffixed with "v2", which can support any number of TWAI controllers. These two sets of API can be used at the same time, but it is recommended to use the "v2" version in your new projects.

Driver Configuration

This section covers how to configure the TWAI driver.

Operating Modes The TWAI driver supports the following modes of operations:

Normal Mode: The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

No Ack Mode: The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

Listen Only Mode: This mode prevents the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller is still able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

Alerts The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

表 5: TWAI Driver Alerts

Alert Flag	Description
TWAI_ALERT_TX_IDLE	No more messages queued for transmission
TWAI_ALERT_TX_SUCCESS	The previous transmission was successful
TWAI_ALERT_RX_DATA	A frame has been received and added to the RX queue
TWAI_ALERT_BELOW_ERR_WARN	Both error counters have dropped below error warning limit
TWAI_ALERT_ERR_ACTIVE	TWAI controller has become error active
TWAI_ALERT_RECOVERY_IN_PROGRESS	TWAI controller is undergoing bus recovery
TWAI_ALERT_BUS_RECOVERED	TWAI controller has successfully completed bus recovery
TWAI_ALERT_ARB_LOST	The previous transmission lost arbitration
TWAI_ALERT_ABOVE_ERR_WARN	One of the error counters have exceeded the error warning limit
TWAI_ALERT_BUS_ERROR	A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus
TWAI_ALERT_TX_FAILED	The previous transmission has failed
TWAI_ALERT_RX_QUEUE_FULL	The RX queue is full causing a received frame to be lost
TWAI_ALERT_ERR_PASS	TWAI controller has become error passive
TWAI_ALERT_BUS_OFF	Bus-off condition occurred. TWAI controller can no longer influence bus

备注: The TWAI controller's **error warning limit** is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the **error warning limit** to **96**. The TWAI_ALERT_ABOVE_ERR_WARN is raised when the TEC or REC becomes larger then or equal to the error warning limit. The TWAI_ALERT_BELOW_ERR_WARN is raised when both TEC and REC return back to values below **96**.

备注: When enabling alerts, the TWAI_ALERT_AND_LOG flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and TWAI_ALERT_AND_LOG if the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled (see *Placing ISR into IRAM*).

备注: The TWAI_ALERT_ALL and TWAI_ALERT_NONE macros can also be used to enable/disable all alerts

during configuration/reconfiguration.

Bit Timing The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple **time quanta**, and the period of a **time quantum** is determined by a pre-scaled version of the TWAI controller's source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quantum
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quantum by dividing the TWAI controller's source clock. On the ESP32-P4, the `brp` can be **any even number from 2 to 32768**. Alternatively, you can decide the resolution of each quantum, by setting `twai_timing_config_t::quanta_resolution_hz` to a non-zero value. In this way, the driver can calculate the underlying `brp` value for you. It is useful when you set different clock sources but want the bitrate to keep the same.

Supported clock source for a TWAI controller is listed in the `twai_clock_source_t` and can be specified in `twai_timing_config_t::clk_src`.

图 40: Bit timing configuration for 500kbit/s given BRP = 8, clock source frequency is 80MHz

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** causes 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. `sjw` can **range from 1 to 4**.

备注: Multiple combinations of `brp`, `tseg_1`, `tseg_2`, and `sjw` can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as **propagation delay, node information processing time, and phase errors**.

Bit timing **macro initializers** are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- `TWAI_TIMING_CONFIG_1MBITS`
- `TWAI_TIMING_CONFIG_800KBITS`
- `TWAI_TIMING_CONFIG_500KBITS`
- `TWAI_TIMING_CONFIG_250KBITS`
- `TWAI_TIMING_CONFIG_125KBITS`
- `TWAI_TIMING_CONFIG_100KBITS`
- `TWAI_TIMING_CONFIG_50KBITS`
- `TWAI_TIMING_CONFIG_25KBITS`
- `TWAI_TIMING_CONFIG_20KBITS`
- `TWAI_TIMING_CONFIG_16KBITS`
- `TWAI_TIMING_CONFIG_12_5KBITS`
- `TWAI_TIMING_CONFIG_10KBITS`
- `TWAI_TIMING_CONFIG_5KBITS`

- TWAI_TIMING_CONFIG_1KBITS

Acceptance Filter The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message **does not receive the message, but will still acknowledge it**. Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within `twai_filter_config_t` known as the **acceptance code** and the **acceptance mask**.

The **acceptance code** specifies the bit sequence which a message's ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode uses the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame's 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask are interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

图 41: Bit layout of single filter mode (Right side MSBit)

Dual Filter Mode uses the acceptance code and mask to define two separate filters allowing for increased flexibility of ID's to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask are interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).

图 42: Bit layout of dual filter mode (Right side MSBit)

Disabling TX Queue The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This allows applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

Placing ISR into IRAM The TWAI driver's ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver's functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR continues to:

- Read received messages from the RX buffer and place them into the driver's RX queue.
- Load messages pending transmission from the driver's TX queue and write them into the TX buffer.

To place the TWAI driver's ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.

- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

备注: When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

Driver Operation

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

图 43: State transition diagram of the TWAI driver (see table below)

Label	Transition	Action/Condition
A	Uninstalled > Stopped	<code>twai_driver_install()</code>
B	Stopped > Uninstalled	<code>twai_driver_uninstall()</code>
C	Stopped > Running	<code>twai_start()</code>
D	Running > Stopped	<code>twai_stop()</code>
E	Running > Bus-Off	Transmit Error Counter \geq 256
F	Bus-Off > Uninstalled	<code>twai_driver_uninstall()</code>
G	Bus-Off > Recovering	<code>twai_initiate_recovery()</code>
H	Recovering > Stopped	128 occurrences of 11 consecutive recessive bits.

Driver States Uninstalled: In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

Stopped: In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller is unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

Running: In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore, the TWAI controller is able to transmit error frames upon detection of errors on the bus.

Bus-Off: The bus-off state is automatically entered when the TWAI controller's Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller is unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

Recovering: The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver remains in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

Message Fields and Flags The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the `flags` member of `twai_message_t` and the following message flags:

Message Flag	Description
TWAI_MSG_FLAG_EXTD	Message is in Extended Frame Format (29bit ID)
TWAI_MSG_FLAG_RTR	Message is a Remote Frame (Remote Transmission Request)
TWAI_MSG_FLAG_SS	Transmit message using Single Shot Transmission (Message will not be re-transmitted upon error or loss of arbitration). Unused for received message.
TWAI_MSG_FLAG_SELF	Transmit message using Self Reception Request (Transmitted message will also be received by the same node). Unused for received message.
TWAI_MSG_FLAG_DLC_NON	Message's Data length code is larger than 8. This will break compliance with TWAI
TWAI_MSG_FLAG_NONE	Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.

Examples

Configuration & Installation The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.

```
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_
    ↪NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    ...
}
```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

Install Multiple TWAI Instances The following code snippet demonstrates how to install multiple TWAI instances via the use of the `twai_driver_install_v2()` function.

```
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    twai_handle_t twai_bus_0;
    twai_handle_t twai_bus_1;
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_0, GPIO_
↳NUM_1, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install driver for TWAI bus 0
    g_config.controller_id = 0;
    if (twai_driver_install_v2(&g_config, &t_config, &f_config, &twai_bus_0) ==_
↳ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }
    //Start TWAI driver
    if (twai_start_v2(twai_bus_0) == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    //Install driver for TWAI bus 1
    g_config.controller_id = 1;
    g_config.tx_io = GPIO_NUM_2;
    g_config.rx_io = GPIO_NUM_3;
    if (twai_driver_install_v2(&g_config, &t_config, &f_config, &twai_bus_1) ==_
↳ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }
    //Start TWAI driver
    if (twai_start_v2(twai_bus_1) == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    //Other Driver operations must use version 2 API as well
    ...
}
```

Message Transmission The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```

#include "driver/twai.h"

...

// Configure message to transmit
twai_message_t message = {
    // Message type and format settings
    .extd = 1,           // Standard vs extended format
    .rtr = 0,           // Data vs RTR frame
    .ss = 0,            // Whether the message is single shot (i.e., does not
↳repeat on error)
    .self = 0,          // Whether the message is a self reception request
↳(loopback)
    .dlc_non_comp = 0,  // DLC is less than 8
    // Message ID and payload
    .identifier = 0xAAAA,
    .data_length_code = 4,
    .data = {0, 1, 2, 3},
};

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}

```

Message Reception The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.

```

#include "driver/twai.h"

...

//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!(message.rtr)) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}

```

Reconfiguring and Reading Alerts The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the `twai_reconfigure_alerts()` and `twai_read_alerts()` functions.

```

#include "driver/twai.h"

...

//Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts");
}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);

```

Stop and Uninstall The following code demonstrates how to stop and uninstall the TWAI driver via the use of the `twai_stop()` and `twai_driver_uninstall()` functions.

```

#include "driver/twai.h"

...

//Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}

```

Multiple ID Filter Configuration The acceptance mask in `twai_filter_config_t` can be configured such that two or more IDs are accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how to calculate the acceptance mask given multiple IDs:

```

ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
//Acceptance Mask
MASK = 11'b000 0000 1101

```

Application Examples **Network Example:** The TWAI Network example demonstrates communication between two ESP32-P4s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of a data from another node acting as a network slave. The example can be found via [peripherals/twai/twai_network](#).

Alert and Recovery Example: This example demonstrates how to use the TWAI driver's alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state.

An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via [peripherals/twai/twai_alert_and_recovery](#).

Self Test Example: This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via [peripherals/twai/twai_self_test](#).

API Reference

Header File

- [components/hal/include/hal/twai_types.h](#)
- This header file can be included with:

```
#include "hal/twai_types.h"
```

Structures

struct **twai_message_t**

Structure to store a TWAI message.

备注: The flags member is deprecated

Public Members

uint32_t **extd**

Extended Frame Format (29bit ID)

uint32_t **rtr**

Message is a Remote Frame

uint32_t **ss**

Transmit as a Single Shot Transmission. Unused for received.

uint32_t **self**

Transmit as a Self Reception Request. Unused for received.

uint32_t **dlc_non_comp**

Message's Data length code is larger than 8. This will break compliance with ISO 11898-1

uint32_t **reserved**

Reserved bits

uint32_t **flags**

Deprecated: Alternate way to set bits using message flags

uint32_t **identifier**

11 or 29 bit identifier

uint8_t **data_length_code**

Data length code

uint8_t **data**[TWAI_FRAME_MAX_DLC]

Data bytes (not relevant in RTR frame)

struct **twai_timing_config_t**

Structure for bit timing configuration of the TWAI driver.

备注: Macro initializers are available for this structure

Public Members

twai_clock_source_t **clk_src**

Clock source, set to 0 or TWAI_CLK_SRC_DEFAULT if you want a default clock source

uint32_t **quanta_resolution_hz**

The resolution of one timing quanta, in Hz. Note: the value of `brp` will be reflected by this field if it's non-zero, otherwise, `brp` needs to be set manually

uint32_t **brp**

Baudrate prescale (i.e., clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for non-ESP32 chip. Note: For ESP32 ECO 2 or later, multiples of 4 from 132 to 256 are also supported

uint8_t **tseg_1**

Timing segment 1 (Number of time quanta, between 1 to 16)

uint8_t **tseg_2**

Timing segment 2 (Number of time quanta, 1 to 8)

uint8_t **sjw**

Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

bool **triple_sampling**

Enables triple sampling when the TWAI controller samples a bit

struct **twai_filter_config_t**

Structure for acceptance filter configuration of the TWAI driver (see documentation)

备注: Macro initializers are available for this structure

Public Members

uint32_t **acceptance_code**

32-bit acceptance code

uint32_t **acceptance_mask**

32-bit acceptance mask

bool **single_filter**

Use Single Filter Mode (see documentation)

Macros

TWAI_EXTD_ID_MASK

TWAI Constants.

Bit mask for 29 bit Extended Frame Format ID

TWAI_STD_ID_MASK

Bit mask for 11 bit Standard Frame Format ID

TWAI_FRAME_MAX_DLC

Max data bytes allowed in TWAI

TWAI_FRAME_EXTD_ID_LEN_BYTES

EFF ID requires 4 bytes (29bit)

TWAI_FRAME_STD_ID_LEN_BYTES

SFF ID requires 2 bytes (11bit)

TWAI_ERR_PASS_THRESH

Error counter threshold for error passive

Type Definitions

typedef *soc_periph_twai_clk_src_t* **twai_clock_source_t**

RMT group clock source.

备注: User should select the clock source based on the power and resolution requirement

Enumerations

enum **twai_mode_t**

TWAI Controller operating modes.

Values:

enumerator **TWAI_MODE_NORMAL**

Normal operating mode where TWAI controller can send/receive/acknowledge messages

enumerator **TWAI_MODE_NO_ACK**

Transmission does not require acknowledgment. Use this mode for self testing

enumerator **TWAI_MODE_LISTEN_ONLY**

The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

Header File

- `components/driver/twai/include/driver/twai.h`
- This header file can be included with:

```
#include "driver/twai.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

Functions

`esp_err_t twai_driver_install` (const `twai_general_config_t` *g_config, const `twai_timing_config_t` *t_config, const `twai_filter_config_t` *f_config)

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

备注: Macro initializers are available for the configuration structures (see documentation)

备注: To reinstall the TWAI driver, call `twai_driver_uninstall()` first

参数

- **g_config** -- [in] General configuration structure
- **t_config** -- [in] Timing configuration structure
- **f_config** -- [in] Filter configuration structure

返回

- `ESP_OK`: Successfully installed TWAI driver
- `ESP_ERR_INVALID_ARG`: Arguments are invalid, e.g. invalid clock source, invalid quanta resolution
- `ESP_ERR_NO_MEM`: Insufficient memory
- `ESP_ERR_INVALID_STATE`: Driver is already installed

`esp_err_t twai_driver_install_v2` (const `twai_general_config_t` *g_config, const `twai_timing_config_t` *t_config, const `twai_filter_config_t` *f_config, `twai_handle_t` *ret_twai)

Install TWAI driver and return a handle.

备注: This is an advanced version of `twai_driver_install` that can return a driver handle, so that it allows you to install multiple TWAI drivers. Don't forget to set the proper `controller_id` in the `twai_general_config_t`. Please refer to the documentation of `twai_driver_install` for more details.

参数

- **g_config** -- [in] General configuration structure
- **t_config** -- [in] Timing configuration structure
- **f_config** -- [in] Filter configuration structure
- **ret_twai** -- [out] Pointer to a new created TWAI handle

返回

- ESP_OK: Successfully installed TWAI driver
- ESP_ERR_INVALID_ARG: Arguments are invalid, e.g. invalid clock source, invalid quanta resolution, invalid controller ID
- ESP_ERR_NO_MEM: Insufficient memory
- ESP_ERR_INVALID_STATE: Driver is already installed

esp_err_t twai_driver_uninstall (void)

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

警告: The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

返回

- ESP_OK: Successfully uninstalled TWAI driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

esp_err_t twai_driver_uninstall_v2 (*twai_handle_t* handle)

Uninstall the TWAI driver with a given handle.

备注: This is an advanced version of `twai_driver_uninstall` that can uninstall a TWAI driver with a given handle. Please refer to the documentation of `twai_driver_uninstall` for more details.

参数 `handle` -- [in] TWAI driver handle returned by `twai_driver_install_v2`

返回

- ESP_OK: Successfully uninstalled TWAI driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

esp_err_t twai_start (void)

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

返回

- ESP_OK: TWAI driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

esp_err_t twai_start_v2 (*twai_handle_t* handle)

Start the TWAI driver with a given handle.

备注: This is an advanced version of `twai_start` that can start a TWAI driver with a given handle. Please refer to the documentation of `twai_start` for more details.

参数 `handle` -- [in] TWAI driver handle returned by `twai_driver_install_v2`

返回

- ESP_OK: TWAI driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

esp_err_t twai_stop (void)

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until `twai_start()` is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

警告: A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

返回

- `ESP_OK`: TWAI driver is now Stopped
- `ESP_ERR_INVALID_STATE`: Driver is not in running state, or is not installed

esp_err_t twai_stop_v2 (*twai_handle_t* handle)

Stop the TWAI driver with a given handle.

备注: This is an advanced version of `twai_stop` that can stop a TWAI driver with a given handle. Please refer to the documentation of `twai_stop` for more details.

参数 `handle` -- [in] TWAI driver handle returned by `twai_driver_install_v2`

返回

- `ESP_OK`: TWAI driver is now Stopped
- `ESP_ERR_INVALID_STATE`: Driver is not in running state, or is not installed

esp_err_t twai_transmit (const *twai_message_t* *message, TickType_t ticks_to_wait)

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

备注: This function does not guarantee that the transmission is successful. The `TX_SUCCESS/TX_FAILED` alert can be enabled to alert the application upon the success/failure of a transmission.

备注: The `TX_IDLE` alert can be used to alert the application when no other messages are awaiting transmission.

参数

- **message** -- [in] Message to transmit
- **ticks_to_wait** -- [in] Number of FreeRTOS ticks to block on the TX queue

返回

- `ESP_OK`: Transmission successfully queued/initiated
- `ESP_ERR_INVALID_ARG`: Arguments are invalid
- `ESP_ERR_TIMEOUT`: Timed out waiting for space on TX queue
- `ESP_FAIL`: TX queue is disabled and another message is currently transmitting
- `ESP_ERR_INVALID_STATE`: TWAI driver is not in running state, or is not installed
- `ESP_ERR_NOT_SUPPORTED`: Listen Only Mode does not support transmissions

esp_err_t twai_transmit_v2 (*twai_handle_t* handle, const *twai_message_t* *message, TickType_t ticks_to_wait)

Transmit a TWAI message via a given handle.

备注: This is an advanced version of `twai_transmit` that can transmit a TWAI message with a given handle. Please refer to the documentation of `twai_transmit` for more details.

参数

- **handle** -- **[in]** TWAI driver handle returned by `twai_driver_install_v2`
- **message** -- **[in]** Message to transmit
- **ticks_to_wait** -- **[in]** Number of FreeRTOS ticks to block on the TX queue

返回

- ESP_OK: Transmission successfully queued/initiated
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
- ESP_FAIL: TX queue is disabled and another message is currently transmitting
- ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
- ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

esp_err_t twai_receive (*twai_message_t* *message, TickType_t ticks_to_wait)

Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue

警告: The flags field of the received message should be checked to determine if the received message contains any data bytes.

参数

- **message** -- **[out]** Received message
- **ticks_to_wait** -- **[in]** Number of FreeRTOS ticks to block on RX queue

返回

- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t twai_receive_v2 (*twai_handle_t* handle, *twai_message_t* *message, TickType_t ticks_to_wait)

Receive a TWAI message via a given handle.

备注: This is an advanced version of `twai_receive` that can receive a TWAI message with a given handle. Please refer to the documentation of `twai_receive` for more details.

参数

- **handle** -- **[in]** TWAI driver handle returned by `twai_driver_install_v2`
- **message** -- **[out]** Received message
- **ticks_to_wait** -- **[in]** Number of FreeRTOS ticks to block on RX queue

返回

- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t twai_read_alerts (uint32_t *alerts, TickType_t ticks_to_wait)

Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

备注: Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

参数

- **alerts** -- **[out]** Bit field of raised alerts (see documentation for alert flags)
- **ticks_to_wait** -- **[in]** Number of FreeRTOS ticks to block for alert

返回

- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t twai_read_alerts_v2 (*twai_handle_t* handle, uint32_t *alerts, TickType_t ticks_to_wait)

Read TWAI driver alerts with a given handle.

备注: This is an advanced version of `twai_read_alerts` that can read TWAI driver alerts with a given handle. Please refer to the documentation of `twai_read_alerts` for more details.

参数

- **handle** -- **[in]** TWAI driver handle returned by `twai_driver_install_v2`
- **alerts** -- **[out]** Bit field of raised alerts (see documentation for alert flags)
- **ticks_to_wait** -- **[in]** Number of FreeRTOS ticks to block for alert

返回

- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t twai_reconfigure_alerts (uint32_t alerts_enabled, uint32_t *current_alerts)

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

参数

- **alerts_enabled** -- **[in]** Bit field of alerts to enable (see documentation for alert flags)
- **current_alerts** -- **[out]** Bit field of currently raised alerts. Set to NULL if unused

返回

- ESP_OK: Alerts reconfigured
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t twai_reconfigure_alerts_v2 (*twai_handle_t* handle, uint32_t alerts_enabled, uint32_t *current_alerts)

Reconfigure which alerts are enabled, with a given handle.

备注: This is an advanced version of `twai_reconfigure_alerts` that can reconfigure which alerts are enabled with a given handle. Please refer to the documentation of `twai_reconfigure_alerts` for more details.

参数

- **handle** -- **[in]** TWAI driver handle returned by `twai_driver_install_v2`
- **alerts_enabled** -- **[in]** Bit field of alerts to enable (see documentation for alert flags)
- **current_alerts** -- **[out]** Bit field of currently raised alerts. Set to NULL if unused

返回

- ESP_OK: Alerts reconfigured
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t `twai_initiate_recovery` (void)

Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

备注: The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

返回

- ESP_OK: Bus recovery started
- ESP_ERR_INVALID_STATE: TWAI driver is not in the bus-off state, or is not installed

esp_err_t `twai_initiate_recovery_v2` (*twai_handle_t* handle)

Start the bus recovery process with a given handle.

备注: This is an advanced version of `twai_initiate_recovery` that can start the bus recovery process with a given handle. Please refer to the documentation of `twai_initiate_recovery` for more details.

参数 **handle** -- **[in]** TWAI driver handle returned by `twai_driver_install_v2`

返回

- ESP_OK: Bus recovery started
- ESP_ERR_INVALID_STATE: TWAI driver is not in the bus-off state, or is not installed

esp_err_t `twai_get_status_info` (*twai_status_info_t* *status_info)

Get current status information of the TWAI driver.

参数 **status_info** -- **[out]** Status information

返回

- ESP_OK: Status information retrieved
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t `twai_get_status_info_v2` (*twai_handle_t* handle, *twai_status_info_t* *status_info)

Get current status information of a given TWAI driver handle.

备注: This is an advanced version of `twai_get_status_info` that can get current status information of a given TWAI driver handle. Please refer to the documentation of `twai_get_status_info` for more details.

参数

- **handle** -- **[in]** TWAI driver handle returned by `twai_driver_install_v2`
- **status_info** -- **[out]** Status information

返回

- ESP_OK: Status information retrieved
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t **twai_clear_transmit_queue** (void)

Clear the transmit queue.

This function will clear the transmit queue of all messages.

备注: The transmit queue is automatically cleared when `twai_stop()` or `twai_initiate_recovery()` is called.

返回

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed or TX queue is disabled

esp_err_t **twai_clear_transmit_queue_v2** (*twai_handle_t* handle)

Clear the transmit queue of a given TWAI driver handle.

备注: This is an advanced version of `twai_clear_transmit_queue` that can clear the transmit queue of a given TWAI driver handle. Please refer to the documentation of `twai_clear_transmit_queue` for more details.

参数 `handle` -- [in] TWAI driver handle returned by `twai_driver_install_v2`

返回

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed or TX queue is disabled

esp_err_t **twai_clear_receive_queue** (void)

Clear the receive queue.

This function will clear the receive queue of all messages.

备注: The receive queue is automatically cleared when `twai_start()` is called.

返回

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t **twai_clear_receive_queue_v2** (*twai_handle_t* handle)

Clear the receive queue of a given TWAI driver handle.

备注: This is an advanced version of `twai_clear_receive_queue` that can clear the receive queue of a given TWAI driver handle. Please refer to the documentation of `twai_clear_receive_queue` for more details.

参数 `handle` -- [in] TWAI driver handle returned by `twai_driver_install_v2`

返回

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

Structures

struct **twai_general_config_t**

Structure for general configuration of the TWAI driver.

备注: Macro initializers are available for this structure

Public Members

int **controller_id**

TWAI controller ID, index from 0. If you want to install TWAI driver with a non-zero `controller_id`, please use `twai_driver_install_v2`

twai_mode_t **mode**

Mode of TWAI controller

gpio_num_t **tx_io**

Transmit GPIO number

gpio_num_t **rx_io**

Receive GPIO number

gpio_num_t **clkout_io**

CLKOUT GPIO number (optional, set to -1 if unused)

gpio_num_t **bus_off_io**

Bus off indicator GPIO number (optional, set to -1 if unused)

uint32_t **tx_queue_len**

Number of messages TX queue can hold (set to 0 to disable TX Queue)

uint32_t **rx_queue_len**

Number of messages RX queue can hold

uint32_t **alerts_enabled**

Bit field of alerts to enable (see documentation)

uint32_t **clkout_divider**

CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

int **intr_flags**

Interrupt flags to set the priority of the driver's ISR. Note that to use the `ESP_INTR_FLAG_IRAM`, the `CONFIG_TWAI_ISR_IN_IRAM` option should be enabled first.

struct **twai_status_info_t**

Structure to store status information of TWAI driver.

Public Members

twai_state_t state

Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

uint32_t msgs_to_tx

Number of messages queued for transmission or awaiting transmission completion

uint32_t msgs_to_rx

Number of messages in RX queue waiting to be read

uint32_t tx_error_counter

Current value of Transmit Error Counter

uint32_t rx_error_counter

Current value of Receive Error Counter

uint32_t tx_failed_count

Number of messages that failed transmissions

uint32_t rx_missed_count

Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

uint32_t rx_overrun_count

Number of messages that were lost due to a RX FIFO overrun

uint32_t arb_lost_count

Number of instances arbitration was lost

uint32_t bus_error_count

Number of instances a bus error has occurred

Macros

TWAI_IO_UNUSED

Marks GPIO as unused in TWAI configuration

Type Definitions

```
typedef struct twai_obj_t *twai_handle_t
```

TWAI controller handle.

Enumerations

```
enum twai_state_t
```

TWAI driver states.

Values:

enumerator **TWAI_STATE_STOPPED**

Stopped state. The TWAI controller will not participate in any TWAI bus activities

enumerator **TWAI_STATE_RUNNING**

Running state. The TWAI controller can transmit and receive messages

enumerator **TWAI_STATE_BUS_OFF**

Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

enumerator **TWAI_STATE_RECOVERING**

Recovering state. The TWAI controller is undergoing bus recovery

2.5.36 通用异步接收器/发送器 (UART)

简介

通用异步接收器/发送器 (UART) 属于一种硬件功能，通过使用 RS232、RS422、RS485 等常见异步串行通信接口来处理通信时序要求和数据帧。UART 是实现不同设备之间全双工或半双工数据交换的一种常用且经济的方式。

ESP32-P4 芯片有 5 个 UART 控制器（也称为端口），每个控制器都有一组相同的寄存器以简化编程并提高灵活性。

每个 UART 控制器可以独立配置波特率、数据位长度、位顺序、停止位位数、奇偶校验位等参数。所有具备完整功能的 UART 控制器都能与不同制造商的 UART 设备兼容，并且支持红外数据协会 (IrDA) 定义的标准协议。

此外，ESP32-P4 芯片还有一个满足低功耗需求的 LP UART 控制器。LP UART 是原 UART 的功能剪裁版本。它只支持基础 UART 功能，不支持 IrDA 或 RS485 协议，并且只有一块较小的 RAM 存储空间。想要全面了解的 UART 及 LP UART 功能区别，请参考 [ESP32-P4 技术参考手册 > UART 控制器 \(UART\) > 主要特性 \[PDF\]](#)。

功能概述

下文介绍了如何使用 UART 驱动程序的函数和数据类型在 ESP32-P4 和其他 UART 设备之间建立通信。基本编程流程分为以下几个步骤：

1. **设置通信参数** - 设置波特率、数据位、停止位等
2. **设置通信管脚** - 分配连接设备的管脚
3. **安装驱动程序** - 为 UART 驱动程序分配 ESP32-P4 资源
4. **运行 UART 通信** - 发送/接收数据
5. **使用中断** - 触发特定通信事件的中断
6. **删除驱动程序** - 如无需 UART 通信，则释放已分配的资源

步骤 1 到 3 为配置阶段，步骤 4 为 UART 运行阶段，步骤 5 和 6 为可选步骤。

此外，LP UART 控制器的编程需要注意使用主核驱动 [LP UART 控制器](#)。

UART 驱动程序函数通过 `uart_port_t` 识别不同的 UART 控制器。调用以下所有函数均需此标识。

设置通信参数 UART 通信参数可以在一个步骤中完成全部配置，也可以在多个步骤中单独配置。

一次性配置所有参数 调用函数 `uart_param_config()` 并向其传递 `uart_config_t` 结构体, `uart_config_t` 结构体应包含所有必要的参数。请参考以下示例。

```
const uart_port_t uart_num = UART_NUM_1;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

了解配置硬件流控模式的更多信息, 请参考 [peripherals/uart/uart_echo](#)。

此外, 置位 `uart_config_t::backup_before_sleep` 会使能在进入睡眠模式前备份 UART 配置寄存器并在退出睡眠后恢复这些寄存器。这个功能使 UART 能够在系统唤醒后继续正常工作, 即使其电源域在睡眠过程中被完全关闭。此选项需要用户在功耗和内存使用之间取得平衡。如果功耗不是一个问题, 可以禁用这个选项来节省内存。

分步依次配置每个参数 调用下表中的专用函数, 能够单独配置特定参数。如需重新配置某个参数, 也可使用这些函数。

表 6: 单独配置特定参数的函数

配置参数	函数
波特率	<code>uart_set_baudrate()</code>
传输位	调用 <code>uart_set_word_length()</code> 设置 <code>uart_word_length_t</code>
奇偶控制	调用 <code>uart_parity_t</code> 设置 <code>uart_set_parity()</code>
停止位	调用 <code>uart_set_stop_bits()</code> 设置 <code>uart_stop_bits_t</code>
硬件流控模式	调用 <code>uart_set_hw_flow_ctrl()</code> 设置 <code>uart_hw_flowcontrol_t</code>
通信模式	调用 <code>uart_set_mode()</code> 设置 <code>uart_mode_t</code>

表中每个函数都可使用 `_get_` 对应项来查看当前设置值。例如, 查看当前波特率值, 请调用 `uart_get_baudrate()`。

设置通信管脚 通信参数设置完成后, 可以配置其他 UART 设备连接的 GPIO 管脚。调用函数 `uart_set_pin()`, 指定配置 Tx、Rx、RTS 和 CTS 信号的 GPIO 管脚编号。如要为特定信号保留当前分配的管脚编号, 可传递宏 `UART_PIN_NO_CHANGE`。

请为不使用的管脚都指定为宏 `UART_PIN_NO_CHANGE`。

```
// Set UART pins (TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_1, 4, 5, 18, 19));
```

安装驱动程序 通信管脚设置完成后, 请调用 `uart_driver_install()` 安装驱动程序并指定以下参数:

- UART 控制器编号
- Tx 环形缓冲区的大小
- Rx 环形缓冲区的大小
- 指向事件队列句柄的指针
- 事件队列大小
- 分配中断的标志

该函数将为 UART 驱动程序分配所需的内部资源。

```
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_1, uart_buffer_size, \
                                   uart_buffer_size, 10, &uart_queue, 0));
```

此步骤完成后，可连接外部 UART 设备检查通信。

运行 UART 通信 串行通信由每个 UART 控制器的有限状态机 (FSM) 控制。

发送数据的过程分为以下步骤：

1. 将数据写入 Tx FIFO 缓冲区
2. FSM 序列化数据
3. FSM 发送数据

接收数据的过程类似，只是步骤相反：

1. FSM 处理且并行化传入的串行流
2. FSM 将数据写入 Rx FIFO 缓冲区
3. 从 Rx FIFO 缓冲区读取数据

因此，应用程序仅会通过 `uart_write_bytes()` 和 `uart_read_bytes()` 从特定缓冲区写入或读取数据，其余工作由 FSM 完成。

发送数据 发送数据准备好后，调用函数 `uart_write_bytes()`，并向其传递数据缓冲区的地址和数据长度。该函数会立即或在有足够可用空间时将数据复制到 Tx 环形缓冲区，随后退出。当 Tx FIFO 缓冲区中有可用空间时，中断服务例程 (ISR) 会在后台将数据从 Tx 环形缓冲区移动到 Tx FIFO 缓冲区。调用函数请参考以下代码。

```
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

函数 `uart_write_bytes_with_break()` 与 `uart_write_bytes()` 类似，但在传输结束时会添加串行中断信号。“串行中断信号”意味着 Tx 线保持低电平的时间长于一个数据帧。

```
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

能够将数据写入 Tx FIFO 缓冲区的另一函数是 `uart_tx_chars()`。与 `uart_write_bytes()` 不同，此函数在没有可用空间之前不会阻塞。相反，它将写入所有可以立即放入硬件 Tx FIFO 的数据，然后返回写入的字节数。

“配套”函数 `uart_wait_tx_done()` 用于监听 Tx FIFO 缓冲区的状态，并在缓冲区为空时返回。

```
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_1;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_
↳ticks (TickType_t)
```

接收数据 一旦 UART 接收了数据，并将其保存在 Rx FIFO 缓冲区中，就需要使用函数 `uart_read_bytes()` 检索数据。读取数据之前，调用 `uart_get_buffered_data_len()` 能够查看 Rx FIFO 缓冲区中可用的字节数。请参考以下示例。

```
// Read data from UART.
const uart_port_t uart_num = UART_NUM_1;
uint8_t data[128];
```

(下页继续)

(续上页)

```
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

如果不再需要 Rx FIFO 缓冲区中的数据，可以调用 `uart_flush()` 清空缓冲区。

软件流控 如果硬件流控处于禁用状态，可使用函数 `uart_set_rts()` 和 `uart_set_dtr()` 分别手动设置 RTS 和 DTR 信号电平。

通信方式选择 UART 控制器支持多种通信模式，使用函数 `uart_set_mode()` 可以选择模式。选择特定模式后，UART 驱动程序将处理已连接 UART 设备的相应行为。例如，使用 RTS 线控制 RS485 驱动芯片，能够实现半双工 RS485 通信。

```
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

使用中断 根据特定的 UART 状态或检测到的错误，可以生成许多不同的中断。**ESP32-P4 技术参考手册** > UART 控制器 (UART) > UART 中断和 UHCI 中断 [PDF] 中提供了可用中断的完整列表。调用 `uart_enable_intr_mask()` 或 `uart_disable_intr_mask()` 能够分别启用或禁用特定中断。

UART 驱动提供了一种便利的方法来处理特定的中断，即将中断包装成相应的事件。这些事件定义在 `uart_event_type_t` 中，FreeRTOS 队列功能可将这些事件报告给用户应用程序。

要接收已发生的事件，请调用 `uart_driver_install()` 函数并获取返回的事件队列句柄，可参考上述示例代码。

UART 驱动可处理的事件包括：

- **FIFO 空间溢出 (UART_FIFO_OVF)**: 当接收到的数据超过 FIFO 的存储能力时，Rx FIFO 会触发中断。
 - (可选) 配置 FIFO 阈值：在结构体 `uart_intr_config_t` 中输入阈值，然后调用 `uart_intr_config()` 使能配置。这有助于驱动及时处理 RX FIFO 中的数据，避免 FIFO 溢出。
 - 启用中断：调用函数 `uart_enable_rx_intr()`
 - 禁用中断：调用函数 `uart_disable_rx_intr()`

```
const uart_port_t uart_num = UART_NUM_1;
// Configure a UART interrupt threshold and timeout
uart_intr_config_t uart_intr = {
    .intr_enable_mask = UART_INTR_RXFIFO_FULL | UART_INTR_RXFIFO_TOUT,
    .rxfifo_full_thresh = 100,
    .rx_timeout_thresh = 10,
};
ESP_ERROR_CHECK(uart_intr_config(uart_num, &uart_intr));

// Enable UART RX FIFO full threshold and timeout interrupts
ESP_ERROR_CHECK(uart_enable_rx_intr(uart_num));
```

- **模式检测 (UART_PATTERN_DET)**: 在检测到重复接收/发送同一字符的“模式”时触发中断，例如，模式检测可用于检测命令字符串末尾是否存在特定数量的相同字符（“模式”）。可以调用以下函数：
 - 配置并启用此中断：调用 `uart_enable_pattern_det_baud_intr()`
 - 禁用中断：调用 `uart_disable_pattern_det_intr()`

```
//Set UART pattern detect function
uart_enable_pattern_det_baud_intr(EX_UART_NUM, '+', PATTERN_CHR_NUM, 9, 0, 0);
```

- **其他事件**: UART 驱动可处理的其他事件包括数据接收 (`UART_DATA`)、环形缓冲区已满 (`UART_BUFFER_FULL`)、在停止位后检测到 NULL (`UART_BREAK`)、奇偶校验错误 (`UART_PARITY_ERR`)、以及帧错误 (`UART_FRAME_ERR`)。

括号中的字符串为相应的事件名称。请参考 [peripherals/uart/uart_events](#) 中处理 UART 事件的示例。

删除驱动程序 如不再需要与 `uart_driver_install()` 建立通信，则可调用 `uart_driver_delete()` 删除驱动程序，释放已分配的资源。

宏指令 API 还定义了一些宏指令。例如，`UART_HW_FIFO_LEN` 定义了硬件 FIFO 缓冲区的长度，`UART_BITRATE_MAX` 定义了 UART 控制器支持的最大波特率。

使用主核驱动 LP UART 控制器 UART 驱动程序还适配了在 Active 模式下对 LP UART 控制器的驱动。LP UART 的配置流程和普通 UART 没有本质上的差别，除了有以下几点需要注意：

- LP UART 控制器的端口号为 `LP_UART_NUM_0`。
- LP UART 控制器的可选时钟源可以在 `lp_uart_sclk_t` 中找到。
- LP UART 控制器的硬件 FIFO 大小要远小于普通 UART 控制器的硬件 FIFO 大小，其值为 `SOC_LP_UART_FIFO_LEN`。
- LP UART 控制器的 GPIO 引脚只能从 LP GPIO 引脚中选择。

RS485 特定通信模式简介

备注：下文将使用 `[UART_REGISTER_NAME].[UART_FIELD_BIT]` 指代 UART 寄存器字段/位。了解特定模式位的更多信息，请参考 [ESP32-P4 技术参考手册 > UART 控制器 \(UART\) > 寄存器摘要 \[PDF\]](#)。请搜索寄存器名称导航至寄存器描述，找到相应字段/位。

- `UART_RS485_CONF_REG.UART_RS485_EN`：设置此位将启用 RS485 通信模式支持。
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`：设置此位，发送器的输出信号将环回到接收器的输入信号。
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`：设置此位，如果接收器繁忙，发送器仍将发送数据（由硬件自动解决冲突）。

ESP32-P4 的 RS485 UART 硬件能够检测数据报传输期间的信号冲突，并在启用此中断时生成中断 `UART_RS485_CLASH_INT`。术语冲突表示发送的数据报与另一端接收到的数据报不同。数据冲突通常与总线上其他活跃设备的存在有关，或者是由于总线错误而出现。

冲突检测功能允许在激活和触发中断时处理冲突。中断 `UART_RS485_FRM_ERR_INT` 和 `UART_RS485_PARITY_ERR_INT` 可与冲突检测功能一起使用，在 RS485 模式下分别控制帧错误和奇偶校验位错误。UART 驱动程序支持此功能，通过选择 `UART_MODE_RS485_APP_CTRL` 模式可以使用（参考函数 `uart_set_mode()`）。

冲突检测功能可与电路 A 和电路 C 一起使用（参考章节 [接口连接选项](#)）。在使用电路 A 或 B 时，连接到总线驱动 DE 管脚的 RTS 管脚应由用户应用程序控制。调用函数 `uart_get_collision_flag()` 能够查看是否触发冲突检测标志。

ESP32-P4 UART 控制器本身不支持半双工通信，因其无法自动控制连接到 RS485 总线驱动 RE/DE 输入的 RTS 管脚。然而，半双工通信能够通过 UART 驱动程序对 RTS 管脚的软件控制来实现，调用 `uart_set_mode()` 并选择 `UART_MODE_RS485_HALF_DUPLEX` 模式能够启用这一功能。

主机开始向 Tx FIFO 缓冲区写入数据时，UART 驱动程序会自动置位 RTS 管脚（逻辑 1）；最后一位数据传输完成后，驱动程序就会取消置位 RTS 管脚（逻辑 0）。要使用此模式，软件必须禁用硬件流控功能。此模式适用于下文所有已用电路。

接口连接选项 本节提供了示例原理图来介绍 ESP32-P4 RS485 接口连接的基本内容。

备注：

- 下列原理图不一定包含所有必要元素。

- 模拟设备 ADM483 和 ADM2483 是 RS485 收发器的常见示例，也可使用其他类似的收发器。

电路 A: 冲突检测电路

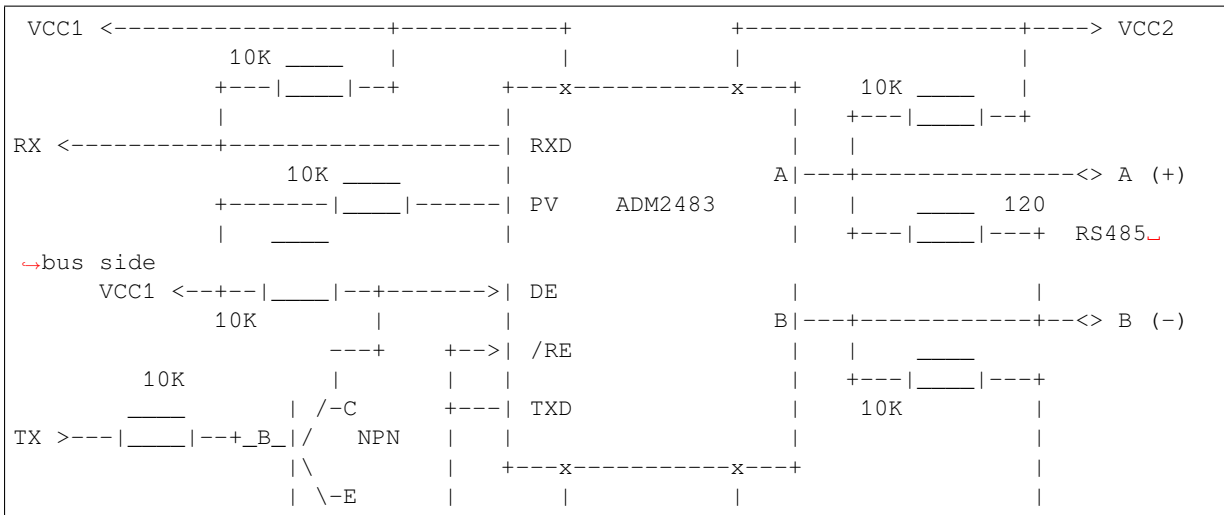

推荐这一电路，因为该电路较为简单，同时能够检测冲突。持续启用线路驱动中的接收器时，UART 将会监控 RS485 总线。启用 UART_RS485_CONF_REG.UART_RS485TX_RX_EN 位时，UART 外设会执行回波抑制。

电路 B: 无冲突检测的手动切换发射器/接收器

该电路无法检测冲突。置位 UART_RS485_CONF_REG.UART_RS485TX_RX_EN 位时，电路将抑制硬件收到的空字节。这种情况下 UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN 位不适用。

电路 C: 自动切换发射器/接收器

(下页继续)

GND1	GND1	GND1	GND2	GND2

这种电气隔离电路不需要用软件应用程序或驱动程序控制 RTS 管脚，因为电路能够自动控制收发器方向。但是在传输过程中，需要将 `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` 设置为 1 并将 `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` 设置为 0 来抑制空字节。此设置可以在任何 RS485 UART 模式下工作，包括 `UART_MODE_UART`。

应用示例

下表列出了目录 `peripherals/uart/` 下可用的代码示例。

代码示例	描述
peripherals/uart/uart_echo	配置 UART 设置、安装 UART 驱动程序以及通过 UART1 接口读取/写入。
peripherals/uart/uart_events	报告各种通信事件，使用模式检测中断。
peripherals/uart/uart_async_rxtxtasks	通过同一 UART 在两个独立的 FreeRTOS 任务中发送和接收数据。
peripherals/uart/uart_select	针对 UART 文件描述符使用同步 I/O 多路复用。
peripherals/uart/uart_echo_rs485	设置 UART 驱动程序以半双工模式通过 RS485 接口进行通信。此示例与 peripherals/uart/uart_echo 类似，但允许通过连接到 ESP32-P4 管脚的 RS485 接口芯片进行通信。
peripherals/uart/nmea0183_parser	解析通过 UART 外设从 GPS 收到的 NMEA0183 语句来获取 GPS 信息。

API 参考

Header File

- `components/esp_driver_uart/include/driver/uart.h`
- This header file can be included with:

```
#include "driver/uart.h"
```

- This header file is a part of the API provided by the `esp_driver_uart` component. To declare that your component depends on `esp_driver_uart`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_uart
```

or

```
PRIV_REQUIRES esp_driver_uart
```

Functions

`esp_err_t uart_driver_install (uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)`

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

备注: `Rx_buffer_size` should be greater than `UART_HW_FIFO_LEN(uart_num)`. `Tx_buffer_size` should be either zero or greater than `UART_HW_FIFO_LEN(uart_num)`.

参数

- `uart_num` -- UART port number, the max port number is `(UART_NUM_MAX - 1)`.

- **rx_buffer_size** -- UART RX ring buffer size.
- **tx_buffer_size** -- UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- **queue_size** -- UART event queue size/depth.
- **uart_queue** -- UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- **intr_alloc_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver's ISR handler is not located in IRAM)

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_driver_delete** (*uart_port_t* uart_num)

Uninstall UART driver.

参数 **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).

返回

- ESP_OK Success
- ESP_FAIL Parameter error

bool **uart_is_driver_installed** (*uart_port_t* uart_num)

Checks whether the driver is installed or not.

参数 **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).

返回

- true driver is installed
- false driver is not installed

esp_err_t **uart_set_word_length** (*uart_port_t* uart_num, *uart_word_length_t* data_bit)

Set UART data bits.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **data_bit** -- UART data bits

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_word_length** (*uart_port_t* uart_num, *uart_word_length_t* *data_bit)

Get the UART data bit configuration.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **data_bit** -- Pointer to accept value of UART data bits.

返回

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*data_bit)

esp_err_t **uart_set_stop_bits** (*uart_port_t* uart_num, *uart_stop_bits_t* stop_bits)

Set UART stop bits.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **stop_bits** -- UART stop bits

返回

- ESP_OK Success
- ESP_FAIL Fail

esp_err_t **uart_get_stop_bits** (*uart_port_t* uart_num, *uart_stop_bits_t* *stop_bits)

Get the UART stop bit configuration.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **stop_bits** -- Pointer to accept value of UART stop bits.

返回

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*stop_bit)

esp_err_t **uart_set_parity** (*uart_port_t* uart_num, *uart_parity_t* parity_mode)

Set UART parity mode.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **parity_mode** -- the enum of uart parity configuration

返回

- ESP_FAIL Parameter error
- ESP_OK Success

esp_err_t **uart_get_parity** (*uart_port_t* uart_num, *uart_parity_t* *parity_mode)

Get the UART parity mode configuration.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **parity_mode** -- Pointer to accept value of UART parity mode.

返回

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*parity_mode)

esp_err_t **uart_get_sclk_freq** (*uart_sclk_t* sclk, uint32_t *out_freq_hz)

Get the frequency of a clock source for the HP UART port.

参数

- **sclk** -- Clock source
- **out_freq_hz** -- [out] Output of frequency, in Hz

返回

- ESP_ERR_INVALID_ARG: if the clock source is not supported
- otherwise ESP_OK

esp_err_t **uart_set_baudrate** (*uart_port_t* uart_num, uint32_t baudrate)

Set UART baud rate.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **baudrate** -- UART baud rate.

返回

- ESP_FAIL Parameter error
- ESP_OK Success

esp_err_t **uart_get_baudrate** (*uart_port_t* uart_num, uint32_t *baudrate)

Get the UART baud rate configuration.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **baudrate** -- Pointer to accept value of UART baud rate

返回

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*baudrate)

esp_err_t **uart_set_line_inverse** (*uart_port_t* uart_num, uint32_t inverse_mask)

Set UART line inverse mode.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).

- **inverse_mask** -- Choose the wires that need to be inverted. Using the ORred mask of `uart_signal_inv_t`

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_hw_flow_ctrl** (*uart_port_t* uart_num, *uart_hw_flowcontrol_t* flow_ctrl, uint8_t rx_thresh)

Set hardware flow control.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **flow_ctrl** -- Hardware flow control mode
- **rx_thresh** -- Threshold of Hardware RX flow control (0 ~ UART_HW_FIFO_LEN(uart_num)). Only when UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_sw_flow_ctrl** (*uart_port_t* uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)

Set software flow control.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1)
- **enable** -- switch on or off
- **rx_thresh_xon** -- low water mark
- **rx_thresh_xoff** -- high water mark

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_hw_flow_ctrl** (*uart_port_t* uart_num, *uart_hw_flowcontrol_t* *flow_ctrl)

Get the UART hardware flow control configuration.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **flow_ctrl** -- Option for different flow control mode.

返回

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*flow_ctrl)

esp_err_t **uart_clear_intr_status** (*uart_port_t* uart_num, uint32_t clr_mask)

Clear UART interrupt status.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **clr_mask** -- Bit mask of the interrupt status to be cleared.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_intr_mask** (*uart_port_t* uart_num, uint32_t enable_mask)

Set UART interrupt enable.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **enable_mask** -- Bit mask of the enable bits.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_disable_intr_mask** (*uart_port_t* uart_num, uint32_t disable_mask)

Clear UART interrupt enable bits.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **disable_mask** -- Bit mask of the disable bits.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_rx_intr** (*uart_port_t* uart_num)

Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

参数 **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_disable_rx_intr** (*uart_port_t* uart_num)

Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

参数 **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_disable_tx_intr** (*uart_port_t* uart_num)

Disable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

参数 **uart_num** -- UART port number

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_tx_intr** (*uart_port_t* uart_num, int enable, int thresh)

Enable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **enable** -- 1: enable; 0: disable
- **thresh** -- Threshold of TX interrupt, 0 ~ UART_HW_FIFO_LEN(uart_num)

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_pin** (*uart_port_t* uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)

Assign signals of a UART peripheral to GPIO pins.

备注: If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0's default TX pin and GPIO3 is UART0's default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

备注: Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **tx_io_num** -- UART TX pin GPIO number.
- **rx_io_num** -- UART RX pin GPIO number.
- **rts_io_num** -- UART RTS pin GPIO number.
- **cts_io_num** -- UART CTS pin GPIO number.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_rts** (*uart_port_t* uart_num, int level)

Manually set the UART RTS pin level.

备注: UART must be configured with hardware flow control disabled.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **level** -- 1: RTS output low (active); 0: RTS output high (block)

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_dtr** (*uart_port_t* uart_num, int level)

Manually set the UART DTR pin level.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **level** -- 1: DTR output low; 0: DTR output high

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_tx_idle_num** (*uart_port_t* uart_num, uint16_t idle_num)

Set UART idle interval after tx FIFO is empty.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **idle_num** -- idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_param_config** (*uart_port_t* uart_num, const *uart_config_t* *uart_config)

Set UART configuration parameters.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **uart_config** -- UART parameter settings

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_intr_config** (*uart_port_t* uart_num, const *uart_intr_config_t* *intr_conf)

Configure UART interrupts.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **intr_conf** -- UART interrupt settings

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_wait_tx_done** (*uart_port_t* uart_num, TickType_t ticks_to_wait)

Wait until UART TX FIFO is empty.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **ticks_to_wait** -- Timeout, count in RTOS ticks

返回

- ESP_OK Success
- ESP_FAIL Parameter error
- ESP_ERR_TIMEOUT Timeout

int **uart_tx_chars** (*uart_port_t* uart_num, const char *buffer, uint32_t len)

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

备注: This function should only be used when UART TX buffer is not enabled.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **buffer** -- data buffer address
- **len** -- data length to send

返回

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart_write_bytes** (*uart_port_t* uart_num, const void *src, size_t size)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx_buffer_size' is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the 'tx_buffer_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **src** -- data buffer address
- **size** -- data length to send

返回

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart_write_bytes_with_break** (*uart_port_t* uart_num, const void *src, size_t size, int brk_len)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx_buffer_size' is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the 'tx_buffer_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **src** -- data buffer address
- **size** -- data length to send

- **brk_len** -- break signal duration(unit: the time it takes to send one bit at current baudrate)

返回

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart_read_bytes** (*uart_port_t* uart_num, void *buf, uint32_t length, TickType_t ticks_to_wait)

UART read bytes from UART buffer.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **buf** -- pointer to the buffer.
- **length** -- data length
- **ticks_to_wait** -- sTimeout, count in RTOS ticks

返回

- (-1) Error
- OTHERS (>=0) The number of bytes read from UART buffer

esp_err_t **uart_flush** (*uart_port_t* uart_num)

Alias of `uart_flush_input`. UART ring buffer flush. This will discard all data in the UART RX buffer.

备注: Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

参数 **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_flush_input** (*uart_port_t* uart_num)

Clear input buffer, discard all the data is in the ring-buffer.

备注: In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

参数 **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_buffered_data_len** (*uart_port_t* uart_num, size_t *size)

UART get RX ring buffer cached data length.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **size** -- Pointer of `size_t` to accept cached data length

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_tx_buffer_free_size** (*uart_port_t* uart_num, size_t *size)

UART get TX ring buffer free space size.

参数

- **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).
- **size** -- Pointer of `size_t` to accept the free space size

返回

- ESP_OK Success

- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **uart_disable_pattern_det_intr** (*uart_port_t* uart_num)

UART disable pattern detect function. Designed for applications like 'AT commands'. When the hardware detects a series of one same character, the interrupt will be triggered.

参数 **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).

返回

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_pattern_det_baud_intr** (*uart_port_t* uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)

UART enable pattern detect function. Designed for applications like 'AT commands'. When the hardware detect a series of one same character, the interrupt will be triggered.

参数

- **uart_num** -- UART port number.
- **pattern_chr** -- character of the pattern.
- **chr_num** -- number of the character, 8bit value.
- **chr_tout** -- timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.
- **post_idle** -- idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char
- **pre_idle** -- idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

int **uart_pattern_pop_pos** (*uart_port_t* uart_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application's responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

备注: If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

参数 **uart_num** -- UART port number, the max port number is (UART_NUM_MAX -1).

返回

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

int **uart_pattern_get_pos** (*uart_port_t* uart_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application's responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

备注: If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

参数 `uart_num` -- UART port number, the max port number is (UART_NUM_MAX -1).
返回

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

esp_err_t `uart_pattern_queue_reset` (*uart_port_t* uart_num, int queue_length)

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

参数

- `uart_num` -- UART port number, the max port number is (UART_NUM_MAX -1).
- `queue_length` -- Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

返回

- ESP_ERR_NO_MEM No enough memory
- ESP_ERR_INVALID_STATE Driver not installed
- ESP_FAIL Parameter error
- ESP_OK Success

esp_err_t `uart_set_mode` (*uart_port_t* uart_num, *uart_mode_t* mode)

UART set communication mode.

备注: This function must be executed after `uart_driver_install()`, when the driver object is initialized.

参数

- `uart_num` -- Uart number to configure, the max port number is (UART_NUM_MAX -1).
- `mode` -- UART UART mode to set

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t `uart_set_rx_full_threshold` (*uart_port_t* uart_num, int threshold)

Set uart threshold value for RX fifo full.

备注: If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

参数

- `uart_num` -- UART port number, the max port number is (UART_NUM_MAX -1)
- `threshold` -- Threshold value above which RX fifo full interrupt is generated

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

esp_err_t `uart_set_tx_empty_threshold` (*uart_port_t* uart_num, int threshold)

Set uart threshold values for TX fifo empty.

参数

- `uart_num` -- UART port number, the max port number is (UART_NUM_MAX -1)

- **threshold** -- Threshold value below which TX fifo empty interrupt is generated
- 返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

esp_err_t **uart_set_rx_timeout** (*uart_port_t* uart_num, const uint8_t tout_thresh)

UART set threshold timeout for TOUT feature.

参数

- **uart_num** -- Uart number to configure, the max port number is (UART_NUM_MAX -1).
- **tout_thresh** -- This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_thresh == 0, the TOUT feature is disabled.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

esp_err_t **uart_get_collision_flag** (*uart_port_t* uart_num, bool *collision_flag)

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

参数

- **uart_num** -- Uart number to configure the max port number is (UART_NUM_MAX -1).
- **collision_flag** -- Pointer to variable of type bool to return collision flag.

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **uart_set_wakeup_threshold** (*uart_port_t* uart_num, int wakeup_threshold)

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter 'a' with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when 'a' is sent, set wakeup_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To ensure that UART has correct Baud rate all the time, it is necessary to select a source clock which has a fixed frequency and remains active during sleep. For the supported clock sources of the chips, please refer to `uart_sclk_t` or `soc_periph_uart_clk_src_legacy_t`

备注: in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

参数

- **uart_num** -- UART number, the max port number is (UART_NUM_MAX -1).

- **wakeup_threshold** -- number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.
- 返回
- ESP_OK on success
 - ESP_ERR_INVALID_ARG if uart_num is incorrect or wakeup_threshold is outside of [3, 0x3ff] range.

esp_err_t **uart_get_wakeup_threshold** (*uart_port_t* uart_num, int *out_wakeup_threshold)

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

参数

- **uart_num** -- UART number, the max port number is (UART_NUM_MAX -1).
- **out_wakeup_threshold** -- [out] output, set to the current value of wakeup threshold for the given UART.

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if out_wakeup_threshold is NULL

esp_err_t **uart_wait_tx_idle_polling** (*uart_port_t* uart_num)

Wait until UART tx memory empty and the last char send ok (polling mode).

•

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

参数 **uart_num** -- UART number

esp_err_t **uart_set_loop_back** (*uart_port_t* uart_num, bool loop_back_en)

Configure TX signal loop back to RX module, just for the test usage.

•

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

参数

- **uart_num** -- UART number
- **loop_back_en** -- Set true to enable the loop back function, else set it false.

void **uart_set_always_rx_timeout** (*uart_port_t* uart_num, bool always_rx_timeout_en)

Configure behavior of UART RX timeout interrupt.

When `always_rx_timeout` is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

参数

- **uart_num** -- UART number
- **always_rx_timeout_en** -- Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

Structures

struct **uart_config_t**

UART configuration parameters for `uart_param_config` function.

Public Members

int **baud_rate**

UART baud rate

uart_word_length_t **data_bits**

UART byte size

uart_parity_t **parity**

UART parity mode

uart_stop_bits_t **stop_bits**

UART stop bits

uart_hw_flowcontrol_t **flow_ctrl**

UART HW flow control mode (cts/rts)

uint8_t **rx_flow_ctrl_thresh**

UART HW RTS threshold

uart_sclk_t **source_clk**

UART source clock selection

lp_uart_sclk_t **lp_source_clk**

LP_UART source clock selection

uint32_t **backup_before_sleep**

If set, the driver will backup/restore the HP UART registers before entering/after exiting sleep mode. By this approach, the system can power off HP UART's power domain. This can save power, but at the expense of more RAM being consumed

struct *uart_config_t*::[anonymous] **flags**

Configuration flags

struct **uart_intr_config_t**

UART interrupt configuration parameters for `uart_intr_config` function.

Public Members

uint32_t **intr_enable_mask**

UART interrupt enable mask, choose from `UART_XXXX_INT_ENA_M` under `UART_INT_ENA_REG(i)`, connect with bit-or operator

`uint8_t rx_timeout_thresh`

UART timeout interrupt threshold (unit: time of sending one byte)

`uint8_t txfifo_empty_intr_thresh`

UART TX empty interrupt threshold.

`uint8_t rxfifo_full_thresh`

UART RX full interrupt threshold.

struct `uart_event_t`

Event structure used in UART event queue.

Public Members

`uart_event_type_t` type

UART event type

`size_t` size

UART data size for UART_DATA event

`bool` timeout_flag

UART data read timeout flag for UART_DATA event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

Macros

`UART_PIN_NO_CHANGE`

`UART_FIFO_LEN`

Length of the HP UART HW FIFO.

`UART_HW_FIFO_LEN` (uart_num)

Length of the UART HW FIFO.

`UART_BITRATE_MAX`

Maximum configurable bitrate.

Type Definitions

typedef `intr_handle_t` `uart_isr_handle_t`

Enumerations

enum `uart_event_type_t`

UART event types used in the ring buffer.

Values:

- enumerator **UART_DATA**
UART data event
- enumerator **UART_BREAK**
UART break event
- enumerator **UART_BUFFER_FULL**
UART RX buffer full event
- enumerator **UART_FIFO_OVF**
UART FIFO overflow event
- enumerator **UART_FRAME_ERR**
UART RX frame error event
- enumerator **UART_PARITY_ERR**
UART RX parity event
- enumerator **UART_DATA_BREAK**
UART TX data and break event
- enumerator **UART_PATTERN_DET**
UART pattern detected
- enumerator **UART_WAKEUP**
UART wakeup event
- enumerator **UART_EVENT_MAX**
UART event max index

Header File

- [components/hal/include/hal/uart_types.h](#)
- This header file can be included with:

```
#include "hal/uart_types.h"
```

Structures

struct **uart_at_cmd_t**

UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.

Public Members

uint8_t **cmd_char**
UART AT cmd char

uint8_t **char_num**

AT cmd char repeat number

uint32_t **gap_tout**

gap time(in baud-rate) between AT cmd char

uint32_t **pre_idle**

the idle time(in baud-rate) between the non AT char and first AT char

uint32_t **post_idle**

the idle time(in baud-rate) between the last AT char and the none AT char

struct **uart_sw_flowctrl_t**

UART software flow control configuration parameters.

Public Members

uint8_t **xon_char**

Xon flow control char

uint8_t **xoff_char**

Xoff flow control char

uint8_t **xon_thrd**

If the software flow control is enabled and the data amount in rxfifo is less than xon_thrd, an xon_char will be sent

uint8_t **xoff_thrd**

If the software flow control is enabled and the data amount in rxfifo is more than xoff_thrd, an xoff_char will be sent

Type Definitions

typedef *soc_periph_uart_clk_src_legacy_t* **uart_sclk_t**

UART source clock.

typedef *soc_periph_lp_uart_clk_src_t* **lp_uart_sclk_t**

LP_UART source clock.

Enumerations

enum **uart_port_t**

UART port number, can be UART_NUM_0 ~ (UART_NUM_MAX -1).

Values:

enumerator **UART_NUM_0**

UART port 0

enumerator **UART_NUM_1**

UART port 1

enumerator **UART_NUM_2**

UART port 2

enumerator **UART_NUM_3**

UART port 3

enumerator **UART_NUM_4**

UART port 4

enumerator **LP_UART_NUM_0**

LP UART port 0

enumerator **UART_NUM_MAX**

UART port max

enum **uart_mode_t**

UART mode selection.

Values:

enumerator **UART_MODE_UART**

mode: regular UART mode

enumerator **UART_MODE_RS485_HALF_DUPLEX**

mode: half duplex RS485 UART mode control by RTS pin

enumerator **UART_MODE_IRDA**

mode: IRDA UART mode

enumerator **UART_MODE_RS485_COLLISION_DETECT**

mode: RS485 collision detection UART mode (used for test purposes)

enumerator **UART_MODE_RS485_APP_CTRL**

mode: application control RS485 UART mode (used for test purposes)

enum **uart_word_length_t**

UART word length constants.

Values:

enumerator **UART_DATA_5_BITS**

word length: 5bits

enumerator **UART_DATA_6_BITS**

word length: 6bits

enumerator **UART_DATA_7_BITS**

word length: 7bits

enumerator **UART_DATA_8_BITS**

word length: 8bits

enumerator **UART_DATA_BITS_MAX**

enum **uart_stop_bits_t**

UART stop bits number.

Values:

enumerator **UART_STOP_BITS_1**

stop bit: 1bit

enumerator **UART_STOP_BITS_1_5**

stop bit: 1.5bits

enumerator **UART_STOP_BITS_2**

stop bit: 2bits

enumerator **UART_STOP_BITS_MAX**

enum **uart_parity_t**

UART parity constants.

Values:

enumerator **UART_PARITY_DISABLE**

Disable UART parity

enumerator **UART_PARITY_EVEN**

Enable UART even parity

enumerator **UART_PARITY_ODD**

Enable UART odd parity

enum **uart_hw_flowcontrol_t**

UART hardware flow control modes.

Values:

enumerator **UART_HW_FLOWCTRL_DISABLE**

disable hardware flow control

enumerator **UART_HW_FLOWCTRL_RTS**

enable RX hardware flow control (rts)

enumerator **UART_HW_FLOWCTRL_CTS**

enable TX hardware flow control (cts)

enumerator **UART_HW_FLOWCTRL_CTS_RTS**

enable hardware flow control

enumerator **UART_HW_FLOWCTRL_MAX**

enum **uart_signal_inv_t**

UART signal bit map.

Values:

enumerator **UART_SIGNAL_INV_DISABLE**

Disable UART signal inverse

enumerator **UART_SIGNAL_IRDA_TX_INV**

inverse the UART irda_tx signal

enumerator **UART_SIGNAL_IRDA_RX_INV**

inverse the UART irda_rx signal

enumerator **UART_SIGNAL_RXD_INV**

inverse the UART rxd signal

enumerator **UART_SIGNAL_CTS_INV**

inverse the UART cts signal

enumerator **UART_SIGNAL_DSR_INV**

inverse the UART dsr signal

enumerator **UART_SIGNAL_TXD_INV**

inverse the UART txd signal

enumerator **UART_SIGNAL_RTS_INV**

inverse the UART rts signal

enumerator **UART_SIGNAL_DTR_INV**

inverse the UART dtr signal

GPIO 查找宏指令 UART 外设提供直接连接的专用 IO_MUX 管脚，但也可用非直接的 GPIO 矩阵将信号配置到其他管脚。如要直接连接，需要知道哪一管脚为 UART 通道的专用 IO_MUX 管脚。GPIO 查找宏简化了查找和分配 IO_MUX 管脚的过程，可根据 IO_MUX 管脚编号或所需 UART 通道名称选择一个宏，该宏将返回匹配的对项。请查看下列示例。

备注：如需较高的 UART 波特率（超过 40 MHz），即仅使用 IO_MUX 管脚时，可以使用此类宏。在其他情况下可以忽略这些宏，并使用 GPIO 矩阵为 UART 功能配置任一 GPIO 管脚。

1. `UART_NUM_2_TXD_DIRECT_GPIO_NUM` 返回 UART 通道 2 TXD 管脚的 IO_MUX 管脚编号（管脚 17）
2. `UART_GPIO19_DIRECT_CHANNEL` 在通过 IO_MUX 连接到 UART 外设时返回 GPIO 19 的 UART 编号（即 `UART_NUM_0`）
3. `GPIO 19` 在通过 IO_MUX 用作 UART CTS 管脚时，`UART_CTS_GPIO19_DIRECT_CHANNEL` 将返回 GPIO 19 的 UART 编号（即 `UART_NUM_0`）。该宏类似于上述宏，但指定了管脚功能，这也是 IO_MUX 分配的一部分。

Header File

- `components/soc/esp32p4/include/soc/uart_channel.h`
- This header file can be included with:

```
#include "soc/uart_channel.h"
```

Macros

`UART_GPIO37_DIRECT_CHANNEL`

`UART_NUM_0_TXD_DIRECT_GPIO_NUM`

`UART_GPIO38_DIRECT_CHANNEL`

`UART_NUM_0_RXD_DIRECT_GPIO_NUM`

`UART_GPIO8_DIRECT_CHANNEL`

`UART_NUM_0_RTS_DIRECT_GPIO_NUM`

`UART_GPIO9_DIRECT_CHANNEL`

`UART_NUM_0_CTS_DIRECT_GPIO_NUM`

`UART_TXD_GPIO37_DIRECT_CHANNEL`

`UART_RXD_GPIO38_DIRECT_CHANNEL`

2.5.37 USB 设备栈

概述

USB 设备栈（以下简称设备栈）支持在 ESP32-P4 上启用 USB 设备支持。通过使用设备栈，可以为 ESP32-P4 烧录任意具有明确定义的 USB 设备功能（如键盘、鼠标、摄像头）、自定义功能（也称特定供应商类别）或上述功能的组合（也称复合设备）。

设备栈基于 TinyUSB 栈构建，但对 TinyUSB 进行了一些小的功能扩展和修改，使其更好地集成到 ESP-IDF。设备栈通过 [ESP-IDF 组件注册器](#) 作为托管组件分发。

功能列表

- 支持多种设备类别 (CDC, HID, MIDI, MSC)
- 支持复合设备
- 支持特定供应商类别
- 最多支持 6 个端点
 - 5 个输入/输出端点
 - 1 个输入端点
- 自供电设备的 VBUS 监测

硬件连接

ESP32-P4 将 USB D+ 和 D- 信号分别路由到 GPIO 20 和 19。为了实现 USB 设备功能，这些 GPIO 应通过某种方式连接到总线上（例如，通过 Micro-B 端口、USB-C 端口或直接连接到标准-A 插头）。

备注: 如果你使用带有两个 USB 端口的 ESP32-P4 开发板，标有“USB”的端口已经连接到 D+ 和 D- GPIO。

备注: 自供电设备还必须通过电压分压器或比较器连接 VBUS，详情请参阅[自供电设备](#)。

设备栈结构

设备栈以 TinyUSB 栈为基础，在此基础上，该设备栈实现了以下功能：

- 自定义 USB 描述符
- 支持串行设备
- 通过串行设备重定向标准流
- 提供用于 USB 设备 MSC 类的存储介质（SPI-Flash 和 SD 卡）
- 封装设备栈中处理 TinyUSB 服务的任务

组件依赖项

设备栈通过 [ESP-IDF 组件注册器](#) 分发，使用前，请使用以下命令将设备栈组件添加为依赖项：

```
idf.py add-dependency esp_tinyusb
```

配置选项 通过 menuconfig 选项，可以对设备栈进行以下多方面配置：

- TinyUSB 日志的详细程度
- 设备栈任务相关选项
- 默认设备/字符串描述符选项
- 特定类别的选项

配置描述符 结构体 `tinyusb_config_t` 提供了以下与 USB 描述符相关的字段，应进行初始化：

- `device_descriptor`
- `configuration_descriptor`
- `string_descriptor`

调用 `tinyusb_driver_install()` 时，设备栈将基于上述字段中提供的描述符实现 USB 设备。

设备栈还提供了默认描述符，将 `tinyusb_driver_install()` 中的相应字段设置为 NULL 即可安装。默认描述符包括：

- 默认设备描述符：启用时，将 `device_descriptor` 设置为 NULL。默认设备描述符将使用相应的 menuconfig 选项设置的值（如 PID、VID、bcdDevice 等）。
- 默认字符串描述符：启用时，将 `string_descriptor` 设置为 NULL。默认字符串描述符将使用相应的 menuconfig 选项设置的值（如制造商、产品和序列字符串描述符选项）。
- 默认配置描述符。某些很少需要自定义配置的类别（如 CDC 和 MSC）将提供默认配置描述符。启用时，将 `configuration_descriptor` 设置为 NULL。

安装设备栈

请调用 `tinycusb_driver_install()` 安装设备栈。结构体 `tinycusb_config_t` 指定了设备栈的配置，而 `tinycusb_config_t` 作为参数传递给 `tinycusb_driver_install()`。

备注： 结构体 `tinycusb_config_t` 可以实现零初始化（如 `const tinycusb_config_t tusb_cfg = { 0 };`）或部分初始化（如下所示）。对于结构体中任何初始化为 0 或 `NULL` 的成员，设备栈将使用其默认配置，请参阅如下示例。

```
const tinycusb_config_t partial_init = {
    .device_descriptor = NULL, // 使用在 menuconfig 中指定的默认设备描述符
    .string_descriptor = NULL, // 使用在 menuconfig 中指定的默认字符串描述符
    .external_phy = false,     // 使用内部 USB PHY
    .configuration_descriptor = NULL, // 使用在 menuconfig_
    ↪ 中根据设置指定的默认配置描述符
};
```

自供电设备

USB 规范要求自供电设备监测 USB 的 `VBUS` 信号的电压水平。与总线供电设备相反，即使没有 USB 连接，自供电设备也可以正常工作。通过监测 `VBUS` 电压水平，自供电设备可以检测连接和断开事件。当 `VBUS` 电压升高到 4.75 V 以上时视为有效；当 `VBUS` 电压下降到 4.35 V 以下时视为无效。

在 ESP32-P4 上，需要使用一个 `GPIO` 作为电压感测管脚，检测 `VBUS` 处于在规定阈值之上/之下。然而，由于 ESP32-P4 管脚具有 3.3 V 容差，即使 `VBUS` 上升/下降到高于/低于上述规定阈值，ESP32-P4 仍会显示为逻辑高电平。因此，为了检测 `VBUS` 是否有效，可以采用以下方法：

- 将 `VBUS` 连接至电压比较器芯片/电路，该芯片/电路可检测上述阈值（即 4.35 V 和 4.75 V），并向 ESP32-P4 输出 3.3 V 逻辑电平，指示 `VBUS` 是否有效。
- 如果 `VBUS` 为 4.4 V，则使用电阻分压器输出 ($0.75 \times V_{dd}$)（见下图）。

备注： 在这两种情况下，设备从 USB 主机拔出后 3 毫秒内，传感引脚上的电压必须为逻辑低电平。

请在结构体 `tinycusb_config_t` 中将 `self_powered` 设置为 `true`，并将 `vbus_monitor_io` 设置为用于 `VBUS` 监测的 `GPIO` 管脚编号以使用此功能。

USB 串行设备 (CDC-ACM)

如果在 `menuconfig` 中启用了 `CDC` 选项，则可以根据 `tinycusb_config_cdacm_t` 的设置，使用 `tusb_cdc_acm_init()` 初始化 USB 串行设备，请参阅如下示例：

```
const tinycusb_config_cdacm_t acm_cfg = {
    .usb_dev = TINYUSB_USBDEV_0,
    .cdc_port = TINYUSB_CDC_ACM_0,
    .rx_unread_buf_sz = 64,
    .callback_rx = NULL,
    .callback_rx_wanted_char = NULL,
    .callback_line_state_changed = NULL,
    .callback_line_coding_changed = NULL
};
tusb_cdc_acm_init(&acm_cfg);
```

可以在配置结构体中设置指向 `tusb_cdacm_callback_t` 函数的指针指定回调函数，或在初始化 USB 串行设备后，调用 `tinycusb_cdacm_register_callback()` 指定回调函数。

图 44: 用于 VBUS 监测的简易分压器

USB 串行控制台 USB 串行设备支持将所有标准输入/输出流 (stdin、stdout、stderr) 重定向到 USB。因此，调用如 `printf()` 等标准库输入/输出函数将导致通过 USB 而不是 UART 发送/接收数据。

建议调用 `esp_tusb_init_console()` 将标准输入/输出流切换到 USB，并调用 `esp_tusb_deinit_console()` 将其切换回 UART。

USB 大容量存储设备 (MSC)

在 `menuconfig` 中启用 `MSC CONFIG_TINYUSB_MSC_ENABLED` 选项时，可以将 ESP 芯片作为 USB 大容量存储设备使用。按如下示例，可以初始化存储媒介（SPI-Flash 或 SD 卡）。

- SPI-Flash

```
static esp_err_t storage_init_spiflash(wl_handle_t *wl_handle)
{
    ***
    esp_partition_t *data_partition = esp_partition_find_first(ESP_PARTITION_TYPE_
    ↪DATA, ESP_PARTITION_SUBTYPE_DATA_FAT, NULL);
    ***
    wl_mount(data_partition, wl_handle);
    ***
}
storage_init_spiflash(&wl_handle);

const tinyusb_msc_spiflash_config_t config_spi = {
    .wl_handle = wl_handle
};
tinyusb_msc_storage_init_spiflash(&config_spi);
```

- SD 卡

```
static esp_err_t storage_init_sdmmc(sdmmc_card_t **card)
{
```

(下页继续)

```

***
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
sdmmc_slot_config_t slot_config = SDMMC_SLOT_CONFIG_DEFAULT();
// 对于 SD 卡, 设置要使用的总线宽度

slot_config.width = 4;
slot_config.clk = CONFIG_EXAMPLE_PIN_CLK;
slot_config.cmd = CONFIG_EXAMPLE_PIN_CMD;
slot_config.d0 = CONFIG_EXAMPLE_PIN_D0;
slot_config.d1 = CONFIG_EXAMPLE_PIN_D1;
slot_config.d2 = CONFIG_EXAMPLE_PIN_D2;
slot_config.d3 = CONFIG_EXAMPLE_PIN_D3;
slot_config.flags |= SDMMC_SLOT_FLAG_INTERNAL_PULLUP;

sd_card = (sdmmc_card_t *)malloc(sizeof(sdmmc_card_t));
(*host.init)();
sdmmc_host_init_slot(host.slot, (const sdmmc_slot_config_t *) &slot_config);
sdmmc_card_init(&host, sd_card);
***
}
storage_init_sdmmc(&card);

const tinyusb_msc_sdmmc_config_t config_sdmmc = {
    .card = card
};
tinyusb_msc_storage_init_sdmmc(&config_sdmmc);

```

应用示例

下表列出了 `peripherals/usb/device` 目录下的代码示例:

代码示例	描述
peripherals/usb/device/tusb_console	设置 ESP32-P4 芯片, 通过串行设备连接获取日志输出
peripherals/usb/device/tusb_serial_device	设置 ESP32-P4 芯片, 将其作为 USB 串行设备使用
peripherals/usb/device/tusb_midi	设置 ESP32-P4 芯片, 将其作为 USB MIDI 设备使用
peripherals/usb/device/tusb_hid	设置 ESP32-P4 芯片, 将其作为 USB 人机界面设备使用
peripherals/usb/device/tusb_msc	设置 ESP32-P4 芯片, 将其作为 USB 大容量存储设备使用
peripherals/usb/device/tusb_composite_msc_serialdevice	设置 ESP32-P4 芯片, 将其作为复合 USB 设备使用 (MSC + CDC)

警告: This document is not updated for ESP32P4 yet, so some of the content may not be correct.

2.5.38 USB 主机

本文档提供了 USB 主机库的相关信息, 按以下章节展开:

章节

- [USB 主机](#)

- 概述
- 架构
- 用法
- 示例
- 主机栈配置
- API 参考
- 维护注意事项

概述

USB 主机库（以下简称主机库）是 USB 主机栈的最底层，提供面向公众开放的 API。应用程序使用 USB 主机功能时，通常无需与主机库直接交互，而是使用某个主机 Class 驱动提供的 API，这些主机 Class 驱动构建在主机库之上。

然而，由于以下的某些原因（但不仅限于此），有时你可能需要直接使用主机库：

- 需要实现自定义主机 Class 驱动程序
- 需要更低级别的抽象

特性和限制 主机库具有以下特性：

- 支持全速 (FS) 和低速 (LS) 设备。
- 支持四种传输类型，即控制传输、块传输、中断传输和同步传输。
- 支持多个 Class 驱动程序同时运行，即主机的多个客户端同时运行。
- 单个设备可以由多个客户端同时使用，如复合设备。
- 主机库及其底层主机栈不会在内部自动创建操作系统任务，任务数量完全由主机库接口的方式决定。一般来说，任务数量为（运行中的主机 Class 驱动程序数量 + 1）。

目前，主机库及其底层主机栈存在以下限制：

- 仅支持单个设备，而主机库的 API 支持多设备。
- 仅支持异步传输。
- 仅支持使用发现的首个配置，尚不支持变更为其他配置。
- 尚不支持传输超时。

架构

上图展示了使用 USB 主机功能时涉及的关键实体，包括：

- 主机库
- 主机库的 客户端
- 设备
- 主机库的 守护进程任务

主机库 主机库是 ESP-IDF USB 主机栈中面向公众开放的最底层的 API 层。任何其他 ESP-IDF 组件（如 Class 驱动程序或用户组件），如果需要与连接的 USB 设备通信，只能直接或间接使用主机库 API。

主机库 API 分为两类，即 **库 API** 和 **客户端 API**。

- 客户端 API 负责主机库的客户端与一或多个 USB 设备间的通信，该 API 只能由主机库的注册客户端调用。
- 库 API 负责主机库处理的通信中不特定于单个客户端的通信，如设备枚举。该 API 通常由主机库的守护进程任务调用。

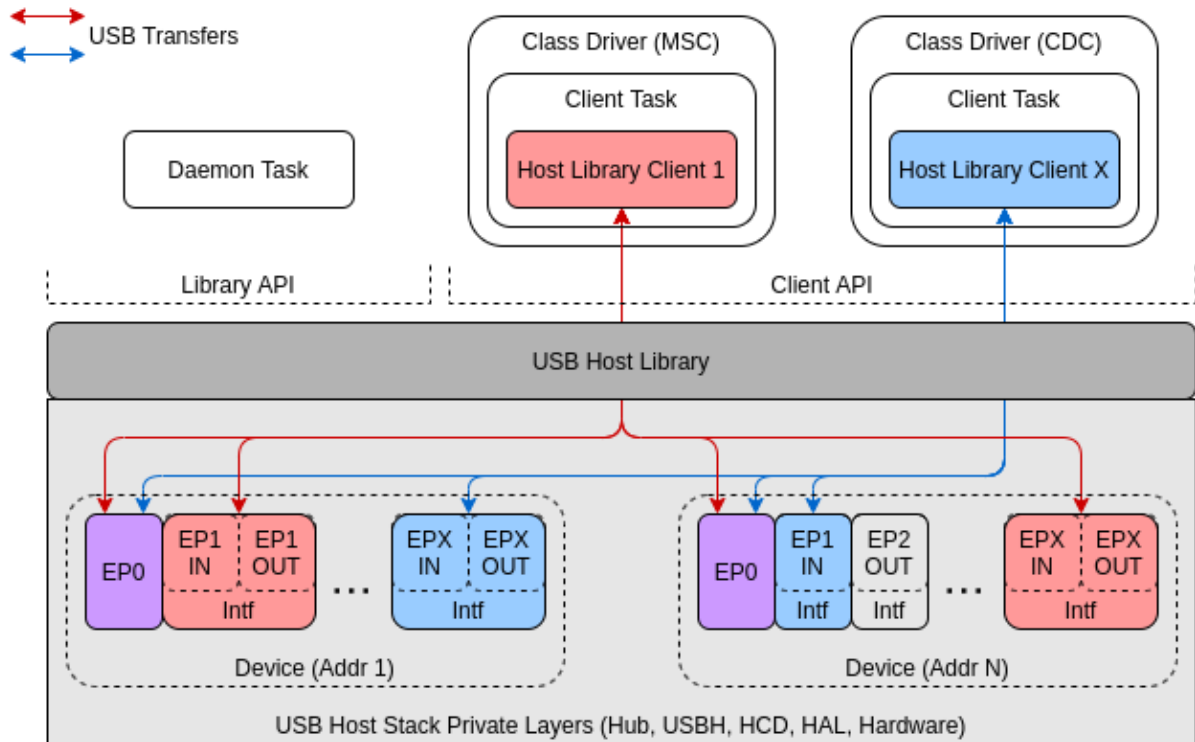

图 45: USB 主机功能涉及的关键实体

客户端 主机库的客户端指使用主机库与 USB 设备通信的软件组件，如主机 Class 驱动程序或用户组件。每个客户端通常与任务间存在一对一关系，这表明，对特定客户端而言，其所有客户端 API 都应该在同一任务的上下文中调用。

通过将使用主机库的软件组件进行分类，划分为独立的客户端，主机库可以将所有客户端特定事件的处理委托给客户端对应的任务。换句话说，每个客户端任务负责管理与其对应的客户端之间的所有 USB 通信操作和事件处理，无需关心其他客户端的事件。

守护进程任务 尽管主机库将客户端事件的处理委托给客户端本身，但仍然需要处理主机库事件，即不特定于客户端的事件。主机库事件处理可能涉及以下内容：

- 处理 USB 设备的连接、枚举和断连
- 将控制传输从/向客户端进行重定向
- 将事件转发给客户端

因此，除客户端任务外，主机库也需要一个任务来处理所有的库事件，这个任务通常是主机库守护进程任务。

设备 主机库隔离了客户端与设备处理的细节，包括连接、内存分配和枚举等，客户端只需提供已连接且已枚举的设备列表供选择。在枚举过程中，每个设备都会自动配置为使用找到的第一个配置，即通过获取配置描述符请求返回的第一个配置描述符。对于大多数标准设备，通常将第一个配置的 `bConfigurationValue` 设置为 1。

只要不与相同接口通信，两个及以上的客户端可以同时与同一设备通信。然而，多个客户端同时与相同设备的默认端点（即 EP0）通信，将导致它们的控制传输序列化。

要与设备通信，客户端必须满足以下条件：

1. 使用设备地址打开设备，告知主机库，客户端正在使用该设备。
2. 获取将用于通信的接口，防止其他客户端获取相同的接口。
3. 通过已经获取了使用权的设备接口的端点通信通道发送数据传输。客户端的任务负责处理其与 USB 设备通信相关的操作和事件。

用法

主机库及底层主机栈不会创建任何任务，客户端任务和守护进程任务等均需由 Class 驱动程序或用户自行创建。然而，主机库提供了两个事件处理函数，可以处理所有必要的主机库操作，这些函数应从客户端任务和守护进程任务中重复调用。因此，客户端任务和守护进程任务的使用将主要集中于调用这些事件处理函数。

主机库与守护进程任务

基本用法 主机库 API 提供了 `usb_host_lib_handle_events()`，可以处理库事件。该函数需要反复调用，通常是从守护进程任务中调用。函数 `usb_host_lib_handle_events()` 有以下特点：

- 该函数会持续阻塞，直至需要处理库事件。
- 每次调用该函数都会返回事件标志，有助于了解卸载主机库的时机。

最基础的守护进程任务通常类似以下代码片段：

```
#include "usb/usb_host.h"

void daemon_task(void *arg)
{
    ...
    bool exit = false;
    while (!exit) {
        uint32_t event_flags;
        usb_host_lib_handle_events(portMAX_DELAY, &event_flags);
        if (event_flags & USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS) {
            ...
        }
        if (event_flags & USB_HOST_LIB_EVENT_FLAGS_ALL_FREE) {
            ...
        }
        ...
    }
    ...
}
```

备注： 了解守护进程任务的完整示例，请前往 peripherals/usb/host/usb_host_lib。

图 46: USB 主机库典型生命周期

生命周期 上图展示了 USB 主机库的典型生命周期，其中涉及多个客户端和设备。具体而言，示例涉及以下内容：

- 两个已注册的客户端（客户端 1 和客户端 2）。
- 两个已连接的设备（设备 1 和设备 2），其中客户端 1 与设备 1 通信，客户端 2 与设备 2 通信。

参考上图可知，典型 USB 主机库生命周期包括以下关键阶段：

1. **调用 `usb_host_install()`，安装主机库。**
 - 调用任意主机库 API 前，请确保已完成主机库安装。
 - 调用 `usb_host_install()` 的位置（如从守护进程任务或其他任务中调用）取决于守护系统任务、客户端任务和系统其余部分间的同步逻辑。
2. **安装完主机库后，调用 `usb_host_client_register()` 注册客户端。**
 - 该注册函数通常从客户端任务调用，而客户端任务需等待来自守护进程任务的信号。
 - 调用过 `usb_host_install()` 后，如有需要，也可以在其他地方调用该注册函数。
3. **设备 1 连接，并进行枚举。**
 - 每个已注册的客户端（本案例中为客户端 1 和客户端 2）都会通过 `USB_HOST_CLIENT_EVENT_NEW_DEV` 事件得到新设备的通知。
 - 客户端 1 开启设备 1，并与其通信。
4. **设备 2 连接，并进行枚举。**
 - 客户端 1 和 2 通过 `USB_HOST_CLIENT_EVENT_NEW_DEV` 事件得到新设备的通知。
 - 客户端 2 开启设备 2，并与其通信。
5. **设备 1 突然断开连接。**
 - 客户端 1 通过 `USB_HOST_CLIENT_EVENT_DEV_GONE` 得到通知，并开始清理，关闭和释放客户端 1 与设备 1 之间的关联资源。
 - 客户端 2 不会收到通知，因为它并未开启设备 1。
6. **客户端 1 完成清理，调用 `usb_host_client_deregister()` 注销客户端。**
 - 该注销函数通常在任务退出前，从客户端任务中调用。
 - 如有需要，只要客户端 1 已完成清理，也可以在其他地方调用该注销函数。
7. **客户端 2 完成与设备 2 的通信，随后关闭设备 2，并自行注销。**
 - 由于客户端 2 是最后一个注销的客户端，通过 `USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS` 事件标志，守护进程任务可以得知，所有客户端已注销。
 - 设备 2 未释放，仍会进行分配，因为虽然没有任何客户端打开设备 2，但它仍处于连接状态。
8. **所有客户端注销后，守护进程任务开始清理。**
 - 守护进程任务需要先调用 `usb_host_device_free_all()`，释放设备 2。
 - 如果 `usb_host_device_free_all()` 能够成功释放所有设备，函数将返回 `ESP_OK`，表明已释放所有设备。
 - 如果 `usb_host_device_free_all()` 无法成功释放所有设备，例如因为设备仍由某个客户端开启，函数将返回 `ESP_ERR_NOT_FINISHED`。
 - 守护进程任务必须等待 `usb_host_lib_handle_events()` 返回事件标志 `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE`，方知何时所有设备均已释放。
9. 一旦守护进程任务确认所有客户端均已注销，且所有设备均已释放，便可调用 `usb_host_uninstall()`，卸载主机库。

客户端与 Class 驱动程序

基本用法 主机库 API 提供函数 `usb_host_client_handle_events()`，可以处理特定客户端事件。该函数需要反复调用，通常是从客户端任务中调用。函数 `usb_host_client_handle_events()` 有以下特点：

- 该函数可以持续阻塞，直至需要处理客户端事件。
- 该函数的主要目的是发生客户端事件时，调用多个事件处理回调函数。

以下回调函数均从 `usb_host_client_handle_events()` 中调用，因此客户端任务能够获取事件通知。

- 类型为 `usb_host_client_event_cb_t` 的客户端事件回调函数会将客户端事件消息传递给客户端，提示添加、移除设备等事件。

- 类型为 `usb_transfer_cb_t` 的 USB 传输完成回调函数表明，先前由客户端提交的特定 USB 传输已完成。

备注： 考虑到上述回调函数从 `usb_host_client_handle_events()` 中调用，应避免在回调函数内部阻塞，否则将导致 `usb_host_client_handle_events()` 阻塞，阻止其他待处理的客户端事件得到处理。

以下代码片段展示了一个基础的主机 Class 驱动程序及其客户端任务，代码片段中包括：

- 一个简单的客户端任务函数 `client_task`，它会在循环中调用 `usb_host_client_handle_events()`。
- 使用客户端事件回调函数和传输完成回调函数。
- 一个用于 Class 驱动程序的简单状态机。该 Class 驱动程序仅支持打开设备，发送 OUT 传输到 EP1，然后关闭设备。

```
#include <string.h>
#include "usb/usb_host.h"

#define CLASS_DRIVER_ACTION_OPEN_DEV    0x01
#define CLASS_DRIVER_ACTION_TRANSFER    0x02
#define CLASS_DRIVER_ACTION_CLOSE_DEV   0x03

struct class_driver_control {
    uint32_t actions;
    uint8_t dev_addr;
    usb_host_client_handle_t client_hdl;
    usb_device_handle_t dev_hdl;
};

static void client_event_cb(const usb_host_client_event_msg_t *event_msg, void_
↳*arg)
{
    //该函数从 usb_host_client_handle_events() 中调用，请勿在此阻塞，并尽量保持简洁
    struct class_driver_control *class_driver_obj = (struct class_driver_control_
↳*)arg;
    switch (event_msg->event) {
        case USB_HOST_CLIENT_EVENT_NEW_DEV:
            class_driver_obj->actions |= CLASS_DRIVER_ACTION_OPEN_DEV;
            class_driver_obj->dev_addr = event_msg->new_dev.address; //
↳存储新设备的地址
            break;
        case USB_HOST_CLIENT_EVENT_DEV_GONE:
            class_driver_obj->actions |= CLASS_DRIVER_ACTION_CLOSE_DEV;
            break;
        default:
            break;
    }
}

static void transfer_cb(usb_transfer_t *transfer)
{
    //该函数从 usb_host_client_handle_events() 中调用，请勿在此阻塞，并尽量保持简洁
    struct class_driver_control *class_driver_obj = (struct class_driver_control_
↳*)transfer->context;
    printf("Transfer status %d, actual number of bytes transferred %d\n", transfer-
↳>status, transfer->actual_num_bytes);
    class_driver_obj->actions |= CLASS_DRIVER_ACTION_CLOSE_DEV;
}

void client_task(void *arg)
{
```

(下页继续)

```

... //等待主机库安装
//初始化 Class 驱动程序对象
struct class_driver_control class_driver_obj = {0};
//注册客户端
usb_host_client_config_t client_config = {
    .is_synchronous = false,
    .max_num_event_msg = 5,
    .async = {
        .client_event_callback = client_event_cb,
        .callback_arg = &class_driver_obj,
    }
};
usb_host_client_register(&client_config, &class_driver_obj.client_hdl);
//分配一个 USB 传输
usb_transfer_t *transfer;
usb_host_transfer_alloc(1024, 0, &transfer);

//事件处理循环
bool exit = false;
while (!exit) {
    //调用客户端事件处理函数
    usb_host_client_handle_events(class_driver_obj.client_hdl, portMAX_DELAY);
    //执行待处理的 Class 驱动程序操作
    if (class_driver_obj.actions & CLASS_DRIVER_ACTION_OPEN_DEV) {
        //开启设备, 声明接口 1
        usb_host_device_open(class_driver_obj.client_hdl, class_driver_obj.dev_
↪addr, &class_driver_obj.dev_hdl);
        usb_host_interface_claim(class_driver_obj.client_hdl, class_driver_obj.
↪dev_hdl, 1, 0);
    }
    if (class_driver_obj.actions & CLASS_DRIVER_ACTION_TRANSFER) {
        //发送一个 OUT 传输到 EP1
        memset(transfer->data_buffer, 0xAA, 1024);
        transfer->num_bytes = 1024;
        transfer->device_handle = class_driver_obj.dev_hdl;
        transfer->bEndpointAddress = 0x01;
        transfer->callback = transfer_cb;
        transfer->context = (void *)&class_driver_obj;
        usb_host_transfer_submit(transfer);
    }
    if (class_driver_obj.actions & CLASS_DRIVER_ACTION_CLOSE_DEV) {
        //释放接口, 关闭设备
        usb_host_interface_release(class_driver_obj.client_hdl, class_driver_
↪obj.dev_hdl, 1);
        usb_host_device_close(class_driver_obj.client_hdl, class_driver_obj.
↪dev_hdl);
        exit = true;
    }
    ... //处理其他 Class 驱动程序要求的行为
}

//清理 Class 驱动程序
usb_host_transfer_free(transfer);
usb_host_client_deregister(class_driver_obj.client_hdl);
... //删除客户端任务。如有需要, 向守护进程任务发送信号。
}

```

备注: 在实际应用中, 主机 Class 驱动程序还能支持更多功能, 因此也存在更复杂的状态机。主机 Class 驱动程序可能需要:

- 能够开启多个设备

- 解析已开启设备的描述符，确定设备是否是目标 Class
- 按特定顺序，与接口的多个端点通信
- 声明设备的多个接口
- 处理各种错误情况

生命周期 客户端任务与 Class 驱动程序的典型生命周期包括以下关键阶段：

1. 等待与主机库有关的信号完成安装。
2. 通过 `usb_host_client_register()` 注册客户端，并分配其他的 Class 驱动程序资源，如使用 `usb_host_transfer_alloc()` 分配传输。
3. 对于 Class 驱动程序需要与之通信的各个新设备：
 - a. 调用 `usb_host_device_addr_list_fill()`，检查设备是否已连接。
 - b. 如果设备尚未连接，则等待客户端事件回调函数的 `USB_HOST_CLIENT_EVENT_NEW_DEV` 事件。
 - c. 调用 `usb_host_device_open()` 开启设备。
 - d. 分别调用 `usb_host_get_device_descriptor()` 和 `usb_host_get_active_config_descriptor()` 解析设备和配置描述符。
 - e. 调用 `usb_host_interface_claim()`，声明设备的必要接口。
4. 调用 `usb_host_transfer_submit()` 或 `usb_host_transfer_submit_control()`，向设备提交传输。
5. 一旦 `USB_HOST_CLIENT_EVENT_DEV_GONE` 事件表示，Class 驱动程序不再需要已打开的设备，或者设备断开连接：
 - a. 在这些端点上调用 `usb_host_endpoint_halt()` 和 `usb_host_endpoint_flush()`，停止先前提交的传输。
 - b. 调用 `usb_host_interface_release()`，释放先前声明的所有接口。
 - c. 调用 `usb_host_device_close()`，关闭设备。
6. 调用 `usb_host_client_deregister()` 注销客户端，并释放其他 Class 驱动程序资源。
7. 删除客户端任务。如有需要，向守护进程任务发送信号。

示例

主机库示例 `peripherals/usb/host/usb_host_lib` 展示了 USB 主机库 API 的基本用法，用于创建伪 Class 驱动程序。

Class 驱动程序示例 USB 主机栈提供了大量示例，展示了如何通过使用主机库 API 创建主机 Class 驱动程序。

CDC-ACM

- 通信设备 Class（抽象控制模型）的主机 Class 驱动程序通过 [ESP-IDF 组件注册器](#) 作为受管理的组件分发。
- 示例 `peripherals/usb/host/cdc/cdc_acm_host` 使用 CDC-ACM 主机驱动程序组件，与 CDC-ACM 设备通信。
- 示例 `peripherals/usb/host/cdc/cdc_acm_vcp` 展示了如何扩展 CDC-ACM 主机驱动程序，与虚拟串口设备交互。
- 示例 `esp_modem` 中也使用了 CDC-ACM 驱动程序，该程序在这些示例中与蜂窝模块通信。

MSC

- 大容量存储 Class（仅支持批量传输）的主机 Class 驱动程序已部署到 [ESP-IDF 组件注册器](#)。
- 示例 `peripherals/usb/host/msc` 展示了如何使用 MSC 主机驱动程序读写 USB flash 驱动。

HID

- HID（人机接口设备）的主机 class 驱动作为托管组件通过 [ESP-IDF 组件注册器](#) 分发。
- 示例 [peripherals/usb/host/hid](#) 展示了从具有多个接口的 USB HID 设备接收报告的可能性。

UVC

- USB 视频设备 Class 的主机 Class 驱动程序作为托管组件通过 [ESP-IDF 组件注册器](#) 分发。
- 示例 [peripherals/usb/host/uvc](#) 展示了如何使用 UVC 主机驱动程序接收来自 USB 摄像头的视频流，并可选择将该流通过 Wi-Fi 转发。

主机栈配置

非兼容设备支持 为了支持某些非兼容或具有特定行为的 USB 设备，可以对 USB 主机栈进行配置。

USB 设备可能是热插拔的，因此必须配置电源开关和设备连接之间的延迟，以及设备内部电源稳定后的延迟。

枚举配置 在枚举已连接 USB 设备的过程中，需要给一些事件配置合适的间隔时间以确保设备正常运行。

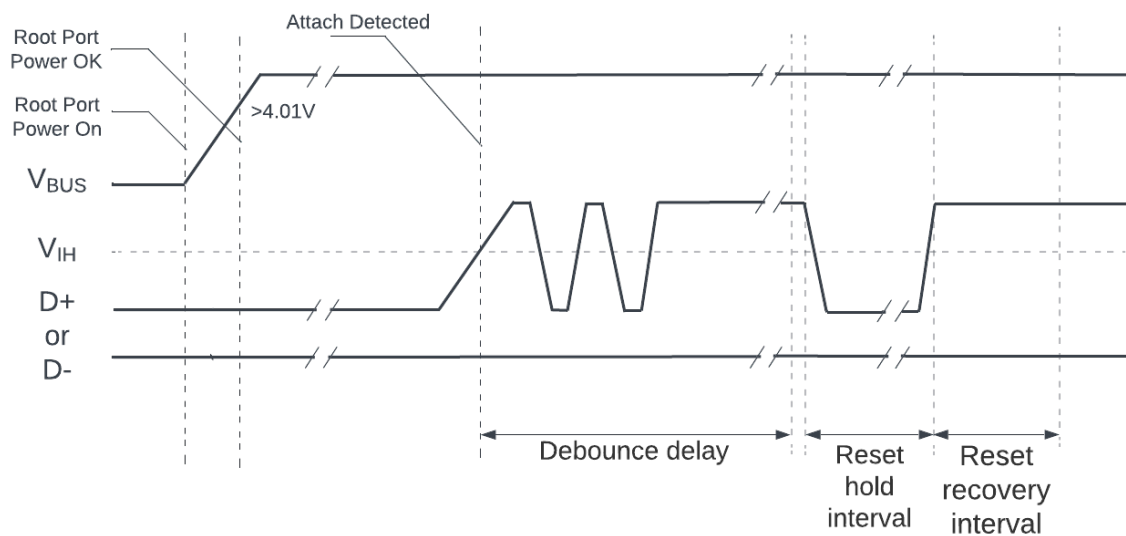

图 47: USB 根集线器上电和连接事件时序

上图展示了与连接设备时开启端口电源和热插拔设备相关的所有间隔时间。

- 端口复位或恢复运行后，USB 系统软件应提供 10 毫秒的恢复时间，此后连接到端口的设备才会响应数据传输。
- 恢复时间结束后，如果设备收到 `SetAddress()` 请求，设备必须能够完成对该请求的处理，并能在 50 毫秒内成功完成请求的状态 (Status) 阶段。
- 状态阶段结束后，设备允许有 2 毫秒的 `SetAddress()` 恢复时间。

备注：有关连接事件时序的更多信息，请参阅 [通用串行总线 2.0 规范](#) > 第 7.1.7.3 章 连接和断开信令。

可通过 `Menuconfig` 选项设置 USB 主机栈的可配置参数。

- `CONFIG_USB_HOST_DEBOUNCE_DELAY_MS` 用于配置防抖延迟。
- `CONFIG_USB_HOST_RESET_HOLD_MS` 用于配置重置保持时间。

- `CONFIG_USB_HOST_RESET_RECOVERY_MS` 用于配置重置恢复时间。
- `CONFIG_USB_HOST_SET_ADDR_RECOVERY_MS` 用于配置 `SetAddress()` 恢复时间。

多项配置支持 对于具有多项配置的 USB 设备，可以在设备枚举过程中指定所需的配置编号。

枚举过滤器 枚举过滤器是类型为 `usb_host_enum_filter_cb_t` 的回调函数。从新连接的 USB 设备上读取设备描述符后，USB 主机栈会在枚举过程开始时调用枚举过滤器，从而为用户提供读取的设备描述符。借助此回调，用户得以：

- 选择 USB 设备的配置。
- 过滤应该进行枚举的 USB 设备。

在 `menuconfig` 中启用 `CONFIG_USB_HOST_ENABLE_ENUM_FILTER_CALLBACK` 选项即可启用枚举过滤器。可以通过设置 `usb_host_config_t::enum_filter_cb` 来指定回调函数，该函数会在调用 `usb_host_install()` 时传递至主机库。

API 参考

USB 主机库的 API 包含以下头文件，但应用程序调用该 API 时只需 `#include "usb/usb_host.h"`，该头文件包含了所有 USB 主机库的头文件。

- `usb/include/usb/usb_host.h` 包含 USB 主机库的函数和类型。
- `usb/include/usb/usb_helpers.h` 包含与 USB 协议相关的各种辅助函数，如描述符解析等。
- `usb/include/usb/usb_types_stack.h` 包含在 USB 主机栈的多个层次中使用的类型。
- `usb/include/usb/usb_types_ch9.h` 包含了与 USB 2.0 规范中第 9 章相关的类型和宏，即描述符和标准请求。

Header File

- `components/usb/include/usb/usb_host.h`
- This header file can be included with:

```
#include "usb/usb_host.h"
```

- This header file is a part of the API provided by the `usb` component. To declare that your component depends on `usb`, add the following to your `CMakeLists.txt`:

```
REQUIRES usb
```

or

```
PRIV_REQUIRES usb
```

Functions

`esp_err_t usb_host_install(const usb_host_config_t *config)`

Install the USB Host Library.

- This function should only once to install the USB Host Library
- This function should be called before any other USB Host Library functions are called

备注: If `skip_phy_setup` is set in the install configuration, the user is responsible for ensuring that the underlying Host Controller is enabled and the USB PHY (internal or external) is already setup before this function is called.

参数 `config` -- [in] USB Host Library configuration

返回 `esp_err_t`

`esp_err_t` **usb_host_uninstall** (void)

Uninstall the USB Host Library.

- This function should be called to uninstall the USB Host Library, thereby freeing its resources
- All clients must have been deregistered before calling this function
- All devices must have been freed by calling `usb_host_device_free_all()` and receiving the `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` event flag

备注: If `skip_phy_setup` was set when the Host Library was installed, the user is responsible for disabling the underlying Host Controller and USB PHY (internal or external).

返回 `esp_err_t`

`esp_err_t` **usb_host_lib_handle_events** (TickType_t timeout_ticks, uint32_t *event_flags_ret)

Handle USB Host Library events.

- This function handles all of the USB Host Library's processing and should be called repeatedly in a loop
- Check `event_flags_ret` to see if an flags are set indicating particular USB Host Library events
- This function should never be called by multiple threads simultaneously

备注: This function can block

参数

- **timeout_ticks** -- [in] Timeout in ticks to wait for an event to occur
- **event_flags_ret** -- [out] Event flags that indicate what USB Host Library event occurred.

返回 `esp_err_t`

`esp_err_t` **usb_host_lib_unblock** (void)

Unblock the USB Host Library handler.

- This function simply unblocks the USB Host Library event handling function (`usb_host_lib_handle_events()`)

返回 `esp_err_t`

`esp_err_t` **usb_host_lib_info** (`usb_host_lib_info_t` *info_ret)

Get current information about the USB Host Library.

参数 `info_ret` -- [out] USB Host Library Information

返回 `esp_err_t`

`esp_err_t` **usb_host_client_register** (const `usb_host_client_config_t` *client_config, `usb_host_client_handle_t` *client_hdl_ret)

Register a client of the USB Host Library.

- This function registers a client of the USB Host Library
- Once a client is registered, its processing function `usb_host_client_handle_events()` should be called repeatedly

参数

- **client_config** -- [in] Client configuration
- **client_hdl_ret** -- [out] Client handle

返回 esp_err_t

esp_err_t usb_host_client_deregister (*usb_host_client_handle_t* client_hdl)

Deregister a USB Host Library client.

- This function deregisters a client of the USB Host Library
- The client must have closed all previously opened devices before attempting to deregister

参数 **client_hdl** -- [in] Client handle

返回 esp_err_t

esp_err_t usb_host_client_handle_events (*usb_host_client_handle_t* client_hdl, TickType_t timeout_ticks)

USB Host Library client processing function.

- This function handles all of a client's processing and should be called repeatedly in a loop
- For a particular client, this function should never be called by multiple threads simultaneously

备注: This function can block

参数

- **client_hdl** -- [in] Client handle
- **timeout_ticks** -- [in] Timeout in ticks to wait for an event to occur

返回 esp_err_t

esp_err_t usb_host_client_unblock (*usb_host_client_handle_t* client_hdl)

Unblock a client.

- This function simply unblocks a client if it is blocked on the `usb_host_client_handle_events()` function.
- This function is useful when need to unblock a client in order to deregister it.

参数 **client_hdl** -- [in] Client handle

返回 esp_err_t

esp_err_t usb_host_device_open (*usb_host_client_handle_t* client_hdl, uint8_t dev_addr, *usb_device_handle_t* *dev_hdl_ret)

Open a device.

- This function allows a client to open a device
- A client must open a device first before attempting to use it (e.g., sending transfers, device requests etc.)

参数

- **client_hdl** -- [in] Client handle
- **dev_addr** -- [in] Device's address
- **dev_hdl_ret** -- [out] Device's handle

返回 esp_err_t

esp_err_t **usb_host_device_close** (*usb_host_client_handle_t* client_hdl, *usb_device_handle_t* dev_hdl)

Close a device.

- This function allows a client to close a device
- A client must close a device after it has finished using the device (claimed interfaces must also be released)
- A client must close all devices it has opened before deregistering

备注: This function can block

参数

- **client_hdl** -- [in] Client handle
- **dev_hdl** -- [in] Device handle

返回 *esp_err_t*

esp_err_t **usb_host_device_free_all** (void)

Indicate that all devices can be freed when possible.

- This function marks all devices as waiting to be freed
- If a device is not opened by any clients, it will be freed immediately
- If a device is opened by at least one client, the device will be free when the last client closes that device.
- Wait for the `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` flag to be set by `usb_host_lib_handle_events()` in order to know when all devices have been freed
- This function is useful when cleaning up devices before uninstalling the USB Host Library

返回

- `ESP_ERR_NOT_FINISHED`: There are one or more devices that still need to be freed. Wait for `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` event
- `ESP_OK`: All devices already freed (i.e., there were no devices)
- Other: Error

esp_err_t **usb_host_device_addr_list_fill** (int list_len, uint8_t *dev_addr_list, int *num_dev_ret)

Fill a list of device address.

- This function fills an empty list with the address of connected devices
- The Device addresses can then used in `usb_host_device_open()`
- If there are more devices than the `list_len`, this function will only fill up to `list_len` number of devices.

参数

- **list_len** -- [in] Length of the empty list
- **dev_addr_list** -- [inout] Empty list to be filled
- **num_dev_ret** -- [out] Number of devices

返回 *esp_err_t*

esp_err_t **usb_host_device_info** (*usb_device_handle_t* dev_hdl, *usb_device_info_t* *dev_info)

Get device's information.

- This function gets some basic information of a device
- The device must be opened first before attempting to get its information

备注: This function can block

参数

- **dev_hdl** -- [in] Device handle
- **dev_info** -- [out] Device information

返回 esp_err_t

esp_err_t **usb_host_get_device_descriptor** (*usb_device_handle_t* dev_hdl, const *usb_device_desc_t* **device_desc)

Get device's device descriptor.

- A client must call `usb_host_device_open()` first
- No control transfer is sent. The device's descriptor is cached on enumeration
- This function simple returns a pointer to the cached descriptor

备注: No control transfer is sent. The device's descriptor is cached on enumeration

参数

- **dev_hdl** -- [in] Device handle
- **device_desc** -- [out] Device descriptor

返回 esp_err_t

esp_err_t **usb_host_get_active_config_descriptor** (*usb_device_handle_t* dev_hdl, const *usb_config_desc_t* **config_desc)

Get device's active configuration descriptor.

- A client must call `usb_host_device_open()` first
- No control transfer is sent. The device's active configuration descriptor is cached on enumeration
- This function simple returns a pointer to the cached descriptor

备注: This function can block

备注: No control transfer is sent. A device's active configuration descriptor is cached on enumeration

参数

- **dev_hdl** -- [in] Device handle
- **config_desc** -- [out] Configuration descriptor

返回 esp_err_t

esp_err_t **usb_host_get_config_desc** (*usb_host_client_handle_t* client_hdl, *usb_device_handle_t* dev_hdl, uint8_t bConfigurationValue, const *usb_config_desc_t* **config_desc_ret)

Get get device's configuration descriptor.

- The USB Host library only caches a device's active configuration descriptor.
- This function reads any configuration descriptor of a particular device (specified by bConfigurationValue).
- This function will read the specified configuration descriptor via control transfers, and allocate memory to store that descriptor.
- Users can call `usb_host_free_config_desc()` to free the descriptor's memory afterwards.

备注: This function can block

备注: A client must call `usb_host_device_open()` on the device first

备注: `bConfigurationValue` starts from index 1

参数

- **client_hdl** -- [in] Client handle - `usb_host_client_handle_events()` should be called repeatedly in a separate task to handle client events
- **dev_hdl** -- [in] Device handle
- **config_desc_ret** -- [out] Returned configuration descriptor
- **bConfigurationValue** -- [in] Index of device's configuration descriptor to be read

返回 `esp_err_t`

esp_err_t **usb_host_free_config_desc** (*const usb_config_desc_t* *config_desc)

Free a configuration descriptor.

This function frees a configuration descriptor that was returned by `usb_host_get_config_desc()`

参数 **config_desc** -- [out] Configuration descriptor

返回 `esp_err_t`

esp_err_t **usb_host_interface_claim** (*usb_host_client_handle_t* client_hdl, *usb_device_handle_t* dev_hdl, *uint8_t* bInterfaceNumber, *uint8_t* bAlternateSetting)

Function for a client to claim a device's interface.

- A client must claim a device's interface before attempting to communicate with any of its endpoints
- Once an interface is claimed by a client, it cannot be claimed by any other client.

备注: This function can block

参数

- **client_hdl** -- [in] Client handle
- **dev_hdl** -- [in] Device handle
- **bInterfaceNumber** -- [in] Interface number
- **bAlternateSetting** -- [in] Interface alternate setting number

返回 `esp_err_t`

esp_err_t **usb_host_interface_release** (*usb_host_client_handle_t* client_hdl, *usb_device_handle_t* dev_hdl, *uint8_t* bInterfaceNumber)

Function for a client to release a previously claimed interface.

- A client should release a device's interface after it no longer needs to communicate with the interface
- A client must release all of its interfaces of a device it has claimed before being able to close the device

备注: This function can block

参数

- **client_hdl** -- [in] Client handle

- **dev_hdl** -- [in] Device handle
- **bInterfaceNumber** -- [in] Interface number

返回 esp_err_t

esp_err_t **usb_host_endpoint_halt** (*usb_device_handle_t* dev_hdl, uint8_t bEndpointAddress)

Halt a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- Once halted, the endpoint must be cleared using `usb_host_endpoint_clear()` before it can communicate again

备注: This function can block

参数

- **dev_hdl** -- Device handle
- **bEndpointAddress** -- Endpoint address

返回 esp_err_t

esp_err_t **usb_host_endpoint_flush** (*usb_device_handle_t* dev_hdl, uint8_t bEndpointAddress)

Flush a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- The endpoint must have been halted (either through a transfer error, or `usb_host_endpoint_halt()`)
- Flushing an endpoint will caused an queued up transfers to be canceled

备注: This function can block

参数

- **dev_hdl** -- Device handle
- **bEndpointAddress** -- Endpoint address

返回 esp_err_t

esp_err_t **usb_host_endpoint_clear** (*usb_device_handle_t* dev_hdl, uint8_t bEndpointAddress)

Clear a halt on a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- The endpoint must have been halted (either through a transfer error, or `usb_host_endpoint_halt()`)
- If the endpoint has any queued up transfers, clearing a halt will resume their execution

备注: This function can block

参数

- **dev_hdl** -- Device handle
- **bEndpointAddress** -- Endpoint address

返回 esp_err_t

esp_err_t **usb_host_transfer_alloc** (size_t data_buffer_size, int num_isoc_packets, *usb_transfer_t* **transfer)

Allocate a transfer object.

- This function allocates a transfer object
- Each transfer object has a fixed sized buffer specified on allocation
- A transfer object can be re-used indefinitely
- A transfer can be submitted using `usb_host_transfer_submit()` or `usb_host_transfer_submit_control()`

参数

- **data_buffer_size** -- [in] Size of the transfer's data buffer
- **num_isoc_packets** -- [in] Number of isochronous packets in transfer (set to 0 for non-isochronous transfers)
- **transfer** -- [out] Transfer object

返回 `esp_err_t`

esp_err_t **usb_host_transfer_free** (*usb_transfer_t* *transfer)

Free a transfer object.

- Free a transfer object previously allocated using `usb_host_transfer_alloc()`
- The transfer must not be in-flight when attempting to free it
- If a NULL pointer is passed, this function will simply return `ESP_OK`

参数 **transfer** -- [in] Transfer object

返回 `esp_err_t`

esp_err_t **usb_host_transfer_submit** (*usb_transfer_t* *transfer)

Submit a non-control transfer.

- Submit a transfer to a particular endpoint. The device and endpoint number is specified inside the transfer
- The transfer must be properly initialized before submitting
- On completion, the transfer's callback will be called from the client's `usb_host_client_handle_events()` function.

参数 **transfer** -- [in] Initialized transfer object

返回 `esp_err_t`

esp_err_t **usb_host_transfer_submit_control** (*usb_host_client_handle_t* client_hdl, *usb_transfer_t* *transfer)

Submit a control transfer.

- Submit a control transfer to a particular device. The client must have opened the device first
- The transfer must be properly initialized before submitting. The first 8 bytes of the transfer's data buffer should contain the control transfer setup packet
- On completion, the transfer's callback will be called from the client's `usb_host_client_handle_events()` function.

参数

- **client_hdl** -- [in] Client handle
- **transfer** -- [in] Initialized transfer object

返回 `esp_err_t`

Structures

struct **usb_host_client_event_msg_t**

Client event message.

Client event messages are sent to each client of the USB Host Library in order to notify them of various USB Host Library events such as:

- Addition of new devices
- Removal of existing devices

备注: The event message structure has a union with members corresponding to each particular event. Based on the event type, only the relevant member field should be accessed.

Public Members

usb_host_client_event_t **event**

Type of event

uint8_t **address**

New device's address

struct *usb_host_client_event_msg_t*::[anonymous]::[anonymous] **new_dev**

New device info

usb_device_handle_t **dev_hdl**

The handle of the device that was gone

struct *usb_host_client_event_msg_t*::[anonymous]::[anonymous] **dev_gone**

Gone device info

struct **usb_host_lib_info_t**

Current information about the USB Host Library obtained via `usb_host_lib_info()`

Public Members

int **num_devices**

Current number of connected (and enumerated) devices

int **num_clients**

Current number of registered clients

struct **usb_host_config_t**

USB Host Library configuration.

Configuration structure of the USB Host Library. Provided in the `usb_host_install()` function

Public Members

bool **skip_phy_setup**

If set, the USB Host Library will not configure the USB PHY thus allowing the user to manually configure the USB PHY before calling `usb_host_install()`. Users should set this if they want to use an external USB PHY. Otherwise, the USB Host Library will automatically configure the internal USB PHY

int **intr_flags**

Interrupt flags for the underlying ISR used by the USB Host stack

usb_host_enum_filter_cb_t **enum_filter_cb**

Enumeration filter callback. Enable `CONFIG_USB_HOST_ENABLE_ENUM_FILTER_CALLBACK` to use this feature. Set to `NULL` otherwise.

struct **usb_host_client_config_t**

USB Host Library Client configuration.

Configuration structure for a USB Host Library client. Provided in `usb_host_client_register()`

Public Members

bool **is_synchronous**

Whether the client is asynchronous or synchronous or not. Set to false for now.

int **max_num_event_msg**

Maximum number of event messages that can be stored (e.g., 3)

usb_host_client_event_cb_t **client_event_callback**

Client's event callback function

void ***callback_arg**

Event callback function argument

struct *usb_host_client_config_t*::[anonymous]::[anonymous] **async**

Async callback config

Macros

USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS

All clients have been deregistered from the USB Host Library

USB_HOST_LIB_EVENT_FLAGS_ALL_FREE

The USB Host Library has freed all devices

Type Definitions

typedef struct *usb_host_client_handle_s* ***usb_host_client_handle_t**

Handle to a USB Host Library asynchronous client.

An asynchronous client can be registered using `usb_host_client_register()`

备注: Asynchronous API

```
typedef void (*usb_host_client_event_cb_t)(const usb_host_client_event_msg_t *event_msg, void *arg)
```

Client event callback.

- Each client of the USB Host Library must register an event callback to receive event messages from the USB Host Library.
- The client event callback is run from the context of the clients `usb_host_client_handle_events()` function

Enumerations

```
enum usb_host_client_event_t
```

The type event in a client event message.

Values:

```
enumerator USB_HOST_CLIENT_EVENT_NEW_DEV
```

A new device has been enumerated and added to the USB Host Library

```
enumerator USB_HOST_CLIENT_EVENT_DEV_GONE
```

A device opened by the client is now gone

Header File

- [components/usb/include/usb/usb_helpers.h](#)
- This header file can be included with:

```
#include "usb/usb_helpers.h"
```

- This header file is a part of the API provided by the `usb` component. To declare that your component depends on `usb`, add the following to your `CMakeLists.txt`:

```
REQUIRES usb
```

or

```
PRIV_REQUIRES usb
```

Functions

```
const usb_standard_desc_t *usb_parse_next_descriptor (const usb_standard_desc_t *cur_desc, uint16_t wTotalLength, int *offset)
```

Get the next descriptor.

Given a particular descriptor within a full configuration descriptor, get the next descriptor within the configuration descriptor. This is a convenience function that can be used to walk each individual descriptor within a full configuration descriptor.

参数

- **cur_desc** -- [in] Current descriptor
- **wTotalLength** -- [in] Total length of the configuration descriptor
- **offset** -- [inout] Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the current descriptor. On output, it is the offset of the returned descriptor.

返回 `usb_standard_desc_t*` Next descriptor, NULL if end of configuration descriptor reached

```
const usb_standard_desc_t *usb_parse_next_descriptor_of_type (const usb_standard_desc_t *cur_desc, uint16_t wTotalLength, uint8_t bDescriptorType, int *offset)
```

Get the next descriptor of a particular type.

Given a particular descriptor within a full configuration descriptor, get the next descriptor of a particular type (i.e., using the `bDescriptorType` value) within the configuration descriptor.

参数

- **cur_desc** -- [in] Current descriptor
- **wTotalLength** -- [in] Total length of the configuration descriptor
- **bDescriptorType** -- [in] Type of the next descriptor to get
- **offset** -- [inout] Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the current descriptor. On output, it is the offset of the returned descriptor.

返回 `usb_standard_desc_t*` Next descriptor, NULL if end descriptor is not found or configuration descriptor reached

```
int usb_parse_interface_number_of_alternate (const usb_config_desc_t *config_desc, uint8_t
                                             bInterfaceNumber)
```

Get the number of alternate settings for a `bInterfaceNumber`.

Given a particular configuration descriptor, for a particular `bInterfaceNumber`, get the number of alternate settings available for that interface (i.e., the max possible value of `bAlternateSetting` for that `bInterfaceNumber`).

参数

- **config_desc** -- [in] Pointer to the start of a full configuration descriptor
- **bInterfaceNumber** -- [in] Interface number

返回 `int` The number of alternate settings that the interface has, -1 if `bInterfaceNumber` not found

```
const usb_intf_desc_t *usb_parse_interface_descriptor (const usb_config_desc_t *config_desc,
                                                    uint8_t bInterfaceNumber, uint8_t
                                                    bAlternateSetting, int *offset)
```

Get a particular interface descriptor (using `bInterfaceNumber` and `bAlternateSetting`)

Given a full configuration descriptor, get a particular interface descriptor.

备注: To get the number of alternate settings for a particular `bInterfaceNumber`, call `usb_parse_interface_number_of_alternate()`

参数

- **config_desc** -- [in] Pointer to the start of a full configuration descriptor
- **bInterfaceNumber** -- [in] Interface number
- **bAlternateSetting** -- [in] Alternate setting number
- **offset** -- [out] Byte offset of the interface descriptor relative to the start of the configuration descriptor. Can be NULL.

返回 `const usb_intf_desc_t*` Pointer to interface descriptor, NULL if not found.

```
const usb_ep_desc_t *usb_parse_endpoint_descriptor_by_index (const usb_intf_desc_t *intf_desc,
                                                           int index, uint16_t wTotalLength,
                                                           int *offset)
```

Get an endpoint descriptor within an interface descriptor.

Given an interface descriptor, get the Nth endpoint descriptor of the interface. The number of endpoints in an interface is indicated by the `bNumEndpoints` field of the interface descriptor.

备注: If `bNumEndpoints` is 0, it means the interface uses the default endpoint only

参数

- **intf_desc** -- [in] Pointer to the start of an interface descriptor

- **index** -- [in] Endpoint index
- **wTotalLength** -- [in] Total length of the containing configuration descriptor
- **offset** -- [inout] Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the interface descriptor. On output, it is the offset of the endpoint descriptor.

返回 const usb_ep_desc_t* Pointer to endpoint descriptor, NULL if not found.

```
const usb_ep_desc_t *usb_parse_endpoint_descriptor_by_address (const usb_config_desc_t
                                                             *config_desc, uint8_t
                                                             bInterfaceNumber, uint8_t
                                                             bAlternateSetting, uint8_t
                                                             bEndpointAddress, int
                                                             *offset)
```

Get an endpoint descriptor based on an endpoint's address.

Given a configuration descriptor, get an endpoint descriptor based on its bEndpointAddress, bAlternateSetting, and bInterfaceNumber.

参数

- **config_desc** -- [in] Pointer to the start of a full configuration descriptor
- **bInterfaceNumber** -- [in] Interface number
- **bAlternateSetting** -- [in] Alternate setting number
- **bEndpointAddress** -- [in] Endpoint address
- **offset** -- [out] Byte offset of the endpoint descriptor relative to the start of the configuration descriptor. Can be NULL

返回 const usb_ep_desc_t* Pointer to endpoint descriptor, NULL if not found.

```
void usb_print_device_descriptor (const usb_device_desc_t *devc_desc)
```

Print device descriptor.

参数 **devc_desc** -- Device descriptor

```
void usb_print_config_descriptor (const usb_config_desc_t *cfg_desc, print_class_descriptor_cb
                                  class_specific_cb)
```

Print configuration descriptor.

- This function prints the full contents of a configuration descriptor (including interface and endpoint descriptors)
- When a non-standard descriptor is encountered, this function will call the class_specific_cb if it is provided

参数

- **cfg_desc** -- Configuration descriptor
- **class_specific_cb** -- Class specific descriptor callback. Can be NULL

```
void usb_print_string_descriptor (const usb_str_desc_t *str_desc)
```

Print a string descriptor.

This function will only print ASCII characters of the UTF-16 encoded string

参数 **str_desc** -- String descriptor

```
static inline int usb_round_up_to_mps (int num_bytes, int mps)
```

Round up to an integer multiple of endpoint's MPS.

This is a convenience function to round up a size/length to an endpoint's MPS (Maximum packet size). This is useful when calculating transfer or buffer lengths of IN endpoints.

- If MPS <= 0, this function will return 0
- If num_bytes <= 0, this function will return 0

参数

- **num_bytes** -- [in] Number of bytes
- **mps** -- [in] MPS

返回 int Round up integer multiple of MPS

Type Definitions

```
typedef void (*print_class_descriptor_cb)(const usb_standard_desc_t*)
```

Print class specific descriptor callback.

Optional callback to be provided to `usb_print_config_descriptor()` function. The callback is called when a non-standard descriptor is encountered. The callback should decode the descriptor as print it.

Header File

- [components/usb/include/usb/usb_types_stack.h](#)
- This header file can be included with:

```
#include "usb/usb_types_stack.h"
```

- This header file is a part of the API provided by the `usb` component. To declare that your component depends on `usb`, add the following to your `CMakeLists.txt`:

```
REQUIRES usb
```

or

```
PRIV_REQUIRES usb
```

Structures

```
struct usb_device_info_t
```

Basic information of an enumerated device.

Public Members

usb_speed_t **speed**

Device's speed

uint8_t **dev_addr**

Device's address

uint8_t **bMaxPacketSize0**

The maximum packet size of the device's default endpoint

uint8_t **bConfigurationValue**

Device's current configuration number

const *usb_str_desc_t* ***str_desc_manufacturer**

Pointer to Manufacturer string descriptor (can be NULL)

const *usb_str_desc_t* ***str_desc_product**

Pointer to Product string descriptor (can be NULL)

const *usb_str_desc_t* ***str_desc_serial_num**

Pointer to Serial Number string descriptor (can be NULL)

struct **usb_isoc_packet_desc_t**

Isochronous packet descriptor.

If the number of bytes in an Isochronous transfer is larger than the MPS of the endpoint, the transfer is split into multiple packets transmitted at the endpoint's specified interval. An array of Isochronous packet descriptors describes how an Isochronous transfer should be split into multiple packets.

Public Members

int **num_bytes**

Number of bytes to transmit/receive in the packet. IN packets should be integer multiple of MPS

int **actual_num_bytes**

Actual number of bytes transmitted/received in the packet

usb_transfer_status_t **status**

Status of the packet

struct **usb_transfer_s**

USB transfer structure.

Public Members

uint8_t *const **data_buffer**

Pointer to data buffer

const size_t **data_buffer_size**

Size of the data buffer in bytes

int **num_bytes**

Number of bytes to transfer. Control transfers should include the size of the setup packet. Isochronous transfer should be the total transfer size of all packets. For non-control IN transfers, num_bytes should be an integer multiple of MPS.

int **actual_num_bytes**

Actual number of bytes transferred

uint32_t **flags**

Transfer flags

usb_device_handle_t **device_handle**

Device handle

uint8_t **bEndpointAddress**

Endpoint Address

***usb_transfer_status_t* status**

Status of the transfer

uint32_t timeout_ms

Timeout (in milliseconds) of the packet (currently not supported yet)

***usb_transfer_cb_t* callback**

Transfer callback

void *context

Context variable for transfer to associate transfer with something

const int num_isoc_packets

Only relevant to Isochronous. Number of service periods (i.e., intervals) to transfer data buffer over.

***usb_isoc_packet_desc_t* isoc_packet_desc[]**

Descriptors for each Isochronous packet

Macros

USB_TRANSFER_FLAG_ZERO_PACK

Terminate Bulk/Interrupt OUT transfer with a zero length packet.

OUT transfers normally terminate when the Host has transferred the exact amount of data it needs to the device. However, for bulk and interrupt OUT transfers, if the transfer size just happened to be a multiple of MPS, it will be impossible to know the boundary between two consecutive transfers to the same endpoint.

Therefore, this flag will cause the transfer to automatically add a zero length packet (ZLP) at the end of the transfer if the following conditions are met:

- The target endpoint is a Bulk/Interrupt OUT endpoint (Host to device)
- The transfer's length (i.e., transfer.num_bytes) is a multiple of the endpoint's MPS

Otherwise, this flag has no effect.

Users should check whether their target device's class requires a ZLP, as not all Bulk/Interrupt OUT endpoints require them. For example:

- For MSC Bulk Only Transport class, the Host MUST NEVER send a ZLP. Bulk transfer boundaries are determined by the CBW and CSW instead
- For CDC Ethernet, the Host MUST ALWAYS send a ZLP if a segment (i.e., a transfer) is a multiple of MPS (See 3.3.1 Segment Delineation)

备注: See USB2.0 specification 5.7.3 and 5.8.3 for more details

备注: IN transfers normally terminate when the Host as receive the exact amount of data it needs (must be multiple of MPS) or the endpoint sends a short packet to the Host (For bulk OUT only). Indicates that a bulk OUT transfers should always terminate with a short packet, even if it means adding an extra zero length packet

Type Definitions

```
typedef struct usb_device_handle_s *usb_device_handle_t
```

Handle of a USB Device connected to a USB Host.

```
typedef bool (*usb_host_enum_filter_cb_t)(const usb_device_desc_t *dev_desc, uint8_t
*bConfigurationValue)
```

Enumeration filter callback.

This callback is called at the beginning of the enumeration process for a newly attached device. Through this callback, users are able to:

- filter which devices should be enumerated
- select the configuration number to use when enumerating the device

The device descriptor is passed to this callback to allow users to filter devices based on Vendor ID, Product ID, and class code.

Attention This callback must be non-blocking

Attention This callback must not submit any USB transfers

Param dev_desc [in] Device descriptor of the device to enumerate

Param bConfigurationValue [out] Configuration number to use when enumerating the device (starts with 1)

Return bool

- true: USB device will be enumerated
- false: USB device will not be enumerated

```
typedef struct usb_transfer_s usb_transfer_t
```

USB transfer structure.

This structure is used to represent a transfer from a software client to an endpoint over the USB bus. Some of the fields are made const on purpose as they are fixed on allocation. Users should call the appropriate USB Host Library function to allocate a USB transfer structure instead of allocating this structure themselves.

The transfer type is inferred from the endpoint this transfer is sent to. Depending on the transfer type, users should note the following:

- Bulk: This structure represents a single bulk transfer. If the number of bytes exceeds the endpoint's MPS, the transfer will be split into multiple MPS sized packets followed by a short packet.
- Control: This structure represents a single control transfer. This first 8 bytes of the data_buffer must be filled with the setup packet (see *usb_setup_packet_t*). The num_bytes field should be the total size of the transfer (i.e., size of setup packet + wLength).
- Interrupt: Represents an interrupt transfer. If num_bytes exceeds the MPS of the endpoint, the transfer will be split into multiple packets, and each packet is transferred at the endpoint's specified interval.
- Isochronous: Represents a stream of bytes that should be transferred to an endpoint at a fixed rate. The transfer is split into packets according to the each isoc_packet_desc. A packet is transferred at each interval of the endpoint. If an entire ISOC URB was transferred without error (skipped packets do not count as errors), the URB's overall status and the status of each packet descriptor will be updated, and the actual_num_bytes reflects the total bytes transferred over all packets. If the ISOC URB encounters an error, the entire URB is considered erroneous so only the overall status will be updated.

备注: For Bulk/Control/Interrupt IN transfers, the num_bytes must be an integer multiple of the endpoint's MPS

备注: This structure should be allocated via usb_host_transfer_alloc()

备注: Once the transfer has been submitted, users should not modify the structure until the transfer has completed

typedef void (***usb_transfer_cb_t**)(*usb_transfer_t* *transfer)
USB transfer completion callback.

Enumerations

enum **usb_speed_t**
USB Standard Speeds.

Values:

enumerator **USB_SPEED_LOW**
USB Low Speed (1.5 Mbit/s)

enumerator **USB_SPEED_FULL**
USB Full Speed (12 Mbit/s)

enumerator **USB_SPEED_HIGH**
USB High Speed (480 Mbit/s)

enum **usb_transfer_type_t**
The type of USB transfer.

备注: The enum values need to match the bmAttributes field of an EP descriptor

Values:

enumerator **USB_TRANSFER_TYPE_CTRL**

enumerator **USB_TRANSFER_TYPE_ISOCHRONOUS**

enumerator **USB_TRANSFER_TYPE_BULK**

enumerator **USB_TRANSFER_TYPE_INTR**

enum **usb_transfer_status_t**
The status of a particular transfer.

Values:

enumerator **USB_TRANSFER_STATUS_COMPLETED**
The transfer was successful (but may be short)

enumerator **USB_TRANSFER_STATUS_ERROR**
The transfer failed because due to excessive errors (e.g. no response or CRC error)

enumerator **USB_TRANSFER_STATUS_TIMED_OUT**

The transfer failed due to a time out

enumerator **USB_TRANSFER_STATUS_CANCELED**

The transfer was canceled

enumerator **USB_TRANSFER_STATUS_STALL**

The transfer was stalled

enumerator **USB_TRANSFER_STATUS_OVERFLOW**

The transfer as more data was sent than was requested

enumerator **USB_TRANSFER_STATUS_SKIPPED**

ISOC packets only. The packet was skipped due to system latency or bus overload

enumerator **USB_TRANSFER_STATUS_NO_DEVICE**

The transfer failed because the target device is gone

Header File

- [components/usb/include/usb/usb_types_ch9.h](#)
- This header file can be included with:

```
#include "usb/usb_types_ch9.h"
```

- This header file is a part of the API provided by the `usb` component. To declare that your component depends on `usb`, add the following to your `CMakeLists.txt`:

```
REQUIRES usb
```

or

```
PRIV_REQUIRES usb
```

Unions

union **usb_setup_packet_t**

`#include <usb_types_ch9.h>` Structure representing a USB control transfer setup packet.

See Table 9-2 of USB2.0 specification for more details

Public Members

uint8_t **bmRequestType**

Characteristics of request

uint8_t **bRequest**

Specific request

uint16_t **wValue**

Word-sized field that varies according to request

uint16_t **wIndex**

Word-sized field that varies according to request; typically used to pass an index or offset

uint16_t **wLength**

Number of bytes to transfer if there is a data stage

struct *usb_setup_packet_t*::[anonymous] **USB_DESC_ATTR**

USB descriptor attributes

uint8_t **val**[USB_SETUP_PACKET_SIZE]

Descriptor value

union **usb_standard_desc_t**

#include <usb_types_ch9.h> USB standard descriptor.

All USB standard descriptors start with these two bytes. Use this type when traversing over configuration descriptors

Public Members

uint8_t **bLength**

Size of the descriptor in bytes

uint8_t **bDescriptorType**

Descriptor Type

struct *usb_standard_desc_t*::[anonymous] **USB_DESC_ATTR**

USB descriptor attributes

uint8_t **val**[USB_STANDARD_DESC_SIZE]

Descriptor value

union **usb_device_desc_t**

See Table 9-8 of USB2.0 specification for more details

Public Members

uint8_t **bLength**

Size of the descriptor in bytes

uint8_t **bDescriptorType**

DEVICE Descriptor Type

uint16_t **bcdUSB**

USB Specification Release Number in Binary-Coded Decimal (i.e., 2.10 is 210H)

`uint8_t bDeviceClass`

Class code (assigned by the USB-IF)

`uint8_t bDeviceSubClass`

Subclass code (assigned by the USB-IF)

`uint8_t bDeviceProtocol`

Protocol code (assigned by the USB-IF)

`uint8_t bMaxPacketSize0`

Maximum packet size for endpoint zero (only 8, 16, 32, or 64 are valid)

`uint16_t idVendor`

Vendor ID (assigned by the USB-IF)

`uint16_t idProduct`

Product ID (assigned by the manufacturer)

`uint16_t bcdDevice`

Device release number in binary-coded decimal

`uint8_t iManufacturer`

Index of string descriptor describing manufacturer

`uint8_t iProduct`

Index of string descriptor describing product

`uint8_t iSerialNumber`

Index of string descriptor describing the device's serial number

`uint8_t bNumConfigurations`

Number of possible configurations

struct *usb_device_desc_t*::[anonymous] **USB_DESC_ATTR**

USB descriptor attributes

`uint8_t val[USB_DEVICE_DESC_SIZE]`

Descriptor value

union **usb_config_desc_t**

#include <usb_types_ch9.h> Structure representing a short USB configuration descriptor.

See Table 9-10 of USB2.0 specification for more details

备注: The full USB configuration includes all the interface and endpoint descriptors of that configuration.

Public Members**uint8_t bLength**

Size of the descriptor in bytes

uint8_t bDescriptorType

CONFIGURATION Descriptor Type

uint16_t wTotalLength

Total length of data returned for this configuration

uint8_t bNumInterfaces

Number of interfaces supported by this configuration

uint8_t bConfigurationValue

Value to use as an argument to the SetConfiguration() request to select this configuration

uint8_t iConfiguration

Index of string descriptor describing this configuration

uint8_t bmAttributes

Configuration characteristics

uint8_t bMaxPower

Maximum power consumption of the USB device from the bus in this specific configuration when the device is fully operational.

struct *usb_config_desc_t*::[anonymous] **USB_DESC_ATTR**

USB descriptor attributes

uint8_t val[USB_CONFIG_DESC_SIZE]

Descriptor value

USB_W_VALUE_DT_ENDPOINT

USB_W_VALUE_DT_DEVICE_QUALIFIER

USB_W_VALUE_DT_OTHER_SPEED_CONFIG

USB_W_VALUE_DT_INTERFACE_POWER

USB_SETUP_PACKET_INIT_SET_ADDR (setup_pkt_ptr, addr)

Initializer for a SET_ADDRESS request.

Sets the address of a connected device

USB_SETUP_PACKET_INIT_GET_DEVICE_DESC (setup_pkt_ptr)

Initializer for a request to get a device's device descriptor.

USB_SETUP_PACKET_INIT_GET_CONFIG (setup_pkt_ptr)

Initializer for a request to get a device's current configuration number.

USB_SETUP_PACKET_INIT_GET_CONFIG_DESC (setup_pkt_ptr, desc_index, desc_len)

Initializer for a request to get one of the device's current configuration descriptor.

- desc_index indicates the configuration's index number
- Number of bytes of the configuration descriptor to get

USB_SETUP_PACKET_INIT_SET_CONFIG (setup_pkt_ptr, config_num)

Initializer for a request to set a device's current configuration number.

USB_SETUP_PACKET_INIT_SET_INTERFACE (setup_pkt_ptr, intf_num, alt_setting_num)

Initializer for a request to set an interface's alternate setting.

USB_SETUP_PACKET_INIT_GET_STR_DESC (setup_pkt_ptr, string_index, lang_id, desc_len)

Initializer for a request to get a string descriptor.

USB_STANDARD_DESC_SIZE

Size of dummy USB standard descriptor.

USB_DEVICE_DESC_SIZE

Size of a USB device descriptor in bytes.

USB_CLASS_PER_INTERFACE

Possible base class values of the bDeviceClass field of a USB device descriptor.

USB_CLASS_AUDIO

USB_CLASS_COMM

USB_CLASS_HID

USB_CLASS_PHYSICAL

USB_CLASS_STILL_IMAGE

USB_CLASS_APP_SPEC

USB_CLASS_VENDOR_SPEC

USB_SUBCLASS_VENDOR_SPEC

Vendor specific subclass code.

USB_CONFIG_DESC_SIZE

Size of a short USB configuration descriptor in bytes.

备注: The size of a full USB configuration includes all the interface and endpoint descriptors of that configuration.

USB_BM_ATTRIBUTES_ONE

Bit masks belonging to the bmAttributes field of a configuration descriptor.

Must be set

USB_BM_ATTRIBUTES_SELFPOWER

Self powered

USB_BM_ATTRIBUTES_WAKEUP

Can wake-up

USB_BM_ATTRIBUTES_BATTERY

Battery powered

USB_IAD_DESC_SIZE

Size of a USB interface association descriptor in bytes.

USB_INTF_DESC_SIZE

Size of a USB interface descriptor in bytes.

USB_EP_DESC_SIZE

Size of a USB endpoint descriptor in bytes.

USB_B_ENDPOINT_ADDRESS_EP_NUM_MASK

Bit masks belonging to the bEndpointAddress field of an endpoint descriptor.

USB_B_ENDPOINT_ADDRESS_EP_DIR_MASK**USB_W_MAX_PACKET_SIZE_MPS_MASK**

Bit masks belonging to the wMaxPacketSize field of endpoint descriptor.

USB_W_MAX_PACKET_SIZE_MULT_MASK**USB_BM_ATTRIBUTES_XFERTYPE_MASK**

Bit masks belonging to the bmAttributes field of an endpoint descriptor.

USB_BM_ATTRIBUTES_XFER_CONTROL**USB_BM_ATTRIBUTES_XFER_ISOC****USB_BM_ATTRIBUTES_XFER_BULK****USB_BM_ATTRIBUTES_XFER_INT****USB_BM_ATTRIBUTES_SYNC_TYPE_MASK****USB_BM_ATTRIBUTES_SYNC_NONE****USB_BM_ATTRIBUTES_SYNC_ASYNC****USB_BM_ATTRIBUTES_SYNC_ADAPTIVE****USB_BM_ATTRIBUTES_SYNC_SYNC****USB_BM_ATTRIBUTES_USAGETYPE_MASK****USB_BM_ATTRIBUTES_USAGE_DATA****USB_BM_ATTRIBUTES_USAGE_FEEDBACK****USB_BM_ATTRIBUTES_USAGE_IMPLICIT_FB****USB_EP_DESC_GET_XFERTYPE** (desc_ptr)

Macro helpers to get information about an endpoint from its descriptor.

USB_EP_DESC_GET_EP_NUM (desc_ptr)**USB_EP_DESC_GET_EP_DIR** (desc_ptr)**USB_EP_DESC_GET_MPS** (desc_ptr)**USB_EP_DESC_GET_MULT** (desc_ptr)

USB_EP_DESC_GET_SYNCTYPE (desc_ptr)

USB_EP_DESC_GET_USAGETYPE (desc_ptr)

USB_STR_DESC_SIZE

Size of a short USB string descriptor in bytes.

Enumerations

enum **usb_device_state_t**

USB2.0 device states.

See Table 9-1 of USB2.0 specification for more details

备注: The `USB_DEVICE_STATE_NOT_ATTACHED` is not part of the USB2.0 specification, but is a catch all state for devices that need to be cleaned up after a sudden disconnection or port error.

Values:

enumerator **USB_DEVICE_STATE_NOT_ATTACHED**

The device was previously configured or suspended, but is no longer attached (either suddenly disconnected or a port error)

enumerator **USB_DEVICE_STATE_ATTACHED**

Device is attached to the USB, but is not powered.

enumerator **USB_DEVICE_STATE_POWERED**

Device is attached to the USB and powered, but has not been reset.

enumerator **USB_DEVICE_STATE_DEFAULT**

Device is attached to the USB and powered and has been reset, but has not been assigned a unique address. Device responds at the default address.

enumerator **USB_DEVICE_STATE_ADDRESS**

Device is attached to the USB, powered, has been reset, and a unique device address has been assigned. Device is not configured.

enumerator **USB_DEVICE_STATE_CONFIGURED**

Device is attached to the USB, powered, has been reset, has a unique address, is configured, and is not suspended. The host may now use the function provided by the device.

enumerator **USB_DEVICE_STATE_SUSPENDED**

Device is, at minimum, attached to the USB and is powered and has not seen bus activity for 3 ms. It may also have a unique address and be configured for use. However, because the device is suspended, the host may not use the device's function.

USB Host Maintainers Notes (Design Guidelines)

Design Considerations The design of the Host Stack takes into account the following design considerations:

Limited Hardware Resources:

The embedded nature of Host Stack means limited hardware resources (such as memory and processing power) when compared to larger host systems.

USB2.0 Chapter 10:

Chapter 10 of the USB 2.0 specification specifies certain requirements of USB Host systems, in particular the required layers of the USB Host's system software.

Diverse Use Case Complexities:

The embedded nature of the Host Stack also means a wide range of use cases with differing complexities. Some USB Host applications aim to only support a single vendor specific device, whereas other applications require support for a wide range of devices of different classes.

Requirements Given the design considerations above, the Host Stack was designed with the following set of requirements:

DMA Support Requirement: The Host Stack must support DMA.

The Host Stack must support DMA in order to reduce CPU's workload. DMA support allows the automatic copying of USB transfer data to/from the Host Controller without CPU intervention. This is especially critical given the embedded nature of the CPU (i.e., lower CPU frequencies) and large maximum data payloads of USB transfers (e.g., 1023 bytes for isochronous transfers).

Minimize Memory Copies Requirement: The Host Stack should minimize the amount of memory copies when passing data between layers.

Various data and objects (e.g., USB transfers) need to be passed between multiple layers of the Host Stack. The Host Stack should minimize the amount of memory copies that occur between layers by allocating the data's/object's memory once, and simply passing a pointer to that data/object between the layers. Therefore, the Host Stack requires some standardized data types shared across multiple layers (see USB2.0 Section 10.3.4).

Event Driven Requirement: The Host Stack must allow for event driven operation (i.e., the Host Stack's API must not be polling).

The Host Stack needs to support some CPU intensive use application scenarios such as video streaming (i.e., UVC class). Therefore, the Host Stack should minimize CPU usage by allowing for completely event driven operation, thus reserving the majority of CPU time for the application itself (i.e., video encoding/decoding in this case).

The Host Stack needs to communicate events across the layers using interrupts, callbacks, and FreeRTOS synchronization primitives (e.g., queues and semaphores).

No Task Creation Requirement: All layers of the Host Stack below (and including) the Host Library layer must not create any tasks.

Task stacks are generally one of the most memory intensive parts of an ESP-IDF applications. Given the wide range of applications scenarios, the number of tasks created (and their stack sizes) can vary greatly. For example...

- applications that require low latency or high throughput (such as isochronous transfers) may choose to create a dedicated task to handle those transfers in order to minimize latency.
- applications that do not have strict latency requirements (such as bulk transfers) may choose to handle those transfers from a shared task in order to save some memory.

Therefore, all layers of the Host Stack below (and including) the Host Library layer **must not** create any tasks. Instead, these layers should expose handlers functions to be called from tasks created by the upper layers. Task creation will be delegated to the class driver or application layer.

Operable at Different Layers Given the wide range of use case complexities, the Host Stack must be operable at different layers, allowing users to use the Host Stack at a lower layer (e.g., the HCD or HAL) or at a higher layer (e.g., a class driver).

Being operable at different layers allows the users to decide on the appropriate trade-off between convenience, control, and optimization for their application when using the Host Stack. For example...

- Host Stack applications that support a dedicated custom device may want to use a lower level of abstraction for better optimization, control, and simpler API.
- Host Stack applications that need to support a wide range of device classes requires the full Host Stack so that device enumeration is automatically handled.

Coding Conventions The Host Stack follows the following set of coding rules/guidelines for better code readability and maintainability:

Symbols Use Layer Name As Prefix For each layer of the Host Stack, the symbols exposed by that layer (i.e., functions, types, macros) must be prefixed with that layer's name. For example, the symbols exposed by the HCD layer will be prefixed `hcd_.../HCD_...`

However, internal symbols (e.g., static functions) **should not** be prefixed with their layer's name. This makes it easier to differentiate between internal and external symbols when modifying that layer's source code.

Critical Section Functions Prefixed With `_` In each layer of the Host Stack, there are various static functions that must be called inside a critical section. The names of these functions are prefixed with `_` (e.g., `_func_called_from_crit()`) to make it easier for maintainers to differentiate which functions should be called from critical sections. For example...

```
some_func(); // Called outside critical section
taskENTER_CRITICAL(&some_lock);
_some_func_crit(); // Called inside critical section. _ prefix makes it easier to
↳differentiate
taskEXIT_CRITICAL(&some_lock);
```

Grouping Structure Members by Locking Mechanism Some layers of the Host Stack utilize multiple locking schemes (e.g., critical sections and task mutexes) to ensure thread safety, where each locking scheme offers a different level of protection. However, member variables of the same object can be protected by different locking scheme. Therefore, to clearly demarcate the different locking schemes and their associated variables, structure members are grouped by locking scheme as nested structures.

表 7: Locking Scheme

Locking Scheme	Nested Structure	Description
Critical Sections	dynamic	Shared data accessed from both a task context and ISR context are protected by a critical section.
Task Mutexes	mutex_protected	Shared data accessed from only a task context are protected by a FreeRTOS Mutex
Single Thread	single_thread	Data that is only ever accessed by the same task do not require the use of any locks.
Constant	constant	Constant data is set once during the object's instantiation and never changed again. Thus, any task or ISR can freely the constant data without the use of locks, so long as the variable is never written to.

Grouping structure members by locking scheme makes the code more maintainable as it makes clear which locking scheme is required when accessing a particular member variable, as demonstrated in the code snippet below:

```
typedef struct some_obj some_obj_t;

some_obj_t obj;

// Accessing dynamic members requires critical section
```

(下页继续)

```
taskENTER_CRITICAL(&some_lock);
obj.dynamic.varA = 1;
taskEXIT_CRITICAL(&some_lock);

// Accessing mutex protected members requires taking the mutex
xSemaphoreTake(&some_mux, portMAX_DELAY);
obj.mux_protected.varB = 1;
xSemaphoreGive(&some_mux);

// Accessing single thread members does not require locking so long as this is the
↳only task to access it
obj.single_thread.varC = 1;

// Accessing constant members requires no locking. But only read access is allowed
int local_var = obj.constant.varD;
```

This warning was automatically inserted due to the source file being in the `add_warnings_pages` list.

USB Host Maintainers Notes (Architecture) The Host Stack is roughly split into multiple layers of abstraction, with each layer representing different USB concepts and a different level of USB Host operation. For example, a higher layer may present an abstraction of devices and application data transfers, whereas a lower layer may present an abstraction of endpoints and USB transfers.

Layer Descriptions The layers of the Host Stack are described in the following table. The layers are ordered from lowest layer (i.e, furthest away from the user) to highest layer (i.e., closest to the user).

表 8: Host Stack Layers

Layer	Files	Description
Host Controller (DWC_OTG)	N/A	This layer represents the USB Controller Hardware of the ESP32-P4. The API presented by this layer is the register interface of the controller.
LL	usbh_ll.h	The LL (Low Level) layer abstracts the basic register access of the USB controller according to ESP-IDF's <i>Hardware Abstraction API Guidelines</i> . In other words, this layer provides APIs to access the controller's registers and format/parse the controller's DMA descriptors.
HAL	usbh_hal.h, usbh_hal.c	The HAL (Hardware Abstraction Layer) abstracts the operating steps of the USB controller into functions according to ESP-IDF's <i>Hardware Abstraction API Guidelines</i> . This layer also abstracts the controller's host port and host channels, and provides APIs to operate the them.
HCD	hcd.h, hcd.c	The HCD (Host Controller Driver) acts as hardware agnostic API for all USB controllers (i.e., an API that can theoretically be used with any USB controller implementation). This layer also abstracts the root port (i.e., root hub) and USB pipes.
USBH and Hub Driver	usbh.h, usbh.c	The USBH (USB Host Driver) layer is equivalent to the USBH layer described in chapter 10 of the USB2.0 specification. The USBH presents an abstraction of USB devices, internally manages a list of connected devices (i.e., device pool), and also arbitrates device sharing between clients (i.e., tracks which endpoints are in use and also presents a shared endpoint 0).
Hub Driver	hub.h, hub.c	The Hub Driver layer acts as a special client of the USBH that is responsible for handling device attachment/detachment, and notifying the USBH of such events. For device attachment, the Hub Driver also handles the enumeration process as well.
USB Host Library	usb_host.h, usb_host.c	The USB Host Library layer is the lowest public API layer of the Host Stack and presents the concept of USB Host Clients. The abstraction of clients allows for multiple class drivers to coexist simultaneously (where each class roughly maps to a single client) and also acts as a mechanism for division of labor (where each client is responsible for its own processing and event handling).
Host Class Drivers	See the ESP-IDF Extra Components repository or the USB Host examples in ESP-IDF (via peripherals/usb/host).	The Host Class Drivers implement the host side of a particular device class (e.g., CDC, MSC, HID). The exposed API is specific to each class driver.

Layer Dependencies The Host Stack roughly follows a top to bottom hierarchy with inter-layer dependencies. Given layers A (highest), B, and C (lowest), the Host Stack has the following inter-layer dependency rules:

- a particular layer can use the API of any layer directly below (Layer A using layer B is allowed)
- a particular layer can use the API of any layer indirectly below (Layer A using layer C is allowed) i.e., skipping layers.
- a particular layer must not use the API of any layer above (Layer C using layer A/B is forbidden)

备注: Layer skipping is permitted in order to circumvent the need to repeat the same abstraction across multiple layers. For example, the abstraction of pipes are presented at the HCD layer but are used by multiple layers above.

警告: This document is not updated for ESP32P4 yet, so some of the content may not be correct.
This warning was automatically inserted due to the source file being in the `add_warnings_pages` list.

USB Host Maintainers Notes (DWC_OTG Controller) The ESP32-P4 uses a DesignWare USB 2.0 On-the-Go Controller (henceforth referred to as DWC_OTG in this document) as its underlying hardware controller, where the DWC_OTG operates in Host Mode with Scatter/Gather DMA enabled.

备注: This section only summarizes the operation of the DWC_OTG operation in Host Mode at a high level. For full details of the DWC_OTG, refer to the DWC_OTG Databook and Programming Guide.

Host Mode Operating Model A simplified version of the operating model of the DWC_OTG in Host Mode is illustrated in the diagram below. The diagram contains some of the key concepts and terms regarding DWC_OTG Host Mode.

备注: Refer to Databook section 2.1.4 (Host Architecture) for more details

Host Port The Host Port represents the single USB port provided by the DWC_OTG (in USB terms, this can be thought a single USB port of the root hub of the bus). The Host Port can only connect to a single device, though more devices can be connected via hub devices.

The Host Port is responsible for:

- detecting direct device connections/disconnections
- detecting the speed of the directly connected device
- issuing various bus signals (such as suspend, resume, reset)

Host Channels In Host Mode, the DWC_OTG uses channels to communicate with device endpoints, where one channel maps to a particular endpoint (in USB terms, channels are the hardware representation of pipes). For example, a channel will map to EP 1 OUT. Each channel has its own set of CSRs (Control and Status Registers) so that they can independently be configured and controlled independently. A channel's CSRs are used to...

- specify the details of the channel's target endpoint (e.g., device address, EP number, transfer type, direction)
- start a transfer on the channel (e.g., by setting up DMA descriptors)

When using Scatter/Gather DMA, transfers on Host Channels are completely event driven. Users simply fill out the appropriate DMA descriptors, fill in the channel's CSRs, then enable the channel. The channel will then generate an interrupt when the transfer completes.

Data FIFOs In Host Mode, the DWC_OTG uses multiple FIFOs as a staging area for the data payloads of USB transfers. When using DMA, the DMA engine will copy data between the TX/RX FIFOs and ESP32-P4's internal memory:

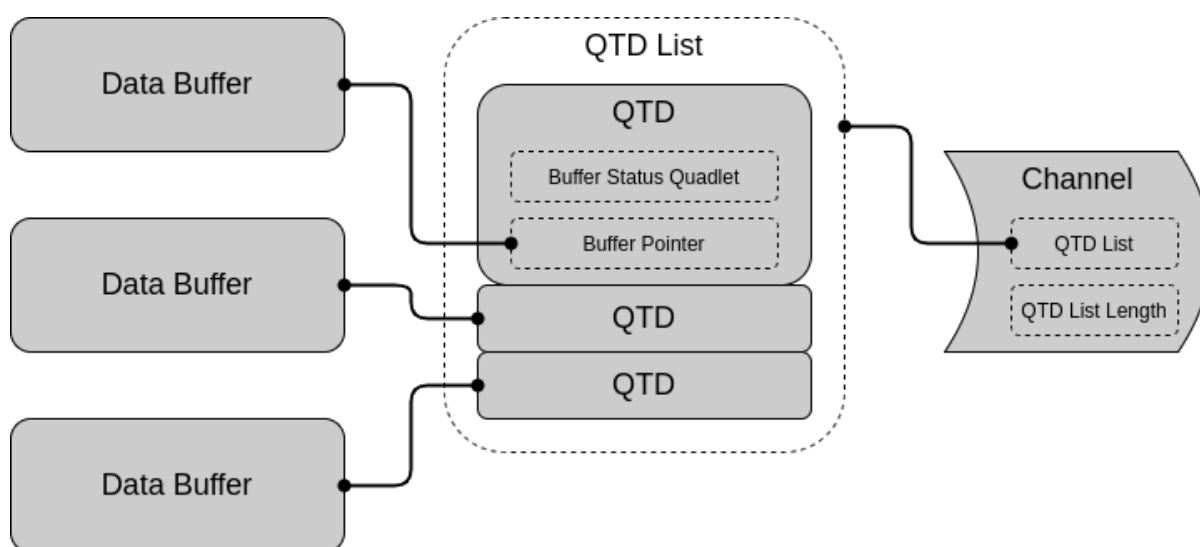

- For an OUT transfer, the transfer's data payload is copied from main memory to one of the TX FIFOs by DMA. The MAC Layer will then transmit that data payload in accordance to USB packet formatting.
- For an IN transfer, the MAC Layer will parse the received USB packet and store the received data payload in the RX FIFO. The data is then copied to main memory by DMA.

The destination FIFO depends on the direction and transfer type of the channel:

- All IN channel data goes to the RX FIFO
- All non-periodic (i.e., Control and Bulk) OUT channel data goes to the Non-periodic TX (NPTX) FIFO
- All periodic (i.e., Interrupt and Isochronous) OUT channel data goes to the Periodic TX (PTX) FIFO

备注: The separation of non-periodic and periodic OUT channels to the NPTX and PTX FIFOs is due to the periodic nature of Interrupt and Isochronous endpoints (specified by the `bInterval` value of the endpoint). The DWC_OTG automatically schedules these periodic transfers, thus a separate PTX FIFO allows these periodic transfers to be staged separately.

DMA Engine The DMA engine is responsible for copying data between the FIFOs and main memory. In Host Mode Scatter/Gather DMA, a particular channel can carry out multiple transfers automatically without software intervention. The following diagram illustrates the DWC_OTG Host Mode Scatter/Gather DMA Memory Structures.

- Each USB transfer is described by a Queue Transfer Descriptor (QTD). Each QTD consists of:
 - A 32-bit Buffer Status Quadlet specifying details of the transfer, and also reports the status of the transfer on completion. The Buffer Status Quadlet has bits to specify whether the QTD should generate an interrupt and/or halt the channel on completion.
 - A 32-bit pointer to the data buffer containing the data payload for OUT transfers, or an empty buffer used to store the data payload for IN transfers.
- The data payload of each QTD can be larger than the MPS (Maximum Packet Size) of its target endpoint. The DWC_OTG hardware automatically handles splitting of the transfer into multiple transactions.

- Multiple QTDs can be placed into a single QTD List. A channel will then execute each QTD in the list automatically, and optionally loop back around if configured to do so.
- Before a channel starts data transfer, it is configured with a QTD list (and QTD list length). Once the channel is enabled, USB transfers are executed automatically by the hardware.
- A channel can generate interrupts (configurable) on completion of a particular QTD, or an entire QTD list.

备注: Refer to Programming Guide section 6.2.1 (Descriptor Memory Structures) for more details

Hardware Configuration The DWC_OTG IP is configurable. The notable Host related configurations of the ESP32-P4's DWC_OTG are listed below:

表 9: ESP32-P4's DWC_OTG Configuration

Description	Configuration
Host and Device Mode support with OTG	OTG_MODE = 0
Full Speed (FS) and Low Speed (LS) support	OTG_FSPHY_INTERFACE = 1, OTG_HSPHY_INTERFACE = 0
Internal DMA controller with Scatter/Gather DMA	OTG_ARCHITECTURE = 2, OTG_EN_DESC_DMA = 1
FS Hubs are supported but HS Hub are not (i.e., split transfers not supported)	OTG_SINGLE_POINT = 0
8 Host Mode channels	OTG_NUM_HOST_CHAN = 8
All transfer types supported, including ISOC and INTR OUT transfers	OTG_EN_PERIO_HOST = 1
Dynamically sized Data FIFO of 1024 bytes (256 lines)	OTG_DFIFO_DYNAMIC = 1, OTG_DFIFO_DEPTH = 256

Scatter/Gather DMA Transfer The basic operating procedure for Host channels transfers consists of the following steps:

1. Prepare data buffers, QTDs, and QTD list. In particular, which QTDs should halt the channel (and generate an interrupt) on completion.
2. Set channel/endpoint characteristics via CSRs (such as EP address, transfer type, EP MPS etc).
3. Set channel's QTD list related CSRs (such as QTD list pointer and QTD list length) and channel interrupt CSRs
4. Enable the channel. Transfers are now handled automatically by hardware using DMA.
5. The Channel generates an interrupt on a channel event (e.g., QTD completion or channel error).
6. Parse the channel interrupt to determine what event occurred.
7. Parse the QTDs to determine the result of each individual transfer.

However, there are some minor differences in channel operation and QTD list usage depending on the transfer type.

Bulk Bulk transfers are a simplest. Each QTD represents a bulk transfer of a particular direction, where the DWC_OTG automatically splits a particular QTD into multiple MPS sized transactions. Thus it is possible to fill a QTD list with multiple bulk transfers, and have the entire list executed automatically (i.e., only interrupt on completion of the last QTD).

Control Control transfers are more complicated as they are bi-directional (i.e., each control transfer stage can have a different direction). Thus, a separate QTD is required for each stage, and each QTD must halt the channel on completion. Halting the channel after each QTD allows changing the channel's direction to be changed by reconfiguring the channel's CSRs. Thus a typical control transfer consists of 3 QTDs (one for each stage).

Interrupt In accordance with the USB2.0 specification, interrupt transfers executes transactions at the endpoints specified service period (i.e., `bInterval`). A particular interrupt endpoint may not execute more than one interrupt transaction within a service period. The service period is specified in number of microframes/frames, thus a particular interrupt endpoint will generally execute one transaction every Nth microframe/frame until the transfer is complete. For interrupt channels, the service period of a particular channel (i.e., `bInterval`) is specified via the Host Frame List (see section 6.5 of programming guide for more details).

备注: HS USB allows an interrupt endpoint to have 3 interrupt transactions in a single microframe. See USB2.0 specification section 5.7.3 (Interrupt Transfer Packet Size Constraints) for more details.

Thus, interrupt transfers in Host Mode Scatter/Gather DMA have the following peculiarities:

- If a QTD payload is larger than the endpoint's MPS, the channel will automatically split the transfer into multiple MPS sized transactions (similar to bulk transfers). However, each transaction **is executed at endpoint's specified service period** (i.e., one transaction per `bInterval`) until the transfer completes.
- For Interrupt IN transfers, if a short packet is received (i.e., transaction's data payload is < MPS), this indicates that the endpoint has no more data to send. In this case:
 - the channel generates an extra channel interrupt even if the transfer's QTD did not set the IOC (interrupt on complete) bit.
 - however, the channel is not halted even if this extra channel interrupt is generated.
 - software must then use this extra interrupt to manually halt the interrupt channel (thus canceling any remaining QTDs in the QTD list).

备注: Due to the interrupt transfer peculiarities, it may be easier for software allocate a QTD for each transaction instead of an entire transfer.

Isochronous In accordance with the USB2.0 specification, isochronous transfers executes transactions at the endpoints specified service period (i.e., `bInterval`) in order to achieve a constant rate of data transfer. A particular isochronous endpoint may not execute more than one isochronous transaction within a service period. The service period is specified in number of microframes/frames, thus a particular isochronous endpoint will generally execute one transaction every Nth microframe/frame until the transfer is complete. For isochronous channels, the service period of a particular channel (i.e., `bInterval`) is specified via the Host Frame List (see section 6.5 of programming guide for more details).

However, unlike interrupt transactions, isochronous transactions are not retried on failure (or NAK), due to the need to maintain the constant data rate.

备注: HS USB allows an isochronous endpoint to have 3 interrupt transactions in a single microframe. See USB2.0 specification section 5.6.3 (Isochronous Transfer Packet Size Constraints) for more details.

Thus, isochronous transfers in Host Mode Scatter/Gather DMA have the following peculiarities:

- A QTD must be allocated for each microframe/frame. However, non-service service period QTDs should be left blank (i.e., only ever Nth QTD should be filled if the channel's service period is every Nth microframe/frame).
- **Each filled QTD must represent a single transaction instead of a transfer.**
- Because isochronous transactions are not retried on failure, the status each completed QTD must be checked.

Supplemental Notes Some of the DWC_OTG's behaviors are not mentioned in the Databook or Programming Guide. This section describes some of those behaviors that are relevant to the Host stack's implementation.

Port Errors Do Not Trigger a Channel Interrupt If a port error occurs (such as a sudden disconnection or port over-current) while there are one or more active channels...

- The active channels remains active (i.e., `HCCHAR.ChEna` remains set) and no channel interrupts are generated.
- Channels could in theory be disabled by setting `HCCHAR.ChDis`, but this does not work for Isochronous channels as the channel disabled interrupt is never generated.

Therefore, on port errors, a controller soft reset should be used to ensure all channels are disabled.

Port Reset Interrupts

- When the `DWC_OTG` issues a reset signal on its port, and during the reset signal the device disconnects, the disconnection interrupt (i.e., `HPRT.PrtConnDet`) is not generated until the reset is deasserted.
- When resetting an already enabled port (i.e., `HPRT.PrtEna`) such as a second reset during enumeration or a run-time reset, a Port Enable/Disable Change interrupt (i.e., `HPRT.PrtEnChng`) is generated both on the assertion and deassertion of the reset signal.

警告: This document is not updated for ESP32P4 yet, so some of the content may not be correct.

USB Host Driver (USBH)

Introduction The USB Host Driver (henceforth referred to as USBH) provides a USB Host software interface which abstracts USB devices. The USBH interface provides APIs to...

- manage the device pool (i.e., adding and removing devices)
- address and configure a device (i.e., setting device and configuration descriptors)
- submit transfers to a particular endpoint of a device

Requirements

USB Specification Requirements Chapter 10 of the USB 2.0 specification outlines some requirements of the USBH (referred to as USBH in the specification). The design of the USBH takes into consideration these requirements from the specification.

- Default pipe of a device is owned by the USBH
- All other pipes are owned and managed by clients of the USBH
- USBH interface must provide the following services
 - Configuration and command mechanism
 - Transfer services via both command and pipe mechanisms
 - Event notification
 - Status reporting and error recovery

Host Stack Requirements In addition to the USB 2.0 specification requirements, the USBH also takes into consideration the requirements set for the overall Host Stack (see *USB Host Maintainers Notes (Design Guidelines)*):

- USBH must not instantiate any tasks/threads
- USBH must be event driven, providing event callbacks and an event processing function

Implementation & Usage

Events & Processing The USBH is completely event driven and all event handling is done via then `usbh_process()` function. The `usbh_config_t.proc_req_cb` callback provided on USBH installation will be called when processing is required. Typically, `usbh_process()` will be called from a dedicated thread/task.

The USBH exposes the following event callbacks:

- `usbh_event_cb_t` used to indicate various events regarding a particular device and control transfers to EP0. This callback is called from the context of `usbh_process()`
- `usbh_ep_cb_t` used to indicate events for all other endpoints. This callback is not called from the `usbh_process()` context (currently called from an HCD interrupt context).

Device Pool The USBH keeps track of all currently connected devices by internally maintaining a device pool (simply a linked list) where each device is represented by a device object.

The USB 2.0 specification "assumes a specialized client of the USBH, called a hub driver, that acts as a clearinghouse for the addition and removal of devices from a particular hub". As a result, the USBH is completely reliant on an external client(s) (typically a Hub Driver) to inform the USBH of device addition and removal. The USBH provides the following APIs for device addition and removal:

- `usbh_devs_add()` which will allocate a new device object and add it to the device pool. The newly added device will be unenumerated, meaning the device object will...
 - be assigned to address 0
 - have no device and configuration descriptor
- `usbh_devs_remove()` which will indicate to the USBH that a device has been removed (such as due to a disconnection or a port error).
 - If the device is not currently opened (i.e., used by one or more clients), the USBH will free the underlying device object immediately.
 - If the device is currently opened, a `USBH_EVENT_DEV_GONE` event will be propagated and the device will be flagged for removal. The last client to close the device will free the device object.
 - When a device object is freed, a `USBH_EVENT_DEV_FREE` event will be propagated. This event is used to indicate that the device's upstream port can be recycled.

Device Enumeration Newly added devices will need to be enumerated. The USBH provides various `usbh_dev_set_...()` functions to enumerate the device, such as assigning the device's address and setting device/configuration/string descriptors. Given that USBH devices can be shared by multiple clients, attempting to enumerate a device while another client has opened the device can cause issues.

Thus, before calling any `usbh_dev_set_...()` enumeration function, a device must be locked for enumeration by calling `usbh_dev_enum_lock()`. This prevents the device from being opened by any other client but the enumerating client.

After enumeration is complete, the enumerating client can call `usbh_devs_trigger_new_dev_event()` to propagate a `USBH_EVENT_NEW_DEV` event.

Device Usage Clients that want to use a device must open the device by calling `usbh_devs_open()` and providing the device's address. The device's address can either be obtained from a `USBH_EVENT_NEW_DEV` event or by calling `usbh_devs_addr_list_fill()`.

Opening a device will do the following:

- Return a `usb_device_handle_t` device handle which can be used to refer to the device in various USBH functions
- Increment the device's internal `open_count` which indicates how many clients have opened the device. As long as `open_count > 0`, the underlying device object will not be freed, thus guaranteeing that the device handle refers to a valid device object.

Once a client no longer needs to use a device, the client should call `usbh_devs_close()` thus invalidating the device handle.

备注: Most device related APIs accept `usb_device_handle_t` as an argument, which means that the calling client must have previously opened the device to obtain the device handle beforehand. This design choice is intentional in order to enforce an "open before use" pattern.

However, a limited set of APIs (e.g., `usbh_devs_remove()`) refer to devices using a Unique Identifier (`uid`) which is assigned on device addition (see `usbh_devs_add()`). The use of `uid` in these functions allows their callers to refer to a device **without needing to open it** due to the lack of a `usb_device_handle_t`.

As a result, it is possible that a caller of a `uid` function may refer to a device that has already been freed. Thus, callers should account for a fact that these functions may return `ESP_ERR_NOT_FOUND`.

Endpoints & Transfers USBH supports transfer to default (i.e., EP0) and non-default endpoints.

For non-default endpoints:

- A client must first allocate the endpoint by calling `usbh_ep_alloc()` which assigns a `usbh_ep_cb_t` callback and returns a `usbh_ep_handle_t` endpoint handle so that the endpoint can be referred to.
- A client can then enqueue a `urb_t` transfer to the endpoint by calling `usbh_ep_enqueue_urb()`.
- The `usbh_ep_cb_t` callback is called to indicate transfer completion
- The client must then dequeue the transfer using `usbh_ep_dequeue_urb()`

Default endpoints are owned and managed by the USBH, thus API for control transfers are different:

- EP0 is always allocated for each device, thus clients do not need to allocate EP0 or provide an endpoint callback.
- Clients should call `usbh_dev_submit_ctrl_urb()` to submit a control transfer to a device's EP0.
- A `USBH_EVENT_CTRL_XFER` event will be propagated when the transfer is complete
- Control transfers do not need to be dequeued

待写章节:

- USB 主机维护者注意事项 (HAL 和 LL)
- USB 主机维护者注意事项 (HCD)
- USB 主机维护者注意事项 (Hub)
- USB 主机维护者注意事项 (USB Host Library)

简介 ESP-IDF USB 主机协议栈允许 ESP32-P4 作为 USB 主机运行, 此时, ESP32-P4 能够与各种 USB 设备通信。然而, 大多数 USB 主机协议栈实现都不运行在嵌入式硬件上 (即在电脑和手机端运行), 因此, 相对来说具有更多的资源 (即, 具有更高内存和 CPU 速度)。

ESP-IDF USB 主机协议栈 (以下简称为主机协议栈) 的实现考虑到了 ESP32-P4 的嵌入式特性, 这体现在主机协议栈设计的各个方面。

特性和局限性 主机协议栈目前支持以下显著特性:

- 支持 FS (全速) 和 LS (低速) 设备
- 支持所有传输类型 (控制传输、批量传输、同步传输和中断传输)
- 自动枚举已连接设备
- 允许多个类驱动程序 (即 USB 主机库的客户端) 同时运行并共享同一设备 (即组合设备)

主机协议栈目前存在以下显著局限:

- 不支持 HS (高速) 设备
- 不支持集线器 (当前仅支持单个设备)

本部分的 API 示例代码存放在 ESP-IDF 示例项目的 [peripherals](#) 目录下。

2.6 项目配置

2.6.1 简介

ESP-IDF 使用基于 `kconfiglib` 的 `esp-idf-kconfig` 包，而 `kconfiglib` 是 `Kconfig` 系统的 Python 扩展。`Kconfig` 提供了编译时的项目配置机制，以及多种类型的配置选项（如整数、字符串和布尔值等）。`Kconfig` 文件指定了选项之间的依赖关系、默认值、组合方式等。

了解所有可用功能，请查看 [Kconfig](#) 和 [kconfiglib 扩展](#)。

2.6.2 项目配置菜单

应用程序开发人员可以通过 `idf.py menuconfig` 构建目标，在终端中打开项目配置菜单。

更新后，此配置将保存在项目根目录的 `sdkconfig` 文件中。借助 `sdkconfig`，应用程序构建目标将在构建目录中生成 `sdkconfig.h` 文件，并使得 `sdkconfig` 选项可用于项目构建系统和源文件。

2.6.3 使用 `sdkconfig.defaults`

在某些情况下，例如 `sdkconfig` 文件处于版本控制状态时，构建系统可能会不便于更改 `sdkconfig` 文件。要避免上述情况，可以在构建系统中创建 `sdkconfig.defaults` 文件。该文件可以手动或自动创建，且构建系统永远不会对其进行更改。该文件包含所有不同于默认选项的重要选项，其格式与 `sdkconfig` 文件格式相同。如果用户记得所有已更改的配置，则可以手动创建 `sdkconfig.defaults`，或运行 `idf.py save-defconfig` 命令来自动生成此文件。

`sdkconfig.defaults` 创建后，用户可以删除 `sdkconfig` 或将其添加到版本控制系统的忽略列表中（例如 `git` 的 `.gitignore` 文件）。项目构建目标将自动创建 `sdkconfig` 文件，填充 `sdkconfig.defaults` 文件中的设置，并将其他设置配置为默认值。请注意，构建时 `sdkconfig.defaults` 中的设置不会覆盖 `sdkconfig` 的已有设置。了解更多信息，请查看 [自定义 `sdconfig` 的默认值](#)。

2.6.4 `Kconfig` 格式规定

`Kconfig` 文件的格式规定如下：

- 在所有菜单中，选项名称的前缀需保持一致。目前，前缀长度应为至少 3 个字符。
- 每级采用 4 个空格的缩进方式，子项需比父项多缩进一级。例如，`menu` 缩进 0 个空格，`menu` 中的 `config` 则缩进 4 个空格，`config` 中的 `help` 缩进 8 个空格，`help` 下的文本缩进 12 个空格。
- 行末不得出现尾随空格。
- 选项最长为 50 个字符。
- 每行最长为 120 个字符。

备注： 菜单中不同配置的 `help` 小节默认视为 `reStructuredText` 格式，以便生成相应选项的参考文档。

格式检查器

`esp-idf-kconfig` 软件包中的 `kconfcheck` 工具可以检查 `Kconfig` 文件是否符合上述格式规定。检查器会检查作为参数给出的所有 `Kconfig` 和 `Kconfig.projbuild` 文件，并生成一个后缀为 `.new` 的新文件，如有格式错误，便会在此文件中提供修改建议。注意，检查器不能解决所有格式问题，开发人员仍需终审并修改文件，使其通过测试。例如，在没有其他误导性格式的情况下，检查器能够更正缩进，但无法为菜单内选项提供常用的前缀。

`esp-idf-kconfig` 软件包可以在 ESP-IDF 环境中使用。运行命令 `python -m kconfcheck <path_to_kconfig_file>` 即可调用检查工具。

如需了解更多内容，请参考 [esp-idf-kconfig 相关文档](#)。

2.6.5 Kconfig 选项的向后兼容性

标准 **Kconfig** 工具会忽略 `sdkconfig` 中的未知选项。因此，如果开发人员对某些选项进行了自定义设置，但这些选项在 ESP-IDF 新版本中重新命名，标准 **Kconfig** 工具将忽略原有设置。以下功能可以避免上述情况：

1. 工具链使用 `kconfiggen` 预处理 `sdkconfig` 文件。例如，`menuconfig` 会读取这些文件，从而保留旧选项设置。
2. `kconfiggen` 递归查找 ESP-IDF 目录中所有包含新旧 **Kconfig** 选项名称的 `sdkconfig.rename` 文件。在 `sdkconfig` 文件中，新选项将替换旧选项。针对单个目标的重命名可以放在特定目标的重命名文件 `sdkconfig.rename.TARGET` 中，其中 `TARGET` 是目标名称，例如 `sdkconfig.rename.esp32s2`。
3. `kconfiggen` 通过添加兼容性语句列表（即经过修改后，将旧选项的值设置为新选项的值），后处理 `sdkconfig` 文件，并生成所有构建结果（`sdkconfig.h`、`sdkconfig.cmake` 以及 `auto.conf`）。如果用户在其代码中仍然使用旧选项，此举可以防止用户代码出现问题。
4. `kconfiggen` 会自动生成 *Deprecated options and their replacements*。

2.6.6 配置选项参考

以下小节包含由 **Kconfig** 文件自动生成的 ESP-IDF 可用选项列表。请注意，由于所选选项不同，下列某些选项可能在 `menuconfig` 界面中默认不可见。

按照惯例，所有选项名称均为大写字母加下划线。当 **Kconfig** 生成 `sdkconfig` 和 `sdkconfig.h` 文件时，选项名称会以 `CONFIG_` 为前缀。因此，如果 **Kconfig** 文件定义了 `ENABLE_FOO` 选项且 `menuconfig` 中选择了该选项，则 `sdkconfig` 和 `sdkconfig.h` 文件也将定义 `CONFIG_ENABLE_FOO`。在以下小节中，选项名称也以 `CONFIG_` 为前缀，与源代码相同。

Build type

Contains:

- `CONFIG_APP_BUILD_TYPE`
- `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`
- `CONFIG_APP_REPRODUCIBLE_BUILD`
- `CONFIG_APP_NO_BLOBS`

CONFIG_APP_BUILD_TYPE

Application build type

Found in: *Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the `.elf` file of the application, such that it can be loaded directly into RAM over JTAG or UART. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for some kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash.

Note: when `APP_BUILD_TYPE_RAM` is selected and loaded with JTAG, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A `gdbinit` file may look as follows (for ESP32):

```
# Connect to a running instance of OpenOCD target remote :3333 # Reset and halt the target
mon reset halt # Run to a specific point in ROM code, # where most of initialization is
complete. thb *0x40007d54 c # Load the application into RAM load # Run till app_main th
app_main c
```

Execute this gdbinit file as follows:

```
xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit
```

Example gdbinit files for other targets can be found in `tools/test_apps/system/gdb_loadable_elf/`

When loading the BIN with UART, the ROM will jump to ram and run the app after finishing the ROM startup code, so there's no additional startup initialization required. You can use the `load_ram` in `esptool.py` to load the generated `.bin` file into ram and execute.

Example: `esptool.py --chip {chip} -p {port} -b {baud} --no-stub load_ram {app.bin}`

Recommended `sdkconfig.defaults` for building loadable ELF files is as follows. `CONFIG_APP_BUILD_TYPE_RAM` is required, other options help reduce application memory footprint.

```
CONFIG_APP_BUILD_TYPE_RAM=y CONFIG_VFS_SUPPORT_TERMIOS=
CONFIG_NEWLIB_NANO_FORMAT=y CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y
CONFIG_ESP_DEBUG_STUBS_ENABLE= CONFIG_ESP_ERR_TO_NAME_LOOKUP=
```

Available options:

- Default (binary application + 2nd stage bootloader) (`CONFIG_APP_BUILD_TYPE_APP_2NDBOOT`)
- Build app runs entirely in RAM (EXPERIMENTAL) (`CONFIG_APP_BUILD_TYPE_RAM`)

CONFIG_APP_BUILD_TYPE_PURE_RAM_APP

Build app without SPI_FLASH/PSRAM support (saves ram)

Found in: [Build type](#)

If this option is enabled, external memory and related peripherals, such as Cache, MMU, Flash and PSRAM, won't be initialized. Corresponding drivers won't be introduced either. Components that depend on the `spi_flash` component will also be unavailable, such as `app_update`, etc. When this option is enabled, about 26KB of RAM space can be saved.

CONFIG_APP_REPRODUCIBLE_BUILD

Enable reproducible build

Found in: [Build type](#)

If enabled, all date, time, and path information would be eliminated. A `.gdbinit` file would be create automatically. (or will be append if you have one already)

Default value:

- No (disabled)

CONFIG_APP_NO_BLOBS

No Binary Blobs

Found in: [Build type](#)

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

Default value:

- No (disabled)

Bootloader config

Contains:

- `CONFIG_BOOTLOADER_LOG_LEVEL`
- *Bootloader manager*
- `CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION`
- `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE`
- `CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE`
- `CONFIG_BOOTLOADER_APP_TEST`
- `CONFIG_BOOTLOADER_FACTORY_RESET`
- `CONFIG_BOOTLOADER_HOLD_TIME_GPIO`
- `CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC`
- *Serial Flash Configurations*
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP`
- `CONFIG_BOOTLOADER_WDT_ENABLE`
- `CONFIG_BOOTLOADER_VDDSDIO_BOOST`

Bootloader manager Contains:

- `CONFIG_BOOTLOADER_PROJECT_VER`
- `CONFIG_BOOTLOADER_COMPILE_TIME_DATE`

CONFIG_BOOTLOADER_COMPILE_TIME_DATE

Use time/date stamp for bootloader

Found in: [Bootloader config](#) > [Bootloader manager](#)

If set, then the bootloader will be built with the current time/date stamp. It is stored in the bootloader description structure. If not set, time/date stamp will be excluded from bootloader image. This can be useful for getting the same binary image files made from the same source, but at different times.

CONFIG_BOOTLOADER_PROJECT_VER

Project version

Found in: [Bootloader config](#) > [Bootloader manager](#)

Project version. It is placed in "version" field of the `esp_bootloader_desc` structure. The type of this field is "uint32_t".

Range:

- from 0 to 4294967295

Default value:

- 1

CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION

Bootloader optimization Level

Found in: [Bootloader config](#)

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default "Size" setting will add the -Os flag to CFLAGS.
- The "Debug" setting will add the -Og flag to CFLAGS.

- The "Performance" setting will add the -O2 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

Available options:

- Size (-Os) (CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION_SIZE)
- Debug (-Og) (CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION_DEBUG)
- Optimize for performance (-O2) (CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (Deprecated, will be removed in IDF v6.0) (CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION_NONE)

CONFIG_BOOTLOADER_LOG_LEVEL

Bootloader log verbosity

Found in: [Bootloader config](#)

Specify how much output to see in bootloader logs.

Available options:

- No output (CONFIG_BOOTLOADER_LOG_LEVEL_NONE)
- Error (CONFIG_BOOTLOADER_LOG_LEVEL_ERROR)
- Warning (CONFIG_BOOTLOADER_LOG_LEVEL_WARN)
- Info (CONFIG_BOOTLOADER_LOG_LEVEL_INFO)
- Debug (CONFIG_BOOTLOADER_LOG_LEVEL_DEBUG)
- Verbose (CONFIG_BOOTLOADER_LOG_LEVEL_VERBOSE)

Serial Flash Configurations Contains:

- [CONFIG_BOOTLOADER_FLASH_DC_AWARE](#)
- [CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT](#)

CONFIG_BOOTLOADER_FLASH_DC_AWARE

Allow app adjust Dummy Cycle bits in SPI Flash for higher frequency (READ HELP FIRST)

Found in: [Bootloader config](#) > [Serial Flash Configurations](#)

This will force 2nd bootloader to be loaded by DOUT mode, and will restore Dummy Cycle setting by resetting the Flash

CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT

Enable the support for flash chips of XMC (READ DOCS FIRST)

Found in: [Bootloader config](#) > [Serial Flash Configurations](#)

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

DON'T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.

comment "Features below require specific hardware (READ DOCS FIRST!)"

Default value:

- Yes (enabled)

CONFIG_BOOTLOADER_VDDSDIO_BOOST

VDDSDIO LDO voltage

Found in: [Bootloader config](#)

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

Available options:

- 1.8V (CONFIG_BOOTLOADER_VDDSDIO_BOOST_1_8V)
- 1.9V (CONFIG_BOOTLOADER_VDDSDIO_BOOST_1_9V)

CONFIG_BOOTLOADER_FACTORY_RESET

GPIO triggers factory reset

Found in: [Bootloader config](#)

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from "factory" partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET

Number of the GPIO input for factory reset

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_FACTORY_RESET](#)

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

Default value:

- 4 if [CONFIG_BOOTLOADER_FACTORY_RESET](#)

CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL

Factory reset GPIO level

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_FACTORY_RESET](#)

Pin level for factory reset, can be triggered on low or high.

Available options:

- Reset on GPIO low (CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LOW)
- Reset on GPIO high (CONFIG_BOOTLOADER_FACTORY_RESET_PIN_HIGH)

CONFIG_BOOTLOADER_OTA_DATA_ERASE

Clear OTA data on factory reset (select factory partition)

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_FACTORY_RESET](#)

The device will boot from "factory" partition (or OTA slot 0 if no factory partition is present) after a factory reset.

CONFIG_BOOTLOADER_DATA_FACTORY_RESET

Comma-separated names of partitions to clear on factory reset

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_FACTORY_RESET](#)

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: "nvs, phy_init, ...") Make sure that the name specified in the partition table and here are the same. Partitions of type "app" cannot be specified here.

Default value:

- "nvs" if [CONFIG_BOOTLOADER_FACTORY_RESET](#)

CONFIG_BOOTLOADER_APP_TEST

GPIO triggers boot from test app partition

Found in: [Bootloader config](#)

Allows to run the test app from "TEST" partition. A boot from "test" partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

CONFIG_BOOTLOADER_NUM_PIN_APP_TEST

Number of the GPIO input to boot TEST partition

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_APP_TEST](#)

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

Range:

- from 0 to 39 if [CONFIG_BOOTLOADER_APP_TEST](#)

Default value:

- 18 if [CONFIG_BOOTLOADER_APP_TEST](#)

CONFIG_BOOTLOADER_APP_TEST_PIN_LEVEL

App test GPIO level

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_APP_TEST](#)

Pin level for app test, can be triggered on low or high.

Available options:

- Enter test app on GPIO low ([CONFIG_BOOTLOADER_APP_TEST_PIN_LOW](#))
- Enter test app on GPIO high ([CONFIG_BOOTLOADER_APP_TEST_PIN_HIGH](#))

CONFIG_BOOTLOADER_HOLD_TIME_GPIO

Hold time of GPIO for reset/test mode (seconds)

Found in: *Bootloader config*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

Default value:

- 5 if *CONFIG_BOOTLOADER_FACTORY_RESET* || *CONFIG_BOOTLOADER_APP_TEST*

CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE

Enable protection for unmapped memory regions

Found in: *Bootloader config*

Protects the unmapped memory regions of the entire address space from unintended accesses. This will ensure that an exception will be triggered whenever the CPU performs a memory operation on unmapped regions of the address space.

Default value:

- Yes (enabled)

CONFIG_BOOTLOADER_WDT_ENABLE

Use RTC watchdog in start code

Found in: *Bootloader config*

Tracks the execution time of startup code. If the execution time is exceeded, the RTC_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow_clk - and ends calling app_main. Re-set timeout is needed due to WDT uses a SLOW_CLK clock source. After changing a frequency slow_clk a time of WDT needs to re-set for new frequency. slow_clk depends on RTC_CLK_SRC (INTERNAL_RC or EXTERNAL_CRYSTAL).

Default value:

- Yes (enabled)

CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE

Allows RTC watchdog disable in user code

Found in: *Bootloader config* > *CONFIG_BOOTLOADER_WDT_ENABLE*

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the rtc_wdt in the app's own code. If this option is not set (default), then rtc_wdt will be disabled by ESP-IDF before calling the app_main() function.

Use function wdt_hal_feed() for resetting counter of RTC_WDT. For esp32/s2 you can also use rtc_wdt_feed().

Use function wdt_hal_disable() for disabling RTC_WDT. For esp32/s2 you can also use rtc_wdt_disable().

Default value:

- No (disabled)

CONFIG_BOOTLOADER_WDT_TIME_MS

Timeout for RTC watchdog (ms)

Found in: *Bootloader config* > *CONFIG_BOOTLOADER_WDT_ENABLE*

Verify that this parameter is correct and more then the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC_WDT will reset while encryption operations will be performed.

Range:

- from 0 to 120000

Default value:

- 9000

CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE

Enable app rollback support

Found in: *Bootloader config*

After updating the app, the bootloader runs a new app with the "ESP_OTA_IMG_PENDING_VERIFY" state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

Enable app anti-rollback support

Found in: *Bootloader config* > *CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE*

This option prevents rollback to previous firmware/application image with lower security version.

Default value:

- No (disabled) if *CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE*

CONFIG_BOOTLOADER_APP_SECURE_VERSION

eFuse secure version of app

Found in: *Bootloader config* > *CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE* > *CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see *BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD* option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with ota_0 + ota_1 (without factory).

Default value:

- 0 if *CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD

Size of the efuse secure version field

Found in: *Bootloader config* > *CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE* > *CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

The size of the efuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

Range:

- from 1 to 16 if *CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

Default value:

- 16 if *CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

CONFIG_BOOTLOADER_EFUSE_SECURE_VERSION_EMULATE

Emulate operations with efuse secure version(only test)

Found in: *Bootloader config* > *CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE* > *CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

This option allows to emulate read/write operations with all eFuses and efuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: *emul_efuse, data, efuse, , 0x2000*.

This option enables: EFUSE_VIRTUAL and EFUSE_VIRTUAL_KEEP_IN_FLASH.

Default value:

- No (disabled) if *CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP

Skip image validation when exiting deep sleep

Found in: *Bootloader config*

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using *deep_sleep()* entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if "allow insecure options" is enabled, however it's strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

Default value:

- No (disabled) if *CONFIG_SECURE_BOOT* && *CONFIG_SECURE_BOOT_INSECURE*

CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON

Skip image validation from power on reset (READ HELP FIRST)

Found in: *Bootloader config*

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it's not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it's not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.

Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option `BOOTLOADER_WDT_ENABLE` enabled and consider also enabling `BOOTLOADER_WDT_DISABLE_IN_USER_CODE` - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS

Skip image validation always (READ HELP FIRST)

Found in: [Bootloader config](#)

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting "Skip image validation from power on reset" instead. However, if boot time is the only important factor then it can be enabled.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC

Reserve RTC FAST memory for custom purposes

Found in: [Bootloader config](#)

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through `PRO_CPU`.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC_IN_CRC

Include custom memory in the CRC calculation

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC](#)

This option allows the customer to use the legacy bootloader behavior when the RTC FAST memory CRC calculation takes place. When this option is enabled, the allocated user custom data will be taken into account in the CRC calculation. This means that any change to the custom data would need a CRC update to prevent the bootloader from marking this data as corrupted. If this option is disabled, the custom data will not be taken into account when calculating the RTC FAST memory CRC. The user custom data can be changed freely, without the need to update the CRC. THIS OPTION MUST BE THE SAME FOR BOTH THE BOOTLOADER AND THE APPLICATION BUILDS.

Default value:

- No (disabled) if [CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC](#)

CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC_SIZE

Size in bytes for custom purposes

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC](#)

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (`rtc_retain_mem_t`) is reserved and has access from the bootloader and an application.

Default value:

- 0 if `CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC`

Security features

Contains:

- `CONFIG_SECURE_BOOT_INSECURE`
- `CONFIG_SECURE_SIGNED_APPS_SCHEME`
- `CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT`
- `CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP`
- `CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_SIZE`
- `CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE`
- `CONFIG_SECURE_FLASH_ENC_ENABLED`
- `CONFIG_SECURE_BOOT`
- `CONFIG_SECURE_FLASH_ENCRYPT_ONLY_IMAGE_LEN_IN_APP_PART`
- `CONFIG_SECURE_BOOT_FLASH_BOOTLOADER_DEFAULT`
- `CONFIG_SECURE_BOOTLOADER_KEY_ENCODING`
- *Potentially insecure options*
- `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`
- `CONFIG_SECURE_BOOT_VERIFICATION_KEY`
- `CONFIG_SECURE_BOOTLOADER_MODE`
- `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`
- `CONFIG_SECURE_UART_ROM_DL_MODE`
- `CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT`

CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT

Require signed app images

Found in: Security features

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

CONFIG_SECURE_SIGNED_APPS_SCHEME

App Signing Scheme

Found in: Security features

Select the Secure App signing scheme. Depends on the Chip Revision. There are two secure boot versions:

1. **Secure boot V1**
 - Legacy custom secure boot scheme. Supported in ESP32 SoC.
2. **Secure boot V2**
 - RSA based secure boot scheme. Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3, ESP32-S3 SoCs.
 - ECDSA based secure boot scheme. Supported in ESP32-C2 SoC.

Available options:

- ECDSA (CONFIG_SECURE_SIGNED_APPS_ECDSA_SCHEME)
Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key. Refer to the documentation before enabling.
- RSA (CONFIG_SECURE_SIGNED_APPS_RSA_SCHEME)
Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.
- ECDSA (V2) (CONFIG_SECURE_SIGNED_APPS_ECDSA_V2_SCHEME)
For Secure boot V2 (e.g., ESP32-C2 SoC), appends ECDSA based signature block to the application. Refer to documentation before enabling.

CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_SIZE

ECDSA key size

Found in: Security features

Select the ECDSA key size. Two key sizes are supported

- 192 bit key using NISTP192 curve
- 256 bit key using NISTP256 curve (Recommended)

The advantage of using 256 bit key is the extra randomness which makes it difficult to be bruteforced compared to 192 bit key. At present, both key sizes are practically implausible to bruteforce.

Available options:

- Using ECC curve NISTP192 (CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_192_BITS)
- Using ECC curve NISTP256 (Recommended) (CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_256_BITS)

CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT

Bootloader verifies app signatures

Found in: Security features

If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn't add significant security by itself so most users will want to leave it disabled.

Default value:

- No (disabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT` && `CONFIG_SECURE_SIGNED_APPS_ECDSA_SCHEME`

CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT

Verify app signature on update

Found in: Security features

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the `esp_ota_ops.h` APIs are used for OTA updates, or `esp_image_format.h` APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

Default value:

- Yes (enabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`

CONFIG_SECURE_BOOT

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

Found in: Security features

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

Default value:

- No (disabled)

CONFIG_SECURE_BOOT_VERSION

Select secure boot version

Found in: Security features > CONFIG_SECURE_BOOT

Select the Secure Boot Version. Depends on the Chip Revision. Secure Boot V2 is the new RSA / ECDSA based secure boot scheme.

- RSA based scheme is supported in ESP32 (Revision 3 onwards), ESP32-S2, ESP32-C3 (ECO3), ESP32-S3.
- ECDSA based scheme is supported in ESP32-C2 SoC.

Please note that, RSA or ECDSA secure boot is property of specific SoC based on its HW design, supported crypto accelerators, die-size, cost and similar parameters. Please note that RSA scheme has requirement for bigger key sizes but at the same time it is comparatively faster than ECDSA verification.

Secure Boot V1 is the AES based (custom) secure boot scheme supported in ESP32 SoC.

Available options:

- Enable Secure Boot version 1 (`CONFIG_SECURE_BOOT_V1_ENABLED`)
Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.
- Enable Secure Boot version 2 (`CONFIG_SECURE_BOOT_V2_ENABLED`)
Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer's Guide for this version before enabling.

CONFIG_SECURE_BOOTLOADER_MODE

Secure bootloader mode

Found in: Security features

Available options:

- One-time flash (`CONFIG_SECURE_BOOTLOADER_ONE_TIME_FLASH`)
On first boot, the bootloader will generate a key which is not readable externally or by software. A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot.
Enabling this option means that the bootloader cannot be changed after the first time it is booted.

- **Reflashable (CONFIG_SECURE_BOOTLOADER_REFLASHABLE)**
Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key.
This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key.
This option is less secure than one-time flash, because a leak of the digest key from one device allows reflashing of any device that uses it.

CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES

Sign binaries during build

Found in: Security features

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named in "Secure boot private signing key" will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using `espsecure.py`. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

CONFIG_SECURE_BOOT_SIGNING_KEY

Secure boot private signing key

Found in: Security features > CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: `espsecure.py generate_signing_key secure_boot_signing_key.pem`

See the Secure Boot section of the ESP-IDF Programmer's Guide for this version for details.

Default value:

- "secure_boot_signing_key.pem" if *CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES*

CONFIG_SECURE_BOOT_VERIFICATION_KEY

Secure boot public signature verification key

Found in: Security features

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the `espsecure.py extract_public_key` command.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE

Enable Aggressive key revoke strategy

Found in: Security features

If this option is set, ROM bootloader will revoke the public key digest burned in efuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling

secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader

This feature provides a strong resistance against physical attacks on the device.

NOTE: Once a digest slot is revoked, it can never be used again to verify an image. This can lead to permanent bricking of the device, in case all keys are revoked because of signature verification failure.

Default value:

- No (disabled) if `CONFIG_SECURE_BOOT`

CONFIG_SECURE_BOOT_FLASH_BOOTLOADER_DEFAULT

Flash bootloader along with other artifacts when using the default flash command

Found in: Security features

When Secure Boot V2 is enabled, by default the bootloader is not flashed along with other artifacts like the application and the partition table images, i.e. bootloader has to be separately flashed using the command `idf.py bootloader flash`, whereas, the application and partition table can be flashed using the command `idf.py flash` itself. Enabling this option allows flashing the bootloader along with the other artifacts by invocation of the command `idf.py flash`.

If this option is enabled make sure that even the bootloader is signed using the correct secure boot key, otherwise the bootloader signature verification would fail, as hash of the public key which is present in the bootloader signature would not match with the digest stored into the efuses and thus the device will not be able to boot up.

Default value:

- No (disabled) if `CONFIG_SECURE_BOOT_V2_ENABLED` && `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`

CONFIG_SECURE_BOOTLOADER_KEY_ENCODING

Hardware Key Encoding

Found in: Security features

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to eFuse with `espefuse.py`.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the eFuse key is truncated to 192 bits.

This configuration item doesn't change any firmware code, it only changes the size of key binary which is generated at build time.

Available options:

- No encoding (256 bit key) (`CONFIG_SECURE_BOOTLOADER_KEY_ENCODING_256BIT`)
- 3/4 encoding (192 bit key) (`CONFIG_SECURE_BOOTLOADER_KEY_ENCODING_192BIT`)

CONFIG_SECURE_BOOT_INSECURE

Allow potentially insecure options

Found in: Security features

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

Default value:

- No (disabled) if `CONFIG_SECURE_BOOT`

CONFIG_SECURE_FLASH_ENC_ENABLED

Enable flash encryption on boot (READ DOCS FIRST)

Found in: [Security features](#)

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read *flash 加密* before enabling.

Default value:

- No (disabled)

CONFIG_SECURE_FLASH_ENCRYPTION_KEYSIZE

Size of generated XTS-AES key

Found in: [Security features](#) > `CONFIG_SECURE_FLASH_ENC_ENABLED`

Size of generated XTS-AES key.

- AES-128 uses a 256-bit key (32 bytes) derived from 128 bits (16 bytes) burned in half Efuse key block. Internally, it calculates SHA256(128 bits)
- AES-128 uses a 256-bit key (32 bytes) which occupies one Efuse key block.
- AES-256 uses a 512-bit key (64 bytes) which occupies two Efuse key blocks.

This setting is ignored if either type of key is already burned to Efuse before the first boot. In this case, the pre-burned key is used and no new key is generated.

Available options:

- AES-128 key derived from 128 bits (SHA256(128 bits)) (`CONFIG_SECURE_FLASH_ENCRYPTION_AES128_DERIVED`)
- AES-128 (256-bit key) (`CONFIG_SECURE_FLASH_ENCRYPTION_AES128`)
- AES-256 (512-bit key) (`CONFIG_SECURE_FLASH_ENCRYPTION_AES256`)

CONFIG_SECURE_FLASH_ENCRYPTION_MODE

Enable usage mode

Found in: [Security features](#) > `CONFIG_SECURE_FLASH_ENC_ENABLED`

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it's possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it's no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

When `EFUSE_VIRTUAL` is enabled, `SECURE_FLASH_ENCRYPTION_MODE_RELEASE` is not available. For CI tests we use `IDF_CI_BUILD` to bypass it ("export `IDF_CI_BUILD=1`"). We do not recommend bypassing it for other purposes.

Refer to the Flash Encryption section of the ESP-IDF Programmer's Guide for details.

Available options:

- Development (NOT SECURE) (CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT)
- Release (CONFIG_SECURE_FLASH_ENCRYPTION_MODE_RELEASE)

Potentially insecure options Contains:

- `CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS`
- `CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION`
- `CONFIG_SECURE_BOOT_ALLOW_JTAG`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE`
- `CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS`
- `CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED`
- `CONFIG_SECURE_FLASH_SKIP_WRITE_PROTECTION_CACHE`

CONFIG_SECURE_BOOT_ALLOW_JTAG

Allow JTAG Debugging

Found in: Security features > Potentially insecure options

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

Default value:

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE` || `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION

Allow app partition length not 64KB aligned

Found in: Security features > Potentially insecure options

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn't support 64KB aligned partition lengths.

CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS

Allow additional read protecting of efuses

Found in: Security features > Potentially insecure options

If not set (default, recommended), on first boot the bootloader will burn the `WR_DIS_RD_DIS` efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the `EFUSE_RD_DIS` efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the `BLK2` efuse (for ESP32) and `BLOCK4-BLOCK10` (i.e. `BLOCK_KEY0-BLOCK_KEY5`)(for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

NOTE: Once a BLOCK is read-protected, the application will read all zeros from that block

NOTE: If "UART ROM download mode (Permanently disabled (recommended))" or "UART ROM download mode (Permanently switch to Secure mode (recommended))" is set, then it is **__NOT__** possible to read/write efuses using espfuse.py utility. However, efuse can be read/written from the application

CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS

Leave unused digest slots available (not revoke)

Found in: Security features > Potentially insecure options

If not set (default), during startup in the app all unused digest slots will be revoked. To revoke unused slot will be called `esp_efuse_set_digest_revoke(num_digest)` for each digest. Revoking unused digest slots makes ensures that no trusted keys can be added later by an attacker. If set, it means that you have a plan to use unused digests slots later.

Note that if you plan to enable secure boot during the first boot up, the bootloader will intentionally revoke the unused digest slots while enabling secure boot, even if the above config is enabled because keeping the unused key slots un-revoked would a security hazard. In case for any development workflow if you need to avoid this revocation, you should enable secure boot externally (host based mechanism) rather than enabling it during the boot up, so that the bootloader would not need to enable secure boot and thus you could avoid its revocation strategy.

Default value:

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE`

CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC

Leave UART bootloader encryption enabled

Found in: Security features > Potentially insecure options

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

Default value:

- No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE

Leave UART bootloader flash cache enabled

Found in: Security features > Potentially insecure options

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

Default value:

- No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT && (SOC_EFUSE_DIS_DOWNLOAD_ICACHE || SOC_EFUSE_DIS_DOWNLOAD_DCACHE)`

CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED

Require flash encryption to be already enabled

Found in: Security features > Potentially insecure options

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash

encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using `espefuse.py`.

Default value:

- No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

CONFIG_SECURE_FLASH_SKIP_WRITE_PROTECTION_CACHE

Skip write-protection of DIS_CACHE (DIS_ICACHE, DIS_DCACHE)

Found in: Security features > Potentially insecure options

If not set (default, recommended), on the first boot the bootloader will burn the write-protection of DIS_CACHE(for ESP32) or DIS_ICACHE/DIS_DCACHE(for other chips) eFuse when Flash Encryption is enabled. Write protection for cache disable efuse prevents the chip from being blocked if it is set by accident. App and bootloader use cache so disabling it makes the chip useless for IDF. Due to other eFuses are linked with the same write protection bit (see the list below) then write-protection will not be done if these `SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC`, `SECURE_BOOT_ALLOW_JTAG` or `SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE` options are selected to give a chance to turn on the chip into the release mode later.

List of eFuses with the same write protection bit: ESP32: `MAC`, `MAC_CRC`, `DISABLE_APP_CPU`, `DISABLE_BT`, `DIS_CACHE`, `VOL_LEVEL_HP_INV`.

ESP32-C3: `DIS_ICACHE`, `DIS_USB_JTAG`, `DIS_DOWNLOAD_ICACHE`, `DIS_USB_SERIAL_JTAG`, `DIS_FORCE_DOWNLOAD`, `DIS_TWAI`, `JTAG_SEL_ENABLE`, `DIS_PAD_JTAG`, `DIS_DOWNLOAD_MANUAL_ENCRYPT`.

ESP32-C6: `SWAP_UART_SDIO_EN`, `DIS_ICACHE`, `DIS_USB_JTAG`, `DIS_DOWNLOAD_ICACHE`, `DIS_USB_SERIAL_JTAG`, `DIS_FORCE_DOWNLOAD`, `DIS_TWAI`, `JTAG_SEL_ENABLE`, `DIS_PAD_JTAG`, `DIS_DOWNLOAD_MANUAL_ENCRYPT`.

ESP32-H2: `DIS_ICACHE`, `DIS_USB_JTAG`, `POWERGLITCH_EN`, `DIS_FORCE_DOWNLOAD`, `SPI_DOWNLOAD_MSPI_DIS`, `DIS_TWAI`, `JTAG_SEL_ENABLE`, `DIS_PAD_JTAG`, `DIS_DOWNLOAD_MANUAL_ENCRYPT`.

ESP32-S2: `DIS_ICACHE`, `DIS_DCACHE`, `DIS_DOWNLOAD_ICACHE`, `DIS_DOWNLOAD_DCACHE`, `DIS_FORCE_DOWNLOAD`, `DIS_USB`, `DIS_TWAI`, `DIS_BOOT_REMAP`, `SOFT_DIS_JTAG`, `HARD_DIS_JTAG`, `DIS_DOWNLOAD_MANUAL_ENCRYPT`.

ESP32-S3: `DIS_ICACHE`, `DIS_DCACHE`, `DIS_DOWNLOAD_ICACHE`, `DIS_DOWNLOAD_DCACHE`, `DIS_FORCE_DOWNLOAD`, `DIS_USB_OTG`, `DIS_TWAI`, `DIS_APP_CPU`, `DIS_PAD_JTAG`, `DIS_DOWNLOAD_MANUAL_ENCRYPT`, `DIS_USB_JTAG`, `DIS_USB_SERIAL_JTAG`, `STRAP_JTAG_SEL`, `USB_PHY_SEL`.

CONFIG_SECURE_FLASH_ENCRYPT_ONLY_IMAGE_LEN_IN_APP_PART

Encrypt only the app image that is present in the partition of type app

Found in: Security features

If set (default), optimise encryption time for the partition of type APP, by only encrypting the app image that is present in the partition, instead of the whole partition. The image length used for encryption is derived from the image metadata, which includes the size of the app image, checksum, hash and also the signature sector when secure boot is enabled.

If not set, the whole partition of type APP would be encrypted, which increases the encryption time but might be useful if there is any custom data appended to the firmware image.

CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP

Check Flash Encryption enabled on app startup

Found in: Security features

If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

Default value:

- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`

CONFIG_SECURE_UART_ROM_DL_MODE

UART ROM download mode

Found in: Security features

Available options:

- UART ROM download mode (Permanently disabled (recommended)) (`CONFIG_SECURE_DISABLE_ROM_DL_MODE`)
If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of `esptool.py`, `espefuse.py` and similar tools.
Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.
It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.
It is also possible to permanently disable Download Mode by calling `esp_efuse_disable_rom_download_mode()` at runtime.
- UART ROM download mode (Permanently switch to Secure mode (recommended)) (`CONFIG_SECURE_ENABLE_SECURE_ROM_DL_MODE`)
If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.
Secure Download mode limits the use of Download Mode functions to update SPI config, changing baud rate, basic flash write and a command to return a summary of currently enabled security features (`get_security_info`).
Secure Download mode is not compatible with the `esptool.py` flasher stub feature, `espefuse.py`, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.
Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential "attack surface" for an attacker to try and bypass them with a successful physical attack.
It is also possible to enable secure download mode at runtime by calling `esp_efuse_enable_rom_secure_download_mode()`
Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).
- UART ROM download mode (Enabled (not recommended)) (`CONFIG_SECURE_INSECURE_ALLOW_DL_MODE`)
This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option SHOULD NOT BE ENABLED for production use cases.

Application manager

Contains:

- `CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR`
- `CONFIG_APP_EXCLUDE_PROJECT_VER_VAR`
- `CONFIG_APP_PROJECT_VER_FROM_CONFIG`
- `CONFIG_APP_RETRIEVE_LEN_ELF_SHA`
- `CONFIG_APP_COMPILE_TIME_DATE`

CONFIG_APP_COMPILE_TIME_DATE

Use time/date stamp for app

Found in: [Application manager](#)

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

CONFIG_APP_EXCLUDE_PROJECT_VER_VAR

Exclude PROJECT_VER from firmware image

Found in: [Application manager](#)

The PROJECT_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

Default value:

- No (disabled)

CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR

Exclude PROJECT_NAME from firmware image

Found in: [Application manager](#)

The PROJECT_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

Default value:

- No (disabled)

CONFIG_APP_PROJECT_VER_FROM_CONFIG

Get the project version from Kconfig

Found in: [Application manager](#)

If this is enabled, then config item APP_PROJECT_VER will be used for the variable PROJECT_VER. Other ways to set PROJECT_VER will be ignored.

Default value:

- No (disabled)

CONFIG_APP_PROJECT_VER

Project version

Found in: [Application manager](#) > `CONFIG_APP_PROJECT_VER_FROM_CONFIG`

Project version

Default value:

- 1 if `CONFIG_APP_PROJECT_VER_FROM_CONFIG`

CONFIG_APP_RETRIEVE_LEN_ELF_SHA

The length of APP ELF SHA is stored in RAM(chars)

Found in: Application manager

At startup, the app will read the embedded APP ELF SHA-256 hash value from flash and convert it into a string and store it in a RAM buffer. This ensures the panic handler and core dump will be able to print this string even when cache is disabled. The size of the buffer is `APP_RETRIEVE_LEN_ELF_SHA` plus the null terminator. Changing this value will change the size of this buffer, in bytes.

Range:

- from 8 to 64

Default value:

- 9

Boot ROM Behavior

Contains:

- `CONFIG_BOOT_ROM_LOG_SCHEME`

CONFIG_BOOT_ROM_LOG_SCHEME

Permanently change Boot ROM output

Found in: Boot ROM Behavior

Controls the Boot ROM log behavior. The rom log behavior can only be changed for once, specific eFuse bit(s) will be burned at app boot stage.

Available options:

- Always Log (`CONFIG_BOOT_ROM_LOG_ALWAYS_ON`)
Always print ROM logs, this is the default behavior.
- Permanently disable logging (`CONFIG_BOOT_ROM_LOG_ALWAYS_OFF`)
Don't print ROM logs.
- Log on GPIO High (`CONFIG_BOOT_ROM_LOG_ON_GPIO_HIGH`)
Print ROM logs when GPIO level is high during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.
- Log on GPIO Low (`CONFIG_BOOT_ROM_LOG_ON_GPIO_LOW`)
Print ROM logs when GPIO level is low during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.

Serial flasher config

Contains:

- `CONFIG_ESPTOOLPY_AFTER`
- `CONFIG_ESPTOOLPY_BEFORE`
- `CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE`
- `CONFIG_ESPTOOLPY_NO_STUB`
- `CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE`
- `CONFIG_ESPTOOLPY_FLASHSIZE`
- `CONFIG_ESPTOOLPY_FLASHMODE`
- `CONFIG_ESPTOOLPY_FLASHFREQ`

CONFIG_ESPTOOLPY_NO_STUB

Disable download stub

Found in: Serial flasher config

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature

CONFIG_ESPTOOLPY_FLASHMODE

Flash SPI mode

Found in: Serial flasher config

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

Available options:

- QIO (CONFIG_ESPTOOLPY_FLASHMODE_QIO)
- QOUT (CONFIG_ESPTOOLPY_FLASHMODE_QOUT)
- DIO (CONFIG_ESPTOOLPY_FLASHMODE_DIO)
- DOUT (CONFIG_ESPTOOLPY_FLASHMODE_DOUT)
- OPI (CONFIG_ESPTOOLPY_FLASHMODE_OPI)

CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE

Flash Sampling Mode

Found in: Serial flasher config

Available options:

- STR Mode (CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE_STR)
- DTR Mode (CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE_DTR)

CONFIG_ESPTOOLPY_FLASHFREQ

Flash SPI speed

Found in: Serial flasher config

Available options:

- 120 MHz (READ DOCS FIRST) (CONFIG_ESPTOOLPY_FLASHFREQ_120M)
 - Optional feature for QSPI Flash. Read docs and enable *CONFIG_SPI_FLASH_HPM_ENA* first!
 - Flash 120 MHz SDR mode is stable.
 - Flash 120 MHz DDR mode is an experimental feature, it works when the temperature is stable.
 - Risks:** If your chip powers on at a certain temperature, then after the temperature increases or decreases by approximately 20 Celsius degrees (depending on the chip), the program will crash randomly.
- 80 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_80M)
- 64 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_64M)
- 60 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_60M)
- 48 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_48M)
- 40 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_40M)
- 32 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_32M)

- 30 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_30M)

- 15 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_15M)

CONFIG_ESPTOOLPY_FLASHSIZE

Flash size

Found in: Serial flasher config

SPI flash size, in megabytes

Available options:

- 1 MB (CONFIG_ESPTOOLPY_FLASHSIZE_1MB)
- 2 MB (CONFIG_ESPTOOLPY_FLASHSIZE_2MB)
- 4 MB (CONFIG_ESPTOOLPY_FLASHSIZE_4MB)
- 8 MB (CONFIG_ESPTOOLPY_FLASHSIZE_8MB)
- 16 MB (CONFIG_ESPTOOLPY_FLASHSIZE_16MB)
- 32 MB (CONFIG_ESPTOOLPY_FLASHSIZE_32MB)
- 64 MB (CONFIG_ESPTOOLPY_FLASHSIZE_64MB)
- 128 MB (CONFIG_ESPTOOLPY_FLASHSIZE_128MB)

CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE

Detect flash size when flashing bootloader

Found in: Serial flasher config

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

Enabling this option turns off the image protection against corruption by a SHA256 digest. Updating the bootloader image before flashing would invalidate the digest.

CONFIG_ESPTOOLPY_BEFORE

Before flashing

Found in: Serial flasher config

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset to bootloader (CONFIG_ESPTOOLPY_BEFORE_RESET)
- No reset (CONFIG_ESPTOOLPY_BEFORE_NORESET)

CONFIG_ESPTOOLPY_AFTER

After flashing

Found in: Serial flasher config

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset after flashing (CONFIG_ESPTOOLPY_AFTER_RESET)
- Stay in bootloader (CONFIG_ESPTOOLPY_AFTER_NORESET)

Partition Table

Contains:

- [CONFIG_PARTITION_TABLE_CUSTOM_FILENAME](#)
- [CONFIG_PARTITION_TABLE_MD5](#)
- [CONFIG_PARTITION_TABLE_OFFSET](#)
- [CONFIG_PARTITION_TABLE_TYPE](#)

CONFIG_PARTITION_TABLE_TYPE

Partition Table

Found in: [Partition Table](#)

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition_table directory. These are mostly intended for example and development use, it's expected that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

Available options:

- Single factory app, no OTA (CONFIG_PARTITION_TABLE_SINGLE_APP)
This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.
The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp.csv
This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Single factory app (large), no OTA (CONFIG_PARTITION_TABLE_SINGLE_APP_LARGE)
This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code.
The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large.csv
This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Factory app, two OTA definitions (CONFIG_PARTITION_TABLE_TWO_OTA)
This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size.
The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota.csv
- Custom partition table CSV (CONFIG_PARTITION_TABLE_CUSTOM)
Specify the path to the partition table CSV to use for your project.
Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.
- Single factory app, no OTA, encrypted NVS (CONFIG_PARTITION_TABLE_SINGLE_APP_ENCRYPTED_NVS)

This is a variation of the default "Single factory app, no OTA" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.

The corresponding CSV file in the IDF directory is `components/partition_table/partitions_singleapp_encr_nvs.csv`

- Single factory app (large), no OTA, encrypted NVS (`CONFIG_PARTITION_TABLE_SINGLE_APP_LARGE_ENC_NVS`)

This is a variation of the "Single factory app (large), no OTA" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.

The corresponding CSV file in the IDF directory is `components/partition_table/partitions_singleapp_large_encr_nvs.csv`

- Factory app, two OTA definitions, encrypted NVS (`CONFIG_PARTITION_TABLE_TWO_OTA_ENCRYPTED_NVS`)

This is a variation of the "Factory app, two OTA definitions" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.

The corresponding CSV file in the IDF directory is `components/partition_table/partitions_two_ota_encr_nvs.csv`

CONFIG_PARTITION_TABLE_CUSTOM_FILENAME

Custom partition CSV file

Found in: [Partition Table](#)

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory by default. However, if the absolute path for the CSV file is provided, then the absolute path is configured.

Default value:

- "partitions.csv"

CONFIG_PARTITION_TABLE_OFFSET

Offset of partition table

Found in: [Partition Table](#)

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same `PARTITION_TABLE_OFFSET` value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

Default value:

- "0x8000"

CONFIG_PARTITION_TABLE_MD5

Generate an MD5 checksum for the partition table

Found in: [Partition Table](#)

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

Default value:

- Yes (enabled)

Compiler options

Contains:

- `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`
- `CONFIG_COMPILER_FLOAT_LIB_FROM`
- `CONFIG_COMPILER_RT_LIB`
- `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT`
- `CONFIG_COMPILER_DISABLE_GCC12_WARNINGS`
- `CONFIG_COMPILER_DISABLE_GCC13_WARNINGS`
- `CONFIG_COMPILER_DUMP_RTL_FILES`
- `CONFIG_COMPILER_SAVE_RESTORE_LIBCALLS`
- `CONFIG_COMPILER_WARN_WRITE_STRINGS`
- `CONFIG_COMPILER_CXX_EXCEPTIONS`
- `CONFIG_COMPILER_CXX_RTTI`
- `CONFIG_COMPILER_OPTIMIZATION`
- `CONFIG_COMPILER_ORPHAN_SECTIONS`
- `CONFIG_COMPILER_HIDE_PATHS_MACROS`
- `CONFIG_COMPILER_STACK_CHECK_MODE`

CONFIG_COMPILER_OPTIMIZATION

Optimization Level

Found in: Compiler options

This option sets compiler optimization level (gcc -O argument) for the app.

- The "Debug" setting will add the -Og flag to CFLAGS.
- The "Size" setting will add the -Os flag to CFLAGS.
- The "Performance" setting will add the -O2 flag to CFLAGS.
- The "None" setting will add the -O0 flag to CFLAGS.

The "Size" setting cause the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The "Performance" setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

"None" with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the `BOOT-LOADER_COMPILER_OPTIMIZATION` setting.

Available options:

- Debug (-Og) (`CONFIG_COMPILER_OPTIMIZATION_DEBUG`)
- Optimize for size (-Os) (`CONFIG_COMPILER_OPTIMIZATION_SIZE`)
- Optimize for performance (-O2) (`CONFIG_COMPILER_OPTIMIZATION_PERF`)
- Debug without optimization (-O0) (`CONFIG_COMPILER_OPTIMIZATION_NONE`)

CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL

Assertion level

Found in: Compiler options

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.

- Set to "silent" to save code size (failed assertions will abort()) but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) `-DNDEBUG` is added to `CPPFLAGS` in this case.

Available options:

- Enabled (`CONFIG_COMPILER_OPTIMIZATION_ASSERTIONS_ENABLE`)
Enable assertions. Assertion content and line number will be printed on failure.
- Silent (saves code size) (`CONFIG_COMPILER_OPTIMIZATION_ASSERTIONS_SILENT`)
Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
- Disabled (sets `-DNDEBUG`) (`CONFIG_COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE`)
If assertions are disabled, `-DNDEBUG` is added to `CPPFLAGS`.

CONFIG_COMPILER_FLOAT_LIB_FROM

Compiler float lib source

Found in: [Compiler options](#)

In the soft-fp part of `libgcc`, riscv version is written in C, and handles all edge cases in IEEE754, which makes it larger and performance is slow.

`RVfplib` is an optimized RISC-V library for FP arithmetic on 32-bit integer processors, for single and double-precision FP. `RVfplib` is "fast", but it has a few exceptions from IEEE 754 compliance.

Available options:

- `libgcc` (`CONFIG_COMPILER_FLOAT_LIB_FROM_GCCLIB`)
- `librvfp` (`CONFIG_COMPILER_FLOAT_LIB_FROM_RVFPLIB`)

CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT

Disable messages in `ESP_RETURN_ON_*` and `ESP_EXIT_ON_*` macros

Found in: [Compiler options](#)

If enabled, the error messages will be discarded in following check macros: -
`ESP_RETURN_ON_ERROR` - `ESP_EXIT_ON_ERROR` - `ESP_RETURN_ON_FALSE` -
`ESP_EXIT_ON_FALSE`

Default value:

- No (disabled)

CONFIG_COMPILER_HIDE_PATHS_MACROS

Replace ESP-IDF and project paths in binaries

Found in: [Compiler options](#)

When expanding the `__FILE__` and `__BASE_FILE__` macros, replace paths inside ESP-IDF with paths relative to the placeholder string "IDF", and convert paths inside the project directory to relative paths.

This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes `-macro-prefix-map` options to the GCC command line. To replace additional paths in your binaries, modify the project `CMakeLists.txt` file to pass custom `-macro-prefix-map` or `-file-prefix-map` arguments.

Default value:

- Yes (enabled)

CONFIG_COMPILER_CXX_EXCEPTIONS

Enable C++ exceptions

Found in: [Compiler options](#)

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any libstdc++ code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

Default value:

- No (disabled)

Contains:

- [CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE](#)

CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE

Emergency Pool Size

Found in: [Compiler options](#) > [CONFIG_COMPILER_CXX_EXCEPTIONS](#)

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

Default value:

- 0 if [CONFIG_COMPILER_CXX_EXCEPTIONS](#)

CONFIG_COMPILER_CXX_RTTI

Enable C++ run-time type info (RTTI)

Found in: [Compiler options](#)

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using `dynamic_cast` conversion and `typeid` operator.

Default value:

- No (disabled)

CONFIG_COMPILER_STACK_CHECK_MODE

Stack smashing protection mode

Found in: [Compiler options](#)

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: `-fstack-protector`) only functions that call `alloca`, and functions with buffers larger than 8 bytes are protected.
- STRONG mode (GCC flag: `-fstack-protector-strong`) is like NORMAL, but includes additional functions to be protected -- those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: `-fstack-protector-all`) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

The performance impact includes increasing the amount of stack memory required for each task.

Available options:

- None (CONFIG_COMPILER_STACK_CHECK_MODE_NONE)
- Normal (CONFIG_COMPILER_STACK_CHECK_MODE_NORM)
- Strong (CONFIG_COMPILER_STACK_CHECK_MODE_STRONG)
- Overall (CONFIG_COMPILER_STACK_CHECK_MODE_ALL)

CONFIG_COMPILER_WARN_WRITE_STRINGS

Enable -Wwrite-strings warning flag

Found in: [Compiler options](#)

Adds -Wwrite-strings flag for the C/C++ compilers.

For C, this gives string constants the type `const char[]` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char *`.

Default value:

- No (disabled)

CONFIG_COMPILER_SAVE_RESTORE_LIBCALLS

Enable -msave-restore flag to reduce code size

Found in: [Compiler options](#)

Adds -msave-restore to C/C++ compilation flags.

When this flag is enabled, compiler will call library functions to save/restore registers in function prologues/epilogues. This results in lower overall code size, at the expense of slightly reduced performance.

This option can be enabled for RISC-V targets only.

CONFIG_COMPILER_DISABLE_GCC12_WARNINGS

Disable new warnings introduced in GCC 12

Found in: [Compiler options](#)

Enable this option if use GCC 12 or newer, and want to disable warnings which don't appear with GCC 11.

Default value:

- No (disabled)

CONFIG_COMPILER_DISABLE_GCC13_WARNINGS

Disable new warnings introduced in GCC 13

Found in: [Compiler options](#)

Enable this option if use GCC 13 or newer, and want to disable warnings which don't appear with GCC 12.

Default value:

- No (disabled)

CONFIG_COMPILER_DUMP_RTL_FILES

Dump RTL files during compilation

Found in: [Compiler options](#)

If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

CONFIG_COMPILER_RT_LIB

Compiler runtime library

Found in: [Compiler options](#)

Select runtime library to be used by compiler. - GCC toolchain supports libgcc only. - Clang allows to choose between libgcc or libclang_rt. - For host builds ("linux" target), uses the default library.

Available options:

- libgcc (CONFIG_COMPILER_RT_LIB_GCCLIB)
- libclang_rt (CONFIG_COMPILER_RT_LIB_CLANGRT)
- Host (CONFIG_COMPILER_RT_LIB_HOST)

CONFIG_COMPILER_ORPHAN_SECTIONS

Orphan sections handling

Found in: [Compiler options](#)

If the linker finds orphan sections, it attempts to place orphan sections after sections of the same attribute such as code vs data, loadable vs non-loadable, etc. That means that orphan sections could be placed between sections defined in IDF linker scripts. This could lead to corruption of the binary image. Configure the linker action here.

Available options:

- Place with warning (CONFIG_COMPILER_ORPHAN_SECTIONS_WARNING)
Places orphan sections without a warning message.
- Place silently (CONFIG_COMPILER_ORPHAN_SECTIONS_PLACE)
Places orphan sections without a warning/error message.

- [CONFIG_APPTRACE_UART_TX_MSG_SIZE](#)
- [CONFIG_APPTRACE_UART_TX_GPIO](#)
- [CONFIG_APPTRACE_UART_TX_BUFF_SIZE](#)

CONFIG_APPTRACE_DESTINATION1

Data Destination 1

Found in: [Component config](#) > [Application Level Tracing](#)

Select destination for application trace: JTAG or none (to disable).

Available options:

- JTAG (CONFIG_APPTRACE_DEST_JTAG)
- None (CONFIG_APPTRACE_DEST_NONE)

CONFIG_APPTRACE_DESTINATION2

Data Destination 2

Found in: [Component config](#) > [Application Level Tracing](#)

Select destination for application trace: UART(XX) or none (to disable).

Available options:

- UART0 (CONFIG_APPTRACE_DEST_UART0)
- UART1 (CONFIG_APPTRACE_DEST_UART1)
- UART2 (CONFIG_APPTRACE_DEST_UART2)
- USB_CDC (CONFIG_APPTRACE_DEST_USB_CDC)
- None (CONFIG_APPTRACE_DEST_UART_NONE)

CONFIG_APPTRACE_UART_TX_GPIO

UART TX on GPIO#

Found in: [Component config](#) > [Application Level Tracing](#)

This GPIO is used for UART TX pin.

CONFIG_APPTRACE_UART_RX_GPIO

UART RX on GPIO#

Found in: [Component config](#) > [Application Level Tracing](#)

This GPIO is used for UART RX pin.

CONFIG_APPTRACE_UART_BAUDRATE

UART baud rate

Found in: [Component config](#) > [Application Level Tracing](#)

This baud rate is used for UART.

The app's maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

CONFIG_APPTRACE_UART_RX_BUFF_SIZE

UART RX ring buffer size

Found in: [Component config](#) > [Application Level Tracing](#)

Size of the UART input ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer. The data placed to this buffer before sent out to the interface.

CONFIG_APPTRACE_UART_TX_BUFF_SIZE

UART TX ring buffer size

Found in: [Component config](#) > [Application Level Tracing](#)

Size of the UART output ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer.

CONFIG_APPTRACE_UART_TX_MSG_SIZE

UART TX message size

Found in: [Component config](#) > [Application Level Tracing](#)

Maximum size of the single message to transfer.

CONFIG_APPTRACE_UART_TASK_PPIO

UART Task Priority

Found in: [Component config](#) > [Application Level Tracing](#)

UART task priority. In case of high events rate, this parameter could be changed up to (config-MAX_PRIORITIES-1).

Range:

- from 1 to 32

Default value:

- 1

CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO

Timeout for flushing last trace data to host on panic

Found in: Component config > Application Level Tracing

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH

Threshold for flushing last trace data to host on panic

Found in: Component config > Application Level Tracing

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

CONFIG_APPTRACE_BUF_SIZE

Size of the apptrace buffer

Found in: Component config > Application Level Tracing

Size of the memory buffer for trace data in bytes.

CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX

Size of the pending data buffer

Found in: Component config > Application Level Tracing

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

FreeRTOS SystemView Tracing Contains:

- *CONFIG_APPTRACE_SV_CPU*
- *CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE*

- *CONFIG_APPTRACE_SV_BUF_WAIT_TMO*

CONFIG_APPTRACE_SV_ENABLE

SystemView Tracing Enable

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables support for SEGGER SystemView tracing functionality.

CONFIG_APPTRACE_SV_DEST

SystemView destination

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

SystemView will transfer data through defined interface.

Available options:

- Data destination JTAG (CONFIG_APPTRACE_SV_DEST_JTAG)
Send SEGGER SystemView events through JTAG interface.
- Data destination UART (CONFIG_APPTRACE_SV_DEST_UART)
Send SEGGER SystemView events through UART interface.

CONFIG_APPTRACE_SV_CPU

CPU to trace

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Define the CPU to trace by SystemView.

Available options:

- CPU0 (CONFIG_APPTRACE_SV_DEST_CPU_0)
Send SEGGER SystemView events for Pro CPU.
- CPU1 (CONFIG_APPTRACE_SV_DEST_CPU_1)
Send SEGGER SystemView events for App CPU.

CONFIG_APPTRACE_SV_TS_SOURCE

Timer to use as timestamp source

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

Available options:

- CPU cycle counter (CCOUNT) (CONFIG_APPTRACE_SV_TS_SOURCE_CCOUNT)
- General Purpose Timer (Timer Group) (CONFIG_APPTRACE_SV_TS_SOURCE_GPTIMER)
- esp_timer high resolution timer (CONFIG_APPTRACE_SV_TS_SOURCE_ESP_TIMER)

CONFIG_APPTRACE_SV_MAX_TASKS

Maximum supported tasks

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Configures maximum supported tasks in sysview debug

CONFIG_APPTRACE_SV_BUF_WAIT_TMO

Trace buffer wait timeout

Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE

Trace Buffer Overflow Event

Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing

Enables "Trace Buffer Overflow" event.

CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE

ISR Enter Event

Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing

Enables "ISR Enter" event.

CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE

ISR Exit Event

Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing

Enables "ISR Exit" event.

CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE

ISR Exit to Scheduler Event

Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing

Enables "ISR to Scheduler" event.

CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE

Task Start Execution Event

Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing

Enables "Task Start Execution" event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE

Task Stop Execution Event

Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing

Enables "Task Stop Execution" event.

CONFIG_APPTRACE_SV_EVT_TASK_START_READY_ENABLE

Task Start Ready State Event

Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing

Enables "Task Start Ready State" event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE

Task Stop Ready State Event

Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing

Enables "Task Stop Ready State" event.

CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE

Task Create Event

Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing

Enables "Task Create" event.

CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE

Task Terminate Event

Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing

Enables "Task Terminate" event.

CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE

System Idle Event

Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing

Enables "System Idle" event.

CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE

Timer Enter Event

Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing

Enables "Timer Enter" event.

CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE

Timer Exit Event

Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing

Enables "Timer Exit" event.

CONFIG_APPTRACE_GCOV_ENABLE

GCOV to Host Enable

Found in: Component config > Application Level Tracing

Enables support for GCOV data transfer to host.

CONFIG_APPTRACE_GCOV_DUMP_TASK_STACK_SIZE

Gcov dump task stack size

Found in: Component config > Application Level Tracing > CONFIG_APPTRACE_GCOV_ENABLE

Configures stack size of Gcov dump task

Default value:

- 2048 if *CONFIG_APPTRACE_GCOV_ENABLE*

Bluetooth Contains:

- [Bluedroid Options](#)
- [CONFIG_BT_ENABLED](#)
- [Common Options](#)
- [Controller Options](#)
- [CONFIG_BT_HCI_LOG_DEBUG_EN](#)
- [NimBLE Options](#)
- [CONFIG_BT_RELEASE_IRAM](#)

CONFIG_BT_ENABLED

Bluetooth

Found in: [Component config](#) > [Bluetooth](#)

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

CONFIG_BT_HOST

Host

Found in: [Component config](#) > [Bluetooth](#) > [CONFIG_BT_ENABLED](#)

This helps to choose Bluetooth host stack

Available options:

- **Bluedroid - Dual-mode (CONFIG_BT_BLUEDROID_ENABLED)**
This option is recommended for classic Bluetooth or for dual-mode usecases
- **NimBLE - BLE only (CONFIG_BT_NIMBLE_ENABLED)**
This option is recommended for BLE only usecases to save on memory
- **Disabled (CONFIG_BT_CONTROLLER_ONLY)**
This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

CONFIG_BT_CONTROLLER

Controller

Found in: [Component config](#) > [Bluetooth](#) > [CONFIG_BT_ENABLED](#)

This helps to choose Bluetooth controller stack

Available options:

- **Enabled (CONFIG_BT_CONTROLLER_ENABLED)**
This option is recommended for Bluetooth controller usecases
- **Disabled (CONFIG_BT_CONTROLLER_DISABLED)**
This option is recommended for Bluetooth Host only usecases

Bluedroid Options Contains:

- [CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK](#)
- [CONFIG_BT_BLUEDROID_MEM_DEBUG](#)
- [CONFIG_BT_BTU_TASK_STACK_SIZE](#)
- [CONFIG_BT_BTC_TASK_STACK_SIZE](#)
- [CONFIG_BT_BLE_ENABLED](#)
- [BT_DEBUG_LOG_LEVEL](#)

- `CONFIG_BT_ACL_CONNECTIONS`
- `CONFIG_BT_SMP_MAX BONDS`
- `CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST`
- `CONFIG_BT_CLASSIC_ENABLED`
- `CONFIG_BT_HID_ENABLED`
- `CONFIG_BT_STACK_NO_LOG`
- `CONFIG_BT_BLE_42_FEATURES_SUPPORTED`
- `CONFIG_BT_BLE_50_FEATURES_SUPPORTED`
- `CONFIG_BT_BLE_HIGH_DUTY_ADV_INTERVAL`

- `CONFIG_BT_BLE_RPA_SUPPORTED`
- `CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY`
- `CONFIG_BT_HFP_WBS_ENABLE`

CONFIG_BT_BTC_TASK_STACK_SIZE

Bluetooth event (callback to application) task stack size

Found in: Component config > Bluetooth > Bluedroid Options

This select btc task stack size

Default value:

- 3072 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE

The cpu core which Bluedroid run

Found in: Component config > Bluetooth > Bluedroid Options

Which the cpu core to run Bluedroid. Can choose core0 and core1. Can not specify no-affinity.

Available options:

- Core 0 (PRO CPU) (`CONFIG_BT_BLUEDROID_PINNED_TO_CORE_0`)
- Core 1 (APP CPU) (`CONFIG_BT_BLUEDROID_PINNED_TO_CORE_1`)

CONFIG_BT_BTU_TASK_STACK_SIZE

Bluetooth Bluedroid Host Stack task stack size

Found in: Component config > Bluetooth > Bluedroid Options

This select btu task stack size

Default value:

- 4352 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_BLUEDROID_MEM_DEBUG

Bluetooth memory debug

Found in: *Component config > Bluetooth > Bluetooth Options*

Bluetooth memory debug

Default value:

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_BLUEDROID_ESP_COEX_VSC

Enable Espressif Vendor-specific HCI commands for coexist status configuration

Found in: *Component config > Bluetooth > Bluetooth Options*

Enable Espressif Vendor-specific HCI commands for coexist status configuration

Default value:

- Yes (enabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_CLASSIC_ENABLED

Classic Bluetooth

Found in: *Component config > Bluetooth > Bluetooth Options*

For now this option needs "SMP_ENABLE" to be set to yes

Default value:

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_BT_CLASSIC_SUPPORTED) || CONFIG_BT_CONTROLLER_DISABLED) && CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_ENC_KEY_SIZE_CTRL_ENABLED

configure encryption key size

Found in: *Component config > Bluetooth > Bluetooth Options > CONFIG_BT_CLASSIC_ENABLED*

This chooses the support status of configuring encryption key size

Available options:

- Supported by standard HCI command (`CONFIG_BT_ENC_KEY_SIZE_CTRL_STD`)
- Supported by Vendor-specific HCI command (`CONFIG_BT_ENC_KEY_SIZE_CTRL_VSC`)
- Not supported (`CONFIG_BT_ENC_KEY_SIZE_CTRL_NONE`)

CONFIG_BT_CLASSIC_BQB_ENABLED

Host Qualification support for Classic Bluetooth

Found in: *Component config > Bluetooth > Bluetooth Options > CONFIG_BT_CLASSIC_ENABLED*

This enables functionalities of Host qualification for Classic Bluetooth.

Default value:

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_A2DP_ENABLE

A2DP

Found in: Component config > Bluetooth > Bluebird Options > CONFIG_BT_CLASSIC_ENABLED

Advanced Audio Distribution Profile

Default value:

- No (disabled) if *CONFIG_BT_CLASSIC_ENABLED* && *CONFIG_BT_BLUEDROID_ENABLED*

CONFIG_BT_SPP_ENABLED

SPP

Found in: Component config > Bluetooth > Bluebird Options > CONFIG_BT_CLASSIC_ENABLED

This enables the Serial Port Profile

Default value:

- No (disabled) if *CONFIG_BT_CLASSIC_ENABLED* && *CONFIG_BT_BLUEDROID_ENABLED*

CONFIG_BT_L2CAP_ENABLED

BT L2CAP

Found in: Component config > Bluetooth > Bluebird Options > CONFIG_BT_CLASSIC_ENABLED

This enables the Logical Link Control and Adaptation Layer Protocol. Only supported classic bluetooth.

Default value:

- No (disabled) if *CONFIG_BT_CLASSIC_ENABLED* && *CONFIG_BT_BLUEDROID_ENABLED*

CONFIG_BT_HFP_ENABLE

Hands Free/Handset Profile

Found in: Component config > Bluetooth > Bluebird Options > CONFIG_BT_CLASSIC_ENABLED

Hands Free Unit and Audio Gateway can be included simultaneously but they cannot run simultaneously due to internal limitations.

Default value:

- No (disabled) if *CONFIG_BT_CLASSIC_ENABLED* && *CONFIG_BT_BLUEDROID_ENABLED*

Contains:

- *CONFIG_BT_HFP_AG_ENABLE*
- *CONFIG_BT_HFP_AUDIO_DATA_PATH*
- *CONFIG_BT_HFP_CLIENT_ENABLE*

CONFIG_BT_HFP_CLIENT_ENABLE

Hands Free Unit

*Found in: Component config > Bluetooth > Bluebird Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE***Default value:**

- Yes (enabled) if *CONFIG_BT_HFP_ENABLE* && *CONFIG_BT_BLUEDROID_ENABLED*

CONFIG_BT_HFP_AG_ENABLE

Audio Gateway

Found in: Component config > Bluetooth > Bluebird Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE

Default value:

- Yes (enabled) if *CONFIG_BT_HFP_ENABLE* && *CONFIG_BT_BLUEBIRD_ENABLED*

CONFIG_BT_HFP_AUDIO_DATA_PATH

audio(SCO) data path

Found in: Component config > Bluetooth > Bluebird Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE

SCO data path, i.e. HCI or PCM. This option is set using API "esp_bredr_sco_datapath_set" in Bluetooth host. Default SCO data path can also be set in Bluetooth Controller.

Available options:

- PCM (*CONFIG_BT_HFP_AUDIO_DATA_PATH_PCM*)
- HCI (*CONFIG_BT_HFP_AUDIO_DATA_PATH_HCI*)

CONFIG_BT_HFP_WBS_ENABLE

Wide Band Speech

Found in: Component config > Bluetooth > Bluebird Options

This enables Wide Band Speech. Should disable it when SCO data path is PCM. Otherwise there will be no data transmitted via GPIOs.

Default value:

- Yes (enabled) if *CONFIG_BT_HFP_AUDIO_DATA_PATH_HCI* && *CONFIG_BT_BLUEBIRD_ENABLED*

CONFIG_BT_HID_ENABLED

Classic BT HID

Found in: Component config > Bluetooth > Bluebird Options

This enables the BT HID Host

Default value:

- No (disabled) if *CONFIG_BT_CLASSIC_ENABLED* && *CONFIG_BT_BLUEBIRD_ENABLED*

Contains:

- *CONFIG_BT_HID_DEVICE_ENABLED*
- *CONFIG_BT_HID_HOST_ENABLED*

CONFIG_BT_HID_HOST_ENABLED

Classic BT HID Host

Found in: Component config > Bluetooth > Bluebird Options > CONFIG_BT_HID_ENABLED

This enables the BT HID Host

Default value:

- No (disabled) if *CONFIG_BT_HID_ENABLED* && *CONFIG_BT_BLUEBIRD_ENABLED*

CONFIG_BT_HID_DEVICE_ENABLED

Classic BT HID Device

Found in: Component config > Bluetooth > Blueroid Options > CONFIG_BT_HID_ENABLED

This enables the BT HID Device

CONFIG_BT_BLE_ENABLED

Bluetooth Low Energy

Found in: Component config > Bluetooth > Blueroid Options

This enables Bluetooth Low Energy

Default value:

- Yes (enabled) if `CONFIG_BT_BLUEROID_ENABLED` && `CONFIG_BT_BLUEROID_ENABLED`

CONFIG_BT_GATTS_ENABLE

Include GATT server module(GATTS)

Found in: Component config > Bluetooth > Blueroid Options > CONFIG_BT_BLE_ENABLED

This option can be disabled when the app work only on gatt client mode

Default value:

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEROID_ENABLED`

CONFIG_BT_GATTS_PPCP_CHAR_GAP

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

Found in: Component config > Bluetooth > Blueroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

This enables "Peripheral Preferred Connection Parameters" characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

Default value:

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEROID_ENABLED`

CONFIG_BT_BLE_BLUFI_ENABLE

Include blufi function

Found in: Component config > Bluetooth > Blueroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

This option can be close when the app does not require blufi function.

Default value:

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEROID_ENABLED`

CONFIG_BT_GATT_MAX_SR_PROFILES

Max GATT Server Profiles

Found in: Component config > Bluetooth > Blueroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Maximum GATT Server Profiles Count

Range:

- from 1 to 32 if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

Default value:

- 8 if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_GATT_MAX_SR_ATTRIBUTES

Max GATT Service Attributes

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Maximum GATT Service Attributes Count

Range:

- from 1 to 500 if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

Default value:

- 100 if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MODE

GATTS Service Change Mode

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Service change indication mode for GATT Server.

Available options:

- GATTS manually send service change indication (`CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MANUAL`)
Manually send service change indication through API `esp_ble_gatts_send_service_change_indication()`
- GATTS automatically send service change indication (`CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_AUTO`)
Let Bluedroid handle the service change indication internally

CONFIG_BT_GATTS_ROBUST_CACHING_ENABLED

Enable Robust Caching on Server Side

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

This option enables the GATT robust caching feature on the server. if turned on, the Client Supported Features characteristic, Database Hash characteristic, and Server Supported Features characteristic will be included in the GAP SERVICE.

Default value:

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_GATTS_DEVICE_NAME_WRITABLE

Allow to write device name by GATT clients

Found in: Component config > Bluetooth > Blueroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Enabling this option allows remote GATT clients to write device name

Default value:

- No (disabled) if *CONFIG_BT_GATTS_ENABLE* && *CONFIG_BT_BLUEDROID_ENABLED*

CONFIG_BT_GATTS_APPEARANCE_WRITABLE

Allow to write appearance by GATT clients

Found in: Component config > Bluetooth > Blueroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Enabling this option allows remote GATT clients to write appearance

Default value:

- No (disabled) if *CONFIG_BT_GATTS_ENABLE* && *CONFIG_BT_BLUEDROID_ENABLED*

CONFIG_BT_GATTC_ENABLE

Include GATT client module(GATTC)

Found in: Component config > Bluetooth > Blueroid Options > CONFIG_BT_BLE_ENABLED

This option can be close when the app work only on gatt server mode

Default value:

- Yes (enabled) if *CONFIG_BT_BLE_ENABLED* && *CONFIG_BT_BLUEDROID_ENABLED*

CONFIG_BT_GATTC_MAX_CACHE_CHAR

Max gattc cache characteristic for discover

Found in: Component config > Bluetooth > Blueroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

Maximum GATTC cache characteristic count

Range:

- from 1 to 500 if *CONFIG_BT_GATTC_ENABLE* && *CONFIG_BT_BLUEDROID_ENABLED*

Default value:

- 40 if *CONFIG_BT_GATTC_ENABLE* && *CONFIG_BT_BLUEDROID_ENABLED*

CONFIG_BT_GATTC_NOTIF_REG_MAX

Max gattc notify(indication) register number

Found in: Component config > Bluetooth > Blueroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

Maximum GATTC notify(indication) register number

Range:

- from 1 to 64 if *CONFIG_BT_GATTC_ENABLE* && *CONFIG_BT_BLUEDROID_ENABLED*

Default value:

- 5 if *CONFIG_BT_GATTC_ENABLE* && *CONFIG_BT_BLUEDROID_ENABLED*

CONFIG_BT_GATTC_CACHE_NVS_FLASH

Save gattc cache data to nvs flash

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

This select can save gattc cache data to nvs flash

Default value:

- No (disabled) if `CONFIG_BT_GATTC_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_GATTC_CONNECT_RETRY_COUNT

The number of attempts to reconnect if the connection establishment failed

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

The number of attempts to reconnect if the connection establishment failed

Range:

- from 0 to 255 if `CONFIG_BT_GATTC_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

Default value:

- 3 if `CONFIG_BT_GATTC_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_BLE_SMP_ENABLE

Include BLE security module(SMP)

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED

This option can be close when the app not used the ble security connect.

Default value:

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_SMP_SLAVE_CON_PARAMS_UPD_ENABLE

Slave enable connection parameters update during pairing

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_BLE_SMP_ENABLE

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

Default value:

- No (disabled) if `CONFIG_BT_BLE_SMP_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_BLE_SMP_ID_RESET_ENABLE

Reset device identity when all bonding records are deleted

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_BLE_SMP_ENABLE

There are tracking risks associated with using a fixed or static IRK. If enabled this option, Bluedroid will assign a new randomly-generated IRK when all pairing and bonding records are deleted. This would decrease the ability of a previously paired peer to be used to determine whether a device with which it previously shared an IRK is within range.

Default value:

- No (disabled) if `CONFIG_BT_BLE_SMP_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_STACK_NO_LOG

Disable BT debug logs (minimize bin size)

Found in: Component config > Bluetooth > Bluedroid Options

This select can save the rodata code size

Default value:

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

BT DEBUG LOG LEVEL Contains:

- `CONFIG_BT_LOG_A2D_TRACE_LEVEL`
- `CONFIG_BT_LOG_APPL_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVCT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVDT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVRC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BLUFI_TRACE_LEVEL`
- `CONFIG_BT_LOG_BNEP_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTIF_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTM_TRACE_LEVEL`
- `CONFIG_BT_LOG_GAP_TRACE_LEVEL`
- `CONFIG_BT_LOG_GATT_TRACE_LEVEL`
- `CONFIG_BT_LOG_HCI_TRACE_LEVEL`
- `CONFIG_BT_LOG_HID_TRACE_LEVEL`
- `CONFIG_BT_LOG_L2CAP_TRACE_LEVEL`
- `CONFIG_BT_LOG_MCA_TRACE_LEVEL`
- `CONFIG_BT_LOG_OSI_TRACE_LEVEL`
- `CONFIG_BT_LOG_PAN_TRACE_LEVEL`
- `CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL`
- `CONFIG_BT_LOG_SDP_TRACE_LEVEL`
- `CONFIG_BT_LOG_SMP_TRACE_LEVEL`

CONFIG_BT_LOG_HCI_TRACE_LEVEL

HCI layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for HCI layer

Available options:

- NONE (`CONFIG_BT_LOG_HCI_TRACE_LEVEL_NONE`)
- ERROR (`CONFIG_BT_LOG_HCI_TRACE_LEVEL_ERROR`)
- WARNING (`CONFIG_BT_LOG_HCI_TRACE_LEVEL_WARNING`)
- API (`CONFIG_BT_LOG_HCI_TRACE_LEVEL_API`)
- EVENT (`CONFIG_BT_LOG_HCI_TRACE_LEVEL_EVENT`)
- DEBUG (`CONFIG_BT_LOG_HCI_TRACE_LEVEL_DEBUG`)
- VERBOSE (`CONFIG_BT_LOG_HCI_TRACE_LEVEL_VERBOSE`)

CONFIG_BT_LOG_BTM_TRACE_LEVEL

BTM layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for BTM layer

Available options:

- NONE (CONFIG_BT_LOG_BTM_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_BTM_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_BTM_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_BTM_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_BTM_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_BTM_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_BTM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_L2CAP_TRACE_LEVEL

L2CAP layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for L2CAP layer

Available options:

- NONE (CONFIG_BT_LOG_L2CAP_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_L2CAP_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_L2CAP_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_L2CAP_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_L2CAP_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_L2CAP_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_L2CAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL

RFCOMM layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for RFCOMM layer

Available options:

- NONE (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SDP_TRACE_LEVEL

SDP layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for SDP layer

Available options:

- NONE (CONFIG_BT_LOG_SDP_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_SDP_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_SDP_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_SDP_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_SDP_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_SDP_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_SDP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GAP_TRACE_LEVEL

GAP layer

Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for GAP layer

Available options:

- NONE (CONFIG_BT_LOG_GAP_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_GAP_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_GAP_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_GAP_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_GAP_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_GAP_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_GAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BNEP_TRACE_LEVEL

BNEP layer

Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for BNEP layer

Available options:

- NONE (CONFIG_BT_LOG_BNEP_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_BNEP_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_BNEP_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_BNEP_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_BNEP_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_BNEP_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_BNEP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_PAN_TRACE_LEVEL

PAN layer

Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for PAN layer

Available options:

- NONE (CONFIG_BT_LOG_PAN_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_PAN_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_PAN_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_PAN_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_PAN_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_PAN_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_PAN_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_A2D_TRACE_LEVEL

A2D layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for A2D layer

Available options:

- NONE (CONFIG_BT_LOG_A2D_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_A2D_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_A2D_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_A2D_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_A2D_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_A2D_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_A2D_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVDT_TRACE_LEVEL

AVDT layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for AVDT layer

Available options:

- NONE (CONFIG_BT_LOG_AVDT_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_AVDT_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_AVDT_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_AVDT_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_AVDT_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_AVDT_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_AVDT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVCT_TRACE_LEVEL

AVCT layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for AVCT layer

Available options:

- NONE (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_EVENT)

- DEBUG (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVRC_TRACE_LEVEL

AVRC layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for AVRC layer

Available options:

- NONE (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_MCA_TRACE_LEVEL

MCA layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for MCA layer

Available options:

- NONE (CONFIG_BT_LOG_MCA_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_MCA_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_MCA_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_MCA_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_MCA_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_MCA_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_MCA_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_HID_TRACE_LEVEL

HID layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for HID layer

Available options:

- NONE (CONFIG_BT_LOG_HID_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_HID_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_HID_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_HID_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_HID_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_HID_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_HID_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_APPL_TRACE_LEVEL

APPL layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for APPL layer

Available options:

- NONE (CONFIG_BT_LOG_APPL_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_APPL_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_APPL_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_APPL_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_APPL_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_APPL_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_APPL_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GATT_TRACE_LEVEL

GATT layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for GATT layer

Available options:

- NONE (CONFIG_BT_LOG_GATT_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_GATT_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_GATT_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_GATT_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_GATT_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_GATT_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_GATT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SMP_TRACE_LEVEL

SMP layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for SMP layer

Available options:

- NONE (CONFIG_BT_LOG_SMP_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_SMP_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_SMP_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_SMP_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_SMP_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_SMP_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_SMP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTIF_TRACE_LEVEL

BTIF layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for BTIF layer

Available options:

- NONE (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTC_TRACE_LEVEL

BTC layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for BTC layer

Available options:

- NONE (CONFIG_BT_LOG_BTC_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_BTC_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_BTC_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_BTC_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_BTC_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_BTC_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_BTC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_OSI_TRACE_LEVEL

OSI layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for OSI layer

Available options:

- NONE (CONFIG_BT_LOG_OSI_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_OSI_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_OSI_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_OSI_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_OSI_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_OSI_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_OSI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BLUFI_TRACE_LEVEL

BLUFI layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for BLUFI layer

Available options:

- NONE (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_ACL_CONNECTIONS

BT/BLE MAX ACL CONNECTIONS(1~9)

Found in: Component config > Bluetooth > Bluedroid Options

Maximum BT/BLE connection count. The ESP32-C3/S3 chip supports a maximum of 10 instances, including ADV, SCAN and connections. The ESP32-C3/S3 chip can connect up to 9 devices if ADV or SCAN uses only one. If ADV and SCAN are both used, The ESP32-C3/S3 chip is connected to a maximum of 8 devices. Because Bluetooth cannot reclaim used instances once ADV or SCAN is used.

Range:

- from 1 to 9 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

Default value:

- 4 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_MULTI_CONNECTION_ENBALE

Enable BLE multi-connections

Found in: Component config > Bluetooth > Bluedroid Options

Enable this option if there are multiple connections

Default value:

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST

BT/BLE will first malloc the memory from the PSRAM

Found in: Component config > Bluetooth > Bluedroid Options

This select can save the internal RAM if there have the PSRAM

Default value:

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY

Use dynamic memory allocation in BT/BLE stack

Found in: Component config > Bluetooth > Bluedroid Options

This select can make the allocation of memory will become more flexible

Default value:

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK

BLE queue congestion check

Found in: Component config > Bluetooth > Blueroid Options

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

Default value:

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_SMP_MAX BONDS

BT/BLE maximum bond device count

Found in: Component config > Bluetooth > Blueroid Options

The number of security records for peer devices.

CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN

Report adv data and scan response individually when BLE active scan

Found in: Component config > Bluetooth > Blueroid Options

Originally, when doing BLE active scan, Blueroid will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Blueroid will report adv data or scan response to application layer immediately.

Memory reserved at start of DRAM for Bluetooth stack

Default value:

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT

Timeout of BLE connection establishment

Found in: Component config > Bluetooth > Blueroid Options

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, `ESP_GATTC_OPEN_EVT` or `ESP_GATTS_OPEN_EVT` is triggered.

Range:

- from 1 to 60 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

Default value:

- 30 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_MAX_DEVICE_NAME_LEN

length of bluetooth device name

Found in: Component config > Bluetooth > Blueroid Options

Bluetooth Device name length shall be no larger than 248 octets, If the broadcast data cannot contain the complete device name, then only the shortname will be displayed, the rest parts that can't fit in will be truncated.

Range:

- from 32 to 248 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

Default value:

- 32 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_BLE_RPA_SUPPORTED

Update RPA to Controller

Found in: Component config > Bluetooth > Bluedroid Options

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For other BLE chips, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.

Default value:

- Yes (enabled) if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_BLE_RPA_TIMEOUT

Timeout of resolvable private address

Found in: Component config > Bluetooth > Bluedroid Options

This set RPA timeout of Controller and Host. Default is 900 s (15 minutes). Range is 1 s to 1 hour (3600 s).

Range:

- from 1 to 3600 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

Default value:

- 900 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_BLE_50_FEATURES_SUPPORTED

Enable BLE 5.0 features

Found in: Component config > Bluetooth > Bluedroid Options

Enabling this option activates BLE 5.0 features. This option is universally supported in chips that support BLE, except for ESP32.

Default value:

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_BLE_50_SUPPORTED) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_BLE_42_FEATURES_SUPPORTED

Enable BLE 4.2 features

Found in: Component config > Bluetooth > Bluedroid Options

This enables BLE 4.2 features.

Default value:

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_BLE_SUPPORTED) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_BLE_FEAT_PERIODIC_ADV_SYNC_TRANSFER

Enable BLE periodic advertising sync transfer feature

Found in: Component config > Bluetooth > Bluedroid Options

This enables BLE periodic advertising sync transfer feature

Default value:

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_ESP_NIMBLE_CONTROLLER) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_BLE_FEAT_PERIODIC_ADV_ENH

Enable periodic adv enhancements(adi support)

Found in: Component config > Bluetooth > Bluedroid Options

Enable the periodic advertising enhancements

Default value:

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_ESP_NIMBLE_CONTROLLER) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_BLE_FEAT_CREATE_SYNC_ENH

Enable create sync enhancements(reporting disable and duplicate filtering enable support)

Found in: Component config > Bluetooth > Bluedroid Options

Enable the create sync enhancements

Default value:

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_ESP_NIMBLE_CONTROLLER) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_BLE_HIGH_DUTY_ADV_INTERVAL

Enable BLE high duty advertising interval feature

Found in: Component config > Bluetooth > Bluedroid Options

This enable BLE high duty advertising interval feature

Default value:

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

NimBLE Options Contains:

- `CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS`
- `CONFIG_BT_NIMBLE_HOST_QUEUE_CONG_CHECK`
- `BLE Services`
- `CONFIG_BT_NIMBLE_WHITELIST_SIZE`
- `CONFIG_BT_NIMBLE_BLE_GATT_BLOB_TRANSFER`
- `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT`
- `CONFIG_BT_NIMBLE_ROLE_BROADCASTER`
- `CONFIG_BT_NIMBLE_ROLE_CENTRAL`

- `CONFIG_BT_NIMBLE_HIGH_DUTY_ADV_ITVL`
- `CONFIG_BT_NIMBLE_MESH`
- `CONFIG_BT_NIMBLE_ROLE_OBSERVER`
- `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL`
- `CONFIG_BT_NIMBLE_SECURITY_ENABLE`
- `CONFIG_BT_NIMBLE_BLUFI_ENABLE`
- `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT`
- `CONFIG_BT_NIMBLE_DYNAMIC_SERVICE`
- `CONFIG_BT_NIMBLE_USE_ESP_TIMER`
- `CONFIG_BT_NIMBLE_DEBUG`
- `CONFIG_BT_NIMBLE_HS_FLOW_CTRL`
- `CONFIG_BT_NIMBLE_VS_SUPPORT`
- `CONFIG_BT_NIMBLE_OPTIMIZE_MULTI_CONN`
- `CONFIG_BT_NIMBLE_ENC_ADV_DATA`
- `CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE`
- *GAP Service*
- *Host-controller Transport*
- `CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN`
- `CONFIG_BT_NIMBLE_MAX BONDS`
- `CONFIG_BT_NIMBLE_MAX CCCDS`
- `CONFIG_BT_NIMBLE_MAX CONNECTIONS`
- `CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM`
- `CONFIG_BT_NIMBLE_GATT_MAX_PROCS`
- `CONFIG_BT_NIMBLE_MEM_ALLOC_MODE`
- *Memory Settings*
- `CONFIG_BT_NIMBLE_LOG_LEVEL`
- `CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE`
- `CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS`
- `CONFIG_BT_NIMBLE_NVS_PERSIST`
- `CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU`
- `CONFIG_BT_NIMBLE_SMP_ID_RESET`
- `CONFIG_BT_NIMBLE_RPA_TIMEOUT`
- `CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE`
- `CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST`

CONFIG_BT_NIMBLE_MEM_ALLOC_MODE

Memory allocation strategy

Found in: Component config > Bluetooth > NimBLE Options

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Available options:

- Internal memory (`CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL`)
- External SPIRAM (`CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL`)
- Default alloc mode (`CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT`)
- Internal IRAM (`CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT`)
Allows to use IRAM memory region as 8bit accessible region.
Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_BT_NIMBLE_LOG_LEVEL

NimBLE Host log verbosity

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed the level set in "Component config --> Log output --> Default log verbosity".

Available options:

- No logs (CONFIG_BT_NIMBLE_LOG_LEVEL_NONE)
- Error logs (CONFIG_BT_NIMBLE_LOG_LEVEL_ERROR)
- Warning logs (CONFIG_BT_NIMBLE_LOG_LEVEL_WARNING)
- Info logs (CONFIG_BT_NIMBLE_LOG_LEVEL_INFO)
- Debug logs (CONFIG_BT_NIMBLE_LOG_LEVEL_DEBUG)

CONFIG_BT_NIMBLE_MAX_CONNECTIONS

Maximum number of concurrent connections

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure BTDM_CTRL_BLE_MAX_CONN from controller menu along with this option. Similarly for ESP32-C3 or ESP32-S3, user is expected to configure BT_CTRL_BLE_MAX_ACT from controller menu. For ESP32C2, ESP32C6 and ESP32H2, each connection will take about 1k DRAM.

Range:

- from 1 to 9 if [CONFIG_BT_NIMBLE_ENABLED](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

Default value:

- 3 if [CONFIG_BT_NIMBLE_ENABLED](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_MAX BONDS

Maximum number of bonds to save across reboots

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Defines maximum number of bonds to save for peer security and our security

Default value:

- 3 if [CONFIG_BT_NIMBLE_ENABLED](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_MAX_CCCDS

Maximum number of CCC descriptors to save across reboots

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Defines maximum number of CCC descriptors to save

Default value:

- 8 if [CONFIG_BT_NIMBLE_ENABLED](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM

Maximum number of connection oriented channels

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

Range:

- from 0 to 9 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

Default value:

- 0 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE

The CPU core on which NimBLE host will run

Found in: Component config > Bluetooth > NimBLE Options

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

Available options:

- Core 0 (PRO CPU) (`CONFIG_BT_NIMBLE_PINNED_TO_CORE_0`)
- Core 1 (APP CPU) (`CONFIG_BT_NIMBLE_PINNED_TO_CORE_1`)

CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE

NimBLE Host task stack size

Found in: Component config > Bluetooth > NimBLE Options

This configures stack size of NimBLE host task

Default value:

- 5120 if `CONFIG_BLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`
- 4096 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ROLE_CENTRAL

Enable BLE Central role

Found in: Component config > Bluetooth > NimBLE Options

Enables central role

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ROLE_PERIPHERAL

Enable BLE Peripheral role

Found in: Component config > Bluetooth > NimBLE Options

Enable peripheral role

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ROLE_BROADCASTER

Enable BLE Broadcaster role

Found in: Component config > Bluetooth > NimBLE Options

Enables broadcaster role

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ROLE_OBSERVER

Enable BLE Observer role

Found in: Component config > Bluetooth > NimBLE Options

Enables observer role

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_NVS_PERSIST

Persist the BLE Bonding keys in NVS

Found in: Component config > Bluetooth > NimBLE Options

Enable this flag to make bonding persistent across device reboots

Default value:

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SMP_ID_RESET

Reset device identity when all bonding records are deleted

Found in: Component config > Bluetooth > NimBLE Options

There are tracking risks associated with using a fixed or static IRK. If enabled this option, Bluebird will assign a new randomly-generated IRK when all pairing and bonding records are deleted. This would decrease the ability of a previously paired peer to be used to determine whether a device with which it previously shared an IRK is within range.

Default value:

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable BLE SM feature

Found in: Component config > Bluetooth > NimBLE Options

Enable BLE sm feature

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

Contains:

- `CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION`
- `CONFIG_BT_NIMBLE_SM_LVL`
- `CONFIG_BT_NIMBLE_SM_LEGACY`
- `CONFIG_BT_NIMBLE_SM_SC`

CONFIG_BT_NIMBLE_SM_LEGACY

Security manager legacy pairing

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable security manager legacy pairing

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SM_SC

Security manager secure connections (4.2)

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_SECURITY_ENABLE](#)

Enable security manager secure connections

Default value:

- Yes (enabled) if [CONFIG_BT_NIMBLE_SECURITY_ENABLE](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS

Use predefined public-private key pair

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_SECURITY_ENABLE](#) > [CONFIG_BT_NIMBLE_SM_SC](#)

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

Default value:

- No (disabled) if [CONFIG_BT_NIMBLE_SECURITY_ENABLE](#) && [CONFIG_BT_NIMBLE_SM_SC](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION

Enable LE encryption

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_SECURITY_ENABLE](#)

Enable encryption connection

Default value:

- Yes (enabled) if [CONFIG_BT_NIMBLE_SECURITY_ENABLE](#) && [CONFIG_BT_NIMBLE_ENABLED](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_SM_LVL

Security level

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_SECURITY_ENABLE](#)

LE Security Mode 1 Levels: 1. No Security 2. Unauthenticated pairing with encryption 3. Authenticated pairing with encryption 4. Authenticated LE Secure Connections pairing with encryption using a 128-bit strength encryption key.

Default value:

- 0 if [CONFIG_BT_NIMBLE_SECURITY_ENABLE](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_DEBUG

Enable extra runtime asserts and host debugging

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

This enables extra runtime asserts and host debugging

Default value:

- No (disabled) if [CONFIG_BT_NIMBLE_ENABLED](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_DYNAMIC_SERVICE

Enable dynamic services

Found in: Component config > Bluetooth > NimBLE Options

This enables user to add/remove Gatt services at runtime

CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME

BLE GAP default device name

Found in: Component config > Bluetooth > NimBLE Options

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API `ble_svc_gap_device_name_set()`

Default value:

- "nimble" if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN

Maximum length of BLE device name in octets

Found in: Component config > Bluetooth > NimBLE Options

Device Name characteristic value shall be 0 to 248 octets in length

Default value:

- 31 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU

Preferred MTU size in octets

Found in: Component config > Bluetooth > NimBLE Options

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API `ble_att_set_preferred_mtu()`

Default value:

- 256 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE

External appearance of the device

Found in: Component config > Bluetooth > NimBLE Options

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

Default value:

- 0 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

Memory Settings Contains:

- `CONFIG_BT_NIMBLE_TRANSPORT_ACL_FROM_LL_COUNT`
- `CONFIG_BT_NIMBLE_TRANSPORT_EVT_DISCARD_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_BUF_FROM_HEAP`
- `CONFIG_BT_NIMBLE_L2CAP_COC_SDU_BUFF_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE`
- `CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE`
- `CONFIG_BT_NIMBLE_TRANSPORT_ACL_SIZE`

- [CONFIG_BT_NIMBLE_TRANSPORT_EVT_COUNT](#)
- [CONFIG_BT_NIMBLE_TRANSPORT_EVT_SIZE](#)

CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT

MSYS_1 Block Count

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)

MSYS is a system level mbuf registry. For prepare write & prepare responses Mbufs are allocated out of msys_1 pool. For NIMBLE_MESH enabled cases, this block count is increased by 8 than user defined count.

Default value:

- 24 if SOC_ESP_NIMBLE_CONTROLLER && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE

MSYS_1 Block Size

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)

Dynamic memory size of block 1

Default value:

- 128 if SOC_ESP_NIMBLE_CONTROLLER && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT

MSYS_2 Block Count

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)

Dynamic memory count

Default value:

- 24 if [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE

MSYS_2 Block Size

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)

Dynamic memory size of block 2

Default value:

- 320 if [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_MSYS_BUF_FROM_HEAP

Get Msys Mbuf from heap

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)

This option sets the source of the shared msys mbuf memory between the Host and the Controller. Allocate the memory from the heap if this option is sets, from the mempool otherwise.

Default value:

- Yes (enabled) if BT_LE_MSYS_INIT_IN_CONTROLLER && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_TRANSPORT_ACL_FROM_LL_COUNT

ACL Buffer count

Found in: Component config > Bluetooth > NimBLE Options > Memory Settings

The number of ACL data buffers allocated for host.

Default value:

- 24 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_TRANSPORT_ACL_SIZE

Transport ACL Buffer size

Found in: Component config > Bluetooth > NimBLE Options > Memory Settings

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

Default value:

- 255 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_TRANSPORT_EVT_SIZE

Transport Event Buffer size

Found in: Component config > Bluetooth > NimBLE Options > Memory Settings

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

Default value:

- 257 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`
- 70 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_TRANSPORT_EVT_COUNT

Transport Event Buffer count

Found in: Component config > Bluetooth > NimBLE Options > Memory Settings

This is the high priority HCI events' buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead

Default value:

- 30 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_TRANSPORT_EVT_DISCARD_COUNT

Discardable Transport Event Buffer count

Found in: Component config > Bluetooth > NimBLE Options > Memory Settings

This is the low priority HCI events' buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped

Default value:

- 8 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_L2CAP_COC_SDU_BUFF_COUNT

L2cap coc Service Data Unit Buffer count

Found in: Component config > Bluetooth > NimBLE Options > Memory Settings

This is the service data unit buffer count for l2cap coc.

Default value:

- 1 if *CONFIG_BT_NIMBLE_ENABLED* && *CONFIG_BT_NIMBLE_ENABLED*

CONFIG_BT_NIMBLE_GATT_MAX_PROCS

Maximum number of GATT client procedures

Found in: Component config > Bluetooth > NimBLE Options

Maximum number of GATT client procedures that can be executed.

Default value:

- 4 if *CONFIG_BT_NIMBLE_ENABLED* && *CONFIG_BT_NIMBLE_ENABLED*

CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Enable Host Flow control

Found in: Component config > Bluetooth > NimBLE Options

Enable Host Flow control

Default value:

- No (disabled) if *CONFIG_BT_NIMBLE_ENABLED* && *CONFIG_BT_NIMBLE_ENABLED*

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_ITVL

Host Flow control interval

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Host flow control interval in msecs

Default value:

- 1000 if *CONFIG_BT_NIMBLE_HS_FLOW_CTRL* && *CONFIG_BT_NIMBLE_ENABLED*

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_THRESH

Host Flow control threshold

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

Default value:

- 2 if *CONFIG_BT_NIMBLE_HS_FLOW_CTRL* && *CONFIG_BT_NIMBLE_ENABLED*

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_TX_ON_DISCONNECT

Host Flow control on disconnect

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Enable this option to send number-of-completed-packets event to controller after disconnection

Default value:

- Yes (enabled) if *CONFIG_BT_NIMBLE_HS_FLOW_CTRL* && *CONFIG_BT_NIMBLE_ENABLED*

CONFIG_BT_NIMBLE_RPA_TIMEOUT

RPA timeout in seconds

Found in: Component config > Bluetooth > NimBLE Options

Time interval between RPA address change.

Range:

- from 1 to 41400 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

Default value:

- 900 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH

Enable BLE mesh functionality

Found in: Component config > Bluetooth > NimBLE Options

Enable BLE Mesh example present in upstream mynewt-nimble and not maintained by Espressif.

IDF maintains ESP-BLE-MESH as the official Mesh solution. Please refer to ESP-BLE-MESH guide at: `./esp32/api-guides/esp-ble-mesh/ble-mesh-index`

Default value:

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

Contains:

- `CONFIG_BT_NIMBLE_MESH_PROVISIONER`
- `CONFIG_BT_NIMBLE_MESH_PROV`
- `CONFIG_BT_NIMBLE_MESH_GATT_PROXY`
- `CONFIG_BT_NIMBLE_MESH_FRIEND`
- `CONFIG_BT_NIMBLE_MESH_LOW_POWER`
- `CONFIG_BT_NIMBLE_MESH_PROXY`
- `CONFIG_BT_NIMBLE_MESH_RELAY`
- `CONFIG_BT_NIMBLE_MESH_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_MESH_NODE_COUNT`

CONFIG_BT_NIMBLE_MESH_PROXY

Enable mesh proxy functionality

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable proxy. This is automatically set whenever `NIMBLE_MESH_PB_GATT` or `NIMBLE_MESH_GATT_PROXY` is set

Default value:

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_PROV

Enable BLE mesh provisioning

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable mesh provisioning

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_PB_ADV

Enable mesh provisioning over advertising bearer

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#) > [CONFIG_BT_NIMBLE_MESH_PROV](#)

Enable this option to allow the device to be provisioned over the advertising bearer

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH_PROV` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_PB_GATT

Enable mesh provisioning over GATT bearer

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#) > [CONFIG_BT_NIMBLE_MESH_PROV](#)

Enable this option to allow the device to be provisioned over the GATT bearer

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH_PROV` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_GATT_PROXY

Enable GATT Proxy functionality

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#)

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_RELAY

Enable mesh relay functionality

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#)

Support for acting as a Mesh Relay Node

Default value:

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_LOW_POWER

Enable mesh low power mode

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#)

Enable this option to be able to act as a Low Power Node

Default value:

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_FRIEND

Enable mesh friend functionality

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable this option to be able to act as a Friend Node

Default value:

- No (disabled) if *CONFIG_BT_NIMBLE_MESH* && *CONFIG_BT_NIMBLE_ENABLED*

CONFIG_BT_NIMBLE_MESH_DEVICE_NAME

Set mesh device name

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

This value defines Bluetooth Mesh device/node name

Default value:

- "nimble-mesh-node" if *CONFIG_BT_NIMBLE_MESH* && *CONFIG_BT_NIMBLE_ENABLED*

CONFIG_BT_NIMBLE_MESH_NODE_COUNT

Set mesh node count

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Defines mesh node count.

Default value:

- 1 if *CONFIG_BT_NIMBLE_MESH* && *CONFIG_BT_NIMBLE_ENABLED*

CONFIG_BT_NIMBLE_MESH_PROVISIONER

Enable BLE mesh provisioner

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable mesh provisioner.

Default value:

- 0 if *CONFIG_BT_NIMBLE_MESH* && *CONFIG_BT_NIMBLE_ENABLED*

CONFIG_BT_NIMBLE_CRYPTOSTACK_MBEDTLS

Override TinyCrypt with mbedTLS for crypto computations

Found in: Component config > Bluetooth > NimBLE Options

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

Default value:

- Yes (enabled) if *CONFIG_BT_NIMBLE_ENABLED* && *CONFIG_BT_NIMBLE_ENABLED*

CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS

BLE host stop timeout in msec

Found in: Component config > Bluetooth > NimBLE Options

BLE Host stop procedure timeout in milliseconds.

Default value:

- 2000 if *CONFIG_BT_NIMBLE_ENABLED* && *CONFIG_BT_NIMBLE_ENABLED*

CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT

Enable connection reattempts on connection establishment error

Found in: [Component config > Bluetooth > NimBLE Options](#)

Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.

Default value:

- Yes (enabled) if `SOC_ESP_NIMBLE_CONTROLLER` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MAX_CONN_REATTEMPT

Maximum number connection reattempts

Found in: [Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT](#)

Defines maximum number of connection reattempts.

Range:

- from 1 to 255 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT` && `CONFIG_BT_NIMBLE_ENABLED`

Default value:

- 3 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable BLE 5 feature

Found in: [Component config > Bluetooth > NimBLE Options](#)

Enable BLE 5 feature

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `SOC_BLE_50_SUPPORTED` && `CONFIG_BT_NIMBLE_ENABLED`

Contains:

- `CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY`
- `CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_CODED_PHY`
- `CONFIG_BT_NIMBLE_EXT_ADV`
- `CONFIG_BT_NIMBLE_GATT_CACHING`
- `CONFIG_BT_NIMBLE_BLE_POWER_CONTROL`
- `CONFIG_BT_NIMBLE_MAX_PERIODIC_ADVERTISER_LIST`
- `CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCES`
- `CONFIG_BT_NIMBLE_PERIODIC_ADV_ENH`

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY

Enable 2M Phy

Found in: [Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#)

Enable 2M-PHY

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_CODED_PHY

Enable coded Phy

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#)

Enable coded-PHY

Default value:

- Yes (enabled) if [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_EXT_ADV

Enable extended advertising

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#)

Enable this option to do extended advertising. Extended advertising will be supported from BLE 5.0 onwards.

Default value:

- No (disabled) if [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_MAX_EXT_ADV_INSTANCES

Maximum number of extended advertising instances.

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#) > [CONFIG_BT_NIMBLE_EXT_ADV](#)

Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want. For ESP32C2, ESP32C6 and ESP32H2, each extended advertising instance will take about 0.5k DRAM.

Range:

- from 0 to 4 if [CONFIG_BT_NIMBLE_EXT_ADV](#) && [CONFIG_BT_NIMBLE_EXT_ADV](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

Default value:

- 1 if [CONFIG_BT_NIMBLE_EXT_ADV](#) && [CONFIG_BT_NIMBLE_EXT_ADV](#) && [CONFIG_BT_NIMBLE_EXT_ADV](#) && [CONFIG_BT_NIMBLE_ENABLED](#)
- 0 if [CONFIG_BT_NIMBLE_EXT_ADV](#) && [CONFIG_BT_NIMBLE_EXT_ADV](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_EXT_ADV_MAX_SIZE

Maximum length of the advertising data.

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#) > [CONFIG_BT_NIMBLE_EXT_ADV](#)

Defines the length of the extended adv data. The value should not exceed 1650.

Range:

- from 0 to 1650 if [CONFIG_BT_NIMBLE_EXT_ADV](#) && [CONFIG_BT_NIMBLE_EXT_ADV](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

Default value:

- 1650 if [CONFIG_BT_NIMBLE_EXT_ADV](#) && [CONFIG_BT_NIMBLE_EXT_ADV](#) && [CONFIG_BT_NIMBLE_EXT_ADV](#) && [CONFIG_BT_NIMBLE_ENABLED](#)
- 0 if [CONFIG_BT_NIMBLE_EXT_ADV](#) && [CONFIG_BT_NIMBLE_EXT_ADV](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV

Enable periodic advertisement.

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#) > [CONFIG_BT_NIMBLE_EXT_ADV](#)

Enable this option to start periodic advertisement.

Default value:

- Yes (enabled) if [CONFIG_BT_NIMBLE_EXT_ADV](#) && [CONFIG_BT_NIMBLE_EXT_ADV](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_PERIODIC_ADV_SYNC_TRANSFER

Enable Transfer Sync Events

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#) > [CONFIG_BT_NIMBLE_EXT_ADV](#) > [CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV](#)

This enables controller transfer periodic sync events to host

Default value:

- Yes (enabled) if [CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV](#) && [CONFIG_BT_NIMBLE_EXT_ADV](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS

Maximum number of periodic advertising syncs

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#)

Set this option to set the upper limit for number of periodic sync connections. This should be less than maximum connections allowed by controller.

Range:

- from 0 to 8 if [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

Default value:

- 1 if [CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV](#) && [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#) && [CONFIG_BT_NIMBLE_ENABLED](#)
- 0 if [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_MAX_PERIODIC_ADVERTISER_LIST

Maximum number of periodic advertiser list

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#)

Set this option to set the upper limit for number of periodic advertiser list.

Range:

- from 1 to 5 if [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#) && [SOC_ESP_NIMBLE_CONTROLLER](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

Default value:

- 5 if [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#) && [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#) && [SOC_ESP_NIMBLE_CONTROLLER](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_BLE_POWER_CONTROL

Enable support for BLE Power Control

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#)

Set this option to enable the Power Control feature

Default value:

- No (disabled) if [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#) && [SOC_BLE_POWER_CONTROL_SUPPORTED](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_PERIODIC_ADV_ENH

Periodic adv enhancements(adi support)

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#)

Enable the periodic advertising enhancements

CONFIG_BT_NIMBLE_GATT_CACHING

Enable GATT caching

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#)

Enable GATT caching

Contains:

- [CONFIG_BT_NIMBLE_GATT_CACHING_MAX_CONNS](#)
- [CONFIG_BT_NIMBLE_GATT_CACHING_MAX_CHRS](#)
- [CONFIG_BT_NIMBLE_GATT_CACHING_MAX_DSCS](#)
- [CONFIG_BT_NIMBLE_GATT_CACHING_MAX_SVCS](#)

CONFIG_BT_NIMBLE_GATT_CACHING_MAX_CONNS

Maximum connections to be cached

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#) > [CONFIG_BT_NIMBLE_GATT_CACHING](#)

Set this option to set the upper limit on number of connections to be cached.

Default value:

- 1 if [CONFIG_BT_NIMBLE_GATT_CACHING](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_GATT_CACHING_MAX_SVCS

Maximum number of services per connection

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#) > [CONFIG_BT_NIMBLE_GATT_CACHING](#)

Set this option to set the upper limit on number of services per connection to be cached.

Default value:

- 64 if [CONFIG_BT_NIMBLE_GATT_CACHING](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_GATT_CACHING_MAX_CHRS

Maximum number of characteristics per connection

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#) > [CONFIG_BT_NIMBLE_GATT_CACHING](#)

Set this option to set the upper limit on number of characteristics per connection to be cached.

Default value:

- 64 if [CONFIG_BT_NIMBLE_GATT_CACHING](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_GATT_CACHING_MAX_DSCS

Maximum number of descriptors per connection

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#) > [CONFIG_BT_NIMBLE_GATT_CACHING](#)

Set this option to set the upper limit on number of descriptors per connection to be cached.

Default value:

- 64 if [CONFIG_BT_NIMBLE_GATT_CACHING](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_WHITELIST_SIZE

BLE white list size

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

BLE list size

Range:

- from 1 to 15 if [CONFIG_BT_NIMBLE_ENABLED](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

Default value:

- 12 if [CONFIG_BT_NIMBLE_ENABLED](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST

Throughput Test Mode enable

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable the throughput test mode

Default value:

- No (disabled) if [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_BLUFI_ENABLE

Enable blufi functionality

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Set this option to enable blufi functionality.

Default value:

- No (disabled) if [CONFIG_BT_NIMBLE_ENABLED](#) && [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_USE_ESP_TIMER

Enable Esp Timer for Nimble

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_BLE_GATT_BLOB_TRANSFER

Blob transfer

Found in: Component config > Bluetooth > NimBLE Options

This option is used when data to be sent is more than 512 bytes. For peripheral role, `BT_NIMBLE_MSYS_1_BLOCK_COUNT` needs to be increased according to the need.

GAP Service Contains:

- *GAP Appearance write permissions*
- `CONFIG_BT_NIMBLE_SVC_GAP_CENT_ADDR_RESOLUTION`
- *GAP device name write permissions*
- `CONFIG_BT_NIMBLE_SVC_GAP_PPCP_MAX_CONN_INTERVAL`
- `CONFIG_BT_NIMBLE_SVC_GAP_PPCP_MIN_CONN_INTERVAL`
- `CONFIG_BT_NIMBLE_SVC_GAP_PPCP_SLAVE_LATENCY`
- `CONFIG_BT_NIMBLE_SVC_GAP_PPCP_SUPERVISION_TMO`

GAP Appearance write permissions Contains:

- `CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE`

CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE

Write

Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions

Enable write permission (`BLE_GATT_CHR_F_WRITE`)

Default value:

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE_ENC

Write with encryption

Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE

Enable write with encryption permission (`BLE_GATT_CHR_F_WRITE_ENC`)

Default value:

- No (disabled) if `CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE_AUTHEN

Write with authentication

Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE

Enable write with authentication permission (`BLE_GATT_CHR_F_WRITE_AUTHEN`)

Default value:

- No (disabled) if `CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE_AUTHOR

Write with authorisation

Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE

Enable write with authorisation permission (BLE_GATT_CHR_F_WRITE_AUTHOR)

Default value:

- No (disabled) if `CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SVC_GAP_CENT_ADDR_RESOLUTION

GAP Characteristic - Central Address Resolution

Found in: Component config > Bluetooth > NimBLE Options > GAP Service

Whether or not Central Address Resolution characteristic is supported on the device, and if supported, whether or not Central Address Resolution is supported.

- Central Address Resolution characteristic not supported
- Central Address Resolution not supported
- Central Address Resolution supported

Available options:

- Characteristic not supported (CONFIG_BT_NIMBLE_SVC_GAP_CAR_CHAR_NOT_SUPP)
- Central Address Resolution not supported (CONFIG_BT_NIMBLE_SVC_GAP_CAR_NOT_SUPP)
- Central Address Resolution supported (CONFIG_BT_NIMBLE_SVC_GAP_CAR_SUPP)

GAP device name write permissions Contains:

- `CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE`

CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE

Write

Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions

Enable write permission (BLE_GATT_CHR_F_WRITE)

Default value:

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE_ENC

Write with encryption

Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE

Enable write with encryption permission (BLE_GATT_CHR_F_WRITE_ENC)

Default value:

- No (disabled) if `CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE_AUTHEN

Write with authentication

Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE

Enable write with authentication permission (BLE_GATT_CHR_F_WRITE_AUTHEN)

Default value:

- No (disabled) if `CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE_AUTHOR

Write with authorisation

Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE

Enable write with authorisation permission (BLE_GATT_CHR_F_WRITE_AUTHOR)

Default value:

- No (disabled) if `CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SVC_GAP_PPCP_MAX_CONN_INTERVAL

PPCP Connection Interval Max (Unit: 1.25 ms)

Found in: Component config > Bluetooth > NimBLE Options > GAP Service

Peripheral Preferred Connection Parameter: Connection Interval maximum value Interval Max = value * 1.25 ms

Default value:

- 0 if `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SVC_GAP_PPCP_MIN_CONN_INTERVAL

PPCP Connection Interval Min (Unit: 1.25 ms)

Found in: Component config > Bluetooth > NimBLE Options > GAP Service

Peripheral Preferred Connection Parameter: Connection Interval minimum value Interval Min = value * 1.25 ms

Default value:

- 0 if `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SVC_GAP_PPCP_SLAVE_LATENCY

PPCP Slave Latency

Found in: Component config > Bluetooth > NimBLE Options > GAP Service

Peripheral Preferred Connection Parameter: Slave Latency

Default value:

- 0 if `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SVC_GAP_PPCP_SUPERVISION_TMO

PPCP Supervision Timeout (Uint: 10 ms)

Found in: Component config > Bluetooth > NimBLE Options > GAP Service

Peripheral Preferred Connection Parameter: Supervision Timeout Timeout = Value * 10 ms

Default value:

- 0 if *CONFIG_BT_NIMBLE_ENABLED*

BLE Services Contains:

- *CONFIG_BT_NIMBLE_HID_SERVICE*

CONFIG_BT_NIMBLE_HID_SERVICE

HID service

Found in: Component config > Bluetooth > NimBLE Options > BLE Services

Enable HID service support

Default value:

- No (disabled) if *CONFIG_BT_NIMBLE_ENABLED* && *CONFIG_BT_NIMBLE_ENABLED*

Contains:

- *CONFIG_BT_NIMBLE_SVC_HID_MAX_RPTS*
- *CONFIG_BT_NIMBLE_SVC_HID_MAX_INSTANCES*

CONFIG_BT_NIMBLE_SVC_HID_MAX_INSTANCES

Maximum HID service instances

Found in: Component config > Bluetooth > NimBLE Options > BLE Services > CONFIG_BT_NIMBLE_HID_SERVICE

Defines maximum number of HID service instances

Default value:

- 2 if *CONFIG_BT_NIMBLE_HID_SERVICE* && *CONFIG_BT_NIMBLE_ENABLED*

CONFIG_BT_NIMBLE_SVC_HID_MAX_RPTS

Maximum HID Report characteristics per service instance

Found in: Component config > Bluetooth > NimBLE Options > BLE Services > CONFIG_BT_NIMBLE_HID_SERVICE

Defines maximum number of report characteristics per service instance

Default value:

- 3 if *CONFIG_BT_NIMBLE_HID_SERVICE* && *CONFIG_BT_NIMBLE_ENABLED*

CONFIG_BT_NIMBLE_VS_SUPPORT

Enable support for VSC and VSE

Found in: Component config > Bluetooth > NimBLE Options

This option is used to enable support for sending Vendor Specific HCI commands and handling Vendor Specific HCI Events.

CONFIG_BT_NIMBLE_OPTIMIZE_MULTI_CONN

Enable the optimization of multi-connection

Found in: Component config > Bluetooth > NimBLE Options

This option enables the use of vendor-specific APIs for multi-connections, which can greatly enhance the stability of coexistence between numerous central and peripheral devices. It will prohibit the usage of standard APIs.

Default value:

- No (disabled) if `SOC_BLE_MULTI_CONN_OPTIMIZATION` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ENC_ADV_DATA

Encrypted Advertising Data

Found in: Component config > Bluetooth > NimBLE Options

This option is used to enable encrypted advertising data.

CONFIG_BT_NIMBLE_MAX_EADS

Maximum number of EAD devices to save across reboots

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_ENC_ADV_DATA

Defines maximum number of encrypted advertising data key material to save

Default value:

- 10 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENC_ADV_DATA` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_HIGH_DUTY_ADV_ITVL

Enable BLE high duty advertising interval feature

Found in: Component config > Bluetooth > NimBLE Options

This enable BLE high duty advertising interval feature

CONFIG_BT_NIMBLE_HOST_QUEUE_CONG_CHECK

BLE queue congestion check

Found in: Component config > Bluetooth > NimBLE Options

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

Default value:

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

Host-controller Transport Contains:

- `CONFIG_BT_NIMBLE_TRANSPORT_UART`
- `CONFIG_BT_NIMBLE_HCI_UART_CTS_PIN`
- `CONFIG_BT_NIMBLE_USE_HCI_UART_FLOW_CTRL`
- `CONFIG_BT_NIMBLE_HCI_UART_RTS_PIN`

CONFIG_BT_NIMBLE_TRANSPORT_UART

Enable Uart Transport

Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport

Use UART transport

Default value:

- Yes (enabled) if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_TRANSPORT_UART_PORT

Uart port

Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG_BT_NIMBLE_TRANSPORT_UART

Uart port

Default value:

- 1 if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_NIMBLE_TRANSPORT_UART` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_HCI_USE_UART_BAUDRATE

Uart Hci Baud Rate

Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG_BT_NIMBLE_TRANSPORT_UART

Uart Baud Rate

Available options:

- 115200 (CONFIG_UART_BAUDRATE_115200)
- 230400 (CONFIG_UART_BAUDRATE_230400)
- 460800 (CONFIG_UART_BAUDRATE_460800)
- 921600 (CONFIG_UART_BAUDRATE_921600)

CONFIG_BT_NIMBLE_USE_HCI_UART_PARITY

Uart PARITY

Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG_BT_NIMBLE_TRANSPORT_UART

Uart Parity

Available options:

- None (CONFIG_UART_PARITY_NONE)
- Odd (CONFIG_UART_PARITY_ODD)
- Even (CONFIG_UART_PARITY_EVEN)

CONFIG_BT_NIMBLE_UART_RX_PIN

UART Rx pin

Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG_BT_NIMBLE_TRANSPORT_UART

Rx pin for Nimble Transport

Default value:

- 5 if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_NIMBLE_TRANSPORT_UART` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_UART_TX_PIN

UART Tx pin

Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG_BT_NIMBLE_TRANSPORT_UART

Tx pin for Nimble Transport

Default value:

- 4 if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_NIMBLE_TRANSPORT_UART` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_USE_HCI_UART_FLOW_CTRL

Uart Flow Control

Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport

Uart Flow Control

Available options:

- Disable (`CONFIG_UART_HW_FLOWCTRL_DISABLE`)
- Enable hardware flow control (`CONFIG_UART_HW_FLOWCTRL_CTS_RTS`)

CONFIG_BT_NIMBLE_HCI_UART_RTS_PIN

UART Rts Pin

Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport

UART HCI RTS pin

Default value:

- 19 if `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_HCI_UART_CTS_PIN

UART Cts Pin

Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport

UART HCI CTS pin

Default value:

- 23 if `CONFIG_BT_NIMBLE_ENABLED`

Controller Options

CONFIG_BT_RELEASE_IRAM

Release Bluetooth text (READ DOCS FIRST)

Found in: [Component config > Bluetooth](#)

This option release Bluetooth text section and merge Bluetooth data, bss & text into a large free heap region when esp_bt_mem_release is called, total saving ~21kB or more of IRAM. ESP32-C2 only 3 configurable PMP entries available, rest of them are hard-coded. We cannot split the memory into 3 different regions (IRAM, BLE-IRAM, DRAM). So this option will disable the PMP (ESP_SYSTEM_PMP_IDRAM_SPLIT)

Default value:

- No (disabled) if [CONFIG_BT_ENABLED](#) && BT_LE_RELEASE_IRAM_SUPPORTED

Common Options Contains:

- [CONFIG_BT_ALARM_MAX_NUM](#)

CONFIG_BT_ALARM_MAX_NUM

Maximum number of Bluetooth alarms

Found in: [Component config > Bluetooth > Common Options](#)

This option decides the maximum number of alarms which could be used by Bluetooth host.

Default value:

- 50

CONFIG_BT_HCI_LOG_DEBUG_EN

Enable Bluetooth HCI debug mode

Found in: [Component config > Bluetooth](#)

This option is used to enable bluetooth debug mode, which saves the hci layer data stream.

Default value:

- No (disabled) if [CONFIG_BT_BLUEDROID_ENABLED](#) || [CONFIG_BT_NIMBLE_ENABLED](#)

CONFIG_BT_HCI_LOG_DATA_BUFFER_SIZE

Size of the cache used for HCI data in Bluetooth HCI debug mode (N*1024 bytes)

Found in: [Component config > Bluetooth > CONFIG_BT_HCI_LOG_DEBUG_EN](#)

This option is to configure the buffer size of the hci data steam cache in hci debug mode. This is a ring buffer, the new data will overwrite the oldest data if the buffer is full.

Range:

- from 1 to 100 if [CONFIG_BT_HCI_LOG_DEBUG_EN](#)

Default value:

- 5 if [CONFIG_BT_HCI_LOG_DEBUG_EN](#)

CONFIG_BT_HCI_LOG_ADV_BUFFER_SIZE

Size of the cache used for adv report in Bluetooth HCI debug mode (N*1024 bytes)

Found in: [Component config > Bluetooth > CONFIG_BT_HCI_LOG_DEBUG_EN](#)

This option is to configure the buffer size of the hci adv report cache in hci debug mode. This is a ring buffer, the new data will overwrite the oldest data if the buffer is full.

Range:

- from 1 to 100 if `CONFIG_BT_HCI_LOG_DEBUG_EN`

Default value:

- 8 if `CONFIG_BT_HCI_LOG_DEBUG_EN`

CONFIG_BLE_MESH

ESP BLE Mesh Support

Found in: Component config

This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:

- *BLE Mesh and BLE coexistence support*
- `CONFIG_BLE_MESH_GATT_PROXY_CLIENT`
- `CONFIG_BLE_MESH_GATT_PROXY_SERVER`
- `BLE Mesh NET BUF DEBUG LOG LEVEL`
- `CONFIG_BLE_MESH_PROV`
- `CONFIG_BLE_MESH_PROXY`
- *BLE Mesh specific test option*
- `BLE Mesh STACK DEBUG LOG LEVEL`
- `CONFIG_BLE_MESH_NO_LOG`
- `CONFIG_BLE_MESH_IVU_DIVIDER`
- `CONFIG_BLE_MESH_FAST_PROV`
- `CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC`
- `CONFIG_BLE_MESH_EXPERIMENTAL`
- `CONFIG_BLE_MESH_CRPL`
- `CONFIG_BLE_MESH_RX_SDU_MAX`
- `CONFIG_BLE_MESH_MODEL_KEY_COUNT`
- `CONFIG_BLE_MESH_APP_KEY_COUNT`
- `CONFIG_BLE_MESH_MODEL_GROUP_COUNT`
- `CONFIG_BLE_MESH_LABEL_COUNT`
- `CONFIG_BLE_MESH_SUBNET_COUNT`
- `CONFIG_BLE_MESH_TX_SEG_MAX`
- `CONFIG_BLE_MESH_RX_SEG_MSG_COUNT`
- `CONFIG_BLE_MESH_TX_SEG_MSG_COUNT`
- `CONFIG_BLE_MESH_MEM_ALLOC_MODE`
- `CONFIG_BLE_MESH_MSG_CACHE_SIZE`
- `CONFIG_BLE_MESH_NOT_RELAY_REPLAY_MSG`
- `CONFIG_BLE_MESH_ADV_BUF_COUNT`
- `CONFIG_BLE_MESH_PB_GATT`
- `CONFIG_BLE_MESH_PB_ADV`
- `CONFIG_BLE_MESH_IVU_RECOVERY_IVI`
- `CONFIG_BLE_MESH_RELAY`
- `CONFIG_BLE_MESH_SAR_ENHANCEMENT`
- `CONFIG_BLE_MESH_SETTINGS`
- `CONFIG_BLE_MESH_ACTIVE_SCAN`
- `CONFIG_BLE_MESH_DEINIT`
- `CONFIG_BLE_MESH_USE_DUPLICATE_SCAN`
- *Support for BLE Mesh Client/Server models*
- *Support for BLE Mesh Foundation models*
- `CONFIG_BLE_MESH_NODE`
- `CONFIG_BLE_MESH_PROVISIONER`
- `CONFIG_BLE_MESH_FRIEND`
- `CONFIG_BLE_MESH_LOW_POWER`
- `CONFIG_BLE_MESH_HCI_5_0`
- `CONFIG_BLE_MESH_RANDOM_ADV_INTERVAL`

- [CONFIG_BLE_MESH_IV_UPDATE_TEST](#)
- [CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT](#)

CONFIG_BLE_MESH_HCI_5_0

Support sending 20ms non-connectable adv packets

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

It is a temporary solution and needs further modifications.

Default value:

- Yes (enabled) if [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_RANDOM_ADV_INTERVAL

Support using random adv interval for mesh packets

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

Enable this option to allow using random advertising interval for mesh packets. And this could help avoid collision of advertising packets.

Default value:

- No (disabled) if [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_USE_DUPLICATE_SCAN

Support Duplicate Scan in BLE Mesh

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is "Scan Duplicate By Device Address and Advertising Data".

Default value:

- Yes (enabled) if [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_ACTIVE_SCAN

Support Active Scan in BLE Mesh

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

Enable this option to allow using BLE Active Scan for BLE Mesh.

CONFIG_BLE_MESH_MEM_ALLOC_MODE

Memory allocation strategy

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

- Internal DRAM (CONFIG_BLE_MESH_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (CONFIG_BLE_MESH_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (CONFIG_BLE_MESH_MEM_ALLOC_MODE_DEFAULT)
Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.
- Internal IRAM (CONFIG_BLE_MESH_MEM_ALLOC_MODE_IRAM_8BIT)
Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC

Enable FreeRTOS static allocation

Found in: *Component config* > *CONFIG_BLE_MESH*

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

Default value:

- No (disabled) if ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_MODE

Memory allocation for FreeRTOS objects

Found in: *Component config* > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC*

Choose the memory to be used for FreeRTOS objects.

Available options:

- External SPIRAM (CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_EXTERNAL)
If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY is enabled. See the SPIRAM options for more details.
- Internal IRAM (CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_IRAM_8BIT)
If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.

CONFIG_BLE_MESH_DEINIT

Support de-initialize BLE Mesh stack

Found in: *Component config* > *CONFIG_BLE_MESH*

If enabled, users can use the function `esp_ble_mesh_deinit()` to de-initialize the whole BLE Mesh stack.

Default value:

- Yes (enabled) if `CONFIG_BLE_MESH`

BLE Mesh and BLE coexistence support Contains:

- `CONFIG_BLE_MESH_SUPPORT_BLE_SCAN`
- `CONFIG_BLE_MESH_SUPPORT_BLE_ADV`

CONFIG_BLE_MESH_SUPPORT_BLE_ADV

Support sending normal BLE advertising packets

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support

When selected, users can send normal BLE advertising packets with specific API.

Default value:

- No (disabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_BLE_ADV_BUF_COUNT

Number of advertising buffers for BLE advertising packets

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support > CONFIG_BLE_MESH_SUPPORT_BLE_ADV

Number of advertising buffers for BLE packets available.

Range:

- from 1 to 255 if `CONFIG_BLE_MESH_SUPPORT_BLE_ADV` && `CONFIG_BLE_MESH`

Default value:

- 3 if `CONFIG_BLE_MESH_SUPPORT_BLE_ADV` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_SUPPORT_BLE_SCAN

Support scanning normal BLE advertising packets

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

Default value:

- No (disabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_FAST_PROV

Enable BLE Mesh Fast Provisioning

Found in: Component config > CONFIG_BLE_MESH

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

Default value:

- No (disabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_NODE

Support for BLE Mesh Node

Found in: *Component config* > *CONFIG_BLE_MESH*

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.

CONFIG_BLE_MESH_PROVISIONER

Support for BLE Mesh Provisioner

Found in: *Component config* > *CONFIG_BLE_MESH*

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

CONFIG_BLE_MESH_WAIT_FOR_PROV_MAX_DEV_NUM

Maximum number of unprovisioned devices that can be added to device queue

Found in: *Component config* > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

Range:

- from 1 to 100 if *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

Default value:

- 10 if *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_MAX_PROV_NODES

Maximum number of devices that can be provisioned by Provisioner

Found in: *Component config* > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

Range:

- from 1 to 1000 if *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

Default value:

- 10 if *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PBA_SAME_TIME

Maximum number of PB-ADV running at the same time by Provisioner

Found in: *Component config* > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-ADV. For examples, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

Range:

- from 1 to 10 if `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

Default value:

- 2 if `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_PBG_SAME_TIME

Maximum number of PB-GATT running at the same time by Provisioner

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

Range:

- from 1 to 5 if `CONFIG_BLE_MESH_PB_GATT` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

Default value:

- 1 if `CONFIG_BLE_MESH_PB_GATT` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_PROVISIONER_SUBNET_COUNT

Maximum number of mesh subnets that can be created by Provisioner

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

Range:

- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

Default value:

- 3 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_PROVISIONER_APP_KEY_COUNT

Maximum number of application keys that can be owned by Provisioner

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

Range:

- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

Default value:

- 3 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_PROVISIONER_RECV_HB

Support receiving Heartbeat messages

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

Default value:

- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_PROVISIONER_RECV_HB_FILTER_SIZE

Maximum number of filter entries for receiving Heartbeat messages

Found in: *Component config* > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_PROVISIONER* > *CONFIG_BLE_MESH_PROVISIONER_RECV_HB*

This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

Range:

- from 1 to 1000 if *CONFIG_BLE_MESH_PROVISIONER_RECV_HB* && *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

Default value:

- 3 if *CONFIG_BLE_MESH_PROVISIONER_RECV_HB* && *CONFIG_BLE_MESH_PROVISIONER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PROV

BLE Mesh Provisioning support

Found in: *Component config* > *CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PROV_EPA

BLE Mesh enhanced provisioning authentication

Found in: *Component config* > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_PROV*

Enable this option to support BLE Mesh enhanced provisioning authentication functionality. This option can increase the security level of provisioning. It is recommended to enable this option.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH_PROV* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_CERT_BASED_PROV

Support Certificate-based provisioning

Found in: *Component config* > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_PROV*

Enable this option to support BLE Mesh Certificate-Based Provisioning.

Default value:

- No (disabled) if *CONFIG_BLE_MESH_PROV* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_RECORD_FRAG_MAX_SIZE

Maximum size of the provisioning record fragment that Provisioner can receive

Found in: *Component config* > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_PROV* > *CONFIG_BLE_MESH_CERT_BASED_PROV*

This option sets the maximum size of the provisioning record fragment that the Provisioner can receive. The range depends on provisioning bearer.

Range:

- from 1 to 57 if `CONFIG_BLE_MESH_CERT_BASED_PROV` && `CONFIG_BLE_MESH`

Default value:

- 56 if `CONFIG_BLE_MESH_CERT_BASED_PROV` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_PB_ADV

Provisioning support using the advertising bearer (PB-ADV)

Found in: `Component config` > `CONFIG_BLE_MESH`

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

Default value:

- Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_UNPROVISIONED_BEACON_INTERVAL

Interval between two consecutive Unprovisioned Device Beacon

Found in: `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_PB_ADV`

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of `BLE_MESH_FAST_PROV` is selected, the value is better to be 3 seconds, or less.

Range:

- from 1 to 100 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`

Default value:

- 5 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`
- 3 if `CONFIG_BLE_MESH_FAST_PROV` && `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_PB_GATT

Provisioning support using GATT (PB-GATT)

Found in: `Component config` > `CONFIG_BLE_MESH`

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

Virtual option enabled whenever any Proxy protocol is needed

CONFIG_BLE_MESH_PROXY

BLE Mesh Proxy protocol support

Found in: `Component config` > `CONFIG_BLE_MESH`

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

Default value:

- Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_GATT_PROXY_SERVER

BLE Mesh GATT Proxy Server

Found in: *Component config* > *CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH_NODE* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_NODE_ID_TIMEOUT

Node Identity advertising timeout

Found in: *Component config* > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

Range:

- from 1 to 60 if *CONFIG_BLE_MESH_GATT_PROXY_SERVER* && *CONFIG_BLE_MESH*

Default value:

- 60 if *CONFIG_BLE_MESH_GATT_PROXY_SERVER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PROXY_FILTER_SIZE

Maximum number of filter entries per Proxy Client

Found in: *Component config* > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

Range:

- from 1 to 32767 if *CONFIG_BLE_MESH_GATT_PROXY_SERVER* && *CONFIG_BLE_MESH*

Default value:

- 4 if *CONFIG_BLE_MESH_GATT_PROXY_SERVER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PROXY_PRIVACY

Support Proxy Privacy

Found in: *Component config* > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_GATT_PROXY_SERVER*

The Proxy Privacy parameter controls the privacy of the Proxy Server over the connection. The value of the Proxy Privacy parameter is controlled by the type of proxy connection, which is dependent on the bearer used by the proxy connection.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH_PRB_SRV* && *CONFIG_BLE_MESH_GATT_PROXY_SERVER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PROXY_SOLIC_PDU_RX

Support receiving Proxy Solicitation PDU

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER

Enable this option to support receiving Proxy Solicitation PDU.

CONFIG_BLE_MESH_PROXY_SOLIC_RX_CRPL

Maximum capacity of solicitation replay protection list

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER > CONFIG_BLE_MESH_PROXY_SOLIC_PDU_RX

This option specifies the maximum capacity of the solicitation replay protection list. The solicitation replay protection list is used to reject Solicitation PDUs that were already processed by a node, which will store the solicitation src and solicitation sequence number of the received Solicitation PDU message.

Range:

- from 1 to 255 if *CONFIG_BLE_MESH_PROXY_SOLIC_PDU_RX* && *CONFIG_BLE_MESH*

Default value:

- 2 if *CONFIG_BLE_MESH_PROXY_SOLIC_PDU_RX* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_GATT_PROXY_CLIENT

BLE Mesh GATT Proxy Client

Found in: Component config > CONFIG_BLE_MESH

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PROXY_SOLIC_PDU_TX

Support sending Proxy Solicitation PDU

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_CLIENT

Enable this option to support sending Proxy Solicitation PDU.

CONFIG_BLE_MESH_PROXY_SOLIC_TX_SRC_COUNT

Maximum number of SSRC that can be used by Proxy Client

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_CLIENT > CONFIG_BLE_MESH_PROXY_SOLIC_PDU_TX

This option specifies the maximum number of Solicitation Source (SSRC) that can be used by Proxy Client for sending a Solicitation PDU. A Proxy Client may use the primary address or any of the secondary addresses as the SSRC for a Solicitation PDU. So for a Proxy Client, it's better to choose the value based on its own element count.

Range:

- from 1 to 16 if *CONFIG_BLE_MESH_PROXY_SOLIC_PDU_TX* && *CONFIG_BLE_MESH*

Default value:

- 2 if *CONFIG_BLE_MESH_PROXY_SOLIC_PDU_TX* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_SETTINGS

Store BLE Mesh configuration persistently

Found in: *Component config* > *CONFIG_BLE_MESH*

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_STORE_TIMEOUT

Delay (in seconds) before storing anything persistently

Found in: *Component config* > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

Range:

- from 0 to 1000000 if *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

Default value:

- 0 if *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_SEQ_STORE_RATE

How often the sequence number gets updated in storage

Found in: *Component config* > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_SETTINGS*

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash). e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment. If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that's guaranteed to be larger than the last one used before power off.

Range:

- from 0 to 1000000 if *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

Default value:

- 0 if *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_RPL_STORE_TIMEOUT

Minimum frequency that the RPL gets updated in storage

Found in: *Component config* > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

Range:

- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

Default value:

- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_SETTINGS_BACKWARD_COMPATIBILITY

A specific option for settings backward compatibility

Found in: `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS`

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of "mesh/role" in nvs. In the new version mesh stack, key of "mesh/role" is added in nvs, recovering node information needs to check "mesh/role" key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of "mesh/role" because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

Default value:

- No (disabled) if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_SPECIFIC_PARTITION

Use a specific NVS partition for BLE Mesh

Found in: `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS`

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API, and the partition must exist in the csv file. When Provisioner needs to store a large amount of nodes' information in the flash (e.g. more than 20), this option is recommended to be enabled.

Default value:

- No (disabled) if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_PARTITION_NAME

Name of the NVS partition for BLE Mesh

Found in: `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_SPECIFIC_PARTITION`

This value defines the name of the specified NVS partition used by the mesh stack.

Default value:

- "ble_mesh" if `CONFIG_BLE_MESH_SPECIFIC_PARTITION` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE

Support using multiple NVS namespaces by Provisioner

Found in: `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS`

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner

moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

Default value:

- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_MAX_NVS_NAMESPACE

Maximum number of NVS namespaces

Found in: `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS` > `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE`

This option specifies the maximum NVS namespaces supported by Provisioner.

Range:

- from 1 to 255 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

Default value:

- 2 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_SUBNET_COUNT

Maximum number of mesh subnets per network

Found in: `Component config` > `CONFIG_BLE_MESH`

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

Range:

- from 1 to 4096 if `CONFIG_BLE_MESH`

Default value:

- 3 if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_APP_KEY_COUNT

Maximum number of application keys per network

Found in: `Component config` > `CONFIG_BLE_MESH`

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

Range:

- from 1 to 4096 if `CONFIG_BLE_MESH`

Default value:

- 3 if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_MODEL_KEY_COUNT

Maximum number of application keys per model

Found in: `Component config` > `CONFIG_BLE_MESH`

This option specifies the maximum number of application keys to which each model can be bound.

Range:

- from 1 to 4096 if `CONFIG_BLE_MESH`

Default value:

- 3 if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_MODEL_GROUP_COUNT

Maximum number of group address subscriptions per model

Found in: `Component config > CONFIG_BLE_MESH`

This option specifies the maximum number of addresses to which each model can be subscribed.

Range:

- from 1 to 4096 if `CONFIG_BLE_MESH`

Default value:

- 3 if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LABEL_COUNT

Maximum number of Label UUIDs used for Virtual Addresses

Found in: `Component config > CONFIG_BLE_MESH`

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

Range:

- from 0 to 4096 if `CONFIG_BLE_MESH`

Default value:

- 3 if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_CRPL

Maximum capacity of the replay protection list

Found in: `Component config > CONFIG_BLE_MESH`

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

Range:

- from 2 to 65535 if `CONFIG_BLE_MESH`

Default value:

- 10 if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_NOT_RELAY_REPLAY_MSG

Not relay replayed messages in a mesh network

Found in: `Component config > CONFIG_BLE_MESH`

There may be many expired messages in a complex mesh network that would be considered replayed messages. Enable this option will refuse to relay such messages, which could help to reduce invalid packets in the mesh network. However, it should be noted that enabling this option may result in packet loss in certain environments. Therefore, users need to decide whether to enable this option according to the actual usage situation.

Default value:

- No (disabled) if `CONFIG_BLE_MESH_EXPERIMENTAL` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_MSG_CACHE_SIZE

Network message cache size

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

Range:

- from 2 to 65535 if [CONFIG_BLE_MESH](#)

Default value:

- 10 if [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_ADV_BUF_COUNT

Number of advertising buffers

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

Number of advertising buffers available. The transport layer reserves ADV_BUF_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

Range:

- from 6 to 256 if [CONFIG_BLE_MESH](#)

Default value:

- 60 if [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_IVU_DIVIDER

Divider for IV Update state refresh timer

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn't necessarily need to happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).

Range:

- from 2 to 96 if [CONFIG_BLE_MESH](#)

Default value:

- 4 if [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_IVU_RECOVERY_IVI

Recovery the IV index when the latest whole IV update procedure is missed

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

According to Section 3.10.5 of Mesh Specification v1.0.1. If a node in Normal Operation receives a Secure Network beacon with an IV index equal to the last known IV index+1 and the IV Update Flag set to 0, the node may update its IV without going to the IV Update in Progress state, or it may initiate an IV Index Recovery procedure (Section 3.10.6), or it may ignore the Secure Network beacon. The node makes the choice depending on the time since last IV update and the likelihood that the node has missed the Secure Network beacons with the IV update Flag. When the above situation is encountered, this option can be used to decide whether to perform the IV index recovery procedure.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_SAR_ENHANCEMENT

Segmentation and reassembly enhancement

Found in: Component config > CONFIG_BLE_MESH

Enable this option to use the enhanced segmentation and reassembly mechanism introduced in Bluetooth Mesh Protocol 1.1.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_TX_SEG_MSG_COUNT

Maximum number of simultaneous outgoing segmented messages

Found in: Component config > CONFIG_BLE_MESH

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

Range:

- from 1 to if *CONFIG_BLE_MESH*

Default value:

- 1 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_RX_SEG_MSG_COUNT

Maximum number of simultaneous incoming segmented messages

Found in: Component config > CONFIG_BLE_MESH

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

Range:

- from 1 to 255 if *CONFIG_BLE_MESH*

Default value:

- 1 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_RX_SDU_MAX

Maximum incoming Upper Transport Access PDU length

Found in: Component config > CONFIG_BLE_MESH

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

Range:

- from 36 to 384 if *CONFIG_BLE_MESH*

Default value:

- 384 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_TX_SEG_MAX

Maximum number of segments in outgoing messages

Found in: Component config > CONFIG_BLE_MESH

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what's the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers (*BLE_MESH_ADV_BUF_COUNT*) as there are outgoing segments.

Range:

- from 2 to 32 if *CONFIG_BLE_MESH*

Default value:

- 32 if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_RELAY

Relay support

Found in: Component config > CONFIG_BLE_MESH

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH_NODE* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_RELAY_ADV_BUF

Use separate advertising buffers for relay packets

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.

Default value:

- No (disabled) if *CONFIG_BLE_MESH_RELAY* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_RELAY_ADV_BUF_COUNT

Number of advertising buffers for relay packets

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY > CONFIG_BLE_MESH_RELAY_ADV_BUF

Number of advertising buffers for relay packets available.

Range:

- from 6 to 256 if `CONFIG_BLE_MESH_RELAY_ADV_BUF` && `CONFIG_BLE_MESH_RELAY` && `CONFIG_BLE_MESH`

Default value:

- 60 if `CONFIG_BLE_MESH_RELAY_ADV_BUF` && `CONFIG_BLE_MESH_RELAY` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LOW_POWER

Support for Low Power features

Found in: `Component config` > `CONFIG_BLE_MESH`

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

CONFIG_BLE_MESH_LPN_ESTABLISHMENT

Perform Friendship establishment using low power

Found in: `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

Default value:

- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LPN_AUTO

Automatically start looking for Friend nodes once provisioned

Found in: `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling `bt_mesh_lpn_set(true)`. When an unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node starts to send Friend Request at a certain period until it finds a proper Friend node.

Default value:

- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LPN_AUTO_TIMEOUT

Time from last received message before going to LPN mode

Found in: `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER` > `CONFIG_BLE_MESH_LPN_AUTO`

Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

Range:

- from 0 to 3600 if `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

Default value:

- 15 if `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LPN_RETRY_TIMEOUT

Retry timeout for Friend requests

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

Range:

- from 1 to 3600 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

Default value:

- 6 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LPN_RSSI_FACTOR

RSSIFactor, used in Friend Offer Delay calculation

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

Range:

- from 0 to 3 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

Default value:

- 0 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LPN_RECV_WIN_FACTOR

ReceiveWindowFactor, used in Friend Offer Delay calculation

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

Range:

- from 0 to 3 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

Default value:

- 0 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LPN_MIN_QUEUE_SIZE

Minimum size of the acceptable friend queue (MinQueueSizeLog)

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The MinQueueSizeLog field is defined as $\log_2(N)$, where N is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives N = 2, and value 7 gives N = 128.

Range:

- from 1 to 7 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

Default value:

- 1 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LPN_RECV_DELAY

Receive delay requested by the local node

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

Range:

- from 10 to 255 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

Default value:

- 100 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LPN_POLL_TIMEOUT

The value of the PollTimeout timer

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

Range:

- from 10 to 244735 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

Default value:

- 300 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LPN_INIT_POLL_TIMEOUT

The starting value of the PollTimeout timer

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

Range:

- from 10 to if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

Default value:

- if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LPN_SCAN_LATENCY

Latency for enabling scanning

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

Range:

- from 0 to 50 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

Default value:

- 10 if *CONFIG_BLE_MESH_LOW_POWER* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LPN_GROUPS

Number of groups the LPN can subscribe to

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

Maximum number of groups to which the LPN can subscribe.

Range:

- from 0 to 16384 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

Default value:

- 8 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LPN_SUB_ALL_NODES_ADDR

Automatically subscribe all nodes address

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

Automatically subscribe all nodes address when friendship established.

Default value:

- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_FRIEND

Support for Friend feature

Found in: Component config > CONFIG_BLE_MESH

Enable this option to be able to act as a Friend Node.

CONFIG_BLE_MESH_FRIEND_RECV_WIN

Friend Receive Window

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Receive Window in milliseconds supported by the Friend node.

Range:

- from 1 to 255 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

Default value:

- 255 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_FRIEND_QUEUE_SIZE

Minimum number of buffers supported per Friend Queue

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.

Range:

- from 2 to 65536 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

Default value:

- 16 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_FRIEND_SUB_LIST_SIZE

Friend Subscription List Size

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

Range:

- from 0 to 1023 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

Default value:

- 3 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_FRIEND_LPN_COUNT

Number of supported LPN nodes

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

Range:

- from 1 to 1000 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

Default value:

- 2 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_FRIEND_SEG_RX

Number of incomplete segment lists per LPN

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Number of incomplete segment lists tracked for each Friends' LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.

Range:

- from 1 to 1000 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

Default value:

- 1 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_NO_LOG

Disable BLE Mesh debug logs (minimize bin size)

Found in: Component config > CONFIG_BLE_MESH

Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

Default value:

- No (disabled) if `CONFIG_BLE_MESH` && `CONFIG_BLE_MESH`

BLE Mesh STACK DEBUG LOG LEVEL Contains:

- `CONFIG_BLE_MESH_STACK_TRACE_LEVEL`

CONFIG_BLE_MESH_STACK_TRACE_LEVEL

BLE_MESH_STACK

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh STACK DEBUG LOG LEVEL

Define BLE Mesh trace level for BLE Mesh stack.

Available options:

- NONE (`CONFIG_BLE_MESH_TRACE_LEVEL_NONE`)
- ERROR (`CONFIG_BLE_MESH_TRACE_LEVEL_ERROR`)
- WARNING (`CONFIG_BLE_MESH_TRACE_LEVEL_WARNING`)
- INFO (`CONFIG_BLE_MESH_TRACE_LEVEL_INFO`)

- DEBUG (CONFIG_BLE_MESH_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BLE_MESH_TRACE_LEVEL_VERBOSE)

BLE Mesh NET BUF DEBUG LOG LEVEL Contains:

- [CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL](#)

CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL

BLE_MESH_NET_BUF

Found in: *Component config* > [CONFIG_BLE_MESH](#) > [BLE Mesh NET BUF DEBUG LOG LEVEL](#)

Define BLE Mesh trace level for BLE Mesh net buffer.

Available options:

- NONE (CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_WARNING)
- INFO (CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_INFO)
- DEBUG (CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_VERBOSE)

CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT

Timeout(ms) for client message response

Found in: *Component config* > [CONFIG_BLE_MESH](#)

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

Range:

- from 100 to 1200000 if [CONFIG_BLE_MESH](#)

Default value:

- 4000 if [CONFIG_BLE_MESH](#)

Support for BLE Mesh Foundation models Contains:

- [CONFIG_BLE_MESH_BRC_CLI](#)
- [CONFIG_BLE_MESH_BRC_SRV](#)
- [CONFIG_BLE_MESH_CFG_CLI](#)
- [CONFIG_BLE_MESH_DF_CLI](#)
- [CONFIG_BLE_MESH_DF_SRV](#)
- [CONFIG_BLE_MESH_HEALTH_CLI](#)
- [CONFIG_BLE_MESH_HEALTH_SRV](#)
- [CONFIG_BLE_MESH_LCD_CLI](#)
- [CONFIG_BLE_MESH_LCD_SRV](#)
- [CONFIG_BLE_MESH_PRB_CLI](#)
- [CONFIG_BLE_MESH_PRB_SRV](#)
- [CONFIG_BLE_MESH_ODP_CLI](#)
- [CONFIG_BLE_MESH_ODP_SRV](#)
- [CONFIG_BLE_MESH_AGG_CLI](#)
- [CONFIG_BLE_MESH_AGG_SRV](#)
- [CONFIG_BLE_MESH_RPR_CLI](#)
- [CONFIG_BLE_MESH_RPR_SRV](#)

- [CONFIG_BLE_MESH_SAR_CLI](#)
- [CONFIG_BLE_MESH_SAR_SRV](#)
- [CONFIG_BLE_MESH_SRPL_CLI](#)
- [CONFIG_BLE_MESH_SRPL_SRV](#)
- [CONFIG_BLE_MESH_COMP_DATA_1](#)
- [CONFIG_BLE_MESH_COMP_DATA_128](#)
- [CONFIG_BLE_MESH_MODELS_METADATA_0](#)

CONFIG_BLE_MESH_CFG_CLI

Configuration Client model

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Foundation models](#)

Enable support for Configuration Client model.

CONFIG_BLE_MESH_HEALTH_CLI

Health Client model

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Foundation models](#)

Enable support for Health Client model.

CONFIG_BLE_MESH_HEALTH_SRV

Health Server model

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Foundation models](#)

Enable support for Health Server model.

Default value:

- Yes (enabled) if [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_BRC_CLI

Bridge Configuration Client model

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Foundation models](#)

Enable support for Bridge Configuration Client model.

CONFIG_BLE_MESH_BRC_SRV

Bridge Configuration Server model

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Foundation models](#)

Enable support for Bridge Configuration Server model.

Default value:

- No (disabled) if [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_MAX_BRIDGING_TABLE_ENTRY_COUNT

Maximum number of Bridging Table entries

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [Support for BLE Mesh Foundation models](#) > [CONFIG_BLE_MESH_BRC_SRV](#)

Maximum number of Bridging Table entries that the Bridge Configuration Server can support.

Range:

- from 16 to 65535 if *CONFIG_BLE_MESH_BRC_SRV* && *CONFIG_BLE_MESH*

Default value:

- 16 if *CONFIG_BLE_MESH_BRC_SRV* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_BRIDGE_CRPL

Maximum capacity of bridge replay protection list

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_BRC_SRV

This option specifies the maximum capacity of the bridge replay protection list. The bridge replay protection list is used to prevent a bridged subnet from replay attack, which will store the source address and sequence number of the received bridge messages.

Range:

- from 1 to 255 if *CONFIG_BLE_MESH_BRC_SRV* && *CONFIG_BLE_MESH*

Default value:

- 5 if *CONFIG_BLE_MESH_BRC_SRV* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PRB_CLI

Mesh Private Beacon Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Mesh Private Beacon Client model.

CONFIG_BLE_MESH_PRB_SRV

Mesh Private Beacon Server model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Mesh Private Beacon Server model.

CONFIG_BLE_MESH_ODP_CLI

On-Demand Private Proxy Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for On-Demand Private Proxy Client model.

CONFIG_BLE_MESH_ODP_SRV

On-Demand Private Proxy Server model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for On-Demand Private Proxy Server model.

CONFIG_BLE_MESH_SRPL_CLI

Solicitation PDU RPL Configuration Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Solicitation PDU RPL Configuration Client model.

CONFIG_BLE_MESH_SRPL_SRV

Solicitation PDU RPL Configuration Server model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Solicitation PDU RPL Configuration Server model. Note: This option depends on the functionality of receiving Solicitation PDU. If the device doesn't support receiving Solicitation PDU, then there is no need to enable this server model.

CONFIG_BLE_MESH_AGG_CLI

Opcodes Aggregator Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Opcodes Aggregator Client model.

CONFIG_BLE_MESH_AGG_SRV

Opcodes Aggregator Server model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Opcodes Aggregator Server model.

CONFIG_BLE_MESH_SAR_CLI

SAR Configuration Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for SAR Configuration Client model.

CONFIG_BLE_MESH_SAR_SRV

SAR Configuration Server model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for SAR Configuration Server model.

CONFIG_BLE_MESH_COMP_DATA_1

Support Composition Data Page 1

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Composition Data Page 1 contains information about the relationships among models. Each model either can be a root model or can extend other models.

CONFIG_BLE_MESH_COMP_DATA_128

Support Composition Data Page 128

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Composition Data Page 128 is used to indicate the structure of elements, features, and models of a node after the successful execution of the Node Address Refresh procedure or the Node Composition Refresh procedure, or after the execution of the Node Removal procedure followed by the provisioning process. Composition Data Page 128 shall be present if the node supports the Remote Provisioning Server model; otherwise it is optional.

CONFIG_BLE_MESH_MODELS_METADATA_0

Support Models Metadata Page 0

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

The Models Metadata state contains metadata of a node's models. The Models Metadata state is composed of a number of pages of information. Models Metadata Page 0 shall be present if the node supports the Large Composition Data Server model.

CONFIG_BLE_MESH_MODELS_METADATA_128

Support Models Metadata Page 128

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_MODELS_METADATA_0

The Models Metadata state contains metadata of a node's models. The Models Metadata state is composed of a number of pages of information. Models Metadata Page 128 contains metadata for the node's models after the successful execution of the Node Address Refresh procedure or the Node Composition Refresh procedure, or after the execution of the Node Removal procedure followed by the provisioning process. Models Metadata Page 128 shall be present if the node supports the Remote Provisioning Server model and the node supports the Large Composition Data Server model.

CONFIG_BLE_MESH_LCD_CLI

Large Composition Data Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Large Composition Data Client model.

CONFIG_BLE_MESH_LCD_SRV

Large Composition Data Server model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Large Composition Data Server model.

CONFIG_BLE_MESH_RPR_CLI

Remote Provisioning Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Remote Provisioning Client model

CONFIG_BLE_MESH_RPR_CLI_PROV_SAME_TIME

Maximum number of PB-Remote running at the same time by Provisioner

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_RPR_CLI

This option specifies how many devices can be provisioned at the same time using PB-REMOTE. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-REMOTE at the same time.

Range:

- from 1 to 5 if *CONFIG_BLE_MESH_RPR_CLI* && *CONFIG_BLE_MESH*

Default value:

- 2 if *CONFIG_BLE_MESH_RPR_CLI* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_RPR_SRV

Remote Provisioning Server model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Remote Provisioning Server model

CONFIG_BLE_MESH_RPR_SRV_MAX_SCANNED_ITEMS

Maximum number of device information can be scanned

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_RPR_SRV

This option specifies how many device information can a Remote Provisioning Server store each time while scanning.

Range:

- from 4 to 255 if *CONFIG_BLE_MESH_RPR_SRV* && *CONFIG_BLE_MESH*

Default value:

- 10 if *CONFIG_BLE_MESH_RPR_SRV* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_RPR_SRV_ACTIVE_SCAN

Support Active Scan for remote provisioning

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_RPR_SRV

Enable this option to support Active Scan for remote provisioning.

CONFIG_BLE_MESH_RPR_SRV_MAX_EXT_SCAN

Maximum number of extended scan procedures

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_RPR_SRV

This option specifies how many extended scan procedures can be started by the Remote Provisioning Server.

Range:

- from 1 to 10 if *CONFIG_BLE_MESH_RPR_SRV* && *CONFIG_BLE_MESH*

Default value:

- 1 if *CONFIG_BLE_MESH_RPR_SRV* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_DF_CLI

Directed Forwarding Configuration Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Directed Forwarding Configuration Client model.

CONFIG_BLE_MESH_DF_SRV

Directed Forwarding Configuration Server model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Directed Forwarding Configuration Server model.

CONFIG_BLE_MESH_MAX_DISC_TABLE_ENTRY_COUNT

Maximum number of discovery table entries in a given subnet

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_DF_SRV

Maximum number of Discovery Table entries supported by the node in a given subnet.

Range:

- from 2 to 255 if *CONFIG_BLE_MESH_DF_SRV* && *CONFIG_BLE_MESH*

Default value:

- 2 if *CONFIG_BLE_MESH_DF_SRV* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_MAX_FORWARD_TABLE_ENTRY_COUNT

Maximum number of forward table entries in a given subnet

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_DF_SRV

Maximum number of Forward Table entries supported by the node in a given subnet.

Range:

- from 2 to 64 if *CONFIG_BLE_MESH_DF_SRV* && *CONFIG_BLE_MESH*

Default value:

- 2 if *CONFIG_BLE_MESH_DF_SRV* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_MAX_DEPS_NODES_PER_PATH

Maximum number of dependent nodes per path

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_DF_SRV

Maximum size of dependent nodes list supported by each forward table entry.

Range:

- from 2 to 64 if *CONFIG_BLE_MESH_DF_SRV* && *CONFIG_BLE_MESH*

Default value:

- 2 if *CONFIG_BLE_MESH_DF_SRV* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_PATH_MONITOR_TEST

Enable Path Monitoring test mode

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_DF_SRV

The option only removes the Path Use timer; all other behavior of the device is not changed. If Path Monitoring test mode is going to be used, this option should be enabled.

Default value:

- No (disabled) if *CONFIG_BLE_MESH_DF_SRV* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_SUPPORT_DIRECTED_PROXY

Enable Directed Proxy functionality

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_DF_SRV

Support Directed Proxy functionality.

Default value:

- Yes (enabled) if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH`

Support for BLE Mesh Client/Server models Contains:

- `CONFIG_BLE_MESH_MBT_CLI`
- `CONFIG_BLE_MESH_MBT_SRV`
- `CONFIG_BLE_MESH_GENERIC_BATTERY_CLI`
- `CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI`
- `CONFIG_BLE_MESH_GENERIC_LEVEL_CLI`
- `CONFIG_BLE_MESH_GENERIC_LOCATION_CLI`
- `CONFIG_BLE_MESH_GENERIC_ONOFF_CLI`
- `CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI`
- `CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI`
- `CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI`
- `CONFIG_BLE_MESH_GENERIC_SERVER`
- `CONFIG_BLE_MESH_LIGHT_CTL_CLI`
- `CONFIG_BLE_MESH_LIGHT_HSL_CLI`
- `CONFIG_BLE_MESH_LIGHT_LC_CLI`
- `CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI`
- `CONFIG_BLE_MESH_LIGHT_XYL_CLI`
- `CONFIG_BLE_MESH_LIGHTING_SERVER`
- `CONFIG_BLE_MESH_SCENE_CLI`
- `CONFIG_BLE_MESH_SCHEDULER_CLI`
- `CONFIG_BLE_MESH_SENSOR_CLI`
- `CONFIG_BLE_MESH_SENSOR_SERVER`
- `CONFIG_BLE_MESH_TIME_SCENE_SERVER`
- `CONFIG_BLE_MESH_TIME_CLI`

CONFIG_BLE_MESH_GENERIC_ONOFF_CLI

Generic OnOff Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic OnOff Client model.

CONFIG_BLE_MESH_GENERIC_LEVEL_CLI

Generic Level Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic Level Client model.

CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI

Generic Default Transition Time Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic Default Transition Time Client model.

CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI

Generic Power OnOff Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic Power OnOff Client model.

CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI

Generic Power Level Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic Power Level Client model.

CONFIG_BLE_MESH_GENERIC_BATTERY_CLI

Generic Battery Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic Battery Client model.

CONFIG_BLE_MESH_GENERIC_LOCATION_CLI

Generic Location Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic Location Client model.

CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI

Generic Property Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic Property Client model.

CONFIG_BLE_MESH_SENSOR_CLI

Sensor Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Sensor Client model.

CONFIG_BLE_MESH_TIME_CLI

Time Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Time Client model.

CONFIG_BLE_MESH_SCENE_CLI

Scene Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Scene Client model.

CONFIG_BLE_MESH_SCHEDULER_CLI

Scheduler Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Scheduler Client model.

CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI

Light Lightness Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Light Lightness Client model.

CONFIG_BLE_MESH_LIGHT_CTL_CLI

Light CTL Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Light CTL Client model.

CONFIG_BLE_MESH_LIGHT_HSL_CLI

Light HSL Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Light HSL Client model.

CONFIG_BLE_MESH_LIGHT_XYL_CLI

Light XYL Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Light XYL Client model.

CONFIG_BLE_MESH_LIGHT_LC_CLI

Light LC Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Light LC Client model.

CONFIG_BLE_MESH_GENERIC_SERVER

Generic server models

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic server models.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_SENSOR_SERVER

Sensor server models

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Sensor server models.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_TIME_SCENE_SERVER

Time and Scenes server models

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Time and Scenes server models.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_LIGHTING_SERVER

Lighting server models

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Lighting server models.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_MBT_CLI

BLOB Transfer Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for BLOB Transfer Client model.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_MAX_BLOB_RECEIVERS

Maximum number of simultaneous blob receivers

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models > CONFIG_BLE_MESH_MBT_CLI

Maximum number of BLOB Transfer Server models that can participating in the BLOB transfer with a BLOB Transfer Client model.

Range:

- from 1 to 255 if *CONFIG_BLE_MESH_MBT_CLI* && *CONFIG_BLE_MESH*

Default value:

- 2 if *CONFIG_BLE_MESH_MBT_CLI* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_MBT_SRV

BLOB Transfer Server model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for BLOB Transfer Server model.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_IV_UPDATE_TEST

Test the IV Update Procedure

Found in: *Component config* > *CONFIG_BLE_MESH*

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

BLE Mesh specific test option

 Contains:

- *CONFIG_BLE_MESH_DEBUG*
- *CONFIG_BLE_MESH_SHELL*
- *CONFIG_BLE_MESH_BQB_TEST*
- *CONFIG_BLE_MESH_SELF_TEST*
- *CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK*
- *CONFIG_BLE_MESH_TEST_USE_WHITE_LIST*

CONFIG_BLE_MESH_SELF_TEST

Perform BLE Mesh self-tests

Found in: *Component config* > *CONFIG_BLE_MESH* > *BLE Mesh specific test option*

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_BQB_TEST

Enable BLE Mesh specific internal test

Found in: *Component config* > *CONFIG_BLE_MESH* > *BLE Mesh specific test option*

This option is used to enable some internal functions for auto-pts test.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK

Unprovisioned device enters mesh network automatically

Found in: *Component config* > *CONFIG_BLE_MESH* > *BLE Mesh specific test option*

With this option enabled, an unprovisioned device can automatically enters mesh network using a specific test function without the provisioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH_SELF_TEST* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_TEST_USE_WHITE_LIST

Use white list to filter mesh advertising packets

Found in: *Component config* > *CONFIG_BLE_MESH* > *BLE Mesh specific test option*

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

Default value:

- No (disabled) if `CONFIG_BLE_MESH_SELF_TEST` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_SHELL

Enable BLE Mesh shell

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option

Activate shell module that provides BLE Mesh commands to the console.

Default value:

- No (disabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_DEBUG

Enable BLE Mesh debug logs

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option

Enable debug logs for the BLE Mesh functionality.

Default value:

- No (disabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_DEBUG_NET

Network layer debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Network layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_TRANS

Transport layer debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Transport layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_BEACON

Beacon debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Beacon-related debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_CRYPT

Crypto debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable cryptographic debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROV

Provisioning debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Provisioning debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ACCESS

Access layer debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Access layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_MODEL

Foundation model debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Foundation Models debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ADV

Advertising debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable advertising debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_LOW_POWER

Low Power debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Low Power debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_FRIEND

Friend debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Friend debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROXY

Proxy debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Proxy protocol debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_EXPERIMENTAL

Make BLE Mesh experimental features visible

Found in: Component config > CONFIG_BLE_MESH

Make BLE Mesh Experimental features visible. Experimental features list: - CONFIG_BLE_MESH_NOT_RELAY_REPLAY_MSG

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

Console Library Contains:

- *CONFIG_CONSOLE_SORTED_HELP*

CONFIG_CONSOLE_SORTED_HELP

Enable sorted help

Found in: Component config > Console Library

Instead of listing the commands in the order of registration, the help command lists the available commands in sorted order, if this option is enabled.

Default value:

- No (disabled)

Driver Configurations Contains:

- *Legacy ADC Driver Configuration*
- *Legacy DAC Driver Configurations*
- *Legacy I2S Driver Configurations*
- *Legacy MCPWM Driver Configurations*
- *Legacy PCNT Driver Configurations*
- *Legacy RMT Driver Configurations*
- *Legacy SDM Driver Configurations*
- *Legacy Temperature Sensor Driver Configurations*
- *Legacy Timer Group Driver Configurations*
- *TWAI Configuration*

TWAI Configuration Contains:

- *CONFIG_TWAI_ISR_IN_IRAM*

CONFIG_TWAI_ISR_IN_IRAM

Place TWAI ISR function into IRAM

Found in: Component config > Driver Configurations > TWAI Configuration

Place the TWAI ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled: - Users should also set the ESP_INTR_FLAG_IRAM in the driver configuration structure when installing the driver (see docs for specifics). - Alert logging (i.e., setting of the TWAI_ALERT_AND_LOG flag) will have no effect.

Default value:

- No (disabled)

Legacy ADC Driver Configuration Contains:

- [CONFIG_ADC_DISABLE_DAC](#)
- [Legacy ADC Calibration Configuration](#)
- [CONFIG_ADC_SUPPRESS_DEPRECATED_WARN](#)

CONFIG_ADC_DISABLE_DAC

Disable DAC when ADC2 is used on GPIO 25 and 26

Found in: [Component config](#) > [Driver Configurations](#) > [Legacy ADC Driver Configuration](#)

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

Default value:

- Yes (enabled) if SOC_DAC_SUPPORTED

CONFIG_ADC_SUPPRESS_DEPRECATED_WARN

Suppress legacy driver deprecated warning

Found in: [Component config](#) > [Driver Configurations](#) > [Legacy ADC Driver Configuration](#)

Whether to suppress the deprecation warnings when using legacy adc driver (driver/adc.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

Default value:

- No (disabled)

Legacy ADC Calibration Configuration Contains:

- [CONFIG_ADC_CALI_SUPPRESS_DEPRECATED_WARN](#)

CONFIG_ADC_CALI_SUPPRESS_DEPRECATED_WARN

Suppress legacy driver deprecated warning

Found in: [Component config](#) > [Driver Configurations](#) > [Legacy ADC Driver Configuration](#) > [Legacy ADC Calibration Configuration](#)

Whether to suppress the deprecation warnings when using legacy adc calibration driver (esp_adc_cal.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

Default value:

- No (disabled)

Legacy DAC Driver Configurations Contains:

- [CONFIG_DAC_SUPPRESS_DEPRECATED_WARN](#)

CONFIG_DAC_SUPPRESS_DEPRECATED_WARN

Suppress legacy driver deprecated warning

Found in: [Component config](#) > [Driver Configurations](#) > [Legacy DAC Driver Configurations](#)

Whether to suppress the deprecation warnings when using legacy dac driver (driver/dac.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

Default value:

- No (disabled) if SOC_DAC_SUPPORTED

Legacy MCPWM Driver Configurations Contains:

- [CONFIG_MCPWM_SUPPRESS_DEPRECATED_WARN](#)

CONFIG_MCPWM_SUPPRESS_DEPRECATED_WARN

Suppress legacy driver deprecated warning

Found in: [Component config](#) > [Driver Configurations](#) > [Legacy MCPWM Driver Configurations](#)

Whether to suppress the deprecation warnings when using legacy MCPWM driver (driver/mcpwm.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

Default value:

- No (disabled)

Legacy Timer Group Driver Configurations Contains:

- [CONFIG_GPTIMER_SUPPRESS_DEPRECATED_WARN](#)

CONFIG_GPTIMER_SUPPRESS_DEPRECATED_WARN

Suppress legacy driver deprecated warning

Found in: [Component config](#) > [Driver Configurations](#) > [Legacy Timer Group Driver Configurations](#)

Whether to suppress the deprecation warnings when using legacy timer group driver (driver/timer.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

Default value:

- No (disabled)

Legacy RMT Driver Configurations Contains:

- [CONFIG_RMT_SUPPRESS_DEPRECATED_WARN](#)

CONFIG_RMT_SUPPRESS_DEPRECATED_WARN

Suppress legacy driver deprecated warning

Found in: [Component config](#) > [Driver Configurations](#) > [Legacy RMT Driver Configurations](#)

Whether to suppress the deprecation warnings when using legacy rmt driver (driver/rmt.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

Default value:

- No (disabled)

Legacy I2S Driver Configurations Contains:

- [CONFIG_I2S_SUPPRESS_DEPRECATED_WARN](#)

CONFIG_I2S_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

Found in: [Component config](#) > [Driver Configurations](#) > [Legacy I2S Driver Configurations](#)

Whether to suppress the deprecation warnings when using legacy i2s driver (driver/i2s.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

Default value:

- No (disabled)

Legacy PCNT Driver Configurations Contains:

- [CONFIG_PCNT_SUPPRESS_DEPRECATE_WARN](#)

CONFIG_PCNT_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

Found in: [Component config](#) > [Driver Configurations](#) > [Legacy PCNT Driver Configurations](#)

whether to suppress the deprecation warnings when using legacy PCNT driver (driver/pcnt.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

Default value:

- No (disabled)

Legacy SDM Driver Configurations Contains:

- [CONFIG_SDM_SUPPRESS_DEPRECATE_WARN](#)

CONFIG_SDM_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

Found in: [Component config](#) > [Driver Configurations](#) > [Legacy SDM Driver Configurations](#)

whether to suppress the deprecation warnings when using legacy SDM driver (driver/sigmadelta.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

Default value:

- No (disabled)

Legacy Temperature Sensor Driver Configurations Contains:

- [CONFIG_TEMP_SENSOR_SUPPRESS_DEPRECATE_WARN](#)

CONFIG_TEMP_SENSOR_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

Found in: [Component config](#) > [Driver Configurations](#) > [Legacy Temperature Sensor Driver Configurations](#)

whether to suppress the deprecation warnings when using legacy temperature sensor driver (driver/temp_sensor.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

Default value:

- No (disabled)

eFuse Bit Manager Contains:

- [CONFIG_EFUSE_VIRTUAL](#)
- [CONFIG_EFUSE_CUSTOM_TABLE](#)

CONFIG_EFUSE_CUSTOM_TABLE

Use custom eFuse table

Found in: [Component config](#) > [eFuse Bit Manager](#)

Allows to generate a structure for eFuse from the CSV file.

Default value:

- No (disabled)

CONFIG_EFUSE_CUSTOM_TABLE_FILENAME

Custom eFuse CSV file

Found in: [Component config](#) > [eFuse Bit Manager](#) > [CONFIG_EFUSE_CUSTOM_TABLE](#)

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.

Default value:

- "main/esp_efuse_custom_table.csv" if [CONFIG_EFUSE_CUSTOM_TABLE](#)

CONFIG_EFUSE_VIRTUAL

Simulate eFuse operations in RAM

Found in: [Component config](#) > [eFuse Bit Manager](#)

If "n" - No virtual mode. All eFuse operations are real and use eFuse registers. If "y" - The virtual mode is enabled and all eFuse operations (read and write) are redirected to RAM instead of eFuse registers, all permanent changes (via eFuse) are disabled. Log output will state changes that would be applied, but they will not be.

If it is "y", then SECURE_FLASH_ENCRYPTION_MODE_RELEASE cannot be used. Because the EFUSE VIRT mode is for testing only.

During startup, the eFuses are copied into RAM. This mode is useful for fast tests.

Default value:

- No (disabled)

CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH

Keep eFuses in flash

Found in: [Component config](#) > [eFuse Bit Manager](#) > [CONFIG_EFUSE_VIRTUAL](#)

In addition to the "Simulate eFuse operations in RAM" option, this option just adds a feature to keep eFuses after reboots in flash memory. To use this mode the partition_table should have the *efuse* partition. partition.csv: "efuse_em, data, efuse, , 0x2000,"

During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This mode is useful when need to keep changes after reboot (testing secure_boot and flash_encryption).

CONFIG_EFUSE_VIRTUAL_LOG_ALL_WRITES

Log all virtual writes

Found in: [Component config](#) > [eFuse Bit Manager](#) > [CONFIG_EFUSE_VIRTUAL](#)

If enabled, log efuse burns. This shows changes that would be made.

ESP-TLS Contains:

- [CONFIG_ESP_TLS_INSECURE](#)
- [CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK](#)
- [CONFIG_ESP_TLS_LIBRARY_CHOOSE](#)
- [CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS](#)
- [CONFIG_ESP_DEBUG_WOLFSSL](#)
- [CONFIG_ESP_TLS_PSK_VERIFICATION](#)
- [CONFIG_ESP_TLS_SERVER_SESSION_TICKETS](#)
- [CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY](#)
- [CONFIG_ESP_TLS_SERVER_MIN_AUTH_MODE_OPTIONAL](#)
- [CONFIG_ESP_TLS_USE_DS_PERIPHERAL](#)

CONFIG_ESP_TLS_LIBRARY_CHOOSE

Choose SSL/TLS library for ESP-TLS (See help for more Info)

Found in: [Component config](#) > [ESP-TLS](#)

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

Available options:

- mbedTLS (CONFIG_ESP_TLS_USING_MBEDTLS)
- wolfSSL (License info in wolfSSL directory README) (CONFIG_ESP_TLS_USING_WOLFSSL)

CONFIG_ESP_TLS_USE_DS_PERIPHERAL

Use Digital Signature (DS) Peripheral with ESP-TLS

Found in: [Component config](#) > [ESP-TLS](#)

Enable use of the Digital Signature Peripheral for ESP-TLS. The DS peripheral can only be used when it is appropriately configured for TLS. Consult the ESP-TLS documentation in ESP-IDF Programming Guide for more details.

Default value:

- Yes (enabled)

CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS

Enable client session tickets

Found in: [Component config](#) > [ESP-TLS](#)

Enable session ticket support as specified in RFC5077.

CONFIG_ESP_TLS_SERVER_SESSION_TICKETS

Enable server session tickets

Found in: [Component config](#) > [ESP-TLS](#)

Enable session ticket support as specified in RFC5077

CONFIG_ESP_TLS_SERVER_SESSION_TICKET_TIMEOUT

Server session ticket timeout in seconds

Found in: [Component config](#) > [ESP-TLS](#) > [CONFIG_ESP_TLS_SERVER_SESSION_TICKETS](#)

Sets the session ticket timeout used in the tls server.

Default value:

- 86400 if [CONFIG_ESP_TLS_SERVER_SESSION_TICKETS](#)

CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK

Certificate selection hook

Found in: [Component config](#) > [ESP-TLS](#)

Ability to configure and use a certificate selection callback during server handshake, to select a certificate to present to the client based on the TLS extensions supplied in the client hello (alpn, sni, etc).

CONFIG_ESP_TLS_SERVER_MIN_AUTH_MODE_OPTIONAL

ESP-TLS Server: Set minimum Certificate Verification mode to Optional

Found in: [Component config](#) > [ESP-TLS](#)

When this option is enabled, the peer (here, the client) certificate is checked by the server, however the handshake continues even if verification failed. By default, the peer certificate is not checked and ignored by the server.

`mbedtls_ssl_get_verify_result()` can be called after the handshake is complete to retrieve status of verification.

CONFIG_ESP_TLS_PSK_VERIFICATION

Enable PSK verification

Found in: [Component config](#) > [ESP-TLS](#)

Enable support for pre shared key ciphers, supported for both mbedtls as well as wolfSSL TLS library.

CONFIG_ESP_TLS_INSECURE

Allow potentially insecure options

Found in: [Component config](#) > [ESP-TLS](#)

You can enable some potentially insecure options. These options should only be used for testing purposes. Only enable these options if you are very sure.

CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY

Skip server certificate verification by default (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

Found in: [Component config](#) > [ESP-TLS](#) > [CONFIG_ESP_TLS_INSECURE](#)

After enabling this option the esp-tls client will skip the server certificate verification by default. Note that this option will only modify the default behaviour of esp-tls client regarding server cert verification. The default behaviour should only be applicable when no other option regarding the server cert verification is opted in the esp-tls config (e.g. `cert_bundle_attach`, `use_global_ca_store` etc.). WARNING : Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like `ca_store` etc.

CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY

Enable SMALL_CERT_VERIFY

Found in: [Component config](#) > [ESP-TLS](#)

Enables server verification with Intermediate CA cert, does not authenticate full chain of trust upto the root CA cert (After Enabling this option client only needs to have Intermediate CA certificate of the server to authenticate server, root CA cert is not necessary).

Default value:

- Yes (enabled) if [CONFIG_ESP_TLS_USING_WOLFSSL](#)

CONFIG_ESP_DEBUG_WOLFSSL

Enable debug logs for wolfSSL

Found in: [Component config](#) > [ESP-TLS](#)

Enable detailed debug prints for wolfSSL SSL library.

ADC and ADC Calibration

 Contains:

- [ADC Calibration Configurations](#)
- [CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE](#)
- [CONFIG_ADC_DISABLE_DAC_OUTPUT](#)
- [CONFIG_ADC_ENABLE_DEBUG_LOG](#)
- [CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM](#)

CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM

Place ISR version ADC oneshot mode read function into IRAM

Found in: [Component config](#) > [ADC and ADC Calibration](#)

Place ISR version ADC oneshot mode read function into IRAM.

Default value:

- No (disabled)

CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE

ADC continuous mode driver ISR IRAM-Safe

Found in: [Component config](#) > [ADC and ADC Calibration](#)

Ensure the ADC continuous mode ISR is IRAM-Safe. When enabled, the ISR handler will be available when the cache is disabled.

Default value:

- No (disabled)

ADC Calibration Configurations**CONFIG_ADC_DISABLE_DAC_OUTPUT**

Disable DAC when ADC2 is in use

Found in: [Component config](#) > [ADC and ADC Calibration](#)

By default, this is set. The ADC oneshot driver will disable the output of the corresponding DAC channels: ESP32: IO25 and IO26 ESP32S2: IO17 and IO18

Disable this option so as to measure the output of DAC by internal ADC, for test usage.

Default value:

- Yes (enabled) if SOC_DAC_SUPPORTED

CONFIG_ADC_ENABLE_DEBUG_LOG

Enable ADC debug log

Found in: [Component config](#) > [ADC and ADC Calibration](#)

whether to enable the debug log message for ADC driver. Note that this option only controls the ADC driver log, will not affect other drivers.

note: This cannot be used in the ADC legacy driver.

Default value:

- No (disabled)

Wireless Coexistence Contains:

- [CONFIG_ESP_COEX_EXTERNAL_COEXIST_ENABLE](#)
- [CONFIG_ESP_COEX_SW_COEXIST_ENABLE](#)
- [CONFIG_ESP_COEX_POWER_MANAGEMENT](#)

CONFIG_ESP_COEX_SW_COEXIST_ENABLE

Software controls WiFi/Bluetooth coexistence

Found in: [Component config](#) > [Wireless Coexistence](#)

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

CONFIG_ESP_COEX_EXTERNAL_COEXIST_ENABLE

External Coexistence

Found in: [Component config](#) > [Wireless Coexistence](#)

If enabled, HW External coexistence arbitration is managed by GPIO pins. It can support three types of wired combinations so far which are 1-wired/2-wired/3-wired. User can select GPIO pins in application code with configure interfaces.

This function depends on BT-off because currently we do not support external coex and internal coex simultaneously.

CONFIG_ESP_COEX_POWER_MANAGEMENT

Support power management under coexistence

Found in: [Component config](#) > [Wireless Coexistence](#)

If enabled, coexist power management will be enabled.

Common ESP-related Contains:

- [CONFIG_ESP_ERR_TO_NAME_LOOKUP](#)

CONFIG_ESP_ERR_TO_NAME_LOOKUP

Enable lookup of error code strings

Found in: [Component config](#) > [Common ESP-related](#)

Functions `esp_err_to_name()` and `esp_err_to_name_r()` return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

Default value:

- Yes (enabled)

ESP-Driver:Analog Comparator Configurations Contains:

- [CONFIG_ANA_CMPR_ISR_IRAM_SAFE](#)
- [CONFIG_ANA_CMPR_ENABLE_DEBUG_LOG](#)
- [CONFIG_ANA_CMPR_CTRL_FUNC_IN_IRAM](#)

CONFIG_ANA_CMPR_ISR_IRAM_SAFE

Analog comparator ISR IRAM-Safe

Found in: [Component config](#) > [ESP-Driver:Analog Comparator Configurations](#)

Ensure the Analog Comparator interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

Default value:

- No (disabled)

CONFIG_ANA_CMPR_CTRL_FUNC_IN_IRAM

Place Analog Comparator control functions into IRAM

Found in: [Component config](#) > [ESP-Driver:Analog Comparator Configurations](#)

Place Analog Comparator control functions (like `ana_cmpr_set_internal_reference`) into IRAM, so that these functions can be IRAM-safe and able to be called in an IRAM interrupt context. Enabling this option can improve driver performance as well.

Default value:

- No (disabled)

CONFIG_ANA_CMPR_ENABLE_DEBUG_LOG

Enable debug log

Found in: Component config > ESP-Driver:Analog Comparator Configurations

whether to enable the debug log message for Analog Comparator driver. Note that, this option only controls the Analog Comparator driver log, won't affect other drivers.

Default value:

- No (disabled)

ESP-Driver:Camera Controller Configurations

 Contains:

- [CONFIG_CAM_CTLR_MIPI_CSI_ISR_IRAM_SAFE](#)
- [CONFIG_CAM_CTLR_DVP_CAM_ISR_IRAM_SAFE](#)
- [CONFIG_CAM_CTLR_ISP_DVP_ISR_IRAM_SAFE](#)

CONFIG_CAM_CTLR_MIPI_CSI_ISR_IRAM_SAFE

CSI ISR IRAM-Safe

Found in: Component config > ESP-Driver:Camera Controller Configurations

Ensure the CSI driver ISR is IRAM-Safe. When enabled, the ISR handler will be available when the cache is disabled.

Default value:

- No (disabled)

CONFIG_CAM_CTLR_ISP_DVP_ISR_IRAM_SAFE

ISP_DVP ISR IRAM-Safe

Found in: Component config > ESP-Driver:Camera Controller Configurations

Ensure the ISP_DVP driver ISR is IRAM-Safe. When enabled, the ISR handler will be available when the cache is disabled.

Default value:

- No (disabled)

CONFIG_CAM_CTLR_DVP_CAM_ISR_IRAM_SAFE

DVP ISR IRAM-Safe

Found in: Component config > ESP-Driver:Camera Controller Configurations

Ensure the DVP driver ISR is IRAM-Safe. When enabled, the ISR handler will be available when the cache is disabled.

Default value:

- No (disabled)

ESP-Driver:DAC Configurations

 Contains:

- [CONFIG_DAC_DMA_AUTO_16BIT_ALIGN](#)
- [CONFIG_DAC_ISR_IRAM_SAFE](#)
- [CONFIG_DAC_ENABLE_DEBUG_LOG](#)
- [CONFIG_DAC_CTRL_FUNC_IN_IRAM](#)

CONFIG_DAC_CTRL_FUNC_IN_IRAM

Place DAC control functions into IRAM

Found in: [Component config](#) > [ESP-Driver:DAC Configurations](#)

Place DAC control functions (e.g. 'dac_one_shot_output_voltage') into IRAM, so that this function can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

Default value:

- No (disabled) if SOC_DAC_SUPPORTED

CONFIG_DAC_ISR_IRAM_SAFE

DAC ISR IRAM-Safe

Found in: [Component config](#) > [ESP-Driver:DAC Configurations](#)

Ensure the DAC interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

Default value:

- No (disabled) if SOC_DAC_SUPPORTED

CONFIG_DAC_ENABLE_DEBUG_LOG

Enable debug log

Found in: [Component config](#) > [ESP-Driver:DAC Configurations](#)

whether to enable the debug log message for DAC driver. Note that, this option only controls the DAC driver log, won't affect other drivers.

Default value:

- No (disabled) if SOC_DAC_SUPPORTED

CONFIG_DAC_DMA_AUTO_16BIT_ALIGN

Align the continuous data to 16 bit automatically

Found in: [Component config](#) > [ESP-Driver:DAC Configurations](#)

Whether to left shift the continuous data to align every bytes to 16 bits in the driver. On ESP32, although the DAC resolution is only 8 bits, the hardware requires 16 bits data in continuous mode. By enabling this option, the driver will left shift 8 bits for the input data automatically. Only disable this option when you decide to do this step by yourself. Note that the driver will allocate a new piece of memory to save the converted data.

Default value:

- Yes (enabled) if SOC_DAC_DMA_16BIT_ALIGN && SOC_DAC_SUPPORTED

ESP-Driver:GPIO Configurations

 Contains:

- [CONFIG_GPIO_CTRL_FUNC_IN_IRAM](#)

CONFIG_GPIO_CTRL_FUNC_IN_IRAM

Place GPIO control functions into IRAM

Found in: [Component config](#) > [ESP-Driver:GPIO Configurations](#)

Place GPIO control functions (like intr_disable/set_level) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

Default value:

- No (disabled)

ESP-Driver:GPTimer Configurations Contains:

- [CONFIG_GPTIMER_ENABLE_DEBUG_LOG](#)
- [CONFIG_GPTIMER_ISR_IRAM_SAFE](#)
- [CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM](#)
- [CONFIG_GPTIMER_ISR_HANDLER_IN_IRAM](#)

CONFIG_GPTIMER_ISR_HANDLER_IN_IRAM

Place GPTimer ISR handler into IRAM

Found in: [Component config](#) > [ESP-Driver:GPTimer Configurations](#)

Place GPTimer ISR handler into IRAM for better performance and fewer cache misses.

Default value:

- Yes (enabled)

CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM

Place GPTimer control functions into IRAM

Found in: [Component config](#) > [ESP-Driver:GPTimer Configurations](#)

Place GPTimer control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

Default value:

- No (disabled)

CONFIG_GPTIMER_ISR_IRAM_SAFE

GPTimer ISR IRAM-Safe

Found in: [Component config](#) > [ESP-Driver:GPTimer Configurations](#)

Ensure the GPTimer interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

Default value:

- No (disabled)

CONFIG_GPTIMER_ENABLE_DEBUG_LOG

Enable debug log

Found in: [Component config](#) > [ESP-Driver:GPTimer Configurations](#)

whether to enable the debug log message for GPTimer driver. Note that, this option only controls the GPTimer driver log, won't affect other drivers.

Default value:

- No (disabled)

ESP-Driver:I2C Configurations Contains:

- [CONFIG_I2C_ENABLE_DEBUG_LOG](#)
- [CONFIG_I2C_ISR_IRAM_SAFE](#)

CONFIG_I2C_ISR_IRAM_SAFE

I2C ISR IRAM-Safe

Found in: Component config > ESP-Driver:I2C Configurations

Ensure the I2C interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). note: This cannot be used in the I2C legacy driver.

Default value:

- No (disabled)

CONFIG_I2C_ENABLE_DEBUG_LOG

Enable I2C debug log

Found in: Component config > ESP-Driver:I2C Configurations

whether to enable the debug log message for I2C driver. Note that this option only controls the I2C driver log, will not affect other drivers.

note: This cannot be used in the I2C legacy driver.

Default value:

- No (disabled)

ESP-Driver:I2S Configurations Contains:

- [CONFIG_I2S_ENABLE_DEBUG_LOG](#)
- [CONFIG_I2S_ISR_IRAM_SAFE](#)

CONFIG_I2S_ISR_IRAM_SAFE

I2S ISR IRAM-Safe

Found in: Component config > ESP-Driver:I2S Configurations

Ensure the I2S interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

Default value:

- No (disabled)

CONFIG_I2S_ENABLE_DEBUG_LOG

Enable I2S debug log

Found in: Component config > ESP-Driver:I2S Configurations

whether to enable the debug log message for I2S driver. Note that, this option only controls the I2S driver log, will not affect other drivers.

Default value:

- No (disabled)

ESP-Driver:ISP Configurations Contains:

- [CONFIG_ISP_ISR_IRAM_SAFE](#)

CONFIG_ISP_ISR_IRAM_SAFE

ISP driver ISR IRAM-Safe

Found in: Component config > ESP-Driver:ISP Configurations

Ensure the ISP driver ISR is IRAM-Safe. When enabled, the ISR handler will be available when the cache is disabled.

Default value:

- No (disabled)

ESP-Driver:JPEG-Codec Configurations

 Contains:

- [CONFIG_JPEG_ENABLE_DEBUG_LOG](#)

CONFIG_JPEG_ENABLE_DEBUG_LOG

Enable debug log

Found in: Component config > ESP-Driver:JPEG-Codec Configurations

whether to enable the debug log message for JPEG driver. Note that, this option only controls the JPEG driver log, won't affect other drivers. Please also note, enable this option will make jpeg codec process speed much slower.

Default value:

- No (disabled)

ESP-Driver:LEDC Configurations

 Contains:

- [CONFIG_LEDC_CTRL_FUNC_IN_IRAM](#)

CONFIG_LEDC_CTRL_FUNC_IN_IRAM

Place LEDC control functions into IRAM

Found in: Component config > ESP-Driver:LEDC Configurations

Place LEDC control functions (ledc_update_duty and ledc_stop) into IRAM, so that these functions can be IRAM-safe and able to be called in an IRAM context. Enabling this option can improve driver performance as well.

Default value:

- No (disabled)

ESP-Driver:MCPWM Configurations

 Contains:

- [CONFIG_MCPWM_ENABLE_DEBUG_LOG](#)
- [CONFIG_MCPWM_CTRL_FUNC_IN_IRAM](#)
- [CONFIG_MCPWM_ISR_IRAM_SAFE](#)

CONFIG_MCPWM_ISR_IRAM_SAFE

Place MCPWM ISR function into IRAM

Found in: Component config > ESP-Driver:MCPWM Configurations

This will ensure the MCPWM interrupt handle is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write)

Default value:

- No (disabled)

CONFIG_MCPWM_CTRL_FUNC_IN_IRAM

Place MCPWM control functions into IRAM

Found in: [Component config](#) > [ESP-Driver:MCPWM Configurations](#)

Place MCPWM control functions (like `set_compare_value`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

Default value:

- No (disabled)

CONFIG_MCPWM_ENABLE_DEBUG_LOG

Enable debug log

Found in: [Component config](#) > [ESP-Driver:MCPWM Configurations](#)

whether to enable the debug log message for MCPWM driver. Note that, this option only controls the MCPWM driver log, won't affect other drivers.

Default value:

- No (disabled)

ESP-Driver:Parallel IO Configurations

 Contains:

- [CONFIG_PARLIO_ENABLE_DEBUG_LOG](#)
- [CONFIG_PARLIO_ISR_IRAM_SAFE](#)

CONFIG_PARLIO_ENABLE_DEBUG_LOG

Enable debug log

Found in: [Component config](#) > [ESP-Driver:Parallel IO Configurations](#)

whether to enable the debug log message for parallel IO driver. Note that, this option only controls the parallel IO driver log, won't affect other drivers.

Default value:

- No (disabled)

CONFIG_PARLIO_ISR_IRAM_SAFE

Parallel IO ISR IRAM-Safe

Found in: [Component config](#) > [ESP-Driver:Parallel IO Configurations](#)

Ensure the Parallel IO interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

Default value:

- No (disabled)

ESP-Driver:PCNT Configurations

 Contains:

- [CONFIG_PCNT_ENABLE_DEBUG_LOG](#)
- [CONFIG_PCNT_ISR_IRAM_SAFE](#)
- [CONFIG_PCNT_CTRL_FUNC_IN_IRAM](#)

CONFIG_PCNT_CTRL_FUNC_IN_IRAM

Place PCNT control functions into IRAM

Found in: [Component config](#) > [ESP-Driver:PCNT Configurations](#)

Place PCNT control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

Default value:

- No (disabled)

CONFIG_PCNT_ISR_IRAM_SAFE

PCNT ISR IRAM-Safe

Found in: [Component config](#) > [ESP-Driver:PCNT Configurations](#)

Ensure the PCNT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

Default value:

- No (disabled)

CONFIG_PCNT_ENABLE_DEBUG_LOG

Enable debug log

Found in: [Component config](#) > [ESP-Driver:PCNT Configurations](#)

whether to enable the debug log message for PCNT driver. Note that, this option only controls the PCNT driver log, won't affect other drivers.

Default value:

- No (disabled)

ESP-Driver:RMT Configurations

 Contains:

- [CONFIG_RMT_ENABLE_DEBUG_LOG](#)
- [CONFIG_RMT_RECV_FUNC_IN_IRAM](#)
- [CONFIG_RMT_ISR_IRAM_SAFE](#)

CONFIG_RMT_ISR_IRAM_SAFE

RMT ISR IRAM-Safe

Found in: [Component config](#) > [ESP-Driver:RMT Configurations](#)

Ensure the RMT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

Default value:

- No (disabled)

CONFIG_RMT_RECV_FUNC_IN_IRAM

Place RMT receive function into IRAM

Found in: [Component config](#) > [ESP-Driver:RMT Configurations](#)

Place RMT receive function into IRAM, so that the receive function can be IRAM-safe and able to be called when the flash cache is disabled. Enabling this option can improve driver performance as well.

Default value:

- No (disabled)

CONFIG_RMT_ENABLE_DEBUG_LOG

Enable debug log

Found in: Component config > ESP-Driver:RMT Configurations

whether to enable the debug log message for RMT driver. Note that, this option only controls the RMT driver log, won't affect other drivers.

Default value:

- No (disabled)

ESP-Driver:Sigma Delta Modulator Configurations

 Contains:

- [CONFIG_SDM_ENABLE_DEBUG_LOG](#)
- [CONFIG_SDM_CTRL_FUNC_IN_IRAM](#)

CONFIG_SDM_CTRL_FUNC_IN_IRAM

Place SDM control functions into IRAM

Found in: Component config > ESP-Driver:Sigma Delta Modulator Configurations

Place SDM control functions (like `set_duty`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

Default value:

- No (disabled)

CONFIG_SDM_ENABLE_DEBUG_LOG

Enable debug log

Found in: Component config > ESP-Driver:Sigma Delta Modulator Configurations

whether to enable the debug log message for SDM driver. Note that, this option only controls the SDM driver log, won't affect other drivers.

Default value:

- No (disabled)

ESP-Driver:SPI Configurations

 Contains:

- [CONFIG_SPI_MASTER_ISR_IN_IRAM](#)
- [CONFIG_SPI_SLAVE_ISR_IN_IRAM](#)
- [CONFIG_SPI_MASTER_IN_IRAM](#)
- [CONFIG_SPI_SLAVE_IN_IRAM](#)

CONFIG_SPI_MASTER_IN_IRAM

Place transmitting functions of SPI master into IRAM

Found in: Component config > ESP-Driver:SPI Configurations

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there's some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue_trans`, `get_trans_result` and `transmit` functions into the IRAM to avoid possible cache miss.

This configuration won't be available if `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH` is enabled.

During unit test, this is enabled to measure the ideal case of api.

CONFIG_SPI_MASTER_ISR_IN_IRAM

Place SPI master ISR function into IRAM

Found in: Component config > ESP-Driver:SPI Configurations

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Enabling this configuration is possible only when `HEAP_PLACE_FUNCTION_INTO_FLASH` is disabled since the spi master uses can allocate transactions buffers into DMA memory section using the heap component API that ipso facto has to be placed in IRAM.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

CONFIG_SPI_SLAVE_IN_IRAM

Place transmitting functions of SPI slave into IRAM

Found in: Component config > ESP-Driver:SPI Configurations

Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there's some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue_trans`, `get_trans_result` and `transmit` functions into the IRAM to avoid possible cache miss.

Default value:

- No (disabled)

CONFIG_SPI_SLAVE_ISR_IN_IRAM

Place SPI slave ISR function into IRAM

Found in: Component config > ESP-Driver:SPI Configurations

Place the SPI slave ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

Default value:

- Yes (enabled)

ESP-Driver:Touch Sensor Configurations Contains:

- [`CONFIG_TOUCH_ENABLE_DEBUG_LOG`](#)
- [`CONFIG_TOUCH_CTRL_FUNC_IN_IRAM`](#)
- [`CONFIG_TOUCH_ISR_IRAM_SAFE`](#)

CONFIG_TOUCH_CTRL_FUNC_IN_IRAM

Place touch sensor control functions into IRAM

Found in: Component config > ESP-Driver:Touch Sensor Configurations

Place touch sensor oneshot scanning and continuous scanning functions into IRAM, so that these function can be IRAM-safe and able to be called when the flash cache is disabled. Enabling this option can improve driver performance as well.

Default value:

- No (disabled)

CONFIG_TOUCH_ISR_IRAM_SAFE

Touch sensor ISR IRAM-Safe

Found in: [Component config](#) > [ESP-Driver:Touch Sensor Configurations](#)

Ensure the touch sensor interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

Default value:

- No (disabled)

CONFIG_TOUCH_ENABLE_DEBUG_LOG

Enable debug log

Found in: [Component config](#) > [ESP-Driver:Touch Sensor Configurations](#)

Whether to enable the debug log message for touch driver. Note that, this option only controls the touch driver log, won't affect other drivers.

Default value:

- No (disabled)

ESP-Driver:Temperature Sensor Configurations Contains:

- [CONFIG_TEMP_SENSOR_ENABLE_DEBUG_LOG](#)
- [CONFIG_TEMP_SENSOR_ISR_IRAM_SAFE](#)

CONFIG_TEMP_SENSOR_ENABLE_DEBUG_LOG

Enable debug log

Found in: [Component config](#) > [ESP-Driver:Temperature Sensor Configurations](#)

whether to enable the debug log message for temperature sensor driver. Note that, this option only controls the temperature sensor driver log, won't affect other drivers.

Default value:

- No (disabled)

CONFIG_TEMP_SENSOR_ISR_IRAM_SAFE

Temperature sensor ISR IRAM-Safe

Found in: [Component config](#) > [ESP-Driver:Temperature Sensor Configurations](#)

Ensure the Temperature Sensor interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

Default value:

- No (disabled)

ESP-Driver:UART Configurations Contains:

- [CONFIG_UART_ISR_IN_IRAM](#)

CONFIG_UART_ISR_IN_IRAM

Place UART ISR function into IRAM

Found in: [Component config](#) > [ESP-Driver:UART Configurations](#)

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

ESP-Driver:USB Serial/JTAG Configuration

 Contains:

- [CONFIG_USJ_ENABLE_USB_SERIAL_JTAG](#)

CONFIG_USJ_ENABLE_USB_SERIAL_JTAG

Enable USB-Serial-JTAG Module

Found in: [Component config](#) > [ESP-Driver:USB Serial/JTAG Configuration](#)

The USB-Serial-JTAG module on ESP chips is turned on by default after power-on. If your application does not need it and not rely on it to be used as system console or use the built-in JTAG for debugging, you can disable this option, then the clock of this module will be disabled at startup, which will save some power consumption.

Default value:

- Yes (enabled)

CONFIG_USJ_NO_AUTO_LS_ON_CONNECTION

Don't enter the automatic light sleep when USB Serial/JTAG port is connected

Found in: [Component config](#) > [ESP-Driver:USB Serial/JTAG Configuration](#) > [CONFIG_USJ_ENABLE_USB_SERIAL_JTAG](#)

If enabled, the chip will constantly monitor the connection status of the USB Serial/JTAG port. As long as the USB Serial/JTAG is connected, a ESP_PM_NO_LIGHT_SLEEP power management lock will be acquired to prevent the system from entering light sleep. This option can be useful if serial monitoring is needed via USB Serial/JTAG while power management is enabled, as the USB Serial/JTAG cannot work under light sleep and after waking up from light sleep. Note. This option can only control the automatic Light-Sleep behavior. If `esp_light_sleep_start()` is called manually from the program, enabling this option will not prevent light sleep entry even if the USB Serial/JTAG is in use.

Ethernet

 Contains:

- [CONFIG_ETH_TRANSMIT_MUTEX](#)
- [CONFIG_ETH_USE_ESP32_EMAC](#)
- [CONFIG_ETH_USE_OPENETH](#)
- [CONFIG_ETH_USE_SPI_ETHERNET](#)

CONFIG_ETH_USE_ESP32_EMAC

Support ESP32 internal EMAC controller

Found in: [Component config](#) > [Ethernet](#)

ESP32 integrates a 10/100M Ethernet MAC controller.

Default value:

- Yes (enabled)

Contains:

- [CONFIG_ETH_DMA_RX_BUFFER_NUM](#)
- [CONFIG_ETH_DMA_TX_BUFFER_NUM](#)

- [CONFIG_ETH_IRAM_OPTIMIZATION](#)
- [CONFIG_ETH_SOFT_FLOW_CONTROL](#)
- [CONFIG_ETH_DMA_BUFFER_SIZE](#)
- [CONFIG_ETH_PHY_INTERFACE](#)

CONFIG_ETH_PHY_INTERFACE

PHY interface

Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC

Select the communication interface between MAC and PHY chip.

Available options:

- Reduced Media Independent Interface (RMII) (CONFIG_ETH_PHY_INTERFACE_RMII)

CONFIG_ETH_DMA_BUFFER_SIZE

Ethernet DMA buffer size (Byte)

Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC

Set the size of each buffer used by Ethernet MAC DMA. !! Important !! Make sure it is 64B aligned for ESP32P4!

Range:

- from 256 to 1600

Default value:

- 512

CONFIG_ETH_DMA_RX_BUFFER_NUM

Amount of Ethernet DMA Rx buffers

Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC

Number of DMA receive buffers. Each buffer's size is ETH_DMA_BUFFER_SIZE. Larger number of buffers could increase throughput somehow.

Range:

- from 3 to 30

Default value:

- 20

CONFIG_ETH_DMA_TX_BUFFER_NUM

Amount of Ethernet DMA Tx buffers

Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC

Number of DMA transmit buffers. Each buffer's size is ETH_DMA_BUFFER_SIZE. Larger number of buffers could increase throughput somehow.

Range:

- from 3 to 30

Default value:

- 10

CONFIG_ETH_SOFT_FLOW_CONTROL

Enable software flow control

Found in: [Component config](#) > [Ethernet](#) > [CONFIG_ETH_USE_ESP32_EMAC](#)

Ethernet MAC engine on ESP32 doesn't feature a flow control logic. The MAC driver can perform a software flow control if you enable this option. Note that, if the RX buffer number is small, enabling software flow control will cause obvious performance loss.

Default value:

- No (disabled)

CONFIG_ETH_IRAM_OPTIMIZATION

Enable IRAM optimization

Found in: [Component config](#) > [Ethernet](#) > [CONFIG_ETH_USE_ESP32_EMAC](#)

If enabled, functions related to RX/TX are placed into IRAM. It can improve Ethernet throughput. If disabled, all functions are placed into FLASH.

Default value:

- No (disabled)

CONFIG_ETH_USE_SPI_ETHERNET

Support SPI to Ethernet Module

Found in: [Component config](#) > [Ethernet](#)

ESP-IDF can also support some SPI-Ethernet modules.

Default value:

- Yes (enabled)

Contains:

- [CONFIG_ETH_SPI_ETHERNET_DM9051](#)
- [CONFIG_ETH_SPI_ETHERNET_KSZ8851SNL](#)
- [CONFIG_ETH_SPI_ETHERNET_W5500](#)

CONFIG_ETH_SPI_ETHERNET_DM9051

Use DM9051

Found in: [Component config](#) > [Ethernet](#) > [CONFIG_ETH_USE_SPI_ETHERNET](#)

DM9051 is a fast Ethernet controller with an SPI interface. It's also integrated with a 10/100M PHY and MAC. Select this to enable DM9051 driver.

CONFIG_ETH_SPI_ETHERNET_W5500

Use W5500 (MAC RAW)

Found in: [Component config](#) > [Ethernet](#) > [CONFIG_ETH_USE_SPI_ETHERNET](#)

W5500 is a HW TCP/IP embedded Ethernet controller. TCP/IP stack, 10/100 Ethernet MAC and PHY are embedded in a single chip. However the driver in ESP-IDF only enables the RAW MAC mode, making it compatible with the software TCP/IP stack. Say yes to enable W5500 driver.

CONFIG_ETH_SPI_ETHERNET_KSZ8851SNL

Use KSZ8851SNL

Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET

The KSZ8851SNL is a single-chip Fast Ethernet controller consisting of a 10/100 physical layer transceiver (PHY), a MAC, and a Serial Peripheral Interface (SPI). Select this to enable KSZ8851SNL driver.

CONFIG_ETH_USE_OPENETH

Support OpenCores Ethernet MAC (for use with QEMU)

Found in: Component config > Ethernet

OpenCores Ethernet MAC driver can be used when an ESP-IDF application is executed in QEMU. This driver is not supported when running on a real chip.

Default value:

- No (disabled)

Contains:

- [CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM](#)
- [CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM](#)

CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM

Number of Ethernet DMA Rx buffers

Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH

Number of DMA receive buffers, each buffer is 1600 bytes.

Range:

- from 1 to 64 if [CONFIG_ETH_USE_OPENETH](#)

Default value:

- 4 if [CONFIG_ETH_USE_OPENETH](#)

CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM

Number of Ethernet DMA Tx buffers

Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH

Number of DMA transmit buffers, each buffer is 1600 bytes.

Range:

- from 1 to 64 if [CONFIG_ETH_USE_OPENETH](#)

Default value:

- 1 if [CONFIG_ETH_USE_OPENETH](#)

CONFIG_ETH_TRANSMIT_MUTEX

Enable Transmit Mutex

Found in: Component config > Ethernet

Prevents multiple accesses when Ethernet interface is used as shared resource and multiple functionalities might try to access it at a time.

Default value:

- No (disabled)

Event Loop Library Contains:

- [CONFIG_ESP_EVENT_LOOP_PROFILING](#)
- [CONFIG_ESP_EVENT_POST_FROM_ISR](#)

CONFIG_ESP_EVENT_LOOP_PROFILING

Enable event loop profiling

Found in: [Component config](#) > [Event Loop Library](#)

Enables collections of statistics in the event loop library such as the number of events posted to/received by an event loop, number of callbacks involved, number of events dropped to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

Default value:

- No (disabled)

CONFIG_ESP_EVENT_POST_FROM_ISR

Support posting events from ISRs

Found in: [Component config](#) > [Event Loop Library](#)

Enable posting events from interrupt handlers.

Default value:

- Yes (enabled)

CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR

Support posting events from ISRs placed in IRAM

Found in: [Component config](#) > [Event Loop Library](#) > [CONFIG_ESP_EVENT_POST_FROM_ISR](#)

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions `esp_event_post` and `esp_event_post_to` in IRAM.

Default value:

- Yes (enabled)

GDB Stub Contains:

- [CONFIG_ESP_GDBSTUB_SUPPORT_TASKS](#)
- [CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME](#)

CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME

GDBStub at runtime

Found in: [Component config](#) > [GDB Stub](#)

Enable builtin GDBStub. This allows to debug the target device using serial port: - Run 'idf.py monitor'. - Wait for the device to initialize. - Press Ctrl+C to interrupt the execution and enter GDB attached to your device for debugging. NOTE: all UART input will be handled by GDBStub.

CONFIG_ESP_GDBSTUB_SUPPORT_TASKS

Enable listing FreeRTOS tasks through GDB Stub

Found in: [Component config](#) > [GDB Stub](#)

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using 'info threads' command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.

Default value:

- Yes (enabled)

CONFIG_ESP_GDBSTUB_MAX_TASKS

Maximum number of tasks supported by GDB Stub

Found in: Component config > GDB Stub > CONFIG_ESP_GDBSTUB_SUPPORT_TASKS

Set the number of tasks which GDB Stub will support.

Default value:

- 32

ESP HTTP client Contains:

- [CONFIG_ESP_HTTP_CLIENT_ENABLE_CUSTOM_TRANSPORT](#)
- [CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH](#)
- [CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH](#)
- [CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS](#)

CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS

Enable https

Found in: Component config > ESP HTTP client

This option will enable https protocol by linking esp-tls library and initializing SSL transport

Default value:

- Yes (enabled)

CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH

Enable HTTP Basic Authentication

Found in: Component config > ESP HTTP client

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS

Default value:

- No (disabled)

CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH

Enable HTTP Digest Authentication

Found in: Component config > ESP HTTP client

This option will enable HTTP Digest Authentication. It is enabled by default, but use of this configuration is not recommended as the password can be derived from the exchange, so it introduces a vulnerability when not using TLS

Default value:

- No (disabled)

CONFIG_ESP_HTTP_CLIENT_ENABLE_CUSTOM_TRANSPORT

Enable custom transport

Found in: [Component config](#) > [ESP HTTP client](#)

This option will enable injection of a custom tcp_transport handle, so the http operation will be performed on top of the user defined transport abstraction (if configured)

Default value:

- No (disabled)

HTTP Server

 Contains:

- [CONFIG_HTTPD_QUEUE_WORK_BLOCKING](#)
- [CONFIG_HTTPD_PURGE_BUF_LEN](#)
- [CONFIG_HTTPD_LOG_PURGE_DATA](#)
- [CONFIG_HTTPD_MAX_REQ_HDR_LEN](#)
- [CONFIG_HTTPD_MAX_URI_LEN](#)
- [CONFIG_HTTPD_ERR_RESP_NO_DELAY](#)
- [CONFIG_HTTPD_WS_SUPPORT](#)

CONFIG_HTTPD_MAX_REQ_HDR_LEN

Max HTTP Request Header Length

Found in: [Component config](#) > [HTTP Server](#)

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server

Default value:

- 512

CONFIG_HTTPD_MAX_URI_LEN

Max HTTP URI Length

Found in: [Component config](#) > [HTTP Server](#)

This sets the maximum supported size of HTTP request URI to be processed by the server

Default value:

- 512

CONFIG_HTTPD_ERR_RESP_NO_DELAY

Use TCP_NODELAY socket option when sending HTTP error responses

Found in: [Component config](#) > [HTTP Server](#)

Using TCP_NODELAY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures

Default value:

- Yes (enabled)

CONFIG_HTTPD_PURGE_BUF_LEN

Length of temporary buffer for purging data

Found in: [Component config](#) > [HTTP Server](#)

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler.

If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

Default value:

- 32

CONFIG_HTTPD_LOG_PURGE_DATA

Log purged content data at Debug level

Found in: [Component config](#) > [HTTP Server](#)

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

Default value:

- No (disabled)

CONFIG_HTTPD_WS_SUPPORT

WebSocket server support

Found in: [Component config](#) > [HTTP Server](#)

This sets the WebSocket server support.

Default value:

- No (disabled)

CONFIG_HTTPD_QUEUE_WORK_BLOCKING

httpd_queue_work as blocking API

Found in: [Component config](#) > [HTTP Server](#)

This makes httpd_queue_work() API to wait until a message space is available on UDP control socket. It internally uses a counting semaphore with count set to `LWIP_UDP_RECVMBOX_SIZE` to achieve this. This config will slightly change API behavior to block until message gets delivered on control socket.

ESP HTTPS OTA Contains:

- [CONFIG_ESP_HTTPS_OTA_ALLOW_HTTP](#)
- [CONFIG_ESP_HTTPS_OTA_DECRYPT_CB](#)

CONFIG_ESP_HTTPS_OTA_DECRYPT_CB

Provide decryption callback

Found in: [Component config](#) > [ESP HTTPS OTA](#)

Exposes an additional callback whereby firmware data could be decrypted before being processed by OTA update component. This can help to integrate external encryption related format and removal of such encapsulation layer from firmware image.

Default value:

- No (disabled)

CONFIG_ESP_HTTPS_OTA_ALLOW_HTTP

Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

Found in: *Component config > ESP HTTPS OTA*

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of: - Non-encrypted communication channel with server - Accepting firmware upgrade image from server with fake identity

Default value:

- No (disabled)

ESP HTTPS server Contains:

- *CONFIG_ESP_HTTPS_SERVER_ENABLE*

CONFIG_ESP_HTTPS_SERVER_ENABLE

Enable ESP_HTTPS_SERVER component

Found in: *Component config > ESP HTTPS server*

Enable ESP HTTPS server component

Hardware Settings Contains:

- *2D-DMA Configurations*
- *Chip revision*
- *Crypto DPA Protection*
- *DCDC Regulator Configurations*
- *DW_GDMA Configurations*
- *ETM Configuration*
- *GDMA Configurations*
- *LDO Regulator Configurations*
- *MAC Config*
- *Main XTAL Config*
- *Peripheral Control*
- *RTC Clock Config*
- *Sleep Config*

Chip revision Contains:

- *CONFIG_ESP_REV_NEW_CHIP_TEST*
- *CONFIG_ESP32P4_REV_MIN*

CONFIG_ESP32P4_REV_MIN

Minimum Supported ESP32-P4 Revision

Found in: *Component config > Hardware Settings > Chip revision*

Required minimum chip revision. ESP-IDF will check for it and reject to boot if the chip revision fails the check. This ensures the chip used will have some modifications (features, or bugfixes).

The compiled binary will only support chips above this revision, this will also help to reduce binary size.

Available options:

- Rev v0.0 (CONFIG_ESP32P4_REV_MIN_0)
- Rev v0.1 (CONFIG_ESP32P4_REV_MIN_1)

CONFIG_ESP_REV_NEW_CHIP_TEST

Internal test mode

Found in: [Component config](#) > [Hardware Settings](#) > [Chip revision](#)

For internal chip testing, a small number of new versions chips didn't update the version field in eFuse, you can enable this option to force the software recognize the chip version based on the rev selected in menuconfig.

Default value:

- No (disabled)

MAC Config

 Contains:

- [CONFIG_ESP_MAC_USE_CUSTOM_MAC_AS_BASE_MAC](#)
- [CONFIG_ESP32P4_UNIVERSAL_MAC_ADDRESSES](#)

CONFIG_ESP32P4_UNIVERSAL_MAC_ADDRESSES

Number of universally administered (by IEEE) MAC address

Found in: [Component config](#) > [Hardware Settings](#) > [MAC Config](#)

Configure the number of universally administered (by IEEE) MAC addresses.

During initialization, MAC addresses for each network interface are generated or derived from a single base MAC address.

If the number of universal MAC addresses is one, only Ethernet interface receives a universally administered MAC address. It's generated by adding 0 to the base MAC address.

When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range.

Available options:

- One ([CONFIG_ESP32P4_UNIVERSAL_MAC_ADDRESSES_ONE](#))

CONFIG_ESP_MAC_USE_CUSTOM_MAC_AS_BASE_MAC

Enable using custom mac as base mac

Found in: [Component config](#) > [Hardware Settings](#) > [MAC Config](#)

When this configuration is enabled, the user can invoke `esp_read_mac` to obtain the desired type of MAC using a custom MAC as the base MAC.

Default value:

- No (disabled)

Sleep Config

 Contains:

- [CONFIG_ESP_SLEEP_GPIO_ENABLE_INTERNAL_RESISTORS](#)
- [CONFIG_ESP_SLEEP_CACHE_SAFE_ASSERTION](#)
- [CONFIG_ESP_SLEEP_EVENT_CALLBACKS](#)
- [CONFIG_ESP_SLEEP_DEBUG](#)
- [CONFIG_ESP_SLEEP_WAIT_FLASH_READY_EXTRA_DELAY](#)
- [CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND](#)
- [CONFIG_ESP_SLEEP_POWER_DOWN_FLASH](#)
- [CONFIG_ESP_SLEEP_MSPI_NEED_ALL_IO_PU](#)
- [CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND](#)

- [CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND](#)

CONFIG_ESP_SLEEP_POWER_DOWN_FLASH

Power down flash in light sleep when there is no SPIRAM

Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)

If enabled, chip will try to power down flash as part of `esp_light_sleep_start()`, which costs more time when chip wakes up. Can only be enabled if there is no SPIRAM configured.

This option will power down flash under a strict but relatively safe condition. Also, it is possible to power down flash under a relaxed condition by using `esp_sleep_pd_config()` to set `ESP_PD_DOMAIN_VDDSDIO` to `ESP_PD_OPTION_OFF`. It should be noted that there is a risk in powering down flash, you can refer *ESP-IDF Programming Guide/API Reference/System API/Sleep Modes/Power-down of Flash* for more details.

CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND

Pull-up Flash CS pin in light sleep

Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)

All IOs will be set to isolate(floating) state by default during sleep. Since the power supply of SPI Flash is not lost during lightsleep, if its CS pin is recognized as low level(selected state) in the floating state, there will be a large current leakage, and the data in Flash may be corrupted by random signals on other SPI pins. Select this option will set the CS pin of Flash to PULL-UP state during sleep, but this will increase the sleep current about 10 uA. If you are developing with esp32xx modules, you must select this option, but if you are developing with chips, you can also pull up the CS pin of SPI Flash in the external circuit to save power consumption caused by internal pull-up during sleep. (!!! Don't deselect this option if you don't have external SPI Flash CS pin pullups.)

CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND

Pull-up PSRAM CS pin in light sleep

Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)

All IOs will be set to isolate(floating) state by default during sleep. Since the power supply of PSRAM is not lost during lightsleep, if its CS pin is recognized as low level(selected state) in the floating state, there will be a large current leakage, and the data in PSRAM may be corrupted by random signals on other SPI pins. Select this option will set the CS pin of PSRAM to PULL-UP state during sleep, but this will increase the sleep current about 10 uA. If you are developing with esp32xx modules, you must select this option, but if you are developing with chips, you can also pull up the CS pin of PSRAM in the external circuit to save power consumption caused by internal pull-up during sleep. (!!! Don't deselect this option if you don't have external PSRAM CS pin pullups.)

Default value:

- Yes (enabled) if [CONFIG_SPIRAM](#)

CONFIG_ESP_SLEEP_MSPI_NEED_ALL_IO_PU

Pull-up all SPI pins in light sleep

Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)

To reduce leakage current, some types of SPI Flash/RAM only need to pull up the CS pin during light sleep. But there are also some kinds of SPI Flash/RAM that need to pull up all pins. It depends on the SPI Flash/RAM chip used.

CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND

light sleep GPIO reset workaround

Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)

esp32c2, esp32c3, esp32s3, esp32c6 and esp32h2 will reset at wake-up if GPIO is received a small electrostatic pulse during light sleep, with specific condition

- GPIO needs to be configured as input-mode only
- The pin receives a small electrostatic pulse, and reset occurs when the pulse voltage is higher than 6 V

For GPIO set to input mode only, it is not a good practice to leave it open/floating, The hardware design needs to controlled it with determined supply or ground voltage is necessary.

This option provides a software workaround for this issue. Configure to isolate all GPIO pins in sleep state.

CONFIG_ESP_SLEEP_WAIT_FLASH_READY_EXTRA_DELAY

Extra delay (in us) after flash powerdown sleep wakeup to wait flash ready

Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)

When the chip exits sleep, the CPU and the flash chip are powered on at the same time. CPU will run rom code (deepsleep) or ram code (lightsleep) first, and then load or execute code from flash.

Some flash chips need sufficient time to pass between power on and first read operation. By default, without any extra delay, this time is approximately 900us, although some flash chip types need more than that.

(!!! Please adjust this value according to the Data Sheet of SPI Flash used in your project.) In Flash Data Sheet, the parameters that define the Flash ready timing after power-up (minimum time from Vcc(min) to CS activeare) usually named tVSL in ELECTRICAL CHARACTERISTICS chapter, and the configuration value here should be: `ESP_SLEEP_WAIT_FLASH_READY_EXTRA_DELAY = tVSL - 900`

For esp32 and esp32s3, the default extra delay is set to 2000us. When optimizing startup time for applications which require it, this value may be reduced.

If you are seeing "flash read err, 1000" message printed to the console after deep sleep reset on esp32, or triggered RTC_WDT/LP_WDT after lightsleep wakeup, try increasing this value. (For esp32, the delay will be executed in both deep sleep and light sleep wake up flow. For chips after esp32, the delay will be executed only in light sleep flow, the delay controlled by the EFUSE_FLASH_TPUW in ROM will be executed in deepsleep wake up flow.)

Range:

- from 0 to 5000

Default value:

- 0

CONFIG_ESP_SLEEP_CACHE_SAFE_ASSERTION

Check the cache safety of the sleep wakeup code in sleep process

Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)

Enabling it will check the cache safety of the code before the flash power is ready after light sleep wakeup, and check PM_SLP_IRAM_OPT related code cache safety. This option is only for code quality inspection. Enabling it will increase the time overhead of entering and exiting sleep. It is not recommended to enable it in the release version.

Default value:

- No (disabled)

CONFIG_ESP_SLEEP_DEBUG

esp sleep debug

Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)

Enable esp sleep debug.

Default value:

- No (disabled)

CONFIG_ESP_SLEEP_GPIO_ENABLE_INTERNAL_RESISTORS

Allow to enable internal pull-up/downs for the Deep-Sleep wakeup IOs

Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)

When using rtc gpio wakeup source during deepsleep without external pull-up/downs, you may want to make use of the internal ones.

Default value:

- Yes (enabled)

CONFIG_ESP_SLEEP_EVENT_CALLBACKS

Enable registration of sleep event callbacks

Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)

If enabled, it allows user to register sleep event callbacks. It is primarily designed for internal developers and customers can use PM_LIGHT_SLEEP_CALLBACKS as an alternative.

NOTE: These callbacks are executed from the IDLE task context hence you cannot have any blocking calls in your callbacks.

NOTE: Enabling these callbacks may change sleep duration calculations based on time spent in callback and hence it is highly recommended to keep them as short as possible.

Default value:

- No (disabled) if [CONFIG_FREERTOS_USE_TICKLESS_IDLE](#)

RTC Clock Config Contains:

- [CONFIG_RTC_CLK_CAL_CYCLES](#)
- [CONFIG_RTC_CLK_SRC](#)

CONFIG_RTC_CLK_SRC

RTC clock source

Found in: [Component config](#) > [Hardware Settings](#) > [RTC Clock Config](#)

Choose which clock is used as RTC clock source.

Available options:

- Internal 150 kHz RC oscillator ([CONFIG_RTC_CLK_SRC_INT_RC](#))
- External 32kHz crystal ([CONFIG_RTC_CLK_SRC_EXT_CRYS](#))
- Internal 32kHz RC oscillator ([CONFIG_RTC_CLK_SRC_INT_RC32K](#))

CONFIG_RTC_CLK_CAL_CYCLES

Number of cycles for RTC_SLOW_CLK calibration

Found in: [Component config](#) > [Hardware Settings](#) > [RTC Clock Config](#)

When the startup code initializes RTC_SLOW_CLK, it can perform calibration by comparing the RTC_SLOW_CLK frequency with main XTAL frequency. This option sets the number of RTC_SLOW_CLK cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:

- 150000 Hz if internal RC oscillator is used as clock source. For this use value 1024.
- **32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more.** In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

Range:

- from 0 to 8190 if `CONFIG_RTC_CLK_SRC_EXT_CRY` || `CONFIG_RTC_CLK_SRC_INT_RC32K`
- from 0 to 32766

Default value:

- 3000 if `CONFIG_RTC_CLK_SRC_EXT_CRY` || `CONFIG_RTC_CLK_SRC_INT_RC32K`
- 1024

Peripheral Control Contains:

- [CONFIG_PERIPH_CTRL_FUNC_IN_IRAM](#)

CONFIG_PERIPH_CTRL_FUNC_IN_IRAM

Place peripheral control functions into IRAM

Found in: [Component config](#) > [Hardware Settings](#) > [Peripheral Control](#)

Place peripheral control functions (e.g. `periph_module_reset`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

Default value:

- No (disabled)

ETM Configuration Contains:

- [CONFIG_ETM_ENABLE_DEBUG_LOG](#)

CONFIG_ETM_ENABLE_DEBUG_LOG

Enable debug log

Found in: [Component config](#) > [Hardware Settings](#) > [ETM Configuration](#)

whether to enable the debug log message for ETM core driver. Note that, this option only controls the ETM related driver log, won't affect other drivers.

Default value:

- No (disabled)

GDMA Configurations Contains:

- [CONFIG_GDMA_ENABLE_DEBUG_LOG](#)
- [CONFIG_GDMA_ISR_IRAM_SAFE](#)
- [CONFIG_GDMA_CTRL_FUNC_IN_IRAM](#)

CONFIG_GDMA_CTRL_FUNC_IN_IRAM

Place GDMA control functions in IRAM

Found in: [Component config](#) > [Hardware Settings](#) > [GDMA Configurations](#)

Place GDMA control functions (like start/stop/append/reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

Default value:

- No (disabled)

CONFIG_GDMA_ISR_IRAM_SAFE

GDMA ISR IRAM-Safe

Found in: [Component config](#) > [Hardware Settings](#) > [GDMA Configurations](#)

This will ensure the GDMA interrupt handler is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write).

Default value:

- No (disabled)

CONFIG_GDMA_ENABLE_DEBUG_LOG

Enable debug log

Found in: [Component config](#) > [Hardware Settings](#) > [GDMA Configurations](#)

Whether to enable the debug log message for GDMA driver. Note that, this option only controls the GDMA driver log, won't affect other drivers.

Default value:

- No (disabled)

DW_GDMA Configurations Contains:

- [CONFIG_DW_GDMA_ENABLE_DEBUG_LOG](#)

CONFIG_DW_GDMA_ENABLE_DEBUG_LOG

Enable debug log

Found in: [Component config](#) > [Hardware Settings](#) > [DW_GDMA Configurations](#)

Whether to enable the debug log message for DW_GDMA driver. Note that, this option only controls the DW_GDMA driver log, won't affect other drivers.

Default value:

- No (disabled)

2D-DMA Configurations Contains:

- [CONFIG_DMA2D_ISR_IRAM_SAFE](#)
- [CONFIG_DMA2D_OPERATION_FUNC_IN_IRAM](#)

CONFIG_DMA2D_OPERATION_FUNC_IN_IRAM

Place 2D-DMA operation functions into IRAM

Found in: [Component config](#) > [Hardware Settings](#) > [2D-DMA Configurations](#)

Place 2D-DMA all operation functions, including control functions (e.g. start/stop/append/reset) and setter functions (e.g. connect/strategy/callback registration) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. It also helps optimizing the performance.

Default value:

- No (disabled)

CONFIG_DMA2D_ISR_IRAM_SAFE

2D-DMA ISR IRAM-Safe

Found in: [Component config](#) > [Hardware Settings](#) > [2D-DMA Configurations](#)

This will ensure the 2D-DMA interrupt handler is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write).

Default value:

- No (disabled)

Main XTAL Config Contains:

- [CONFIG_XTAL_FREQ_SEL](#)

CONFIG_XTAL_FREQ_SEL

Main XTAL frequency

Found in: [Component config](#) > [Hardware Settings](#) > [Main XTAL Config](#)

This option selects the operating frequency of the XTAL (crystal) clock used to drive the ESP target. The selected value MUST reflect the frequency of the given hardware.

Note: The XTAL_FREQ_AUTO option allows the ESP target to automatically estimating XTAL clock's operating frequency. However, this feature is only supported on the ESP32. The ESP32 uses the internal 8MHZ as a reference when estimating. Due to the internal oscillator's frequency being temperature dependent, usage of the XTAL_FREQ_AUTO is not recommended in applications that operate in high ambient temperatures or use high-temperature qualified chips and modules.

Available options:

- 24 MHz (CONFIG_XTAL_FREQ_24)
- 26 MHz (CONFIG_XTAL_FREQ_26)
- 32 MHz (CONFIG_XTAL_FREQ_32)
- 40 MHz (CONFIG_XTAL_FREQ_40)
- 48 MHz (CONFIG_XTAL_FREQ_48)
- Autodetect (CONFIG_XTAL_FREQ_AUTO)

Crypto DPA Protection Contains:

- [CONFIG_ESP_CRYPTO_DPA_PROTECTION_AT_STARTUP](#)

CONFIG_ESP_CRYPTODPA_PROTECTION_AT_STARTUP

Enable crypto DPA protection at startup

Found in: [Component config](#) > [Hardware Settings](#) > [Crypto DPA Protection](#)

This config controls the DPA (Differential Power Analysis) protection knob for the crypto peripherals. DPA protection dynamically adjusts the clock frequency of the crypto peripheral. DPA protection helps to make it difficult to perform SCA attacks on the crypto peripherals. However, there is also associated performance impact based on the security level set. Please refer to the TRM for more details.

Default value:

- Yes (enabled) if SOC_CRYPTODPA_PROTECTION_SUPPORTED

CONFIG_ESP_CRYPTODPA_PROTECTION_LEVEL

DPA protection level

Found in: [Component config](#) > [Hardware Settings](#) > [Crypto DPA Protection](#) > [CONFIG_ESP_CRYPTODPA_PROTECTION_AT_STARTUP](#)

Configure the DPA protection security level

Available options:

- Security level low (CONFIG_ESP_CRYPTODPA_PROTECTION_LEVEL_LOW)
- Security level medium (CONFIG_ESP_CRYPTODPA_PROTECTION_LEVEL_MEDIUM)
- Security level high (CONFIG_ESP_CRYPTODPA_PROTECTION_LEVEL_HIGH)

DCDC Regulator Configurations

 Contains:

- [CONFIG_ESP_SLEEP_KEEP_DCDC_ALWAYS_ON](#)

CONFIG_ESP_SLEEP_KEEP_DCDC_ALWAYS_ON

Keep DC-DC power always on during light-sleep

Found in: [Component config](#) > [Hardware Settings](#) > [DCDC Regulator Configurations](#)

ESP32P4 will switch the power supply to LDO before sleeping, and switch to DCDC after waking up. These two processes take a long time and may bring some risks for some short duration light sleep. (DCDC -> LDO: 2.5ms (max), LDO -> DCDC: 1.2 ms) Enabling this option will make chip powered by DCDC during light sleep to reduce some power switch risks, this will also increase the power consumption during the light sleep.

DO NOT DISABLE UNLESS YOU KNOW WHAT YOU ARE DOING.

Default value:

- Yes (enabled)

CONFIG_ESP_SLEEP_DCM_VSET_VAL_IN_SLEEP

DCDC voltage parameter during sleep

Found in: [Component config](#) > [Hardware Settings](#) > [DCDC Regulator Configurations](#) > [CONFIG_ESP_SLEEP_KEEP_DCDC_ALWAYS_ON](#)

This value determines the voltage of the DCDC chip during sleep. The same parameter value may correspond to different voltage values on different models of DCDC chips. Please update this value according to the model of external DCDC selected in your hardware solution.

For the DCDC chip model recommended by ESP, the recommended configuration values are listed below:

- TI-TLV62569/TLV62569P: 14

Range:

- from 0 to 31

Default value:

- 14

LDO Regulator Configurations Contains:

- [CONFIG_ESP_LDO_CHAN_PSRAM_DOMAIN](#)
- [CONFIG_ESP_LDO_CHAN_SPI_NOR_FLASH_DOMAIN](#)
- [CONFIG_ESP_LDO_VOLTAGE_PSRAM_DOMAIN](#)
- [CONFIG_ESP_LDO_VOLTAGE_SPI_NOR_FLASH_DOMAIN](#)

CONFIG_ESP_LDO_CHAN_SPI_NOR_FLASH_DOMAIN

LDO regulator channel that used to power SPI NOR Flash (READ HELP)

Found in: [Component config](#) > [Hardware Settings](#) > [LDO Regulator Configurations](#)

The internal LDO regulator can be used to power the SPI Flash specific power domain. This option is to select which LDO channel to connect to that domain. Please set this option correctly according to your schematic. Set to -1 if the Flash is using any external power supply.

Range:

- from -1 to 4

Default value:

- 1

CONFIG_ESP_LDO_VOLTAGE_SPI_NOR_FLASH_DOMAIN

SPI NOR Flash power domain voltage

Found in: [Component config](#) > [Hardware Settings](#) > [LDO Regulator Configurations](#)

Select the voltage used by the Flash power domain.

Available options:

- 3.3V ([CONFIG_ESP_LDO_VOLTAGE_SPI_NOR_FLASH_3300_MV](#))

CONFIG_ESP_LDO_CHAN_PSRAM_DOMAIN

LDO regulator channel that used to power PSRAM and MPLL (READ HELP)

Found in: [Component config](#) > [Hardware Settings](#) > [LDO Regulator Configurations](#)

The internal LDO regulator can be used to power the PSRAM specific power domain. This option is to select which LDO channel to connect to that domain. Please set this option correctly according to your schematic. Set to -1 if the PSRAM is using any external power supply.

Range:

- from -1 to 4

Default value:

- 2

CONFIG_ESP_LDO_VOLTAGE_PSRAM_DOMAIN

PSRAM power domain voltage

Found in: [Component config](#) > [Hardware Settings](#) > [LDO Regulator Configurations](#)

Select the voltage used by the PSRAM power domain.

Available options:

- 1.9V (CONFIG_ESP_LDO_VOLTAGE_PSRAM_1900_MV)

LCD and Touch Panel Contains:

- [LCD Peripheral Configuration](#)

LCD Peripheral Configuration Contains:

- [CONFIG_LCD_DSI_ISR_IRAM_SAFE](#)
- [CONFIG_LCD_ENABLE_DEBUG_LOG](#)
- [CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE](#)
- [CONFIG_LCD_RGB_RESTART_IN_VSYNC](#)
- [CONFIG_LCD_RGB_ISR_IRAM_SAFE](#)

CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE

LCD panel io format buffer size

Found in: [Component config](#) > [LCD and Touch Panel](#) > [LCD Peripheral Configuration](#)

LCD driver allocates an internal buffer to transform the data into a proper format, because of the endian order mismatch. This option is to set the size of the buffer, in bytes.

Default value:

- 32 if SOC_LCD_I80_SUPPORTED

CONFIG_LCD_ENABLE_DEBUG_LOG

Enable debug log

Found in: [Component config](#) > [LCD and Touch Panel](#) > [LCD Peripheral Configuration](#)

whether to enable the debug log message for LCD driver. Note that, this option only controls the LCD driver log, won't affect other drivers.

Default value:

- No (disabled)

CONFIG_LCD_RGB_ISR_IRAM_SAFE

RGB LCD ISR IRAM-Safe

Found in: [Component config](#) > [LCD and Touch Panel](#) > [LCD Peripheral Configuration](#)

Ensure the LCD interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). If you want the LCD driver to keep flushing the screen even when cache ops disabled, you can enable this option. Note, this will also increase the IRAM usage.

Default value:

- No (disabled) if SOC_LCD_RGB_SUPPORTED

CONFIG_LCD_RGB_RESTART_IN_VSYNC

Restart transmission in VSYNC

Found in: [Component config](#) > [LCD and Touch Panel](#) > [LCD Peripheral Configuration](#)

Reset the GDMA channel every VBlank to stop permanent desyncs from happening. Only need to enable it when in your application, the DMA can't deliver data as fast as the LCD consumes it.

Default value:

- No (disabled) if SOC_LCD_RGB_SUPPORTED

CONFIG_LCD_DSI_ISR_IRAM_SAFE

DSI LCD ISR IRAM-Safe

Found in: [Component config](#) > [LCD and Touch Panel](#) > [LCD Peripheral Configuration](#)

Ensure the LCD interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). If you want the LCD driver to keep flushing the screen even when cache ops disabled, you can enable this option. Note, this will also increase the IRAM usage.

Default value:

- No (disabled)

ESP NETIF Adapter Contains:

- [CONFIG_ESP_NETIF_BRIDGE_EN](#)
- [CONFIG_ESP_NETIF_L2_TAP](#)
- [CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL](#)
- [CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB](#)
- [CONFIG_ESP_NETIF_RECEIVE_REPORT_ERRORS](#)

CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL

IP Address lost timer interval (seconds)

Found in: [Component config](#) > [ESP NETIF Adapter](#)

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled.

The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started everytime the IP is lost. Event SYSTEM_EVENT_STA_LOST_IP will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

Range:

- from 0 to 65535

Default value:

- 120

CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB

TCP/IP Stack Library

Found in: [Component config](#) > [ESP NETIF Adapter](#)

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

Available options:

- LwIP (CONFIG_ESP_NETIF_TCPIP_LWIP)
lwIP is a small independent implementation of the TCP/IP protocol suite.

- Loopback (CONFIG_ESP_NETIF_LOOPBACK)
Dummy implementation of esp-netif functionality which connects driver transmit to receive function. This option is for testing purpose only

CONFIG_ESP_NETIF_RECEIVE_REPORT_ERRORS

Use esp_err_t to report errors from esp_netif_receive

Found in: Component config > ESP NETIF Adapter

Enable if esp_netif_receive() should return error code. This is useful to inform upper layers that packet input to TCP/IP stack failed, so the upper layers could implement flow control. This option is disabled by default due to backward compatibility and will be enabled in v6.0 (IDF-7194)

Default value:

- No (disabled)

CONFIG_ESP_NETIF_L2_TAP

Enable netif L2 TAP support

Found in: Component config > ESP NETIF Adapter

A user program can read/write link layer (L2) frames from/to ESP TAP device. The ESP TAP device can be currently associated only with Ethernet physical interfaces.

CONFIG_ESP_NETIF_L2_TAP_MAX_FDS

Maximum number of opened L2 TAP File descriptors

Found in: Component config > ESP NETIF Adapter > CONFIG_ESP_NETIF_L2_TAP

Maximum number of opened File descriptors (FD's) associated with ESP TAP device. ESP TAP FD's take up a certain amount of memory, and allowing fewer FD's to be opened at the same time conserves memory.

Range:

- from 1 to 10 if *CONFIG_ESP_NETIF_L2_TAP*

Default value:

- 5 if *CONFIG_ESP_NETIF_L2_TAP*

CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE

Size of L2 TAP Rx queue

Found in: Component config > ESP NETIF Adapter > CONFIG_ESP_NETIF_L2_TAP

Maximum number of frames queued in opened File descriptor. Once the queue is full, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

Range:

- from 1 to 100 if *CONFIG_ESP_NETIF_L2_TAP*

Default value:

- 20 if *CONFIG_ESP_NETIF_L2_TAP*

CONFIG_ESP_NETIF_BRIDGE_EN

Enable LwIP IEEE 802.1D bridge

Found in: Component config > ESP NETIF Adapter

Enable LwIP IEEE 802.1D bridge support in ESP-NETIF. Note that "Number of clients store data in netif" (LWIP_NUM_NETIF_CLIENT_DATA) option needs to be properly configured to be LwIP bridge available!

Default value:

- No (disabled)

Partition API Configuration

Power Management

 Contains:

- [CONFIG_PM_LIGHTSLEEP_RTC_OSC_CAL_INTERVAL](#)
- [CONFIG_PM_SLP_DISABLE_GPIO](#)
- [CONFIG_PM_LIGHT_SLEEP_CALLBACKS](#)
- [CONFIG_PM_POWER_DOWN_CPU_IN_LIGHT_SLEEP](#)
- [CONFIG_PM_POWER_DOWN_PERIPHERAL_IN_LIGHT_SLEEP](#)
- [CONFIG_PM_SLP_IRAM_OPT](#)
- [CONFIG_PM_RTOS_IDLE_OPT](#)
- [CONFIG_PM_ENABLE](#)

CONFIG_PM_ENABLE

Support for power management

Found in: [Component config](#) > [Power Management](#)

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

Default value:

- No (disabled)

CONFIG_PM_DFS_INIT_AUTO

Enable dynamic frequency scaling (DFS) at startup

Found in: [Component config](#) > [Power Management](#) > [CONFIG_PM_ENABLE](#)

If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to DEFAULT_CPU_FREQ_MHZ setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using esp_pm_configure function.

Default value:

- No (disabled) if [CONFIG_PM_ENABLE](#)

CONFIG_PM_PROFILING

Enable profiling counters for PM locks

Found in: [Component config](#) > [Power Management](#) > [CONFIG_PM_ENABLE](#)

If enabled, esp_pm_* functions will keep track of the amount of time each of the power management locks has been held, and esp_pm_dump_locks function will print this information. This feature can be used to analyze which locks are preventing the chip from going into a lower power state, and see what time the chip spends in each power saving mode. This feature does incur some run-time overhead, so should typically be disabled in production builds.

Default value:

- No (disabled) if [CONFIG_PM_ENABLE](#)

CONFIG_PM_TRACE

Enable debug tracing of PM using GPIOs

Found in: [Component config](#) > [Power Management](#) > [CONFIG_PM_ENABLE](#)

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit from idle state. Refer to `pm_trace.c` file for the list of GPIOs. This feature is intended to be used when analyzing/debugging behavior of power management implementation, and should be kept disabled in applications.

Default value:

- No (disabled) if [CONFIG_PM_ENABLE](#)

CONFIG_PM_SLP_IRAM_OPT

Put lightsleep related codes in internal RAM

Found in: [Component config](#) > [Power Management](#)

If enabled, about 2.1KB of lightsleep related source code would be in IRAM and chip would sleep longer for 310us at 160MHz CPU frequency most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

CONFIG_PM_RTOS_IDLE_OPT

Put RTOS IDLE related codes in internal RAM

Found in: [Component config](#) > [Power Management](#)

If enabled, about 180Bytes of RTOS_IDLE related source code would be in IRAM and chip would sleep longer for 20us at 160MHz CPU frequency most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

CONFIG_PM_SLP_DISABLE_GPIO

Disable all GPIO when chip at sleep

Found in: [Component config](#) > [Power Management](#)

This feature is intended to disable all GPIO pins at automatic sleep to get a lower power mode. If enabled, chips will disable all GPIO pins at automatic sleep to reduce about 200~300 uA current. If you want to specifically use some pins normally as chip wakes when chip sleeps, you can call `'gpio_sleep_sel_dis'` to disable this feature on those pins. You can also keep this feature on and call `'gpio_sleep_set_direction'` and `'gpio_sleep_set_pull_mode'` to have a different GPIO configuration at sleep. Warning: If you want to enable this option on ESP32, you should enable `GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL` at first, otherwise you will not be able to switch pullup/pulldown mode.

CONFIG_PM_LIGHTSLEEP_RTC_OSC_CAL_INTERVAL

Calibrate the RTC_FAST/SLOW clock every N times of light sleep

Found in: [Component config](#) > [Power Management](#)

The value of this option determines the calibration interval of the RTC_FAST/SLOW clock during sleep when power management is enabled. When it is configured as N, the RTC_FAST/SLOW clock will be calibrated every N times of lightsleep. Decreasing this value will increase the time the chip is in the active state, thereby increasing the average power consumption of the chip. Increasing this value can reduce the average power consumption, but when the external environment changes drastically and the chip RTC_FAST/SLOW oscillator frequency drifts, it may cause system instability.

Range:

- from 1 to 128 if [CONFIG_PM_ENABLE](#)

Default value:

- 1 if `CONFIG_PM_ENABLE`

CONFIG_PM_POWER_DOWN_CPU_IN_LIGHT_SLEEP

Power down CPU in light sleep

Found in: [Component config](#) > [Power Management](#)

If enabled, the CPU will be powered down in light sleep, ESP chips supports saving and restoring CPU's running context before and after light sleep, the feature provides applications with seamless CPU poweredown lightsleep without user awareness. But this will takes up some internal memory. On esp32c3 soc, enabling this option will consume 1.68 KB of internal RAM and will reduce sleep current consumption by about 100 uA. On esp32s3 soc, enabling this option will consume 8.58 KB of internal RAM and will reduce sleep current consumption by about 650 uA.

Default value:

- Yes (enabled) if `SOC_PM_SUPPORT_CPU_PD`

CONFIG_PM_POWER_DOWN_PERIPHERAL_IN_LIGHT_SLEEP

Power down Digital Peripheral in light sleep (EXPERIMENTAL)

Found in: [Component config](#) > [Power Management](#)

If enabled, digital peripherals will be powered down in light sleep, it will reduce sleep current consumption by about 100 uA. Chip will save/restore register context at sleep/wake time to keep the system running. Enabling this option will increase static RAM and heap usage, the actual cost depends on the peripherals you have initialized. In order to save/restore the context of the necessary hardware for FreeRTOS to run, it will need at least 4.55 KB free heap at sleep time. Otherwise sleep will not power down the peripherals.

Note1: Please use this option with caution, the current IDF does not support the retention of all peripherals. When the digital peripherals are powered off and a sleep and wake-up is completed, the peripherals that have not saved the running context are equivalent to performing a reset. !!! Please confirm the peripherals used in your application and their sleep retention support status before enabling this option, peripherals sleep retention driver support status is tracked in `power_management.rst`

Note2: When this option is enabled simultaneously with `FREERTOS_USE_TICKLESS_IDLE`, since the UART will be powered down, the uart FIFO will be flushed before sleep to avoid data loss, however, this has the potential to block the sleep process and cause the wakeup time to be skipped, which will cause the tick of freertos to not be compensated correctly when returning from sleep and cause the system to crash. To avoid this, you can increase `FREERTOS_IDLE_TIME_BEFORE_SLEEP` threshold in `menuconfig`.

Default value:

- No (disabled)

CONFIG_PM_LIGHT_SLEEP_CALLBACKS

Enable registration of pm light sleep callbacks

Found in: [Component config](#) > [Power Management](#)

If enabled, it allows user to register entry and exit callbacks which are called before and after entering auto light sleep.

NOTE: These callbacks are executed from the IDLE task context hence you cannot have any blocking calls in your callbacks.

NOTE: Enabling these callbacks may change sleep duration calculations based on time spent in callback and hence it is highly recommended to keep them as short as possible

Default value:

- No (disabled) if *CONFIG_FREERTOS_USE_TICKLESS_IDLE*

ESP PSRAM Contains:

- *CONFIG_SPIRAM*

CONFIG_SPIRAM

Support for external PSRAM

Found in: Component config > ESP PSRAM

This enables support for an external PSRAM chip, connected in parallel with the main SPI flash chip.

PSRAM config Contains:

- *CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY*
- *CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY*
- *CONFIG_SPIRAM_XIP_FROM_PSRAM*
- *CONFIG_SPIRAM_ECC_ENABLE*
- *CONFIG_SPIRAM_BOOT_INIT*
- *CONFIG_SPIRAM_MODE*
- *CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL*
- *CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL*
- *CONFIG_SPIRAM_MEMTEST*
- *CONFIG_SPIRAM_SPEED*
- *CONFIG_SPIRAM_USE*
- *CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP*

CONFIG_SPIRAM_MODE

Line Mode of PSRAM chip in use

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > PSRAM config

Available options:

- 16-Line-Mode PSRAM (*CONFIG_SPIRAM_MODE_HEX*)

CONFIG_SPIRAM_SPEED

Set PSRAM clock speed

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > PSRAM config

Select the speed for the PSRAM chip.

Available options:

- 200MHz clock speed (*CONFIG_SPIRAM_SPEED_200M*)
- 20MHz clock speed (*CONFIG_SPIRAM_SPEED_20M*)

CONFIG_SPIRAM_XIP_FROM_PSRAM

Enable Executable in place from (XiP) from PSRAM feature (READ HELP)

Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG_SPIRAM](#) > [PSRAM config](#)

If enabled, firmware in flash including instructions and data will be moved into PSRAM on startup, firmware code will execute directly from PSRAM.

With this option enabled, code that requires execution during an MSPI1 Flash operation does not have to be placed in IRAM. Therefore codes that need to be executing during Flash operations can continue working normally.

Because P4 flash and PSRAM are using two separate SPI buses, moving flash content to PSRAM will actually increase the load of the PSRAM MSPI bus, so the exact impact on performance will be dependent on your app usage of PSRAM. For example, as the PSRAM bus speed could be much faster than flash bus speed, if the instructions and data that are used to be in flash are not accessed very frequently, you might get better performance with this option enabled. We suggest doing performance profiling to determine if enabling this option.

CONFIG_SPIRAM_ECC_ENABLE

Enable PSRAM ECC

Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG_SPIRAM](#) > [PSRAM config](#)

Enable Error-Correcting Code function when accessing PSRAM.

If enabled, 1/8 of the PSRAM total size will be reserved for error-correcting code.

CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY

Allow external memory as an argument to xTaskCreateStatic

Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG_SPIRAM](#) > [PSRAM config](#)

Accessing memory in PSRAM has certain restrictions, so task stacks allocated by xTaskCreate are by default allocated from internal RAM.

This option allows for passing memory allocated from PSRAM to be passed to xTaskCreateStatic. This should only be used for tasks where the stack is never accessed while the L2Cache is disabled, e.g. during SPI Flash operations

CONFIG_SPIRAM_BOOT_INIT

Initialize SPI RAM during startup

Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG_SPIRAM](#) > [PSRAM config](#)

If this is enabled, the SPI RAM will be enabled during initial boot. Unless you have specific requirements, you'll want to leave this enabled so memory allocated during boot-up can also be placed in SPI RAM.

CONFIG_SPIRAM_IGNORE_NOTFOUND

Ignore PSRAM when not found

Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG_SPIRAM](#) > [PSRAM config](#) > [CONFIG_SPIRAM_BOOT_INIT](#)

Normally, if psram initialization is enabled during compile time but not found at runtime, it is seen as an error making the CPU panic. If this is enabled, booting will complete but no PSRAM will be available. If PSRAM failed to initialize, the following configs may be affected and may need to be corrected manually. SPIRAM_TRY_ALLOCATE_WIFI_LWIP will affect some LWIP and WiFi buffer default values and range values. Enable SPIRAM_TRY_ALLOCATE_WIFI_LWIP, ESP_WIFI_AMSDU_TX_ENABLED,

ESP_WIFI_CACHE_TX_BUFFER_NUM and use static WiFi Tx buffer may cause potential memory exhaustion issues. Suggest disable SPIRAM_TRY_ALLOCATE_WIFI_LWIP. Suggest disable ESP_WIFI_AMSDU_TX_ENABLED. Suggest disable ESP_WIFI_CACHE_TX_BUFFER_NUM, need clear CONFIG_FEATURE_CACHE_TX_BUF_BIT of config->feature_caps. Suggest change ESP_WIFI_TX_BUFFER from static to dynamic. Also suggest to adjust some buffer numbers to the values used without PSRAM case. Such as, ESP_WIFI_STATIC_TX_BUFFER_NUM, ESP_WIFI_DYNAMIC_TX_BUFFER_NUM.

CONFIG_SPIRAM_USE

SPI RAM access method

Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG_SPIRAM](#) > [PSRAM config](#)

The SPI RAM can be accessed in multiple methods: by just having it available as an unmanaged memory region in the CPU's memory map, by integrating it in the heap as 'special' memory needing heap_caps_malloc to allocate, or by fully integrating it making malloc() also able to return SPI RAM pointers.

Available options:

- Integrate RAM into memory map (CONFIG_SPIRAM_USE_MEMMAP)
- Make RAM allocatable using heap_caps_malloc(..., MALLOC_CAP_SPIRAM) (CONFIG_SPIRAM_USE_CAPS_ALLOC)
- Make RAM allocatable using malloc() as well (CONFIG_SPIRAM_USE_MALLOC)

CONFIG_SPIRAM_MEMTEST

Run memory test on SPI RAM initialization

Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG_SPIRAM](#) > [PSRAM config](#)

Runs a rudimentary memory test on initialization. Aborts when memory test fails. Disable this for slightly faster startup.

CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL

Maximum malloc() size, in bytes, to always put in internal memory

Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG_SPIRAM](#) > [PSRAM config](#)

If malloc() is capable of also allocating SPI-connected ram, its allocation strategy will prefer to allocate chunks less than this size in internal memory, while allocations larger than this will be done from external RAM. If allocation from the preferred region fails, an attempt is made to allocate from the non-preferred region instead, so malloc() will not suddenly fail when either internal or external memory is full.

CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, allocate internal memory

Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG_SPIRAM](#) > [PSRAM config](#)

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, try to allocate internal memory then.

CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL

Reserve this amount of bytes for data that specifically needs to be in DMA or internal memory

Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG_SPIRAM](#) > [PSRAM config](#)

Because the external/internal RAM allocation strategy is not always perfect, it sometimes may happen that the internal memory is entirely filled up. This causes allocations that are specifically done in internal memory, for example the stack for new tasks or memory to service DMA or have memory that's also available when SPI cache is down, to fail. This option reserves a pool specifically for requests like that; the memory in this pool is not given out when a normal `malloc()` is called.

Set this to 0 to disable this feature.

Note that because FreeRTOS stacks are forced to internal memory, they will also use this memory pool; be sure to keep this in mind when adjusting this value.

Note also that the DMA reserved pool may not be one single contiguous memory region, depending on the configured size and the static memory usage of the app.

CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY

Allow .bss segment placed in external memory

Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG_SPIRAM](#) > [PSRAM config](#)

If enabled, variables with `EXT_RAM_BSS_ATTR` attribute will be placed in SPIRAM instead of internal DRAM. BSS section of *lwip*, *net80211*, *pp*, *bt* libraries will be automatically placed in SPIRAM. BSS sections from other object files and libraries can also be placed in SPIRAM through linker fragment scheme *extram_bss*.

Note that the variables placed in SPIRAM using `EXT_RAM_BSS_ATTR` will be zero initialized.

ESP Ringbuf Contains:

- [CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH](#)

CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH

Place non-ISR ringbuf functions into flash

Found in: [Component config](#) > [ESP Ringbuf](#)

Place non-ISR ringbuf functions (like `xRingbufferCreate/xRingbufferSend`) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled.

Default value:

- No (disabled)

CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH

Place ISR ringbuf functions into flash

Found in: [Component config](#) > [ESP Ringbuf](#) > [CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH](#)

Place ISR ringbuf functions (like `xRingbufferSendFromISR/xRingbufferReceiveFromISR`) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled or from an IRAM interrupt context.

This option is not compatible with ESP-IDF drivers which are configured to run the ISR from an IRAM context, e.g. `CONFIG_UART_ISR_IN_IRAM`.

Default value:

- No (disabled) if [CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH](#)

ESP System Settings Contains:

- `CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES`
- *Brownout Detector*
- *Cache config*
- `CONFIG_ESP_CONSOLE_UART`
- `CONFIG_ESP_CONSOLE_SECONDARY`
- `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ`
- `CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP`
- `CONFIG_ESP_TASK_WDT_EN`
- `CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE`
- `CONFIG_ESP_SYSTEM_USE_EH_FRAME`
- `CONFIG_ESP_SYSTEM_HW_PC_RECORD`
- `CONFIG_ESP_SYSTEM_HW_STACK_GUARD`
- `CONFIG_ESP_XT_WDT`
- `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL`
- `CONFIG_ESP_INT_WDT`
- `CONFIG_ESP_MAIN_TASK_AFFINITY`
- `CONFIG_ESP_MAIN_TASK_STACK_SIZE`
- `CONFIG_ESP_DEBUG_OCDAWARE`
- *Memory protection*
- `CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE`
- `CONFIG_ESP_DEBUG_STUBS_ENABLE`
- `CONFIG_ESP_SYSTEM_PANIC`
- `CONFIG_ESP_SYSTEM_PANIC_REBOOT_DELAY_SECONDS`
- `CONFIG_ESP_PANIC_HANDLER_IRAM`
- `CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE`
- `CONFIG_ESP_CONSOLE_UART_BAUDRATE`
- `CONFIG_ESP_CONSOLE_UART_NUM`
- `CONFIG_ESP_CONSOLE_UART_RX_GPIO`
- `CONFIG_ESP_CONSOLE_UART_TX_GPIO`

CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ

CPU frequency

Found in: Component config > ESP System Settings

CPU frequency to be set on application startup.

Available options:

- 40 MHz (`CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ_40`)
- 360 MHz (`CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ_360`)

Cache config Contains:

- `CONFIG_CACHE_L2_CACHE_LINE_SIZE`
- `CONFIG_CACHE_L2_CACHE_SIZE`

CONFIG_CACHE_L2_CACHE_SIZE

L2 cache size

Found in: Component config > ESP System Settings > Cache config

L2 cache size to be set on application startup.

Available options:

- 128KB (CONFIG_CACHE_L2_CACHE_128KB)
- 256KB (CONFIG_CACHE_L2_CACHE_256KB)
- 512KB (CONFIG_CACHE_L2_CACHE_512KB)

CONFIG_CACHE_L2_CACHE_LINE_SIZE

L2 cache line size

Found in: Component config > ESP System Settings > Cache config

L2 cache line size to be set on application startup.

Available options:

- 64 Bytes (CONFIG_CACHE_L2_CACHE_LINE_64B)
- 128 Bytes (CONFIG_CACHE_L2_CACHE_LINE_128B)

CONFIG_ESP_SYSTEM_PANIC

Panic handler behaviour

Found in: Component config > ESP System Settings

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handler's action here.

Available options:

- Print registers and halt (CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT)
Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.
- Print registers and reboot (CONFIG_ESP_SYSTEM_PANIC_PRINT_REBOOT)
Outputs the relevant registers over the serial port and immediately reset the processor.
- Silent reboot (CONFIG_ESP_SYSTEM_PANIC_SILENT_REBOOT)
Just resets the processor without outputting anything
- GDBStub on panic (CONFIG_ESP_SYSTEM_PANIC_GDBSTUB)
Invoke gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.

CONFIG_ESP_SYSTEM_PANIC_REBOOT_DELAY_SECONDS

Panic reboot delay (Seconds)

Found in: Component config > ESP System Settings

After the panic handler executes, you can specify a number of seconds to wait before the device reboots.

Range:

- from 0 to 99

Default value:

- 0

CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES

Bootstrap cycles for external 32kHz crystal

Found in: Component config > ESP System Settings

To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).

If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.

To accurately determine if the crystal has started, set a larger "Number of cycles for RTC_SLOW_CLK calibration" (about 3000).

CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP

Enable RTC fast memory for dynamic allocations

Found in: [Component config](#) > [ESP System Settings](#)

This config option allows to add RTC fast memory region to system heap with capability similar to that of DRAM region but without DMA. This memory will be consumed first per heap initialization order by early startup services and scheduler related code. Speed wise RTC fast memory operates on APB clock and hence does not have much performance impact.

Default value:

- Yes (enabled)

CONFIG_ESP_SYSTEM_USE_EH_FRAME

Generate and use eh_frame for backtracing

Found in: [Component config](#) > [ESP System Settings](#)

Generate DWARF information for each function of the project. These information will be parsed and used to perform backtracing when panics occur. Activating this option will activate asynchronous frame unwinding and generation of both .eh_frame and .eh_frame_hdr sections, resulting in a bigger binary size (20% to 100% larger). The main purpose of this option is to be able to have a backtrace parsed and printed by the program itself, regardless of the serial monitor used. This option shall NOT be used for production.

Default value:

- No (disabled)

Memory protection Contains:

- [CONFIG_ESP_SYSTEM_PMP_IDRAM_SPLIT](#)
- [CONFIG_ESP_SYSTEM_MEMPROT_FEATURE](#)

CONFIG_ESP_SYSTEM_PMP_IDRAM_SPLIT

Enable IRAM/DRAM split protection

Found in: [Component config](#) > [ESP System Settings](#) > [Memory protection](#)

If enabled, the CPU watches all the memory access and raises an exception in case of any memory violation. This feature automatically splits the SRAM memory, using PMP, into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

Default value:

- Yes (enabled)

CONFIG_ESP_SYSTEM_MEMPROT_FEATURE

Enable memory protection

Found in: [Component config](#) > [ESP System Settings](#) > [Memory protection](#)

If enabled, the permission control module watches all the memory access and fires the panic handler if a permission violation is detected. This feature automatically splits the SRAM memory into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

Default value:

- Yes (enabled) if SOC_MEMPROT_SUPPORTED

CONFIG_ESP_SYSTEM_MEMPROT_FEATURE_LOCK

Lock memory protection settings

Found in: [Component config](#) > [ESP System Settings](#) > [Memory protection](#) > [CONFIG_ESP_SYSTEM_MEMPROT_FEATURE](#)

Once locked, memory protection settings cannot be changed anymore. The lock is reset only on the chip startup.

Default value:

- Yes (enabled) if [CONFIG_ESP_SYSTEM_MEMPROT_FEATURE](#)

CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE

System event queue size

Found in: [Component config](#) > [ESP System Settings](#)

Config system event queue size in different application.

Default value:

- 32

CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE

Event loop task stack size

Found in: [Component config](#) > [ESP System Settings](#)

Config system event task stack size in different application.

Default value:

- 2304

CONFIG_ESP_MAIN_TASK_STACK_SIZE

Main task stack size

Found in: [Component config](#) > [ESP System Settings](#)

Configure the "main task" stack size. This is the stack of the task which calls `app_main()`. If `app_main()` returns then this task is deleted and its stack memory is freed.

Default value:

- 3584

CONFIG_ESP_MAIN_TASK_AFFINITY

Main task core affinity

Found in: [Component config](#) > [ESP System Settings](#)

Configure the "main task" core affinity. This is the used core of the task which calls `app_main()`. If `app_main()` returns then this task is deleted.

Available options:

- CPU0 (CONFIG_ESP_MAIN_TASK_AFFINITY_CPU0)
- CPU1 (CONFIG_ESP_MAIN_TASK_AFFINITY_CPU1)
- No affinity (CONFIG_ESP_MAIN_TASK_AFFINITY_NO_AFFINITY)

CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE

Minimal allowed size for shared stack

Found in: [Component config](#) > [ESP System Settings](#)

Minimal value of size, in bytes, accepted to execute a expression with shared stack.

Default value:

- 2048

CONFIG_ESP_CONSOLE_UART

Channel for console output

Found in: [Component config](#) > [ESP System Settings](#)

Select where to send console output (through `stdout` and `stderr`).

- Default is to use UART0 on pre-defined GPIOs.
- If "Custom" is selected, UART0 or UART1 can be chosen, and any pins can be selected.
- If "None" is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This ROM output can be suppressed by GPIO strapping or EFUSE, refer to chip datasheet for details.
- On chips with USB OTG peripheral, "USB CDC" option redirects output to the CDC port. This option uses the CDC driver in the chip ROM. This option is incompatible with TinyUSB stack.
- On chips with an USB serial/JTAG debug controller, selecting the option for that redirects output to the CDC/ACM (serial port emulation) component of that device.

Available options:

- Default: UART0 (CONFIG_ESP_CONSOLE_UART_DEFAULT)
- USB CDC (CONFIG_ESP_CONSOLE_USB_CDC)
- USB Serial/JTAG Controller (CONFIG_ESP_CONSOLE_USB_SERIAL_JTAG)
- Custom UART (CONFIG_ESP_CONSOLE_UART_CUSTOM)
- None (CONFIG_ESP_CONSOLE_NONE)

CONFIG_ESP_CONSOLE_SECONDARY

Channel for console secondary output

Found in: [Component config](#) > [ESP System Settings](#)

This secondary option supports output through other specific port like `USB_SERIAL_JTAG` when `UART0` port as a primary is selected but not connected. This secondary output currently only supports non-blocking mode without using REPL. If you want to output in blocking mode with REPL or

input through this secondary port, please change the primary config to this port in *Channel for console output* menu.

Available options:

- No secondary console (CONFIG_ESP_CONSOLE_SECONDARY_NONE)
- USB_SERIAL_JTAG PORT (CONFIG_ESP_CONSOLE_SECONDARY_USB_SERIAL_JTAG)
This option supports output through USB_SERIAL_JTAG port when the UART0 port is not connected. The output currently only supports non-blocking mode without using the console. If you want to output in blocking mode with REPL or input through USB_SERIAL_JTAG port, please change the primary config to ESP_CONSOLE_USB_SERIAL_JTAG above.

CONFIG_ESP_CONSOLE_UART_NUM

UART peripheral to use for console output (0-1)

Found in: Component config > ESP System Settings

This UART peripheral is used for console output from the ESP-IDF Bootloader and the app.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Due to an ESP32 ROM bug, UART2 is not supported for console output via `esp_rom_printf`.

Available options:

- UART0 (CONFIG_ESP_CONSOLE_UART_CUSTOM_NUM_0)
- UART1 (CONFIG_ESP_CONSOLE_UART_CUSTOM_NUM_1)

CONFIG_ESP_CONSOLE_UART_TX_GPIO

UART TX on GPIO#

Found in: Component config > ESP System Settings

This GPIO is used for console UART TX output in the ESP-IDF Bootloader and the app (including boot log output and default standard output and standard error of the app).

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Range:

- from 0 to 54 if *CONFIG_ESP_CONSOLE_UART_CUSTOM*

Default value:

- 37 if *CONFIG_ESP_CONSOLE_UART_CUSTOM*
- 43 if *CONFIG_ESP_CONSOLE_UART_CUSTOM*

CONFIG_ESP_CONSOLE_UART_RX_GPIO

UART RX on GPIO#

Found in: Component config > ESP System Settings

This GPIO is used for UART RX input in the ESP-IDF Bootloader and the app (including default default standard input of the app).

Note: The default ESP-IDF Bootloader configures this pin but doesn't read anything from the UART.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Range:

- from 0 to 54 if `CONFIG_ESP_CONSOLE_UART_CUSTOM`

Default value:

- 38 if `CONFIG_ESP_CONSOLE_UART_CUSTOM`
- 44 if `CONFIG_ESP_CONSOLE_UART_CUSTOM`

CONFIG_ESP_CONSOLE_UART_BAUDRATE

UART console baud rate

Found in: [Component config](#) > [ESP System Settings](#)

This baud rate is used by both the ESP-IDF Bootloader and the app (including boot log output and default standard input/output/error of the app).

The app's maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Range:

- from 1200 to 1000000 if `CONFIG_PM_ENABLE`

Default value:

- 115200

CONFIG_ESP_INT_WDT

Interrupt watchdog

Found in: [Component config](#) > [ESP System Settings](#)

This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time, either because a task turned off interrupts and did not turn them on for a long time, or because an interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

Default value:

- Yes (enabled)

CONFIG_ESP_INT_WDT_TIMEOUT_MS

Interrupt watchdog timeout (ms)

Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG_ESP_INT_WDT](#)

The timeout of the watchdog, in milliseconds. Make this higher than the FreeRTOS tick rate.

Range:

- from 10 to 10000

Default value:

- 300

CONFIG_ESP_INT_WDT_CHECK_CPU1

Also watch CPU1 tick interrupt

Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG_ESP_INT_WDT](#)

Also detect if interrupts on CPU 1 are disabled for too long.

CONFIG_ESP_TASK_WDT_EN

Enable Task Watchdog Timer

Found in: [Component config](#) > [ESP System Settings](#)

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this option will enable the Task Watchdog Timer. It can be either initialized automatically at startup or initialized after startup (see Task Watchdog Timer API Reference)

Default value:

- Yes (enabled)

CONFIG_ESP_TASK_WDT_INIT

Initialize Task Watchdog Timer on startup

Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG_ESP_TASK_WDT_EN](#)

Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup.

Default value:

- Yes (enabled)

CONFIG_ESP_TASK_WDT_PANIC

Invoke panic handler on Task Watchdog timeout

Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG_ESP_TASK_WDT_EN](#) > [CONFIG_ESP_TASK_WDT_INIT](#)

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference)

Default value:

- No (disabled)

CONFIG_ESP_TASK_WDT_TIMEOUT_S

Task Watchdog timeout period (seconds)

Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG_ESP_TASK_WDT_EN](#) > [CONFIG_ESP_TASK_WDT_INIT](#)

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference)

Range:

- from 1 to 60

Default value:

- 5

CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0

Watch CPU0 Idle Task

Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG_ESP_TASK_WDT_EN](#) > [CONFIG_ESP_TASK_WDT_INIT](#)

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.

Default value:

- Yes (enabled)

CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1

Watch CPU1 Idle Task

Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG_ESP_TASK_WDT_EN](#) > [CONFIG_ESP_TASK_WDT_INIT](#)

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.

CONFIG_ESP_XT_WDT

Initialize XTAL32K watchdog timer on startup

Found in: [Component config](#) > [ESP System Settings](#)

This watchdog timer can detect oscillation failure of the XTAL32K_CLK. When such a failure is detected the hardware can be set up to automatically switch to BACKUP32K_CLK and generate an interrupt.

CONFIG_ESP_XT_WDT_TIMEOUT

XTAL32K watchdog timeout period

Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG_ESP_XT_WDT](#)

Timeout period configuration for the XTAL32K watchdog timer based on RTC_CLK.

Range:

- from 1 to 255 if [CONFIG_ESP_XT_WDT](#)

Default value:

- 200 if [CONFIG_ESP_XT_WDT](#)

CONFIG_ESP_XT_WDT_BACKUP_CLK_ENABLE

Automatically switch to BACKUP32K_CLK when timer expires

Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG_ESP_XT_WDT](#)

Enable this to automatically switch to BACKUP32K_CLK as the source of RTC_SLOW_CLK when the watchdog timer expires.

Default value:

- Yes (enabled) if [CONFIG_ESP_XT_WDT](#)

CONFIG_ESP_PANIC_HANDLER_IRAM

Place panic handler code in IRAM

Found in: [Component config](#) > [ESP System Settings](#)

If this option is disabled (default), the panic handler code is placed in flash not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code (including required UART functions) is placed in IRAM. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash) or when flash cache is corrupted when an exception is triggered.

Default value:

- No (disabled)

CONFIG_ESP_DEBUG_STUBS_ENABLE

OpenOCD debug stubs

Found in: [Component config](#) > [ESP System Settings](#)

Debug stubs are used by OpenOCD to execute pre-compiled onboard code which does some useful debugging stuff, e.g. GCOV data dump.

CONFIG_ESP_DEBUG_OCDAWARE

Make exception and panic handlers JTAG/OCD aware

Found in: [Component config](#) > [ESP System Settings](#)

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

Default value:

- Yes (enabled)

CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL

Interrupt level to use for Interrupt Watchdog and other system checks

Found in: [Component config](#) > [ESP System Settings](#)

Interrupt level to use for Interrupt Watchdog, IPC_ISR and other system checks.

Available options:

- Level 5 interrupt (CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL_5)
Using level 5 interrupt for Interrupt Watchdog, IPC_ISR and other system checks.
- Level 4 interrupt (CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL_4)
Using level 4 interrupt for Interrupt Watchdog, IPC_ISR and other system checks.

Brownout Detector Contains:

- [CONFIG_ESP_BROWNOUT_DET](#)

CONFIG_ESP_BROWNOUT_DET

Hardware brownout detect & reset

Found in: [Component config](#) > [ESP System Settings](#) > [Brownout Detector](#)

The ESP32-P4 has a built-in brownout detector which can detect if the voltage is lower than a specific value. If this happens, it will reset the chip in order to prevent unintended behaviour.

Default value:

- Yes (enabled)

CONFIG_ESP_BROWNOUT_DET_LVL_SEL

Brownout voltage level

Found in: [Component config](#) > [ESP System Settings](#) > [Brownout Detector](#) > [CONFIG_ESP_BROWNOUT_DET](#)

The brownout detector will reset the chip when the supply voltage is approximately below this level. Note that there may be some variation of brownout voltage level between each chip.

#The voltage levels here are estimates, more work needs to be done to figure out the exact voltages #of the brownout threshold levels.

Available options:

- 2.51V (CONFIG_ESP_BROWNOUT_DET_LVL_SEL_7)
- 2.64V (CONFIG_ESP_BROWNOUT_DET_LVL_SEL_6)
- 2.76V (CONFIG_ESP_BROWNOUT_DET_LVL_SEL_5)
- 2.92V (CONFIG_ESP_BROWNOUT_DET_LVL_SEL_4)
- 3.10V (CONFIG_ESP_BROWNOUT_DET_LVL_SEL_3)
- 3.27V (CONFIG_ESP_BROWNOUT_DET_LVL_SEL_2)

CONFIG_ESP_SYSTEM_HW_STACK_GUARD

Hardware stack guard

Found in: Component config > ESP System Settings

This config allows to trigger a panic interrupt when Stack Pointer register goes out of allocated stack memory bounds.

Default value:

- Yes (enabled)

CONFIG_ESP_SYSTEM_HW_PC_RECORD

Hardware PC recording

Found in: Component config > ESP System Settings

This option will enable the PC recording function of assist_debug module. The PC value of the CPU will be recorded to PC record register in assist_debug module in real time. When an exception occurs and the CPU is reset, this register will be kept, then we can use the recorded PC to debug the causes of the reset.

Default value:

- Yes (enabled)

IPC (Inter-Processor Call) Contains:

- [CONFIG_ESP_IPC_TASK_STACK_SIZE](#)
- [CONFIG_ESP_IPC_USES_CALLERS_PRIORITY](#)

CONFIG_ESP_IPC_TASK_STACK_SIZE

Inter-Processor Call (IPC) task stack size

Found in: Component config > IPC (Inter-Processor Call)

Configure the IPC tasks stack size. An IPC task runs on each core (in dual core mode), and allows for cross-core function calls. See IPC documentation for more details. The default IPC stack size should be enough for most common simple use cases. However, users can increase/decrease the stack size to their needs.

Range:

- from 512 to 65536

Default value:

- 1024

CONFIG_ESP_IPC_USES_CALLERS_PRIORITY

IPC runs at caller's priority

Found in: Component config > IPC (Inter-Processor Call)

If this option is not enabled then the IPC task will keep behavior same as prior to that of ESP-IDF v4.0, hence IPC task will run at (configMAX_PRIORITIES - 1) priority.

ESP Timer (High Resolution Timer) Contains:

- [CONFIG_ESP_TIMER_PROFILING](#)
- [CONFIG_ESP_TIMER_TASK_AFFINITY](#)
- [CONFIG_ESP_TIMER_TASK_STACK_SIZE](#)
- [CONFIG_ESP_TIMER_INTERRUPT_LEVEL](#)
- [CONFIG_ESP_TIMER_SHOW_EXPERIMENTAL](#)
- [CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD](#)
- [CONFIG_ESP_TIMER_ISR_AFFINITY](#)

CONFIG_ESP_TIMER_PROFILING

Enable esp_timer profiling features

Found in: Component config > ESP Timer (High Resolution Timer)

If enabled, esp_timer_dump will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

Default value:

- No (disabled)

CONFIG_ESP_TIMER_TASK_STACK_SIZE

High-resolution timer task stack size

Found in: Component config > ESP Timer (High Resolution Timer)

Configure the stack size of "timer_task" task. This task is used to dispatch callbacks of timers created using ets_timer and esp_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.

Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see "FreeRTOS timer task stack size" option in "FreeRTOS".

Range:

- from 2048 to 65536

Default value:

- 3584

CONFIG_ESP_TIMER_INTERRUPT_LEVEL

Interrupt level

Found in: Component config > ESP Timer (High Resolution Timer)

This sets the interrupt priority level for esp_timer ISR. A higher value reduces interrupt latency by minimizing the timer processing delay.

Range:

- from 1 to 1

Default value:

- 1

CONFIG_ESP_TIMER_SHOW_EXPERIMENTAL

show esp_timer's experimental features

Found in: [Component config](#) > [ESP Timer \(High Resolution Timer\)](#)

This shows some hidden features of esp_timer. Note that they may break other features, use them with care.

CONFIG_ESP_TIMER_TASK_AFFINITY

esp_timer task core affinity

Found in: [Component config](#) > [ESP Timer \(High Resolution Timer\)](#)

The default settings: timer TASK on CPU0 and timer ISR on CPU0. Other settings may help in certain cases, but note that they may break other features, use them with care. - "CPU0": (default) esp_timer task is processed by CPU0. - "CPU1": esp_timer task is processed by CPU1. - "No affinity": esp_timer task can be processed by any CPU.

Available options:

- CPU0 (CONFIG_ESP_TIMER_TASK_AFFINITY_CPU0)
- CPU1 (CONFIG_ESP_TIMER_TASK_AFFINITY_CPU1)
- No affinity (CONFIG_ESP_TIMER_TASK_AFFINITY_NO_AFFINITY)

CONFIG_ESP_TIMER_ISR_AFFINITY

timer interrupt core affinity

Found in: [Component config](#) > [ESP Timer \(High Resolution Timer\)](#)

The default settings: timer TASK on CPU0 and timer ISR on CPU0. Other settings may help in certain cases, but note that they may break other features, use them with care. - "CPU0": (default) timer interrupt is processed by CPU0. - "CPU1": timer interrupt is processed by CPU1. - "No affinity": timer interrupt can be processed by any CPU. It helps to reduce latency but there is a disadvantage it leads to the timer ISR running on every core. It increases the CPU time usage for timer ISRs by N on an N-core system.

Available options:

- CPU0 (CONFIG_ESP_TIMER_ISR_AFFINITY_CPU0)
- CPU1 (CONFIG_ESP_TIMER_ISR_AFFINITY_CPU1)
- No affinity (CONFIG_ESP_TIMER_ISR_AFFINITY_NO_AFFINITY)

CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD

Support ISR dispatch method

Found in: [Component config](#) > [ESP Timer \(High Resolution Timer\)](#)

Allows using ESP_TIMER_ISR dispatch method (ESP_TIMER_TASK dispatch method is also available). - ESP_TIMER_TASK - Timer callbacks are dispatched from a high-priority esp_timer task. - ESP_TIMER_ISR - Timer callbacks are dispatched directly from the timer interrupt handler. The ISR dispatch can be used, in some cases, when a callback is very simple or need a lower-latency.

Default value:

- No (disabled)

Wi-Fi Contains:

- *WPS Configuration Options*

CONFIG_ESP_HOST_WIFI_ENABLED

Host WiFi Enable

Found in: *Component config > Wi-Fi*

Default value:

- No (disabled)

CONFIG_ESP_WIFI_STATIC_RX_BUFFER_NUM

Max number of WiFi static RX buffers

Found in: *Component config > Wi-Fi*

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static rx buffers are allocated when esp_wifi_init is called, they are not freed until esp_wifi_deinit is called.

WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher throughput but increases memory use. If ESP_WIFI_AMPDU_RX_ENABLED is enabled, this value is recommended to set equal or bigger than ESP_WIFI_RX_BA_WIN in order to achieve better throughput and compatibility with both stations and APs.

Range:

- from 2 to 128 if SOC_WIFI_HE_SUPPORT && *CONFIG_ESP_HOST_WIFI_ENABLED*

Default value:

- 16 if *CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP* && *CONFIG_ESP_HOST_WIFI_ENABLED*

CONFIG_ESP_WIFI_DYNAMIC_RX_BUFFER_NUM

Max number of WiFi dynamic RX buffers

Found in: *Component config > Wi-Fi*

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).

If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.

Range:

- from 0 to 1024 if *CONFIG_LWIP_WND_SCALE* && *CONFIG_ESP_HOST_WIFI_ENABLED*

Default value:

- 32 if *CONFIG_ESP_HOST_WIFI_ENABLED*

CONFIG_ESP_WIFI_TX_BUFFER

Type of WiFi TX buffers

Found in: *Component config > Wi-Fi*

Select type of WiFi TX buffers:

If "Static" is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

If "Dynamic" is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the Wifi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the

WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.

If PSRAM is enabled, "Static" should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled, "Dynamic" should be selected to improve the utilization of RAM.

Available options:

- Static (CONFIG_ESP_WIFI_STATIC_TX_BUFFER)
- Dynamic (CONFIG_ESP_WIFI_DYNAMIC_TX_BUFFER)

CONFIG_ESP_WIFI_STATIC_TX_BUFFER_NUM

Max number of WiFi static TX buffers

Found in: Component config > Wi-Fi

Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when esp_wifi_init() is called, they are not released until esp_wifi_deinit() is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

Range:

- from 1 to 64 if `CONFIG_ESP_WIFI_STATIC_TX_BUFFER` && `CONFIG_ESP_HOST_WIFI_ENABLED`

Default value:

- 16 if `CONFIG_ESP_WIFI_STATIC_TX_BUFFER` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_CACHE_TX_BUFFER_NUM

Max number of WiFi cache TX buffers

Found in: Component config > Wi-Fi

Set the number of WiFi cache TX buffer number.

For each TX packet from uplayer, such as LWIP etc, WiFi driver needs to allocate a static TX buffer and makes a copy of uplayer packet. If WiFi driver fails to allocate the static TX buffer, it caches the uplayer packets to a dedicated buffer queue, this option is used to configure the size of the cached TX queue.

Range:

- from 16 to 128 if `CONFIG_SPIRAM` && `CONFIG_ESP_HOST_WIFI_ENABLED`

Default value:

- 32 if `CONFIG_SPIRAM` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_DYNAMIC_TX_BUFFER_NUM

Max number of WiFi dynamic TX buffers

Found in: Component config > Wi-Fi

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.

For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

Range:

- from 1 to 128 if `CONFIG_ESP_WIFI_DYNAMIC_TX_BUFFER` && `CONFIG_ESP_HOST_WIFI_ENABLED`

Default value:

- 32 if `CONFIG_ESP_WIFI_DYNAMIC_TX_BUFFER` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_MGMT_RX_BUFFER

Type of WiFi RX MGMT buffers

Found in: [Component config](#) > [Wi-Fi](#)

Select type of WiFi RX MGMT buffers:

If "Static" is selected, WiFi RX MGMT buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static RX MGMT buffer is fixed to about 500 Bytes.

If "Dynamic" is selected, each WiFi RX MGMT buffer is allocated as needed when a MGMT data frame is received. The MGMT buffer is freed after the MGMT data frame has been processed by the WiFi driver.

Available options:

- Static (`CONFIG_ESP_WIFI_STATIC_RX_MGMT_BUFFER`)
- Dynamic (`CONFIG_ESP_WIFI_DYNAMIC_RX_MGMT_BUFFER`)

CONFIG_ESP_WIFI_RX_MGMT_BUF_NUM_DEF

Max number of WiFi RX MGMT buffers

Found in: [Component config](#) > [Wi-Fi](#)

Set the number of WiFi RX_MGMT buffers.

For Management buffers, the number of dynamic and static management buffers is the same. In order to prevent memory fragmentation, the management buffer type should be set to static first.

Range:

- from 1 to 10 if `CONFIG_ESP_HOST_WIFI_ENABLED`

Default value:

- 5 if `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_CSI_ENABLED

WiFi CSI(Channel State Information)

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to enable CSI(Channel State Information) feature. CSI takes about `CONFIG_ESP_WIFI_STATIC_RX_BUFFER_NUM` KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

Default value:

- No (disabled) if `SOC_WIFI_CSI_SUPPORT` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_AMPDU_TX_ENABLED

WiFi AMPDU TX

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to enable AMPDU TX feature

Default value:

- Yes (enabled) if `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_TX_BA_WIN

WiFi AMPDU TX BA window size

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_AMPDU_TX_ENABLED

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP TX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12.

Range:

- from 2 to 64 if `SOC_WIFI_HE_SUPPORT` && `CONFIG_ESP_WIFI_AMPDU_TX_ENABLED` && `CONFIG_ESP_HOST_WIFI_ENABLED`

Default value:

- 6 if `CONFIG_ESP_WIFI_AMPDU_TX_ENABLED` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_AMPDU_RX_ENABLED

WiFi AMPDU RX

Found in: Component config > Wi-Fi

Select this option to enable AMPDU RX feature

Default value:

- Yes (enabled) if `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_RX_BA_WIN

WiFi AMPDU RX BA window size

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_AMPDU_RX_ENABLED

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP RX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12. If PSRAM is used and WiFi memory is preferred to allocate in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

Range:

- from 2 to 64 if `SOC_WIFI_HE_SUPPORT` && `CONFIG_ESP_WIFI_AMPDU_RX_ENABLED` && `CONFIG_ESP_HOST_WIFI_ENABLED`

Default value:

- 16 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP` && `CONFIG_ESP_WIFI_AMPDU_RX_ENABLED` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_AMSDU_TX_ENABLED

WiFi AMSDU TX

Found in: Component config > Wi-Fi

Select this option to enable AMSDU TX feature

Default value:

- No (disabled) if `CONFIG_SPIRAM` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_NVS_ENABLED

WiFi NVS flash

Found in: *Component config > Wi-Fi*

Select this option to enable WiFi NVS flash

Default value:

- Yes (enabled) if *CONFIG_ESP_HOST_WIFI_ENABLED*

CONFIG_ESP_WIFI_TASK_CORE_ID

WiFi Task Core ID

Found in: *Component config > Wi-Fi*

Pinned WiFi task to core 0 or core 1.

Available options:

- Core 0 (*CONFIG_ESP_WIFI_TASK_PINNED_TO_CORE_0*)
- Core 1 (*CONFIG_ESP_WIFI_TASK_PINNED_TO_CORE_1*)

CONFIG_ESP_WIFI_SOFTAP_BEACON_MAX_LEN

Max length of WiFi SoftAP Beacon

Found in: *Component config > Wi-Fi*

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurrence of more root nodes conflict involving more than five root nodes, the conflict resolution process will detect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added on top of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 ($752+36*5$).

Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.

Range:

- from 752 to 1256 if *CONFIG_ESP_HOST_WIFI_ENABLED*

Default value:

- 752 if *CONFIG_ESP_HOST_WIFI_ENABLED*

CONFIG_ESP_WIFI_MGMT_SBUF_NUM

WiFi mgmt short buffer number

Found in: *Component config > Wi-Fi*

Set the number of WiFi management short buffer.

Range:

- from 6 to 32 if *CONFIG_ESP_HOST_WIFI_ENABLED*

Default value:

- 32 if *CONFIG_ESP_HOST_WIFI_ENABLED*

CONFIG_ESP_WIFI_IRAM_OPT

WiFi IRAM speed optimization

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

Default value:

- Yes (enabled) if [CONFIG_ESP_HOST_WIFI_ENABLED](#)

CONFIG_ESP_WIFI_EXTRA_IRAM_OPT

WiFi EXTRA IRAM speed optimization

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to place additional frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 5Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

Default value:

- Yes (enabled) if [SOC_WIFI_HE_SUPPORT](#) && [CONFIG_ESP_HOST_WIFI_ENABLED](#)
- No (disabled) if [CONFIG_ESP_HOST_WIFI_ENABLED](#)

CONFIG_ESP_WIFI_RX_IRAM_OPT

WiFi RX IRAM speed optimization

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.

Default value:

- Yes (enabled) if [CONFIG_ESP_HOST_WIFI_ENABLED](#)

CONFIG_ESP_WIFI_ENABLE_WPA3_SAE

Enable WPA3-Personal

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP's. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

Default value:

- Yes (enabled) if [CONFIG_ESP_HOST_WIFI_ENABLED](#)

CONFIG_ESP_WIFI_ENABLE_SAE_PK

Enable SAE-PK

Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG_ESP_WIFI_ENABLE_WPA3_SAE](#)

Select this option to enable SAE-PK

Default value:

- Yes (enabled) if [CONFIG_ESP_WIFI_ENABLE_WPA3_SAE](#) && [CONFIG_ESP_HOST_WIFI_ENABLED](#)

CONFIG_ESP_WIFI_SOFTAP_SAE_SUPPORT

Enable WPA3 Personal(SAE) SoftAP

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_WPA3_SAE

Select this option to enable SAE support in softAP mode.

Default value:

- Yes (enabled) if `CONFIG_ESP_WIFI_ENABLE_WPA3_SAE` && `CONFIG_ESP_WIFI_SOFTAP_SUPPORT` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_ENABLE_WPA3_OWE_STA

Enable OWE STA

Found in: Component config > Wi-Fi

Select this option to allow the device to establish OWE connection with eligible AP's. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

Default value:

- Yes (enabled) if `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_SLP_IRAM_OPT

WiFi SLP IRAM speed optimization

Found in: Component config > Wi-Fi

Select this option to place called Wi-Fi library TBTT process and receive beacon functions in IRAM. Some functions can be put in IRAM either by `ESP_WIFI_IRAM_OPT` and `ESP_WIFI_RX_IRAM_OPT`, or this one. If already enabled `ESP_WIFI_IRAM_OPT`, the other 7.3KB IRAM memory would be taken by this option. If already enabled `ESP_WIFI_RX_IRAM_OPT`, the other 1.3KB IRAM memory would be taken by this option. If neither of them are enabled, the other 7.4KB IRAM memory would be taken by this option. Wi-Fi power-save mode average current would be reduced if this option is enabled.

Default value:

- Yes (enabled) if `SOC_WIFI_HE_SUPPORT` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_SLP_DEFAULT_MIN_ACTIVE_TIME

Minimum active time

Found in: Component config > Wi-Fi

Only for station in `WIFI_PS_MIN_MODEM` or `WIFI_PS_MAX_MODEM`. When the station enters the active state, it will work for at least `ESP_WIFI_SLP_DEFAULT_MIN_ACTIVE_TIME`. If a data packet is received or sent during this period, the time will be refreshed. If the time is up, but the station still has packets to receive or send, the time will also be refreshed. unit: milliseconds.

Range:

- from 8 to 60 if `CONFIG_ESP_HOST_WIFI_ENABLED`

Default value:

- 50 if `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_SLP_DEFAULT_MAX_ACTIVE_TIME

Maximum keep alive time

Found in: Component config > Wi-Fi

Only for station in WIFI_PS_MIN_MODEM or WIFI_PS_MAX_MODEM. If no packet has been sent within ESP_WIFI_SLP_DEFAULT_MAX_ACTIVE_TIME, a null data packet will be sent to maintain the connection with the AP. unit: seconds.

Range:

- from 10 to 60 if `CONFIG_ESP_HOST_WIFI_ENABLED`

Default value:

- 10 if `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_SLP_DEFAULT_WAIT_BROADCAST_DATA_TIME

Minimum wait broadcast data time

Found in: *Component config > Wi-Fi*

Only for station in WIFI_PS_MIN_MODEM or WIFI_PS_MAX_MODEM. When the station knows through the beacon that AP will send broadcast packet, it will wait for ESP_WIFI_SLP_DEFAULT_WAIT_BROADCAST_DATA_TIME before entering the sleep process. If a broadcast packet is received with more data bits, the time will refreshed. unit: milliseconds.

Range:

- from 10 to 30 if `CONFIG_ESP_HOST_WIFI_ENABLED`

Default value:

- 15 if `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_FTM_ENABLE

WiFi FTM

Found in: *Component config > Wi-Fi*

Enable feature Fine Timing Measurement for calculating WiFi Round-Trip-Time (RTT).

Default value:

- No (disabled) if `SOC_WIFI_FTM_SUPPORT` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_FTM_INITIATOR_SUPPORT

FTM Initiator support

Found in: *Component config > Wi-Fi > CONFIG_ESP_WIFI_FTM_ENABLE*

Default value:

- Yes (enabled) if `CONFIG_ESP_WIFI_FTM_ENABLE` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_FTM_RESPONDER_SUPPORT

FTM Responder support

Found in: *Component config > Wi-Fi > CONFIG_ESP_WIFI_FTM_ENABLE*

Default value:

- Yes (enabled) if `CONFIG_ESP_WIFI_FTM_ENABLE` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE

Power Management for station at disconnected

Found in: *Component config > Wi-Fi*

Select this option to enable power_management for station when disconnected. Chip will do modem-sleep when rf module is not in use any more.

Default value:

- Yes (enabled) if `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_GCMP_SUPPORT

WiFi GCMP Support(GCMP128 and GCMP256)

Found in: `Component config > Wi-Fi`

Select this option to enable GCMP support. GCMP support is compulsory for WiFi Suite-B support.

Default value:

- No (disabled) if `SOC_WIFI_GCMP_SUPPORT` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_GMAC_SUPPORT

WiFi GMAC Support(GMAC128 and GMAC256)

Found in: `Component config > Wi-Fi`

Select this option to enable GMAC support. GMAC support is compulsory for WiFi 192 bit certification.

Default value:

- Yes (enabled) if `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_SOFTAP_SUPPORT

WiFi SoftAP Support

Found in: `Component config > Wi-Fi`

WiFi module can be compiled without SoftAP to save code size.

Default value:

- Yes (enabled) if `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_ENHANCED_LIGHT_SLEEP

WiFi modem automatically receives the beacon

Found in: `Component config > Wi-Fi`

The wifi modem automatically receives the beacon frame during light sleep.

Default value:

- No (disabled) if `ESP_PHY_MAC_BB_PD` && `SOC_PM_SUPPORT_BEACON_WAKEUP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

Wifi sleep optimize when beacon lost

Found in: `Component config > Wi-Fi`

Enable wifi sleep optimization when beacon loss occurs and immediately enter sleep mode when the WiFi module detects beacon loss.

CONFIG_ESP_WIFI_SLP_BEACON_LOST_TIMEOUT

Beacon loss timeout

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

Timeout time for close rf phy when beacon loss occurs, Unit: 1024 microsecond.

Range:

- from 5 to 100 if *CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT* && *CONFIG_ESP_HOST_WIFI_ENABLED*

Default value:

- 10 if *CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT* && *CONFIG_ESP_HOST_WIFI_ENABLED*

CONFIG_ESP_WIFI_SLP_BEACON_LOST_THRESHOLD

Maximum number of consecutive lost beacons allowed

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

Maximum number of consecutive lost beacons allowed, WiFi keeps Rx state when the number of consecutive beacons lost is greater than the given threshold.

Range:

- from 0 to 8 if *CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT* && *CONFIG_ESP_HOST_WIFI_ENABLED*

Default value:

- 3 if *CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT* && *CONFIG_ESP_HOST_WIFI_ENABLED*

CONFIG_ESP_WIFI_SLP_PHY_ON_DELTA_EARLY_TIME

Delta early time for RF PHY on

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

Delta early time for rf phy on, When the beacon is lost, the next rf phy on will be earlier the time specified by the configuration item, Unit: 32 microsecond.

Range:

- from 0 to 100 if *CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT* && *SOC_WIFI_SUPPORT_VARIABLE_BEACON_WINDOW* && *CONFIG_ESP_HOST_WIFI_ENABLED*

Default value:

- 2 if *CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT* && *SOC_WIFI_SUPPORT_VARIABLE_BEACON_WINDOW* && *CONFIG_ESP_HOST_WIFI_ENABLED*

CONFIG_ESP_WIFI_SLP_PHY_OFF_DELTA_TIMEOUT_TIME

Delta timeout time for RF PHY off

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

Delta timeout time for rf phy off, When the beacon is lost, the next rf phy off will be delayed for the time specified by the configuration item. Unit: 1024 microsecond.

Range:

- from 0 to 8 if *CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT* && *SOC_WIFI_SUPPORT_VARIABLE_BEACON_WINDOW* && *CONFIG_ESP_HOST_WIFI_ENABLED*

Default value:

- 2 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT` &&
`SOC_WIFI_SUPPORT_VARIABLE_BEACON_WINDOW` && `CON-`
`FIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM

Maximum espnow encrypt peers number

Found in: *Component config > Wi-Fi*

Maximum number of encrypted peers supported by espnow. The number of hardware keys for encryption is fixed. And the espnow and SoftAP share the same hardware keys. So this configuration will affect the maximum connection number of SoftAP. Maximum espnow encrypted peers number + maximum number of connections of SoftAP = Max hardware keys number. When using ESP mesh, this value should be set to a maximum of 6.

Range:

- from 0 to 17 if `CONFIG_ESP_HOST_WIFI_ENABLED`

Default value:

- 7 if `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_NAN_ENABLE

WiFi Aware

Found in: *Component config > Wi-Fi*

Enable WiFi Aware (NAN) feature.

Default value:

- No (disabled) if `SOC_WIFI_NAN_SUPPORT` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_MBEDTLS_CRYPTO

Use MbedTLS crypto APIs

Found in: *Component config > Wi-Fi*

Select this option to enable the use of MbedTLS crypto APIs. The internal crypto support within the supplicant is limited and may not suffice for all new security features, including WPA3.

It is recommended to always keep this option enabled. Additionally, note that MbedTLS can leverage hardware acceleration if available, resulting in significantly faster cryptographic operations.

Default value:

- Yes (enabled) if `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_MBEDTLS_TLS_CLIENT

Use MbedTLS TLS client for WiFi Enterprise connection

Found in: *Component config > Wi-Fi > CONFIG_ESP_WIFI_MBEDTLS_CRYPTO*

Select this option to use MbedTLS TLS client for WPA2 enterprise connection. Please note that from MbedTLS-3.0 onwards, MbedTLS does not support SSL-3.0 TLS-v1.0, TLS-v1.1 versions. In case your server is using one of these version, it is advisable to update your server. Please disable this option for compatibility with older TLS versions.

Default value:

- Yes (enabled) if `CONFIG_ESP_WIFI_ENTERPRISE_SUPPORT` && `CON-`
`FIG_ESP_WIFI_MBEDTLS_CRYPTO` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_EAP_TLS1_3

Enable EAP-TLS v1.3 Support for WiFi Enterprise connection

Found in: `Component config > Wi-Fi > CONFIG_ESP_WIFI_MBEDTLS_CRYPTO > CONFIG_ESP_WIFI_MBEDTLS_TLS_CLIENT`

Select this option to support EAP with TLS v1.3. This configuration still supports compatibility with EAP-TLS v1.2. Please note that enabling this configuration will cause every application which uses TLS go for TLS1.3 if server supports that. TLS1.3 is still in development in mbedtls and there may be interoperability issues with this. Please modify your application to set max version as TLS1.2 if you want to enable TLS1.3 only for WiFi connection.

Default value:

- No (disabled) if `CONFIG_ESP_WIFI_MBEDTLS_TLS_CLIENT` && `CONFIG_IDF_EXPERIMENTAL_FEATURES` && `CONFIG_ESP_WIFI_MBEDTLS_CRYPTO` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_WAPI_PSK

Enable WAPI PSK support

Found in: `Component config > Wi-Fi`

Select this option to enable WAPI-PSK which is a Chinese National Standard Encryption for Wireless LANs (GB 15629.11-2003).

Default value:

- No (disabled) if `SOC_WIFI_WAPI_SUPPORT` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_SUITE_B_192

Enable NSA suite B support with 192 bit key

Found in: `Component config > Wi-Fi`

Select this option to enable 192 bit NSA suite-B. This is necessary to support WPA3 192 bit security.

Default value:

- No (disabled) if `SOC_WIFI_GCMP_SUPPORT` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_11KV_SUPPORT

Enable 802.11k, 802.11v APIs Support

Found in: `Component config > Wi-Fi`

Select this option to enable 802.11k 802.11v APIs(RRM and BTM support). Only APIs which are helpful for network assisted roaming are supported for now. Enable this option with BTM and RRM enabled in sta config to make device ready for network assisted roaming. BTM: BSS transition management enables an AP to request a station to transition to a specific AP, or to indicate to a station a set of preferred APs. RRM: Radio measurements enable STAs to understand the radio environment, it enables STAs to observe and gather data on radio link performance and on the radio environment. Current implementation adds beacon report, link measurement, neighbor report.

Default value:

- No (disabled) if `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_SCAN_CACHE

Keep scan results in cache

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_11KV_SUPPORT

Keep scan results in cache, if not enabled, those will be flushed immediately.

Default value:

- No (disabled) if *CONFIG_ESP_WIFI_11KV_SUPPORT* && *CONFIG_ESP_HOST_WIFI_ENABLED*

CONFIG_ESP_WIFI_MBO_SUPPORT

Enable Multi Band Operation Certification Support

Found in: Component config > Wi-Fi

Select this option to enable WiFi Multiband operation certification support.

Default value:

- No (disabled) if *CONFIG_ESP_HOST_WIFI_ENABLED*

CONFIG_ESP_WIFI_ENABLE_ROAMING_APP

Advanced support for Wi-Fi Roaming (Experimental)

Found in: Component config > Wi-Fi

Enable Espressif's roaming app to allow for efficient Wi-Fi roaming. This includes configurable periodic environment scans, maintaining a cache of the best APs, handling low rssi events etc.

Risk Warning Please note that this feature is still experimental and enabling this potentially can lead to unpredictable scanning, connection and roaming attempts. We are still working on tuning and optimising this feature to ensure reliable and stable use.

Default value:

- No (disabled) if *CONFIG_IDF_EXPERIMENTAL_FEATURES* && *CONFIG_ESP_HOST_WIFI_ENABLED*

Configure roaming App Contains:

- *CONFIG_ESP_WIFI_ROAMING_BACKOFF_TIME*
- *Roaming Methods*
- *Roaming triggers*
- *Scan Configuration*
- *CONFIG_ESP_WIFI_ROAMING_PERIODIC_RRM_MONITORING*

Roaming triggers Contains:

- *CONFIG_ESP_WIFI_ROAMING_PERIODIC_SCAN_MONITOR*
- *CONFIG_ESP_WIFI_ROAMING_LOW_RSSI_ROAMING*

CONFIG_ESP_WIFI_ROAMING_LOW_RSSI_ROAMING

Use Low RSSI to trigger roaming.

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_ROAMING_APP > Configure roaming App > Roaming triggers

Enable to use a RSSI threshold to trigger roaming.

Default value:

- Yes (enabled) if *CONFIG_ESP_WIFI_ENABLE_ROAMING_APP* && *CONFIG_ESP_HOST_WIFI_ENABLED*

CONFIG_ESP_WIFI_ROAMING_LOW_RSSI_THRESHOLD

WiFi RSSI threshold to trigger roaming

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_ROAMING_APP > Configure roaming App > Roaming triggers > CONFIG_ESP_WIFI_ROAMING_LOW_RSSI_ROAMING

WiFi RSSI threshold to trigger roaming value in dBm (-99 to -1). Values under -30 dbm might lead to a flood of low rssi events. This interferes with normal functioning and TX/Rx performance.

Range:

- from -99 to -30 if *CONFIG_ESP_WIFI_ROAMING_LOW_RSSI_ROAMING* && *CONFIG_ESP_WIFI_ENABLE_ROAMING_APP* && *CONFIG_ESP_HOST_WIFI_ENABLED*

Default value:

- "-60" if *CONFIG_ESP_WIFI_ROAMING_LOW_RSSI_ROAMING* && *CONFIG_ESP_WIFI_ENABLE_ROAMING_APP* && *CONFIG_ESP_HOST_WIFI_ENABLED*

CONFIG_ESP_WIFI_ROAMING_LOW_RSSI_OFFSET

Offset by which to reset the RSSI Threshold after attempt to roam.

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_ROAMING_APP > Configure roaming App > Roaming triggers > CONFIG_ESP_WIFI_ROAMING_LOW_RSSI_ROAMING

Decide the offset by which to decrease the Low RSSI threshold set by ESP_WIFI_ROAMING_LOW_RSSI_THRESHOLD after each failed attempt to roam. This allows for the station to keep scanning for better AP's after the Low RSSI threshold is reached in a stepped manner, rather than only attempting to roam the first time the current AP's RSSI breaches the set RSSI threshold. Setting 0 here may cause station to be flooded with low rssi events, therefore that's not recommended to be kept.

Range:

- from 0 to 99 if *CONFIG_ESP_WIFI_ROAMING_LOW_RSSI_ROAMING* && *CONFIG_ESP_WIFI_ENABLE_ROAMING_APP* && *CONFIG_ESP_HOST_WIFI_ENABLED*

Default value:

- 5 if *CONFIG_ESP_WIFI_ROAMING_LOW_RSSI_ROAMING* && *CONFIG_ESP_WIFI_ENABLE_ROAMING_APP* && *CONFIG_ESP_HOST_WIFI_ENABLED*

CONFIG_ESP_WIFI_ROAMING_PERIODIC_SCAN_MONITOR

Conduct periodic scans to check if a better AP is available

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_ROAMING_APP > Configure roaming App > Roaming triggers

Conduct periodic scans periodically to check if a better AP is available.

Default value:

- Yes (enabled) if *CONFIG_ESP_WIFI_ENABLE_ROAMING_APP* && *CONFIG_ESP_HOST_WIFI_ENABLED*

CONFIG_ESP_WIFI_ROAMING_PERIODIC_SCAN_THRESHOLD

Threshold at which to begin periodic scanning for a better AP.

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_ROAMING_APP > Configure roaming App > Roaming triggers > CONFIG_ESP_WIFI_ROAMING_PERIODIC_SCAN_MONITOR

Threshold at which the station will begin scanning to find an AP with better RSSI.

Range:

- from -99 to -1 if *CONFIG_ESP_WIFI_ROAMING_PERIODIC_SCAN_MONITOR* && *CONFIG_ESP_WIFI_ENABLE_ROAMING_APP* && *CONFIG_ESP_HOST_WIFI_ENABLED*

Default value:

- "-50" if `CONFIG_ESP_WIFI_ROAMING_PERIODIC_SCAN_MONITOR` && `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_ROAMING_SCAN_MONITOR_INTERVAL

Time intervals (in seconds) at which station will initiate a scan

Found in: `Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_ROAMING_APP > Configure roaming App > Roaming triggers > CONFIG_ESP_WIFI_ROAMING_PERIODIC_SCAN_MONITOR`

Intervals at which station will periodically scan to check if better AP is available

Range:

- from 1 to 1500 if `CONFIG_ESP_WIFI_ROAMING_PERIODIC_SCAN_MONITOR` && `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

Default value:

- 30 if `CONFIG_ESP_WIFI_ROAMING_PERIODIC_SCAN_MONITOR` && `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_ROAMING_SCAN_ROAM_RSSI_DIFF

RSSI difference b/w current AP and candidate AP to initiate connection

Found in: `Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_ROAMING_APP > Configure roaming App > Roaming triggers > CONFIG_ESP_WIFI_ROAMING_PERIODIC_SCAN_MONITOR`

Minimum RSSI difference b/w current AP and a potential roaming candidate AP to trigger a roaming attempt.

Range:

- from 0 to 99 if `CONFIG_ESP_WIFI_ROAMING_PERIODIC_SCAN_MONITOR` && `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

Default value:

- 15 if `CONFIG_ESP_WIFI_ROAMING_PERIODIC_SCAN_MONITOR` && `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

Roaming Methods Contains:

- `CONFIG_ESP_WIFI_ROAMING_LEGACY_ROAMING`
- `CONFIG_ESP_WIFI_ROAMING_NETWORK_ASSISTED_ROAM`

CONFIG_ESP_WIFI_ROAMING_LEGACY_ROAMING

Support Legacy roaming approach

Found in: `Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_ROAMING_APP > Configure roaming App > Roaming Methods`

Roaming between APs that do not support 802.11kv. This will allow station to roam even when connection is not BTM supported, by forcefully disconnecting from current AP and connecting to better AP.

Default value:

- Yes (enabled) if `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_ROAMING_NETWORK_ASSISTED_ROAM

Support Network Assisted roaming using 802.11kv

Found in: `Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_ROAMING_APP > Configure roaming App > Roaming Methods`

Roaming between APs using network assisted Roaming. This involves BSS Transition Management mechanisms outlined in 802.11v. Note that this moves the responsibility to the AP's network, and hence isn't guaranteed to cause the station to attempt to roam each time.

Default value:

- Yes (enabled) if `CONFIG_ESP_WIFI_11KV_SUPPORT` && `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_NETWORK_ASSISTED_ROAMING_RETRY_COUNT

Retry count after which to switch to legacy roaming

Found in: `Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_ROAMING_APP > Configure roaming App > Roaming Methods > CONFIG_ESP_WIFI_ROAMING_NETWORK_ASSISTED_ROAM`

Retry threshold after which the station should stop using Network Assisted roaming methods and start using legacy roaming instead.

Range:

- from 1 to 5 if `CONFIG_ESP_WIFI_ROAMING_NETWORK_ASSISTED_ROAM` && `CONFIG_ESP_WIFI_ROAMING_LEGACY_ROAMING` && `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

Default value:

- 2 if `CONFIG_ESP_WIFI_ROAMING_NETWORK_ASSISTED_ROAM` && `CONFIG_ESP_WIFI_ROAMING_LEGACY_ROAMING` && `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

Scan Configuration Contains:

- `CONFIG_ESP_WIFI_ROAMING_HOME_CHANNEL_DWELL_TIME`
- `CONFIG_ESP_WIFI_ROAMING_MAX_CANDIDATES`
- `CONFIG_ESP_WIFI_ROAMING_SCAN_MAX_SCAN_TIME`
- `CONFIG_ESP_WIFI_ROAMING_SCAN_MIN_SCAN_TIME`
- `CONFIG_ESP_WIFI_ROAMING_SCAN_CHAN_LIST`
- `CONFIG_ESP_WIFI_ROAMING_SCAN_EXPIRY_WINDOW`

CONFIG_ESP_WIFI_ROAMING_SCAN_MIN_SCAN_TIME

Minimum duration (in milliseconds) of station's per channel active scan

Found in: `Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_ROAMING_APP > Configure roaming App > Scan Configuration`

Minimum duration of active scanning per channel in milliseconds.

Range:

- from 0 to 120 if `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

Default value:

- 10 if `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_ROAMING_SCAN_MAX_SCAN_TIME

Maximum duration (in milliseconds) of station's per channel active scan time

Found in: `Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_ROAMING_APP > Configure roaming App > Scan Configuration`

Maximum duration of active scanning per channel in milliseconds.

Range:

- from 30 to 120 if `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

Default value:

- 70 if `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_ROAMING_HOME_CHANNEL_DWELL_TIME

Home channel dwell time scanning between consecutive channels

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_ROAMING_APP > Configure roaming App > Scan Configuration

If connected, duration for which the station will return to its home channel for Tx/Rx of frames stored in buffers between scanning on consecutive channels.

Range:

- from 30 to 150 if `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

Default value:

- 30 if `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_ROAMING_SCAN_CHAN_LIST

Preferred channel list for scanning

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_ROAMING_APP > Configure roaming App > Scan Configuration

Channels your wireless network operates on to allow for faster scanning. Specify the channels (between 1-14) in a comma separated manner.

Default value:

- "None" if `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_ROAMING_SCAN_EXPIRY_WINDOW

Scan results expiry window (in seconds)

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_ROAMING_APP > Configure roaming App > Scan Configuration

Duration for which the results from the most recent scans can be used by the roaming app for determining the roaming candidates.

Range:

- from 5 to 20 if `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

Default value:

- 10 if `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_ROAMING_MAX_CANDIDATES

Max Candidates in the network

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_ROAMING_APP > Configure roaming App > Scan Configuration

Max candidates that can be considered while scanning as a part of the network at one time.

Range:

- from 3 to 20 if `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

Default value:

- 3 if `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_ROAMING_BACKOFF_TIME

Default time to wait between subsequent roaming attempts.

Found in: `Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_ROAMING_APP > Configure roaming App`

Time to wait (in seconds) by station before registering for the RSSI event again or start continuous monitoring to find better AP.

Range:

- from 0 to 120 if `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

Default value:

- 15 if `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_ROAMING_PERIODIC_RRM_MONITORING

Send periodic neighbor report request to AP for internal list updation

Found in: `Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_ROAMING_APP > Configure roaming App`

This option will enable station to keep sending RRM neighbor list request to AP and update its internal list.

Default value:

- Yes (enabled) if `CONFIG_ESP_WIFI_11KV_SUPPORT` && `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_ROAMING_RRM_MONITOR_TIME

Time interval (in seconds) between neighbor report requests to an AP

Found in: `Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_ROAMING_APP > Configure roaming App > CONFIG_ESP_WIFI_ROAMING_PERIODIC_RRM_MONITORING`

Enable this to send periodic neighbor report requests to the AP. These neighbor report requests provide information about other APs in the same managed network. This information is used for more intelligent roaming.

Range:

- from 0 to 1500 if `CONFIG_ESP_WIFI_ROAMING_PERIODIC_RRM_MONITORING` && `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

Default value:

- 60 if `CONFIG_ESP_WIFI_ROAMING_PERIODIC_RRM_MONITORING` && `CONFIG_ESP_WIFI_ENABLE_ROAMING_APP` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_ROAMING_RRM_MONITOR_THRESHOLD

Threshold for sending periodic neighbor report requests

Found in: *Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_ROAMING_APP > Configure roaming App > CONFIG_ESP_WIFI_ROAMING_PERIODIC_RRM_MONITORING*

The RSSI threshold beyond which we start sending periodic neighbor report requests.

Range:

- from -99 to 0 if *CONFIG_ESP_WIFI_ROAMING_PERIODIC_RRM_MONITORING* && *CONFIG_ESP_WIFI_ENABLE_ROAMING_APP* && *CONFIG_ESP_HOST_WIFI_ENABLED*

Default value:

- "-20" if *CONFIG_ESP_WIFI_ROAMING_PERIODIC_RRM_MONITORING* && *CONFIG_ESP_WIFI_ENABLE_ROAMING_APP* && *CONFIG_ESP_HOST_WIFI_ENABLED*

CONFIG_ESP_WIFI_DPP_SUPPORT

Enable DPP support

Found in: *Component config > Wi-Fi*

Select this option to enable WiFi Easy Connect Support.

Default value:

- No (disabled) if *CONFIG_ESP_HOST_WIFI_ENABLED*

CONFIG_ESP_WIFI_11R_SUPPORT

Enable 802.11R (Fast Transition) Support

Found in: *Component config > Wi-Fi*

Select this option to enable WiFi Fast Transition Support.

Default value:

- No (disabled) if *CONFIG_ESP_HOST_WIFI_ENABLED*

CONFIG_ESP_WIFI_WPS_SOFTAP_REGISTRAR

Add WPS Registrar support in SoftAP mode

Found in: *Component config > Wi-Fi*

Select this option to enable WPS registrar support in softAP mode.

Default value:

- No (disabled) if *CONFIG_ESP_WIFI_SOFTAP_SUPPORT* && *CONFIG_ESP_HOST_WIFI_ENABLED*

CONFIG_ESP_WIFI_ENABLE_WIFI_TX_STATS

Enable Wi-Fi transmission statistics

Found in: *Component config > Wi-Fi*

Enable Wi-Fi transmission statistics. Total support 4 access category. Each access category will use 346 bytes memory.

Default value:

- No (disabled) if *SOC_WIFI_HE_SUPPORT* && *CONFIG_ESP_HOST_WIFI_ENABLED*

CONFIG_ESP_WIFI_ENABLE_WIFI_RX_STATS

Enable Wi-Fi reception statistics

Found in: [Component config > Wi-Fi](#)

Enable Wi-Fi reception statistics. Total support 2 access category. Each access category will use 190 bytes memory.

Default value:

- No (disabled) if SOC_WIFI_HE_SUPPORT && [CONFIG_ESP_HOST_WIFI_ENABLED](#)

CONFIG_ESP_WIFI_ENABLE_WIFI_RX_MU_STATS

Enable Wi-Fi DL MU-MIMO and DL OFDMA reception statistics

Found in: [Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_WIFI_RX_STATS](#)

Enable Wi-Fi DL MU-MIMO and DL OFDMA reception statistics. Will use 10932 bytes memory.

Default value:

- No (disabled) if [CONFIG_ESP_WIFI_ENABLE_WIFI_RX_STATS](#) && [CONFIG_ESP_HOST_WIFI_ENABLED](#)

CONFIG_ESP_WIFI_TX_HETB_QUEUE_NUM

WiFi TX HE TB QUEUE number for STA HE TB PPDU transmission

Found in: [Component config > Wi-Fi](#)

Set the maximum number of queue that can be aggregated by the STA in the A-MPDU carried in the HE TB PPDU.

Range:

- from 1 to 4 if SOC_WIFI_HE_SUPPORT && [CONFIG_ESP_HOST_WIFI_ENABLED](#)

Default value:

- 3 if SOC_WIFI_HE_SUPPORT && [CONFIG_ESP_HOST_WIFI_ENABLED](#)

CONFIG_ESP_WIFI_ENABLE_DUMP_HESIGB

Enable Wi-Fi dump HE-SIGB which is contained in DL HE MU PPDU

Found in: [Component config > Wi-Fi](#)

Enable Wi-Fi dump HE-SIGB which is contained in DL HE MU PPDU.

Default value:

- No (disabled) if SOC_WIFI_HE_SUPPORT_5G && [CONFIG_ESP_HOST_WIFI_ENABLED](#)

CONFIG_ESP_WIFI_ENABLE_DUMP_MU_CFO

Enable Wi-Fi dump MU CFO

Found in: [Component config > Wi-Fi](#)

Enable Wi-Fi dump MU CFO.

Default value:

- No (disabled) if SOC_WIFI_HE_SUPPORT_5G && [CONFIG_ESP_HOST_WIFI_ENABLED](#)

CONFIG_ESP_WIFI_ENABLE_DUMP_CTRL_NDPA

Enable Wi-Fi dump NDPA frames

Found in: [Component config](#) > [Wi-Fi](#)

Enable Wi-Fi dump NDPA frames.

Default value:

- No (disabled) if `SOC_WIFI_HE_SUPPORT_5G` && `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_ENABLE_DUMP_CTRL_BFRP

Enable Wi-Fi dump BFRP frames

Found in: [Component config](#) > [Wi-Fi](#)

Enable Wi-Fi dump BFRP frames.

Default value:

- No (disabled) if `SOC_WIFI_HE_SUPPORT_5G` && `CONFIG_ESP_HOST_WIFI_ENABLED`

WPS Configuration Options

 Contains:

- `CONFIG_ESP_WIFI_WPS_PASSPHRASE`
- `CONFIG_ESP_WIFI_WPS_STRICT`

CONFIG_ESP_WIFI_WPS_STRICT

Strictly validate all WPS attributes

Found in: [Component config](#) > [Wi-Fi](#) > [WPS Configuration Options](#)

Select this option to enable validate each WPS attribute rigorously. Disabling this add the workarounds with various APs. Enabling this may cause inter operability issues with some APs.

Default value:

- No (disabled) if `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_WPS_PASSPHRASE

Get WPA2 passphrase in WPS config

Found in: [Component config](#) > [Wi-Fi](#) > [WPS Configuration Options](#)

Select this option to get passphrase during WPS configuration. This option fakes the virtual display capabilities to get the configuration in passphrase mode. Not recommended to be used since WPS credentials should not be shared to other devices, making it in readable format increases that risk, also passphrase requires pbkdf2 to convert in psk.

Default value:

- No (disabled) if `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_DEBUG_PRINT

Print debug messages from WPA Supplicant

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to print logging information from WPA supplicant, this includes handshake information and key hex dumps depending on the project logging level.

Enabling this could increase the build size ~60kb depending on the project logging level.

Default value:

- No (disabled) if `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_TESTING_OPTIONS

Add DPP testing code

Found in: [Component config](#) > [Wi-Fi](#)

Select this to enable unity test for DPP.

Default value:

- No (disabled) if `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_ENTERPRISE_SUPPORT

Enable enterprise option

Found in: [Component config](#) > [Wi-Fi](#)

Select this to enable/disable enterprise connection support.

disabling this will reduce binary size. disabling this will disable the use of any `esp_wifi_sta_wpa2_ent_*` (as APIs will be meaningless)

Note that when using bigger certificates on low-power chips without crypto hardware acceleration, it is recommended to adjust the task watchdog timer (TWDT) if it is enabled. For precise information on timing requirements, you can check performance numbers at <https://github.com/espressif/mbdts/wiki/Performance-Numbers>.

Default value:

- Yes (enabled) if `CONFIG_ESP_HOST_WIFI_ENABLED`

CONFIG_ESP_WIFI_ENT_FREE_DYNAMIC_BUFFER

Free dynamic buffers during WiFi enterprise connection

Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG_ESP_WIFI_ENTERPRISE_SUPPORT](#)

Select this configuration to free dynamic buffers during WiFi enterprise connection. This will enable chip to reduce heap consumption during WiFi enterprise connection.

Default value:

- No (disabled) if `CONFIG_ESP_WIFI_ENTERPRISE_SUPPORT` && `CONFIG_ESP_HOST_WIFI_ENABLED`

Core dump Contains:

- `CONFIG_ESP_COREDUMP_CHECK_BOOT`
- `CONFIG_ESP_COREDUMP_DATA_FORMAT`
- `CONFIG_ESP_COREDUMP_CHECKSUM`
- `CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART`
- `CONFIG_ESP_COREDUMP_UART_DELAY`
- `CONFIG_ESP_COREDUMP_FLASH_NO_OVERWRITE`
- `CONFIG_ESP_COREDUMP_LOGS`
- `CONFIG_ESP_COREDUMP_DECODE`
- `CONFIG_ESP_COREDUMP_CAPTURE_DRAM`
- `CONFIG_ESP_COREDUMP_MAX_TASKS_NUM`
- `CONFIG_ESP_COREDUMP_STACK_SIZE`
- `CONFIG_ESP_COREDUMP_SUMMARY_STACKDUMP_SIZE`

CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART

Data destination

Found in: [Component config](#) > [Core dump](#)

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to Flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the `components/partition_table` directory.

Available options:

- Flash (`CONFIG_ESP_COREDUMP_ENABLE_TO_FLASH`)
- UART (`CONFIG_ESP_COREDUMP_ENABLE_TO_UART`)
- None (`CONFIG_ESP_COREDUMP_ENABLE_TO_NONE`)

CONFIG_ESP_COREDUMP_DATA_FORMAT

Core dump data format

Found in: [Component config](#) > [Core dump](#)

Select the data format for core dump.

Available options:

- Binary format (`CONFIG_ESP_COREDUMP_DATA_FORMAT_BIN`)
- ELF format (`CONFIG_ESP_COREDUMP_DATA_FORMAT_ELF`)

CONFIG_ESP_COREDUMP_CHECKSUM

Core dump data integrity check

Found in: [Component config](#) > [Core dump](#)

Select the integrity check for the core dump.

Available options:

- Use CRC32 for integrity verification (`CONFIG_ESP_COREDUMP_CHECKSUM_CRC32`)
- Use SHA256 for integrity verification (`CONFIG_ESP_COREDUMP_CHECKSUM_SHA256`)

CONFIG_ESP_COREDUMP_CAPTURE_DRAM

Include whole `.bss` and `.data` sections and heap data into core dump file

Found in: [Component config](#) > [Core dump](#)

Storing these sections can help with easier debugging and troubleshooting. However, additional storage space will be required in the core dump partition. At least 128KB should be reserved, but the actual amount required may vary based on the application's DRAM usage. Note that sections located in external RAM will not be stored.

Default value:

- No (disabled) if `CONFIG_ESP_COREDUMP_DATA_FORMAT_ELF`

CONFIG_ESP_COREDUMP_CHECK_BOOT

Check core dump data integrity on boot

Found in: [Component config](#) > [Core dump](#)

When enabled, if any data are found on the flash core dump partition, they will be checked by calculating their checksum.

Default value:

- Yes (enabled) if [CONFIG_ESP_COREDUMP_ENABLE_TO_FLASH](#)

CONFIG_ESP_COREDUMP_LOGS

Enable coredump logs for debugging

Found in: [Component config](#) > [Core dump](#)

Enable/disable coredump logs. Logs strings from espcoredump component are placed in DRAM. Disabling these helps to save ~5KB of internal memory.

CONFIG_ESP_COREDUMP_MAX_TASKS_NUM

Maximum number of tasks

Found in: [Component config](#) > [Core dump](#)

Maximum number of tasks snapshots in core dump.

CONFIG_ESP_COREDUMP_UART_DELAY

Delay before print to UART

Found in: [Component config](#) > [Core dump](#)

Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.

Default value:

- 0 if [CONFIG_ESP_COREDUMP_ENABLE_TO_UART](#)

CONFIG_ESP_COREDUMP_FLASH_NO_OVERWRITE

Don't overwrite existing core dump

Found in: [Component config](#) > [Core dump](#)

Don't overwrite an existing core dump already present in flash. Enable this option to only keep the first of multiple core dumps.

If enabled, the core dump partition must be erased before the first core dump can be written.

Default value:

- No (disabled) if [CONFIG_ESP_COREDUMP_ENABLE_TO_FLASH](#)

CONFIG_ESP_COREDUMP_STACK_SIZE

Reserved stack size

Found in: [Component config](#) > [Core dump](#)

Size of the memory to be reserved for core dump stack. If 0 core dump process will run on the stack of crashed task/ISR, otherwise special stack will be allocated. To ensure that core dump itself will not overflow task/ISR stack set this to the value around 1300-1800 depending on the chosen checksum calculation method. SHA256 method needs more stack space than CRC32. NOTE: It eats DRAM.

CONFIG_ESP_COREDUMP_SUMMARY_STACKDUMP_SIZE

Size of the stack dump buffer

Found in: Component config > Core dump

Size of the buffer that would be reserved for extracting backtrace info summary. This buffer will contain the stack dump of the crashed task. This dump is useful in generating backtrace

Range:

- from 512 to 4096 if `CONFIG_ESP_COREDUMP_DATA_FORMAT_ELF` && `CONFIG_ESP_COREDUMP_ENABLE_TO_FLASH`

Default value:

- 1024 if `CONFIG_ESP_COREDUMP_DATA_FORMAT_ELF` && `CONFIG_ESP_COREDUMP_ENABLE_TO_FLASH`

CONFIG_ESP_COREDUMP_DECODE

Handling of UART core dumps in IDF Monitor

Found in: Component config > Core dump

Available options:

- Decode and show summary (info_corefile) (CONFIG_ESP_COREDUMP_DECODE_INFO)
- Don't decode (CONFIG_ESP_COREDUMP_DECODE_DISABLE)

FAT Filesystem support Contains:

- `CONFIG_FATFS_API_ENCODING`
- `CONFIG_FATFS_VFS_FSTAT_BLKSIZE`
- `CONFIG_FATFS_IMMEDIATE_FSYNC`
- `CONFIG_FATFS_USE_FASTSEEK`
- `CONFIG_FATFS_LONG_FILENAMES`
- `CONFIG_FATFS_MAX_LFN`
- `CONFIG_FATFS_FS_LOCK`
- `CONFIG_FATFS_VOLUME_COUNT`
- `CONFIG_FATFS_CHOOSE_CODEPAGE`
- `CONFIG_FATFS_LINK_LOCK`
- `CONFIG_FATFS_ALLOC_PREFER_EXTRAM`
- `CONFIG_FATFS_SECTOR_SIZE`
- `CONFIG_FATFS_TIMEOUT_MS`
- `CONFIG_FATFS_USE_DYN_BUFFERS`
- `CONFIG_FATFS_USE_LABEL`
- `CONFIG_FATFS_PER_FILE_CACHE`

CONFIG_FATFS_VOLUME_COUNT

Number of volumes

Found in: Component config > FAT Filesystem support

Number of volumes (logical drives) to use.

Range:

- from 1 to 10

Default value:

- 2

CONFIG_FATFS_LONG_FILENAMES

Long filename support

Found in: [Component config](#) > [FAT Filesystem support](#)

Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap.

Available options:

- No long filenames (CONFIG_FATFS_LFN_NONE)
- Long filename buffer in heap (CONFIG_FATFS_LFN_HEAP)
- Long filename buffer on stack (CONFIG_FATFS_LFN_STACK)

CONFIG_FATFS_SECTOR_SIZE

Sector size

Found in: [Component config](#) > [FAT Filesystem support](#)

Specify the size of the sector in bytes for FATFS partition generator.

Available options:

- 512 (CONFIG_FATFS_SECTOR_512)
- 4096 (CONFIG_FATFS_SECTOR_4096)

CONFIG_FATFS_CHOOSE_CODEPAGE

OEM Code Page

Found in: [Component config](#) > [FAT Filesystem support](#)

OEM code page used for file name encodings.

If "Dynamic" is selected, code page can be chosen at runtime using `f_setcp` function. Note that choosing this option will increase application size by ~480kB.

Available options:

- Dynamic (all code pages supported) (CONFIG_FATFS_CODEPAGE_DYNAMIC)
- US (CP437) (CONFIG_FATFS_CODEPAGE_437)
- Arabic (CP720) (CONFIG_FATFS_CODEPAGE_720)
- Greek (CP737) (CONFIG_FATFS_CODEPAGE_737)
- KBL (CP771) (CONFIG_FATFS_CODEPAGE_771)
- Baltic (CP775) (CONFIG_FATFS_CODEPAGE_775)
- Latin 1 (CP850) (CONFIG_FATFS_CODEPAGE_850)
- Latin 2 (CP852) (CONFIG_FATFS_CODEPAGE_852)
- Cyrillic (CP855) (CONFIG_FATFS_CODEPAGE_855)
- Turkish (CP857) (CONFIG_FATFS_CODEPAGE_857)
- Portuguese (CP860) (CONFIG_FATFS_CODEPAGE_860)
- Icelandic (CP861) (CONFIG_FATFS_CODEPAGE_861)
- Hebrew (CP862) (CONFIG_FATFS_CODEPAGE_862)
- Canadian French (CP863) (CONFIG_FATFS_CODEPAGE_863)
- Arabic (CP864) (CONFIG_FATFS_CODEPAGE_864)
- Nordic (CP865) (CONFIG_FATFS_CODEPAGE_865)
- Russian (CP866) (CONFIG_FATFS_CODEPAGE_866)
- Greek 2 (CP869) (CONFIG_FATFS_CODEPAGE_869)
- Japanese (DBCS) (CP932) (CONFIG_FATFS_CODEPAGE_932)

- Simplified Chinese (DBCS) (CP936) (CONFIG_FATFS_CODEPAGE_936)
- Korean (DBCS) (CP949) (CONFIG_FATFS_CODEPAGE_949)
- Traditional Chinese (DBCS) (CP950) (CONFIG_FATFS_CODEPAGE_950)

CONFIG_FATFS_MAX_LFN

Max long filename length

Found in: [Component config](#) > [FAT Filesystem support](#)

Maximum long filename length. Can be reduced to save RAM.

CONFIG_FATFS_API_ENCODING

API character encoding

Found in: [Component config](#) > [FAT Filesystem support](#)

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.

Available options:

- API uses ANSI/OEM encoding (CONFIG_FATFS_API_ENCODING_ANSI_OEM)
- API uses UTF-8 encoding (CONFIG_FATFS_API_ENCODING_UTF_8)

CONFIG_FATFS_FS_LOCK

Number of simultaneously open files protected by lock function

Found in: [Component config](#) > [FAT Filesystem support](#)

This option sets the FATFS configuration value `_FS_LOCK`. The option `_FS_LOCK` switches file lock function to control duplicated file open and illegal operation to open objects.

* 0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.

* >0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.

Note that the file lock control is independent of re-entrancy.

Range:

- from 0 to 65535

Default value:

- 0

CONFIG_FATFS_TIMEOUT_MS

Timeout for acquiring a file lock, ms

Found in: [Component config](#) > [FAT Filesystem support](#)

This option sets FATFS configuration value `_FS_TIMEOUT`, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and time out after amount of time set by this option.

Default value:

- 10000

CONFIG_FATFS_PER_FILE_CACHE

Use separate cache for each file

Found in: [Component config](#) > [FAT Filesystem support](#)

This option affects FATFS configuration value `_FS_TINY`.

If this option is set, `_FS_TINY` is 0, and each open file has its own cache, size of the cache is equal to the `_MAX_SS` variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, `_FS_TINY` is 1, and single cache is used for all open files, size is also equal to `_MAX_SS` variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.

Default value:

- Yes (enabled)

CONFIG_FATFS_ALLOC_PREFER_EXTRAM

Prefer external RAM when allocating FATFS buffers

Found in: [Component config](#) > [FAT Filesystem support](#)

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

Default value:

- Yes (enabled) if `CONFIG_SPIRAM_USE_CAPS_ALLOC` || `CONFIG_SPIRAM_USE_MALLOC`

CONFIG_FATFS_USE_FASTSEEK

Enable fast seek algorithm when using `lseek` function through VFS FAT

Found in: [Component config](#) > [FAT Filesystem support](#)

The fast seek feature enables fast backward/long seek operations without FAT access by using an in-memory CLMT (cluster link map table). Please note, fast-seek is only allowed for read-mode files, if a file is opened in write-mode, the seek mechanism will automatically fallback to the default implementation.

Default value:

- No (disabled)

CONFIG_FATFS_FAST_SEEK_BUFFER_SIZE

Fast seek CLMT buffer size

Found in: [Component config](#) > [FAT Filesystem support](#) > [CONFIG_FATFS_USE_FASTSEEK](#)

If fast seek algorithm is enabled, this defines the size of CLMT buffer used by this algorithm in 32-bit word units. This value should be chosen based on prior knowledge of maximum elements of each file entry would store.

Default value:

- 64 if `CONFIG_FATFS_USE_FASTSEEK`

CONFIG_FATFS_VFS_FSTAT_BLKSIZE

Default block size

Found in: [Component config](#) > [FAT Filesystem support](#)

If set to 0, the 'newlib' library's default size (BLKSIZ) is used (128 B). If set to a non-zero value, the value is used as the block size. Default file buffer size is set to this value and the buffer is allocated when first attempt of reading/writing to a file is made. Increasing this value improves fread() speed, however the heap usage is increased as well.

NOTE: The block size value is shared by all the filesystem functions accessing target media for given file descriptor! See 'Improving I/O performance' section of 'Maximizing Execution Speed' documentation page for more details.

Default value:

- 0

CONFIG_FATFS_IMMEDIATE_FSYNC

Enable automatic f_sync

Found in: [Component config](#) > [FAT Filesystem support](#)

Enables automatic calling of f_sync() to flush recent file changes after each call of vfs_fat_write(), vfs_fat_pwrite(), vfs_fat_link(), vfs_fat_truncate() and vfs_fat_ftruncate() functions. This feature improves file-consistency and size reporting accuracy for the FatFS, at a price on decreased performance due to frequent disk operations

Default value:

- No (disabled)

CONFIG_FATFS_USE_LABEL

Use FATFS volume label

Found in: [Component config](#) > [FAT Filesystem support](#)

Allows FATFS volume label to be specified using f_setlabel

Default value:

- No (disabled)

CONFIG_FATFS_LINK_LOCK

Perform the whole link operation under lock

Found in: [Component config](#) > [FAT Filesystem support](#)

If enabled, the whole link operation (including file copying) is performed under lock. This ensures that the link operation is atomic, but may cause performance for large files. It may create less fragmented file copy.

Default value:

- Yes (enabled)

CONFIG_FATFS_USE_DYN_BUFFERS

Use dynamic buffers

Found in: [Component config](#) > [FAT Filesystem support](#)

If enabled, the buffers used by FATFS will be allocated separately from the rest of the structure. This option is useful when using multiple FATFS instances with different sector sizes, as the buffers will be allocated according to the sector size. If disabled, the greatest sector size will be used for all FATFS

instances. (In most cases, this would be the sector size of Wear Levelling library) This might cause more memory to be used than necessary.

Default value:

- Yes (enabled) if CONFIG_WL_SECTOR_SIZE_4096

FreeRTOS Contains:

- [Kernel](#)
- [Port](#)

Kernel Contains:

- [CONFIG_FREERTOS_CHECK_STACKOVERFLOW](#)
- [CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY](#)
- [CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS](#)
- [CONFIG_FREERTOS_MAX_TASK_NAME_LEN](#)
- [CONFIG_FREERTOS_IDLE_TASK_STACKSIZE](#)
- [CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS](#)
- [CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE](#)
- [CONFIG_FREERTOS_TASK_NOTIFICATION_ARRAY_ENTRIES](#)
- [CONFIG_FREERTOS_HZ](#)
- [CONFIG_FREERTOS_TIMER_QUEUE_LENGTH](#)
- [CONFIG_FREERTOS_TIMER_SERVICE_TASK_CORE_AFFINITY](#)
- [CONFIG_FREERTOS_TIMER_SERVICE_TASK_NAME](#)
- [CONFIG_FREERTOS_TIMER_TASK_PRIORITY](#)
- [CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH](#)
- [CONFIG_FREERTOS_USE_APPLICATION_TASK_TAG](#)
- [CONFIG_FREERTOS_USE_IDLE_HOOK](#)
- [CONFIG_FREERTOS_USE_LIST_DATA_INTEGRITY_CHECK_BYTES](#)
- [CONFIG_FREERTOS_OPTIMIZED_SCHEDULER](#)
- [CONFIG_FREERTOS_USE_TICK_HOOK](#)
- [CONFIG_FREERTOS_USE_TICKLESS_IDLE](#)
- [CONFIG_FREERTOS_USE_TRACE_FACILITY](#)
- [CONFIG_FREERTOS_VTASKLIST_INCLUDE_COREID](#)
- [CONFIG_FREERTOS_UNICORE](#)

CONFIG_FREERTOS_UNICORE

Run FreeRTOS only on first core

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

CONFIG_FREERTOS_HZ

configTICK_RATE_HZ

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)

Sets the FreeRTOS tick interrupt frequency in Hz (see configTICK_RATE_HZ documentation for more details).

Range:

- from 1 to 1000

Default value:

- 100

CONFIG_FREERTOS_OPTIMIZED_SCHEDULER

configUSE_PORT_OPTIMISED_TASK_SELECTION

Found in: *Component config > FreeRTOS > Kernel*

Enables port specific task selection method. This option can speed up the search of ready tasks when scheduling (see configUSE_PORT_OPTIMISED_TASK_SELECTION documentation for more details).

Default value:

- Yes (enabled) if *CONFIG_FREERTOS_UNICORE*

CONFIG_FREERTOS_CHECK_STACKOVERFLOW

configCHECK_FOR_STACK_OVERFLOW

Found in: *Component config > FreeRTOS > Kernel*

Enables FreeRTOS to check for stack overflows (see configCHECK_FOR_STACK_OVERFLOW documentation for more details).

Note: If users do not provide their own `vApplicationStackOverflowHook()` function, a default function will be provided by ESP-IDF.

Available options:

- No checking (*CONFIG_FREERTOS_CHECK_STACKOVERFLOW_NONE*)
Do not check for stack overflows (`configCHECK_FOR_STACK_OVERFLOW = 0`)
- Check by stack pointer value (Method 1) (*CONFIG_FREERTOS_CHECK_STACKOVERFLOW_PTRVAL*)
Check for stack overflows on each context switch by checking if the stack pointer is in a valid range. Quick but does not detect stack overflows that happened between context switches (`configCHECK_FOR_STACK_OVERFLOW = 1`)
- Check using canary bytes (Method 2) (*CONFIG_FREERTOS_CHECK_STACKOVERFLOW_CANARY*)
Places some magic bytes at the end of the stack area and on each context switch, check if these bytes are still intact. More thorough than just checking the pointer, but also slightly slower. (`configCHECK_FOR_STACK_OVERFLOW = 2`)

CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS

configNUM_THREAD_LOCAL_STORAGE_POINTERS

Found in: *Component config > FreeRTOS > Kernel*

Set the number of thread local storage pointers in each task (see configNUM_THREAD_LOCAL_STORAGE_POINTERS documentation for more details).

Note: In ESP-IDF, this value must be at least 1. Index 0 is reserved for use by the pthreads API thread-local-storage. Other indexes can be used for any desired purpose.

Range:

- from 1 to 256

Default value:

- 1

CONFIG_FREERTOS_IDLE_TASK_STACKSIZE

configMINIMAL_STACK_SIZE (Idle task stack size)

Found in: *Component config > FreeRTOS > Kernel*

Sets the idle task stack size in bytes (see `configMINIMAL_STACK_SIZE` documentation for more details).

Note:

- ESP-IDF specifies stack sizes in bytes instead of words.
- The default size is enough for most use cases.
- The stack size may need to be increased above the default if the app installs idle or thread local storage cleanup hooks that use a lot of stack memory.
- Conversely, the stack size can be reduced to the minimum if non of the idle features are used.

Range:

- from 768 to 32768

Default value:

- 1536

CONFIG_FREERTOS_USE_IDLE_HOOK

`configUSE_IDLE_HOOK`

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)

Enables the idle task application hook (see `configUSE_IDLE_HOOK` documentation for more details).

Note:

- The application must provide the hook function `void vApplicationIdleHook(void) ;`
- `vApplicationIdleHook()` is called from FreeRTOS idle task(s)
- The FreeRTOS idle hook is NOT the same as the ESP-IDF Idle Hook, but both can be enabled simultaneously.

Default value:

- No (disabled)

CONFIG_FREERTOS_USE_TICK_HOOK

`configUSE_TICK_HOOK`

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)

Enables the tick hook (see `configUSE_TICK_HOOK` documentation for more details).

Note:

- The application must provide the hook function `void vApplicationTickHook(void) ;`
- `vApplicationTickHook()` is called from FreeRTOS's tick handling function `xTaskIncrementTick()`
- The FreeRTOS tick hook is NOT the same as the ESP-IDF Tick Interrupt Hook, but both can be enabled simultaneously.

Default value:

- No (disabled)

CONFIG_FREERTOS_MAX_TASK_NAME_LEN

`configMAX_TASK_NAME_LEN`

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)

Sets the maximum number of characters for task names (see `configMAX_TASK_NAME_LEN` documentation for more details).

Note: For most uses, the default of 16 characters is sufficient.

Range:

- from 1 to 256

Default value:

- 16

CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY

configENABLE_BACKWARD_COMPATIBILITY

Found in: Component config > FreeRTOS > Kernel

Enable backward compatibility with APIs prior to FreeRTOS v8.0.0. (see configENABLE_BACKWARD_COMPATIBILITY documentation for more details).

Default value:

- No (disabled)

CONFIG_FREERTOS_TIMER_SERVICE_TASK_NAME

configTIMER_SERVICE_TASK_NAME

Found in: Component config > FreeRTOS > Kernel

Sets the timer task's name (see configTIMER_SERVICE_TASK_NAME documentation for more details).

Default value:

- "Tmr Svc"

CONFIG_FREERTOS_TIMER_SERVICE_TASK_CORE_AFFINITY

configTIMER_SERVICE_TASK_CORE_AFFINITY

Found in: Component config > FreeRTOS > Kernel

Sets the timer task's core affinity (see configTIMER_SERVICE_TASK_CORE_AFFINITY documentation for more details).

Available options:

- CPU0 (CONFIG_FREERTOS_TIMER_TASK_AFFINITY_CPU0)
- CPU1 (CONFIG_FREERTOS_TIMER_TASK_AFFINITY_CPU1)
- No affinity (CONFIG_FREERTOS_TIMER_TASK_NO_AFFINITY)

CONFIG_FREERTOS_TIMER_TASK_PRIORITY

configTIMER_TASK_PRIORITY

Found in: Component config > FreeRTOS > Kernel

Sets the timer task's priority (see configTIMER_TASK_PRIORITY documentation for more details).

Range:

- from 1 to 25

Default value:

- 1

CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH

configTIMER_TASK_STACK_DEPTH

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)

Set the timer task's stack size (see configTIMER_TASK_STACK_DEPTH documentation for more details).

Range:

- from 1536 to 32768

Default value:

- 2048

CONFIG_FREERTOS_TIMER_QUEUE_LENGTH

configTIMER_QUEUE_LENGTH

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)

Set the timer task's command queue length (see configTIMER_QUEUE_LENGTH documentation for more details).

Range:

- from 5 to 20

Default value:

- 10

CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE

configQUEUE_REGISTRY_SIZE

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)

Set the size of the queue registry (see configQUEUE_REGISTRY_SIZE documentation for more details).

Note: A value of 0 will disable queue registry functionality

Range:

- from 0 to 20

Default value:

- 0

CONFIG_FREERTOS_TASK_NOTIFICATION_ARRAY_ENTRIES

configTASK_NOTIFICATION_ARRAY_ENTRIES

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)

Set the size of the task notification array of each task. When increasing this value, keep in mind that this means additional memory for each and every task on the system. However, task notifications in general are more light weight compared to alternatives such as semaphores.

Range:

- from 1 to 32

Default value:

- 1

CONFIG_FREERTOS_USE_TRACE_FACILITY

configUSE_TRACE_FACILITY

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)

Enables additional structure members and functions to assist with execution visualization and tracing (see `configUSE_TRACE_FACILITY` documentation for more details).

Default value:

- No (disabled)

CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS

`configUSE_STATS_FORMATTING_FUNCTIONS`

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#) > [CONFIG_FREERTOS_USE_TRACE_FACILITY](#)

Set `configUSE_TRACE_FACILITY` and `configUSE_STATS_FORMATTING_FUNCTIONS` to 1 to include the `vTaskList()` and `vTaskGetRunTimeStats()` functions in the build (see `configUSE_STATS_FORMATTING_FUNCTIONS` documentation for more details).

Default value:

- No (disabled) if [CONFIG_FREERTOS_USE_TRACE_FACILITY](#)

CONFIG_FREERTOS_USE_LIST_DATA_INTEGRITY_CHECK_BYTES

`configUSE_LIST_DATA_INTEGRITY_CHECK_BYTES`

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)

Enable list integrity checker (see `configUSE_LIST_DATA_INTEGRITY_CHECK_BYTES` documentation for more details).

Default value:

- No (disabled)

CONFIG_FREERTOS_VTASKLIST_INCLUDE_COREID

Enable display of `xCoreID` in `vTaskList`

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)

If enabled, this will include an extra column when `vTaskList` is called to display the `CoreID` the task is pinned to (0,1) or -1 if not pinned.

Default value:

- No (disabled) if [CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS](#)

CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS

`configGENERATE_RUN_TIME_STATS`

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)

Enables collection of run time statistics for each task (see `configGENERATE_RUN_TIME_STATS` documentation for more details).

Note: The clock used for run time statistics can be configured in `FREERTOS_RUN_TIME_STATS_CLK`.

Default value:

- No (disabled)

CONFIG_FREERTOS_RUN_TIME_COUNTER_TYPE

`configRUN_TIME_COUNTER_TYPE`

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#) > [CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS](#)

Sets the data type used for the FreeRTOS run time stats. A larger data type can be used to reduce the frequency of the counter overflowing.

Available options:

- `uint32_t` (`CONFIG_FREERTOS_RUN_TIME_COUNTER_TYPE_U32`)
`configRUN_TIME_COUNTER_TYPE` is set to `uint32_t`
- `uint64_t` (`CONFIG_FREERTOS_RUN_TIME_COUNTER_TYPE_U64`)
`configRUN_TIME_COUNTER_TYPE` is set to `uint64_t`

CONFIG_FREERTOS_USE_TICKLESS_IDLE

`configUSE_TICKLESS_IDLE`

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)

If power management support is enabled, FreeRTOS will be able to put the system into light sleep mode when no tasks need to run for a number of ticks. This number can be set using `FREERTOS_IDLE_TIME_BEFORE_SLEEP` option. This feature is also known as "automatic light sleep".

Note that timers created using `esp_timer` APIs may prevent the system from entering sleep mode, even when no tasks need to run. To skip unnecessary wake-up initialize a timer with the "skip_unhandled_events" option as true.

If disabled, automatic light sleep support will be disabled.

Default value:

- No (disabled) if [CONFIG_PM_ENABLE](#)

CONFIG_FREERTOS_IDLE_TIME_BEFORE_SLEEP

`configEXPECTED_IDLE_TIME_BEFORE_SLEEP`

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#) > [CONFIG_FREERTOS_USE_TICKLESS_IDLE](#)

FreeRTOS will enter light sleep mode if no tasks need to run for this number of ticks. You can enable `PM_PROFILING` feature in `esp_pm` components and dump the sleep status with `esp_pm_dump_locks`, if the proportion of rejected sleeps is too high, please increase this value to improve scheduling efficiency

Range:

- from 2 to 4294967295 if [CONFIG_FREERTOS_USE_TICKLESS_IDLE](#)

Default value:

- 3 if [CONFIG_FREERTOS_USE_TICKLESS_IDLE](#)

CONFIG_FREERTOS_USE_APPLICATION_TASK_TAG

`configUSE_APPLICATION_TASK_TAG`

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)

Enables task tagging functionality and its associated API (see `configUSE_APPLICATION_TASK_TAG` documentation for more details).

Default value:

- No (disabled)

Port Contains:

- [CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER](#)
- [CONFIG_FREERTOS_RUN_TIME_STATS_CLK](#)

CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER

Wrap task functions

Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)

If enabled, all FreeRTOS task functions will be enclosed in a wrapper function. If a task function mistakenly returns (i.e. does not delete), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application. This option is also required for GDB backtraces and C++ exceptions to work correctly inside top-level task functions.

Default value:

- Yes (enabled)

CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK

Enable stack overflow debug watchpoint

Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)

FreeRTOS can check if a stack has overflowed its bounds by checking either the value of the stack pointer or by checking the integrity of canary bytes. (See `CONFIG_FREERTOS_CHECK_STACKOVERFLOW` for more information.) These checks only happen on a context switch, and the situation that caused the stack overflow may already be long gone by then. This option will use the last debug memory watchpoint to allow breaking into the debugger (or panicking) as soon as any of the last 32 bytes on the stack of a task are overwritten. The side effect is that using gdb, you effectively have one hardware watchpoint less because the last one is overwritten as soon as a task switch happens.

Another consequence is that due to alignment requirements of the watchpoint, the usable stack size decreases by up to 60 bytes. This is because the watchpoint region has to be aligned to its size and the size for the stack watchpoint in IDF is 32 bytes.

This check only triggers if the stack overflow writes within 32 bytes near the end of the stack, rather than overshooting further, so it is worth combining this approach with one of the other stack overflow check methods.

When this watchpoint is hit, gdb will stop with a SIGTRAP message. When no JTAG OCD is attached, esp-idf will panic on an unhandled debug exception.

Default value:

- No (disabled)

CONFIG_FREERTOS_TLSP_DELETION_CALLBACKS

Enable thread local storage pointers deletion callbacks

Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)

ESP-IDF provides users with the ability to free TLSP memory by registering TLSP deletion callbacks. These callbacks are automatically called by FreeRTOS when a task is deleted. When this option is turned on, the memory reserved for TLSPs in the TCB is doubled to make space for storing the deletion callbacks. If the user does not wish to use TLSP deletion callbacks then this option could be turned off to save space in the TCB memory.

Default value:

- Yes (enabled)

CONFIG_FREERTOS_TASK_PRE_DELETION_HOOK

Enable task pre-deletion hook

Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)

Enable this option to make FreeRTOS call a user provided hook function right before it deletes a task (i.e., frees/releases a dynamically/statically allocated task's memory). This is useful if users want to know when a task is actually deleted (in case the task's deletion is delegated to the IDLE task).

If this config option is enabled, users must define a `void vTaskPreDeletionHook(void * pxTCB)` hook function in their application.

CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP

Enable static task clean up hook (DEPRECATED)

Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)

THIS OPTION IS DEPRECATED. Use FREERTOS_TASK_PRE_DELETION_HOOK instead.

Enable this option to make FreeRTOS call the static task clean up hook when a task is deleted.

Note: Users will need to provide a `void vPortCleanUpTCB (void *pxTCB)` callback

Default value:

- No (disabled)

CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER

Check that mutex semaphore is given by owner task

Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)

If enabled, assert that when a mutex semaphore is given, the task giving the semaphore is the task which is currently holding the mutex.

Default value:

- Yes (enabled)

CONFIG_FREERTOS_ISR_STACKSIZE

ISR stack size

Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)

The interrupt handlers have their own stack. The size of the stack can be defined here. Each processor has its own stack, so the total size occupied will be twice this.

Range:

- from 2096 to 32768 if [CONFIG_ESP_COREDUMP_DATA_FORMAT_ELF](#)
- from 1536 to 32768

Default value:

- 2096 if [CONFIG_ESP_COREDUMP_DATA_FORMAT_ELF](#)
- 1536

CONFIG_FREERTOS_INTERRUPT_BACKTRACE

Enable backtrace from interrupt to task context
